supply chain — The linked activities associated with providing materiel from a raw materiel stage to an end user as a finished product. See also **supply; supply chain management.** (JP 4-09)

supply chain management — A cross-functional approach to procuring, producing, and delivering products and services to customers. See also **supply; supply chain.** (JP 4-09)

supply support activity — Activities assigned a Department of Defense activity address code and that have a supply support mission. Also called **SSA.** (JP 4-09)

support — 1. The action of a force that aids, protects, complements, or sustains another force in accordance with a directive requiring such action. 2. A unit that helps another unit in battle. 3. An element of a command that assists, protects, or supplies other forces in combat. See also **close support; direct support; general support; inter-Service support; mutual support.** (JP 1)

supported commander — 1. The commander having primary responsibility for all aspects of a task assigned by the Joint Strategic Capabilities Plan or other joint operation planning authority. 2. In the context of joint operation planning, the commander who prepares operation plans or operation orders in response to requirements of the Chairman of the Joint Chiefs of Staff. 3. In the context of a support command relationship, the commander who receives assistance from another commander's force or capabilities, and who is responsible for ensuring that the supporting commander understands the assistance required. See also **support; supporting commander.** (JP 3-0)

supported unit — As related to contracted support, a supported unit is the organization that is the recipient, but not necessarily the requester of, contractor-provided support. See also **requiring activity.** (JP 4-10)

supporting arms — Weapons and weapons systems of all types employed to support forces by indirect or direct fire. (JP 3-02)

supporting arms coordination center — A single location on board an amphibious warfare command ship in which all communication facilities incident to the coordination of fire support of the artillery, air, and naval gunfire are centralized. Also called **SACC.** See also **fire support coordination center.** (JP 3-09.3)

supporting commander — 1. A commander who provides augmentation forces or other support to a supported commander or who develops a supporting plan. 2. In the context of a support command relationship, the commander who aids, protects, complements, or sustains another commander's force, and who is responsible for providing the assistance required by the supported commander. See also **support; supported commander.** (JP 3-0)

supporting fire — Fire delivered by supporting units to assist or protect a unit in combat. (JP 3-09)

supporting operations — In amphibious operations, those operations conducted by forces other than those conducted by the amphibious force. See also **amphibious force; amphibious operation.** (JP 3-02)

supporting plan — An operation plan prepared by a supporting commander, a subordinate commander, or an agency to satisfy the requests or requirements of the supported commander's plan. See also **supported commander; supporting commander.** (JP 5-0)

suppression — Temporary or transient degradation by an opposing force of the performance of a weapons system below the level needed to fulfill its mission objectives. (JP 3-01)

suppression of enemy air defenses — Activity that neutralizes, destroys, or temporarily degrades surface-based enemy air defenses by destructive and/or disruptive means. Also called **SEAD.** See also **electromagnetic spectrum; electronic warfare.** (JP 3-01)

surface action group — A temporary or standing organization of combatant ships, other than carriers, tailored for a specific tactical mission. Also called **SAG.** See **group**; **mission.** (JP 3-32)

surface combatant — A ship constructed and armed for combat use with the capability to conduct operations in multiple maritime roles against air, surface and subsurface threats, and land targets. (JP 3-32)

surface-to-air missile site — A plot of ground prepared in such a manner that it will readily accept the hardware used in surface-to-air missile system. (JP 3-01)

surface warfare — That portion of maritime warfare in which operations are conducted to destroy or neutralize enemy naval surface forces and merchant vessels. Also called **SUW.** (JP 3-32)

surf line — The point offshore where waves and swells are affected by the underwater surface and become breakers. (JP 4-01.6)

surf zone — The area of water from the surf line to the beach. See also **surf line.** (JP 4-01.6)

surveillance — The systematic observation of aerospace, surface, or subsurface areas, places, persons, or things, by visual, aural, electronic, photographic, or other means. (JP 3-0)

survivability — All aspects of protecting personnel, weapons, and supplies while simultaneously deceiving the enemy. (JP 3-34)

survival, evasion, resistance, and escape — Actions performed by isolated personnel designed to ensure their health, mobility, safety, and honor in anticipation of or preparation for their return to friendly control. Also called **SERE.** (JP 3-50)

suspect — 1. In counterdrug operations, a track of interest where correlating information actually ties the track of interest to alleged illegal drug operations. See also **counterdrug operations; track of interest.** 2. An identity applied to a track that is potentially hostile because of its characteristics, behavior, origin, or nationality. See also **assumed friend; neutral; unknown**. (JP 3-07.4)

sustainment — The provision of logistics and personnel services required to maintain and prolong operations until successful mission accomplishment. (JP 3-0)

sustainment, restoration, and modernization — The fuels asset sustainment program within Defense Logistics Agency Energy that provides a long-term process to cost-effectively sustain, restore, and modernize fuel facilities. Also called **SRM.** (JP 4-03)

synchronization — 1. The arrangement of military actions in time, space, and purpose to produce maximum relative combat power at a decisive place and time. 2. In the

intelligence context, application of intelligence sources and methods in concert with the operation plan to answer intelligence requirements in time to influence the decisions they support. (JP 2-0)

synthesis — In intelligence usage, the examining and combining of processed information with other information and intelligence for final interpretation. (JP 2-0)

system — A functionally, physically, and/or behaviorally related group of regularly interacting or interdependent elements; that group of elements forming a unified whole. (JP 3-0)

systems support contract — A prearranged contract awarded by a Service acquisition program management office that provides technical support, maintenance and, in some cases, repair parts for selected military weapon and support systems. See also **external support contract; theater support contract.** (JP 4-10)

Intentionally Blank

T

table of allowance — An equipment allowance document that prescribes basic allowances of organizational equipment, and provides the control to develop, revise, or change equipment authorization inventory data. Also called **TOA.** (JP 4-09)

TABOO frequencies — Any friendly frequency of such importance that it must never be deliberately jammed or interfered with by friendly forces including international distress, safety, and controller frequencies. See also **electronic warfare.** (JP 3-13.1)

tactical air command center — The principal US Marine Corps air command and control agency from which air operations and air defense warning functions are directed. Also called **Marine TACC.** (JP 3-09.3)

tactical air control center — The principal air operations installation (ship-based) from which all aircraft and air warning functions of tactical air operations are controlled. Also called **Navy TACC.** (JP 3-09.3)

tactical air control party — A subordinate operational component of a tactical air control system designed to provide air liaison to land forces and for the control of aircraft. Also called **TACP.** (JP 3-09.3)

tactical air coordinator (airborne) — An officer who coordinates, from an aircraft, the actions of other aircraft engaged in air support of ground or sea forces. Also called **TAC(A).** See also **forward observer**. (JP 3-09.3)

tactical air direction center — An air operations installation under the overall control of the Navy tactical air control center or the Marine Corps tactical air command center, from which aircraft and air warning service functions of tactical air operations in support of amphibious operations are directed. Also called **TADC.** (JP 3-09.3)

tactical air officer — The officer under the amphibious task force commander who, until control is passed ashore, coordinates planning of all phases of air participation of the amphibious operation and air operations of supporting forces en route to and in the objective area. Also called **TAO**. (JP 3-02)

tactical air operations center — The principal air control agency of the United States Marine Corps air command and control system responsible for airspace control and management. Also called **TAOC.** (JP 3-09.3)

tactical assembly area — An area that is generally out of the reach of light artillery and the location where units make final preparations (pre-combat checks and inspections) and rest, prior to moving to the line of departure. See also **line of departure.** (JP 3-35)

tactical combat casualty care — A set of trauma management guidelines customized for use on the battlefield that maintains a sharp focus on the most common causes of preventable

deaths on the battlefield: external hemorrhage; tension pneumothorax; and airway obstruction. (JP 4-02)

tactical combat force — A rapidly deployable, air-ground mobile combat unit, with appropriate combat support and combat service support assets assigned to and capable of defeating Level III threats including combined arms. Also called **TCF.** (JP 3-10)

tactical control — The authority over forces that is limited to the detailed direction and control of movements or maneuvers within the operational area necessary to accomplish missions or tasks assigned. Also called **TACON.** See also **combatant command; combatant command (command authority); operational control.** (JP 1)

tactical data link — A Joint Staff-approved, standardized communication link suitable for transmission of digital information, which interfaces two or more command and control or weapons systems via a single or multiple network architecture and multiple communication media for exchange of tactical information. Also called **TDL.** (JP 6-0)

tactical exploitation of national capabilities — Congressionally mandated program to improve the combat effectiveness of the Services through more effective military use of national programs. Also called **TENCAP.** (JP 2-01)

tactical intelligence — Intelligence required for the planning and conduct of tactical operations. See also **intelligence.** (JP 2-01.2)

tactical level of war — The level of war at which battles and engagements are planned and executed to achieve military objectives assigned to tactical units or task forces. See also **operational level of war; strategic level of war.** (JP 3-0)

tactical-logistical group — Representatives designated by troop commanders to assist Navy control officers aboard control ships in the ship-to-shore movement of troops, equipment, and supplies. Also called **TACLOG group**. (JP 3-02)

tactical minefield — A minefield that is employed to directly attack enemy maneuver as part of a formation obstacle plan and is laid to delay, channel, or break up an enemy advance, giving the defending element a positional advantage over the attacker. (JP 3-15)

tactical obstacles — Those obstacles employed to disrupt enemy formations, to turn them into a desired area, to fix them in position under direct and indirect fires, and to block enemy penetrations. (JP 3-15)

tactical questioning — The field-expedient initial questioning for information of immediate tactical value of a captured or detained person at or near the point of capture and before the individual is placed in a detention facility. Also called **TQ.** (JP 3-63)

tactical recovery of aircraft and personnel — A Marine Corps mission performed by an assigned and briefed aircrew for the specific purpose of the recovery of personnel,

equipment, and/or aircraft when the tactical situation precludes search and rescue assets from responding and when survivors and their location have been confirmed. Also called **TRAP.** (JP 3-50)

tactical reserve — A part of a force held under the control of the commander as a maneuvering force to influence future action. (JP 3-02)

tactics — The employment and ordered arrangement of forces in relation to each other. See also **procedures; techniques.** (CJCSM 5120.01)

target — 1. An entity or object that performs a function for the adversary considered for possible engagement or other action. 2. In intelligence usage, a country, area, installation, agency, or person against which intelligence operations are directed. 3. An area designated and numbered for future firing. 4. In gunfire support usage, an impact burst that hits the target. See also **objective area.** (JP 3-60)

target acquisition — The detection, identification, and location of a target in sufficient detail to permit the effective employment of weapons. Also called **TA.** See also **target analysis.** (JP 3-60)

target analysis — An examination of potential targets to determine military importance, priority of attack, and weapons required to obtain a desired level of damage or casualties. See also **target acquisition.** (JP 3-60)

target area of interest — The geographical area where high-value targets can be acquired and engaged by friendly forces. Also called **TAI.** See also **area of interest; high-value target; target.** (JP 2-01.3)

target audience — An individual or group selected for influence. Also called **TA.** (JP 3-13)

target complex — A geographically integrated series of target concentrations. See also **target.** (JP 3-60)

target component — A set of targets within a target system performing a similar function. See also **target.** (JP 3-60)

target development — The systematic examination of potential target systems - and their components, individual targets, and even elements of targets - to determine the necessary type and duration of the action that must be exerted on each target to create an effect that is consistent with the commander's specific objectives. (JP 3-60)

targeteer — An individual who has completed formal targeting training in an established Service or joint school and participates in the joint targeting cycle in their current duties. (JP 3-60)

target folder — A folder, hardcopy or electronic, containing target intelligence and related materials prepared for planning and executing action against a specific target. See also **target.** (JP 3-60)

target information center — The agency or activity responsible for collecting, displaying, evaluating, and disseminating information pertaining to potential targets. Also called **TIC**. See also **target.** (JP 3-02)

targeting — The process of selecting and prioritizing targets and matching the appropriate response to them, considering operational requirements and capabilities. See also **joint targeting coordination board; target.** (JP 3-0)

target intelligence — Intelligence that portrays and locates the components of a target or target complex and indicates its vulnerability and relative importance. See also **target; target complex.** (JP 3-60)

target location error — The difference between the coordinates generated for a target and the actual location of the target. Also called **TLE**. (JP 3-09.3)

target materials — Graphic, textual, tabular, digital, video, or other presentations of target intelligence, primarily designed to support operations against designated targets by one or more weapon(s) systems. See also **Air Target Materials Program.** (JP 3-60)

target nomination list — A prioritized list of targets drawn from the joint target list and nominated by component commanders, appropriate agencies, or the joint force commander's staff for inclusion on the joint integrated prioritized target list. Also called **TNL.** See also **candidate target list; joint integrated prioritized target list; target.** (JP 3-60)

target of opportunity — 1. A target identified too late, or not selected for action in time, to be included in deliberate targeting that, when detected or located, meets criteria specific to achieving objectives and is processed using dynamic targeting. 2. A target visible to a surface or air sensor or observer, which is within range of available weapons and against which fire has not been scheduled or requested. See also **dynamic targeting; target; unplanned target; unanticipated target.** (JP 3-60)

target reference point — A predetermined point of reference, normally a permanent structure or terrain feature that can be used when describing a target location. Also called **TRP.** (JP 3-09.3)

target system — 1. All the targets situated in a particular geographic area and functionally related. 2. A group of targets that are so related that their destruction will produce some particular effect desired by the attacker. See also **target; target complex.** (JP 3-60)

target system analysis — An all-source examination of potential target systems to determine relevance to stated objectives, military importance, and priority of attack. Also called **TSA.** (JP 3-60)

target system assessment — The broad assessment of the overall impact and effectiveness of the full spectrum of military force applied against the operation of an enemy target system, significant subdivisions of the system, or total combat effectiveness relative to the operational objectives established. See also **target system.** (JP 3-60)

target system component — A set of targets belonging to one or more groups of industries and basic utilities required to produce component parts of an end product, or one type of a series of interrelated commodities. (JP 3-60)

task — A clearly defined action or activity specifically assigned to an individual or organization that must be done as it is imposed by an appropriate authority. (JP 1)

task component — A subdivision of a fleet, task force, task group, or task unit, organized by the respective commander or by higher authority for the accomplishment of specific tasks. (JP 3-32)

task element — A component of a naval task unit organized by the commander of a task unit or higher authority. (JP 3-32)

task force — A component of a fleet organized by the commander of a task fleet or higher authority for the accomplishment of a specific task or tasks. Also called **TF.** (JP 3-32)

task force counterintelligence coordinating authority — An individual that affects the overall coordination of counterintelligence activities (in a joint force intelligence directorate counterintelligence and human intelligence staff element, joint task force configuration), with other supporting counterintelligence organizations, and supporting agencies to ensure full counterintelligence coverage of the task force operational area. Also called **TFCICA**. See also **counterintelligence; counterintelligence activities; joint task force**. (JP 2-01.2)

task group — A component of a naval task force organized by the commander of a task force or higher authority. Also called **TG.** (JP 3-32)

tasking order — A method used to task and to disseminate to components, subordinate units, and command and control agencies projected targets and specific missions as well as general and specific instructions for accomplishment of the mission. Also called **TASKORD.** See also **mission; target.** (JP 3-05.1)

task order — Order for services placed against an established contract. See also **civil augmentation program.** (JP 4-10)

task organization — An organization that assigns to responsible commanders the means with which to accomplish their assigned tasks in any planned action. (JP 3-33)

task unit — A component of a naval task group organized by the commander of a task group or higher authority. (JP 3-32)

tear line — A physical line on an intelligence message or document separating categories of information that have been approved for foreign disclosure and release. (JP 2-0)

technical analysis — In imagery interpretation, the precise description of details appearing on imagery. (JP 2-03)

technical assistance — The providing of advice, assistance, and training pertaining to the installation, operation, and maintenance of equipment. (JP 3-22)

technical escort — An individual technically qualified and properly equipped to accompany designated material requiring a high degree of safety or security during shipment. (JP 3-15.1)

technical evaluation — The study and investigations by a developing agency to determine the technical suitability of material, equipment, or a system for use in the Services. (JP 3-15.1)

technical intelligence — Intelligence derived from the collection, processing, analysis, and exploitation of data and information pertaining to foreign equipment and materiel for the purposes of preventing technological surprise, assessing foreign scientific and technical capabilities, and developing countermeasures designed to neutralize an adversary's technological advantages. Also called **TECHINT.** See also **exploitation; intelligence.** (JP 2-0)

technical nuclear forensics — The collection, analysis and evaluation of pre-detonation (intact) and post-detonation (exploded) radiological or nuclear materials, devices, and debris, as well as the immediate effects created by a nuclear detonation. (JP 3-41)

technical review authority — The organization tasked to provide specialized technical or administrative expertise to the lead agent, primary review authority, Joint Staff doctrine sponsor, or coordinating review authority for joint publications. Also called **TRA**. See also **coordinating review authority; joint publication; primary review authority.** (CJCSM 5120.01)

technical surveillance countermeasures — Techniques and measures to detect and neutralize a wide variety of hostile penetration technologies that are used to obtain unauthorized access to classified and sensitive information. Technical penetrations include the employment of optical, electro-optical, electromagnetic, fluidic, and acoustic means as the sensor and transmission medium, or the use of various types of stimulation or modification to equipment or building components for the direct or indirect

transmission of information meant to be protected. Also called **TSCM.** See also **counterintelligence.** (JP 2-01.2)

techniques — Non-prescriptive ways or methods used to perform missions, functions, or tasks. See also **procedures; tactics.** (CJCSM 5120.01)

telecommunications — Any transmission, emission, or reception of signs, signals, writings, images, sounds, or information of any nature by wire, radio, visual, or other electromagnetic systems. (JP 6-0)

telemedicine — Rapid access to shared and remote medical expertise by means of telecommunications and information technologies to deliver health services and exchange health information for the purpose of improving patient care. (JP 4-02)

tempest — An unclassified term referring to technical investigations for compromising emanations from electrically operated information processing equipment; these investigations are conducted in support of emanations and emissions security. See also **counterintelligence.** (JP 2-01.2)

temporary interment — A site for the purpose of: a. the interment of the remains if the circumstances permit; or b. the reburial of remains exhumed from an emergency interment. See also **mortuary affairs.** (JP 4-06)

terminal — A facility designed to transfer cargo from one means of conveyance to another. See also **facility.** (JP 4-01.6)

terminal attack control — The authority to control the maneuver of and grant weapons release clearance to attacking aircraft. See also **joint terminal attack controller.** (JP 3-09.3)

terminal control — 1. A type of air control with the authority to direct aircraft to maneuver into a position to deliver ordnance, passengers, or cargo to a specific location or target. 2. Any electronic, mechanical, or visual control given to aircraft to facilitate target acquisition and resolution. See also **terminal guidance.** (JP 3-09.3)

terminal guidance — 1. The guidance applied to a guided missile between midcourse guidance and arrival in the vicinity of the target. 2. Electronic, mechanical, visual, or other assistance given an aircraft pilot to facilitate arrival at, operation within or over, landing upon, or departure from an air landing or airdrop facility. See also **terminal control.** (JP 3-03)

terminal guidance operations — Actions using electronic, mechanical, voice, or visual communications that provide approaching aircraft and/or weapons additional information regarding a specific target location. Also called **TGO.** (JP 3-09)

terminal operations — The reception, processing, and staging of passengers; the receipt, transit, storage, and marshalling of cargo; the loading and unloading of modes of transport conveyances; and the manifesting and forwarding of cargo and passengers to destination. See also **operation; terminal.** (JP 4-01.5)

terminal phase — That portion of the flight of a ballistic missile that begins when the warhead or payload reenters the atmosphere and ends when the warhead or payload detonates, releases its submunitions, or impacts. See also **boost phase; midcourse phase.** (JP 3-01)

termination criteria — The specified standards approved by the President and/or the Secretary of Defense that must be met before a joint operation can be concluded. (JP 3-0)

terms of reference — 1. A mutual agreement under which a command, element, or unit exercises authority or undertakes specific missions or tasks relative to another command, element, or unit. 2. The directive providing the legitimacy and authority to undertake a mission, task, or endeavor. Also called **TORs.** (JP 3-0)

terrain analysis — The collection, analysis, evaluation, and interpretation of geographic information on the natural and man-made features of the terrain, combined with other relevant factors, to predict the effect of the terrain on military operations. (JP 2-03)

terrain avoidance system — A system that provides the pilot or navigator of an aircraft with a situation display of the ground or obstacles so that the pilot can maneuver the aircraft to avoid the obstruction. (JP 3-50)

terrain flight — Flight close to the Earth's surface during which airspeed, height, and/or altitude are adapted to the contours and cover of the ground in order to avoid enemy detection and fire. Also called **contour flight**; **low-level flight**; **nap-of-the-earth flight.** (JP 3-09.3)

terrain intelligence — Intelligence on the military significance of natural and man-made characteristics of an area. (JP 3-15)

terrestrial environment — The Earth's land area, including its man-made and natural surface and sub-surface features, and its interfaces and interactions with the atmosphere and the oceans. (JP 3-59)

territorial airspace — Airspace above land territory and internal, archipelagic, and territorial waters. (JP 1)

territorial waters — A belt of ocean space adjacent to and measured from the coastal states baseline to a maximum width of 12 nautical miles. (JP 1)

terrorism — The unlawful use of violence or threat of violence, often motivated by religious, political, or other ideological beliefs, to instill fear and coerce governments or societies in pursuit of goals that are usually political. See also **antiterrorism; combating terrorism; counterterrorism; force protection condition.** (JP 3-07.2)

terrorist threat level — A Department of Defense intelligence threat assessment of the level of terrorist threat faced by United States personnel and interests in a foreign country; the levels are expressed as **LOW**, **MODERATE**, **SIGNIFICANT**, and **HIGH**. (JP 3-07.2)

theater — The geographical area for which a commander of a geographic combatant command has been assigned responsibility. (JP 1)

theater antisubmarine warfare commander — A Navy commander assigned to develop plans and direct assigned and attached assets for the conduct of antisubmarine warfare within an operational area. Also called **TASWC.** (JP 3-32)

theater-assigned transportation assets — Transportation assets that are assigned under the combatant command (command authority) of a geographic combatant commander. See also **combatant command (command authority); single manager for transportation.** (JP 4-01)

theater detainee reporting center — The field operating agency of the National Detainee Reporting Center responsible for maintaining information on all detainees and their personal property within a theater of operations or assigned area of operations. Also called **TDRC.** (JP 3-63)

theater distribution — The flow of personnel, equipment, and materiel within theater to meet the geographic combatant commander's missions. See also **distribution; theater; theater distribution system.** (JP 4-09)

theater distribution system — A distribution system comprised of four independent and mutually supported networks within theater to meet the geographic combatant commander's requirements: the physical network; the financial network; the information network; and the communications network. See also **distribution; distribution plan; distribution system; theater; theater distribution.** (JP 4-01)

theater event system — Architecture for reporting ballistic missile events, composed of three independent processing and reporting elements: the joint tactical ground stations, tactical detection and reporting, and the space-based infrared system mission control station. Also called **TES.** (JP 3-14)

theater hospitalization capability — Essential care and health service support capabilities to either return the patient to duty and/or stabilization to ensure the patient can tolerate evacuation to a definitive care facility outside the theater, which is known as Role 3 in North Atlantic Treaty Organization doctrine. (JP 4-02)

theater of operations — An operational area defined by the geographic combatant commander for the conduct or support of specific military operations. Also called **TO.** See also **theater of war.** (JP 3-0)

theater of war — Defined by the President, Secretary of Defense, or the geographic combatant commander as the area of air, land, and water that is, or may become, directly involved in the conduct of major operations and campaigns involving combat. See also **area of responsibility; theater of operations.** (JP 3-0)

theater patient movement requirements center — The activity responsible for intratheater patient movement management (medical regulating and aeromedical evacuation scheduling), the development of theater-level patient movement plans and schedules, the monitoring and execution in concert with the Global Patient Movement Requirements Center. Also called **TPMRC.** (JP 4-02)

theater special operations command — A subordinate unified command established by a combatant commander to plan, coordinate, conduct, and support joint special operations. Also called **TSOC.** See also **special operations.** (JP 3-05)

theater strategy — An overarching construct outlining a combatant commander's vision for integrating and synchronizing military activities and operations with the other instruments of national power in order to achieve national strategic objectives. See also n**ational military strategy; national security strategy; strategy.** (JP 3-0)

theater support contract — A type of contingency contract awarded by contracting officers in the operational area serving under the direct contracting authority of the Service component or designated joint head of contracting activity for the designated contingency operation. See also **external support contract; systems support contract.** (JP 4-10)

thermal crossover — The natural phenomenon that normally occurs twice daily when temperature conditions are such that there is a loss of contrast between two adjacent objects on infrared imagery. (JP 3-09.3)

thermal radiation — 1. The heat and light produced by a nuclear explosion. 2. Electromagnetic radiations emitted from a heat or light source as a consequence of its temperature. (JP 3-41)

thorough decontamination — Decontamination carried out by a unit to reduce contamination on personnel, equipment, materiel, and/or working areas equal to natural background or to the lowest possible levels, to permit the partial or total removal of individual protective equipment and to maintain operations with minimum degradation. See also **immediate decontamination; operational decontamination.** (JP 3-11)

threat analysis — In antiterrorism, a continual process of compiling and examining all available information concerning potential terrorist activities by terrorist groups which could target a facility. See also **antiterrorism.** (JP 3-07.2)

threat assessment — In antiterrorism, examining the capabilities, intentions, and activities, past and present, of terrorist organizations as well as the security environment within which friendly forces operate to determine the level of threat. Also called **TA.** (JP 3-07.2)

threat warning — The urgent communication and acknowledgement of time-critical information essential for the preservation of life and/or vital resources. (JP 2-01)

throughput — 1. In transportation, the average quantity of cargo and passengers that can pass through a port on a daily basis from arrival at the port to loading onto a ship or plane, or from the discharge from a ship or plane to the exit (clearance) from the port complex. (JP 4-01.5) 2. In patient movement and care, the maximum number of patients (stable or stabilized) by category, that can be received at the airport, staged, transported, and received at the proper hospital within any 24-hour period. (JP 4-02)

throughput capacity — The estimated capacity of a port or an anchorage to clear cargo and/or passengers in 24 hours usually expressed in tons for cargo, but may be expressed in any agreed upon unit of measurement. See also **clearance capacity**. (JP 4-01.5)

time-definite delivery — The consistent delivery of requested logistic support at a time and destination specified by the receiving activity. See also **logistic support.** Also called **TDD.** (JP 4-09)

time of flight — In artillery, mortar, and naval gunfire support, the time in seconds from the instant a weapon is fired, launched, or released from the delivery vehicle or weapons system to the instant it strikes or detonates. Also called **TOF**. (JP 3-09)

time on target — The actual time at which munitions impact the target. Also called **TOT.** (JP 3-09.3)

time-phased force and deployment data — The time-phased force data, non-unit cargo and personnel data, and movement data for the operation plan or operation order or ongoing rotation of forces. Also called **TPFDD.** See also **time-phased force and deployment list.** (JP 5-0)

time-phased force and deployment list — Appendix 1 to Annex A of the operation plan, which identifies types and/or actual units required to support the operation plan and indicates origin and ports of debarkation or ocean area. Also called **TPFDL.** See also **Joint Operation Planning and Execution System; time-phased force and deployment data.** (JP 4-05)

times — The Chairman of the Joint Chiefs of Staff coordinates the proposed dates and times with the commanders of the appropriate unified and specified commands, as well as any recommended changes to when specified operations are to occur (C-, D-, M-days end at 2400 hours Universal Time [Zulu time] and are assumed to be 24 hours long for planning). (JP 5-0)

time-sensitive target — A joint force commander validated target or set of targets requiring immediate response because it is a highly lucrative, fleeting target of opportunity or it poses (or will soon pose) a danger to friendly forces. Also called **TST.** (JP 3-60)

time to target — The number of minutes and seconds to elapse before aircraft ordnance impacts on target. Also called **TTT.** (JP 3-09.3)

tophandler — A device specially designed to permit the lifting and handling of containers from the top with rough terrain container handlers. See also **container.** (JP 4-01.6)

topographic map — A map that presents the vertical position of features in measurable form as well as their horizontal positions. (JP 2-03)

top secret — Security classification that shall be applied to information, the unauthorized disclosure of which reasonably could be expected to cause exceptionally grave damage to the national security that the original classification authority is able to identify or describe. (EO 13526)

torture — As defined by Title 18, US Code, Section 2340, it is any act committed by a person acting under color of law specifically intended to inflict severe physical or mental pain or suffering (other than pain or suffering incidental to lawful sanctions) upon another person within his custody or physical control. "Severe mental pain or suffering" means the prolonged mental harm caused by or resulting from: (a) the intentional infliction or threatened infliction of severe physical pain or suffering; (b) the administration or application, or threatened administration or application, of mind-altering substances or other procedures calculated to disrupt profoundly the senses or personality; (c) the threat of imminent death; or (d) the threat that another person will imminently be subjected to death, severe physical pain or suffering, or the administration or application of mind-altering substances or other procedures calculated to disrupt profoundly the senses or personality. (JP 2-01.2)

total mobilization — Expansion of the active Armed Forces resulting from action by Congress and the President to organize and/or generate additional units or personnel beyond the existing force structure, and the resources needed for their support, to meet the total requirements of a war or other national emergency involving an external threat to the national security. (JP 4-05)

toxic industrial biological — Any biological material manufactured, used, transported, or stored by industrial, medical, or commercial processes which could pose an infectious or toxic threat. Also called **TIB.** (JP 3-11)

toxic industrial chemical — A chemical developed or manufactured for use in industrial operations or research by industry, government, or academia that poses a hazard. Also called **TIC.** (JP 3-11)

toxic industrial material — A generic term for toxic, chemical, biological, or radioactive substances in solid, liquid, aerosolized, or gaseous form that may be used, or stored for use, for industrial, commercial, medical, military, or domestic purposes. Also called **TIM.** (JP 3-11)

toxic industrial radiological — Any radiological material manufactured, used, transported, or stored by industrial, medical, or commercial processes. Also called **TIR.** (JP 3-11)

track — 1. A series of related contacts displayed on a data display console or other display device. 2. To display or record the successive positions of a moving object. 3. To lock onto a point of radiation and obtain guidance therefrom. 4. To keep a gun properly aimed, or to point continuously a target-locating instrument at a moving target. 5. The actual path of an aircraft above or a ship on the surface of the Earth. 6. One of the two endless belts on which a full-track or half-track vehicle runs. 7. A metal part forming a path for a moving object such as the track around the inside of a vehicle for moving a mounted machine gun. (JP 3-01)

track correlation — Correlating track information for identification purposes using all available data. (JP 3-01)

tracking — Precise and continuous position-finding of targets by radar, optical, or other means. (JP 3-07.4)

track management — Defined set of procedures whereby the commander ensures accurate friendly and enemy unit and/or platform locations, and a dissemination procedure for filtering, combining, and passing that information to higher, adjacent, and subordinate commanders. (JP 3-01)

track of interest — In counterdrug operations, contacts that meet the initial identification criteria applicable in the area where the contacts are detected. Also called **TOI.** See also **suspect.** (JP 3-07.4)

tradecraft — Specialized methods and equipment used in the organization and activity of intelligence organizations, especially techniques and methods for handling communications with agents. Operational practices and skills used in the performance of intelligence related duties. (JP 2-01.2)

traffic management — The direction, control, and supervision of all functions incident to the procurement and use of freight and passenger transportation services. (JP 4-09)

training aid — Any item developed or procured with the primary intent that it shall assist in training and the process of learning. (JP 1-06)

training and readiness oversight — The authority that combatant commanders may exercise over assigned Reserve Component forces when not on active duty or when on active duty for training. Also called **TRO.** See also **combatant commander.** (JP 1)

transient forces — Forces that pass or stage through, or base temporarily within, the operational area of another command but are not under its operational control. See also **force.** (JP 1)

transit zone — The path taken by either airborne or seaborne smugglers. See also **arrival zone.** (JP 3-07.4)

transmission security — The component of communications security that results from all measures designed to protect communications from interception and exploitation by means other than cryptanalysis. Also called **TRANSEC**. See also **communications security.** (JP 6-0)

transnational threat — Any activity, individual, or group not tied to a particular country or region that operates across international boundaries and threatens United States national security or interests. (JP 3-26)

transport area — In amphibious operations, an area assigned to a transport organization for the purpose of debarking troops and equipment. See also **inner transport area; outer transport area**. (JP 3-02)

transportation closure — The actual arrival date of a specified movement requirement at port of debarkation. (JP 3-35)

transportation component command — A major command of its parent Service under United States Transportation Command, which includes Air Force Air Mobility Command, Navy Military Sealift Command, and Army Military Surface Deployment and Distribution Command. Also called **TCC.** (JP 4-01.6)

transportation feasibility — A determination that the capability exists to move forces, equipment, and supplies from the point of origin to the final destination within the time required. See also **operation plan.** (JP 4-09)

transportation feasible — A determination made by the supported commander that a draft operation plan can be supported with the apportioned transportation assets. (JP 5-0)

transportation priorities — Indicators assigned to eligible traffic that establish its movement precedence. (JP 4-09)

transportation system — All the land, water, and air routes and transportation assets engaged in the movement of United States forces and their supplies during military operations, involving both mature and immature theaters and at the strategic, operational, and tactical levels of war. (JP 4-01)

transport group — An element that directly deploys and supports the landing of the landing force, and is functionally designated as a transport group in the amphibious task force organization. (JP 3-02)

transshipment point — A location where material is transferred between vehicles. (JP 4-01.5)

troop space cargo — Cargo such as sea or barracks bags, bedding rolls or hammocks, locker trunks, and office equipment, normally stowed in an accessible place, as well as normal hand-carried combat equipment and weapons to be carried ashore by the assault troops. (JP 3-02.1)

turnaround — The length of time between arriving at a point and being ready to depart from that point. (JP 4-01.5)

turning movement — A variation of the envelopment in which the attacking force passes around or over the enemy's principal defensive positions to secure objectives deep in the enemy's rear to force the enemy to abandon his position or divert major forces to meet the threat. (JP 3-06)

two-person rule — A system designed to prohibit access by an individual to nuclear weapons and certain designated components by requiring the presence at all times of at least two authorized persons, each capable of detecting incorrect or unauthorized procedures with respect to the task to be performed.

Intentionally Blank

U

unanticipated target — A target of opportunity that was unknown or not expected to exist in the operational environment. See also **operational area; target; target of opportunity.** (JP 3-60)

unauthorized commitment — An agreement that is not binding solely because the United States Government representative who made it lacked the authority to enter into that agreement on behalf of the United States Government. (JP 4-10)

uncertain environment — Operational environment in which host government forces, whether opposed to or receptive to operations that a unit intends to conduct, do not have totally effective control of the territory and population in the intended operational area. (JP 3-0)

unconventional assisted recovery — Nonconventional assisted recovery conducted by special operations forces. Also called **UAR.** See also **evader; recovery.** (JP 3-50)

unconventional assisted recovery coordination cell — A compartmented special operations forces cell, established to coordinate, synchronize, and deconflict nonconventional assisted recovery operations within the operational area assigned to the joint force commander. Also called **UARCC.** See also **joint operations center; joint personnel recovery center; special operations forces; unconventional assisted recovery.** (JP 3-50)

unconventional warfare — Activities conducted to enable a resistance movement or insurgency to coerce, disrupt, or overthrow a government or occupying power by operating through or with an underground, auxiliary, and guerrilla force in a denied area. Also called **UW.** (JP 3-05.1)

undersea warfare — Military operations conducted to establish and maintain control of the undersea portion of the maritime domain. Also called **USW.** See also **antisubmarine warfare; mine warfare.** (JP 3-32)

underwater demolition — The destruction or neutralization of underwater obstacles that is normally accomplished by underwater demolition teams. (JP 3-34)

underwater demolition team — A group of officers and enlisted specially trained and equipped to accomplish the destruction or neutralization of underwater obstacles and associated tasks. Also called **UDT.** (JP 3-34)

unexploded explosive ordnance — Explosive ordnance which has been primed, fused, armed or otherwise prepared for action, and which has been fired, dropped, launched, projected, or placed in such a manner as to constitute a hazard to operations, installations, personnel, or material and remains unexploded either by malfunction or design or for any other cause. Also called **UXO.** See also **explosive ordnance.** (JP 3-15)

unified action — The synchronization, coordination, and/or integration of the activities of governmental and nongovernmental entities with military operations to achieve unity of effort. (JP 1)

unified combatant command — See **unified command.** (JP 1)

unified command — A command with a broad continuing mission under a single commander and composed of significant assigned components of two or more Military Departments that is established and so designated by the President, through the Secretary of Defense with the advice and assistance of the Chairman of the Joint Chiefs of Staff. Also called **unified combatant command.** See also **combatant command; subordinate unified command.** (JP 1)

Unified Command Plan — The document, approved by the President, that sets forth basic guidance to all unified combatant commanders; establishes their missions, responsibilities, and force structure; delineates the general geographical area of responsibility for geographic combatant commanders; and specifies functional responsibilities for functional combatant commanders. Also called **UCP.** See also **combatant command; combatant commander.** (JP 1)

uniformed services — The Army, Navy, Air Force, Marine Corps, Coast Guard, National Oceanic and Atmospheric Administration, and Public Health Services. See also **Military Department; Service.** (JP 1-0)

unit — 1. Any military element whose structure is prescribed by competent authority. 2. An organization title of a subdivision of a group in a task force. 3. A standard or basic quantity into which an item of supply is divided, issued, or used. Also called **unit of issue.** 4. With regard to Reserve Component of the Armed Forces, a selected reserve unit organized, equipped, and trained for mobilization to serve on active duty as a unit or to augment or be augmented by another unit. (JP 3-33)

unit aircraft — Those aircraft provided an aircraft unit for the performance of a flying mission. (JP 3-17)

United States — Includes the land area, internal waters, territorial sea, and airspace of the United States, including a. United States territories; and b. Other areas over which the United States Government has complete jurisdiction and control or has exclusive authority or defense responsibility. (JP 1)

United States Armed Forces — Used to denote collectively the Army, Marine Corps, Navy, Air Force, and Coast Guard. See also **Armed Forces of the United States.** (JP 1)

United States-controlled shipping — Shipping under United States flag and selected ships under foreign flag considered to be under effective United States control. See also **effective United States-controlled ships.** (JP 4-01.2)

United States message text format — A program designed to enhance joint and combined combat effectiveness through standardization of message formats, data elements, and information exchange procedures. Also called **USMTF.** (JP 3-50)

United States Naval Ship — A public vessel of the United States that is in the custody of the Navy and is: a. Operated by the Military Sealift Command and manned by a civil service crew; or b. Operated by a commercial company under contract to the Military Sealift Command and manned by a merchant marine crew. Also called **USNS.** See also **Military Sealift Command.** (JP 4-01.2)

United States Signals Intelligence System — The unified organization of signals intelligence activities under the direction of the Director, National Security Agency/Chief, Central Security Service. It consists of the National Security Agency/Central Security Service, the components of the Military Services authorized to conduct signals intelligence, and such other entities (other than the Federal Bureau of Investigation) authorized by the National Security Council or the Secretary of Defense to conduct signals intelligence activities. Also called **USSS.** See also **counterintelligence.** (JP 2-01.2)

unit identification code — A six-character, alphanumeric code that uniquely identifies each Active, Reserve, and National Guard unit of the Armed Forces. Also called **UIC.** (JP 1-0)

unit line number — A seven-character alphanumeric code that describes a unique increment of a unit deployment, i.e., advance party, main body, equipment by sea and air, reception team, or trail party, in the time-phased force and deployment data. Also called **ULN**. (JP 3-35)

unit movement control center — A temporary organization activated by major subordinate commands and subordinate units during deployment to control and manage marshalling and movement. Also called **UMCC.** See also **deployment; marshaling; unit.** (JP 3-35)

unit movement data — A unit equipment and/or supply listing containing corresponding transportability data. Tailored unit movement data has been modified to reflect a specific movement requirement. Also called **UMD.** (JP 3-35)

unit personnel and tonnage table — A table included in the loading plan of a combat-loaded ship as a recapitulation of totals of personnel and cargo by type, listing cubic measurements and weight. Also called **UP&TT**. (3-02.1)

unit type code — A Joint Chiefs of Staff developed and assigned code, consisting of five characters that uniquely identify a "type unit." Also called **UTC.** (JP 4-02)

unity of command — The operation of all forces under a single responsible commander who has the requisite authority to direct and employ those forces in pursuit of a common purpose. (JP 3-0)

unity of effort — Coordination and cooperation toward common objectives, even if the participants are not necessarily part of the same command or organization, which is the product of successful unified action. (JP 1)

Universal Joint Task List — A menu of capabilities that may be selected by a joint force commander to accomplish the assigned mission. Also called **UJTL.** (JP 3-33)

universal polar stereographic grid — A military grid prescribed for joint use in operations in limited areas and used for operations requiring precise position reporting. It covers areas between the 80 degree parallels and the poles. (JP 2-03)

Universal Time — A measure of time that conforms, within a close approximation, to the mean diurnal rotation of the Earth and serves as the basis of civil timekeeping. Also called **ZULU time.** (Formerly called Greenwich Mean Time.) (JP 5-0)

unknown — 1. A code meaning "information not available." 2. An unidentified target. An aircraft or ship that has not been determined to be hostile, friendly, or neutral using identification friend or foe and other techniques, but that must be tracked by air defense or naval engagement systems. 3. An identity applied to an evaluated track that has not been identified. See also **assumed friend; friend; neutral; suspect.** (JP 3-01)

unmanned aircraft — An aircraft that does not carry a human operator and is capable of flight with or without human remote control. Also called **UA.** (JP 3-30)

unmanned aircraft system — That system whose components include the necessary equipment, network, and personnel to control an unmanned aircraft. Also called **UAS.** (JP 3-30)

unplanned target — A target of opportunity that is known to exist in the operational environment. See also **operational area; target; target of opportunity.** (JP 3-60)

unrestricted reporting — A process that a Service member uses to disclose, without requesting confidentiality or restricted reporting, that he or she is the victim of a sexual assault. (JP 1-0)

unstable patient — A patient whose physiological status is in fluctuation and for whom emergent, treatment, and/or surgical intervention are anticipated during treatment or evacuation; and the patient's rapidly changing status and requirements are beyond the standard en route care capability and requires medical/surgical augmentation. (JP 4-02)

unstuffing — The removal of cargo from a container. Also called **stripping.** (JP 4-09)

use of force policy — Policy guidance issued by the Commandant, US Coast Guard, on the use of force and weapons. (JP 3-03)

US forces — All Armed Forces (including the Coast Guard) of the United States, any person in the Armed Forces of the United States, and all equipment of any description that either belongs to the US Armed Forces or is being used (including Type I and II Military Sealift Command vessels), escorted, or conveyed by the US Armed Forces. (JP 1)

US national — US citizen and US permanent and temporary legal resident aliens. (JP 1)

US person — For intelligence purposes, a US person is defined as one of the following: (1) a US citizen; (2) an alien known by the intelligence agency concerned to be a permanent resident alien; (3) an unincorporated association substantially composed of US citizens or permanent resident aliens; or (4) a corporation incorporated in the United States, except for those directed and controlled by a foreign government or governments. (JP 2-01.2)

Intentionally Blank

V

validate — Execution procedure used by combatant command components, supporting combatant commanders, and providing organizations to confirm to the supported commander and United States Transportation Command that all the information records in a time-phased force and deployment data not only are error-free for automation purposes, but also accurately reflect the current status, attributes, and availability of units and requirements. (JP 5-0)

validation — 1. A process associated with the collection and production of intelligence that confirms that an intelligence collection or production requirement is sufficiently important to justify the dedication of intelligence resources, does not duplicate an existing requirement, and has not been previously satisfied. (JP 2-01) 2. A part of target development that ensures all vetted targets meet the objectives and criteria outlined in the commander's guidance and ensures compliance with the law war and rules of engagement. (JP 3-60) 3. In computer modeling and simulation, the process of determining the degree to which a model or simulation is an accurate representation of the real world from the perspective of the intended uses of the model or simulation. (JP 3-35) 4. Execution procedure whereby all the information records in a time-phased force and deployment data are confirmed error free and accurately reflect the current status, attributes, and availability of units and requirements. See also **time-phased force and deployment data; verification.** (JP 3-35)

vehicle-borne improvised explosive device — A device placed or fabricated in an improvised manner on a vehicle incorporating destructive, lethal, noxious, pyrotechnic, or incendiary chemicals and designed to destroy, incapacitate, harass, or distract. Also called **VBIED.** (JP 3-10)

vehicle cargo — Wheeled or tracked equipment, including weapons, that require certain deck space, head room, and other definite clearance. (JP 4-01.2)

vehicle summary and priority table — A table detailing all vehicles by priority of debarkation from a combat-loaded ship. Also called **VS&PT.** (JP 3-02.1)

verification — 1. In arms control, any action, including inspection, detection, and identification, taken to ascertain compliance with agreed measures. (JP 3-41) 2. In computer modeling and simulation, the process of determining that a model or simulation implementation accurately represents the developer's conceptual description and specifications. See also **configuration management; validation.** (JP 3-13.1)

vertical envelopment — A tactical maneuver in which troops that are air-dropped, air-landed, or inserted via air assault, attack the rear and flanks of a force, in effect cutting off or encircling the force.. (JP 3-18)

vertical replenishment — The use of a helicopter for the transfer of materiel to or from a ship. Also called **VERTREP.** (JP 3-04)

vertical stowage — A method of stowage in depth within a single compartment by which loaded items are continually accessible for unloading, and the unloading can be completed without corresponding changes or prior unloading of other cargo. (JP 3-02.1)

vetting — A part of target development that assesses the accuracy of the supporting intelligence to targeting. (JP 3-60)

visual information — Various visual media with or without sound that generally includes still and motion photography, audio video recording, graphic arts, and visual presentations. Also called **VI.** (JP 3-61)

visual meteorological conditions — Weather conditions in which visual flight rules apply; expressed in terms of visibility, ceiling height, and aircraft clearance from clouds along the path of flight. Also called **VMC.** See also **instrument meteorological conditions.** (JP 3-04)

Voluntary Intermodal Sealift Agreement — An agreement that provides the Department of Defense with assured access to United States flag assets, both vessel capacity and intermodal systems, to meet Department of Defense contingency requirements. Also called **VISA.** See also **intermodal** (JP 4-01.2)

voluntary tanker agreement — An agreement established by the Maritime Administration to provide for United States commercial tanker owners and operators to voluntarily make their vessels available to satisfy the Department of Defense to meet contingency or war requirements for point-to-point petroleum, oils, and lubricants movements. Also called **VTA.** (JP 4-01.2)

vulnerability — 1. The susceptibility of a nation or military force to any action by any means through which its war potential or combat effectiveness may be reduced or its will to fight diminished. (JP 3-01) 2. The characteristics of a system that cause it to suffer a definite degradation (incapability to perform the designated mission) as a result of having been subjected to a certain level of effects in an unnatural (man-made) hostile environment. (JP 3-60) 3. In information operations, a weakness in information system security design, procedures, implementation, or internal controls that could be exploited to gain unauthorized access to information or an information system. See also **information operations.** (JP 3-13)

vulnerability assessment — A Department of Defense, command, or unit-level evaluation (assessment) to determine the vulnerability of an installation, unit, exercise, port, ship, residence, facility, or other site to a terrorist attack. Also called **VA.** (JP 3-07.2)

W

walk-in — An unsolicited contact who provides information. (JP 2-01.2)

warden system — An informal method of communication used to pass information to United States citizens living in affected areas overseas during emergencies. See also **noncombatant evacuation operation.** (JP 3-68)

warning intelligence — Those intelligence activities intended to detect and report time-sensitive intelligence information on foreign developments that forewarn of hostile actions or intention against United States entities, partners, or interests. (JP 2-0)

warning order — 1. A preliminary notice of an order or action that is to follow. 2. A planning directive that initiates the development and evaluation of military courses of action by a supported commander and requests that the supported commander submit a commander's estimate. 3. A planning directive that describes the situation, allocates forces and resources, establishes command relationships, provides other initial planning guidance, and initiates subordinate unit mission planning. Also called **WARNORD.** (JP 5-0)

war reserve materiel requirement — That portion of the war materiel requirement required to be on hand on D-day. This level consists of the war materiel requirement less the sum of the peacetime assets assumed to be available on D-day and the war materiel procurement capability. (JP 4-02)

war reserve stock — That portion of total materiel assets designated to satisfy the war reserve materiel requirement. Also called **WRS.** See also **reserve; war reserve materiel requirement.** (JP 2-03)

wartime reserve modes — Characteristics and operating procedures of sensor, communications, navigation aids, threat recognition, weapons, and countermeasures systems that will contribute to military effectiveness if unknown to or misunderstood by opposing commanders before they are used, but could be exploited or neutralized if known in advance. Also called **WARM.** (JP 3-13.1)

Washington Liaison Group — An organization consisting of members of Department of State and Department of Defense, chaired by a representative of Department of State, which has basic responsibility for the coordination and implementation of plans for the protection and evacuation in emergencies of persons abroad for whom the Secretaries of State or Defense are responsible. Also called **WLG.** (JP 3-68)

waterspace management — The allocation of waterspace in terms of antisubmarine warfare attack procedures to permit the rapid and effective engagement of hostile submarines while preventing inadvertent attacks on friendly submarines. Also called **WSM.** (JP 3-32)

wave — A formation of forces, including ships, landing craft, amphibious vehicles or aircraft, required to beach or land about the same time. (JP 3-02)

weaponeer — An individual who has completed requisite training to determine the quantity and type of lethal or nonlethal means required to create a desired effect on a given target. (JP 3-60)

weaponeering — The process of determining the quantity of a specific type of lethal or nonlethal means required to create a desired effect on a given target. (JP 3-60)

weapon engagement zone — In air defense, airspace of defined dimensions within which the responsibility for engagement of air threats normally rests with a particular weapon system. Also called **WEZ**. (JP 3-01)

weapons control status — An air defense control measure declared for a particular area and time by an area air defense commander, or delegated subordinate commander, based on the rules of engagement designed to establish the freedom for fighters and surface air defense weapons to engage threats. Also call **WCS.** (JP 3-01)

weapons free zone — An air defense zone established for the protection of key assets or facilities, other than air bases, where weapon systems may be fired at any target not positively recognized as friendly. (JP 3-01)

weapons of mass destruction — Chemical, biological, radiological, or nuclear weapons capable of a high order of destruction or causing mass casualties, and excluding the means of transporting or propelling the weapon where such means is a separable and divisible part from the weapon. Also called **WMD.** See also **special operations.** (JP 3-40)

weapons of mass destruction proliferation — The transfer of weapons of mass destruction or related materials, technology, and expertise from suppliers to state or non-state actors. (JP 3-40)

weapons readiness state — The degree of readiness of air defense weapons which can become airborne or be launched to carry out an assigned task and normally expressed in numbers of weapons and numbers of minutes. (JP 3-01)

weapons release authority — The authority originating from the President to engage or direct engagement of ballistic missile threats using ground-based interceptors of the ground-based midcourse defense. Also call **WRA.** (JP 3-01)

weapons technical intelligence — A category of intelligence and processes derived from the technical and forensic collection and exploitation of improvised explosive devices, associated components, improvised weapons, and other weapon systems. Also called **WTI.** (JP 3-15.1)

weapon system — A combination of one or more weapons with all related equipment, materials, services, personnel, and means of delivery and deployment (if applicable) required for self-sufficiency. (JP 3-0)

wellness — Force health protection program that consolidates and incorporates physical and mental fitness, health promotion, and environmental and occupational health. See also **force health protection.** (JP 4-02)

wing — 1. An Air Force unit composed normally of one primary mission group and the necessary supporting organizations. 2. A fleet air wing is the basic organizational and administrative unit for naval-, land-, and tender-based aviation. 3. A balanced Marine Corps task organization of aircraft groups and squadrons, together with appropriate command, air control, administrative, service, and maintenance units. 4. A flank unit; that part of a military force to the right or left of the main body. (JP 3-09.3)

withdrawal operation — A planned retrograde operation in which a force in contact disengages from an enemy force and moves in a direction away from the enemy. (JP 3-17)

witting — A term of intelligence art that indicates that one is not only aware of a fact or piece of information but also aware of its connection to intelligence activities. (JP 2-01.2)

wounded warrior programs – A system of support and advocacy to guide and assist the wounded, ill, and injured Service members and family or designated caregiver through treatment, rehabilitation, return to duty, or military retirement into the civilian community. Each Military Department has a unique wounded warrior program that addresses its Service members' needs. (DODI 6025.22)

working capital fund — A revolving fund established to finance inventories of supplies and other stores, or to provide working capital for industrial-type activities. (JP 1-06)

working group — An enduring or ad hoc organization within a joint force commander's headquarters consisting of a core functional group and other staff and component representatives whose purpose is to provide analysis on the specific function to users. Also called **WG.** (JP 3-33)

Intentionally Blank

X

Intentionally Blank

Y

Intentionally Blank

Z

zone of action — A tactical subdivision of a larger area, the responsibility for which is assigned to a tactical unit; generally applied to offensive action. (JP 3-09)

zone of fire — An area into which a designated ground unit or fire support ship delivers, or is prepared to deliver, fire support. Also called **ZF**. (JP 3-09)

ZULU time — See **Universal Time.**

Intentionally Blank

APPENDIX A
ABBREVIATIONS AND ACRONYMS

A

A	analog
A&P	administrative and personnel; analysis and production
A-1	director of manpower, personnel, and services (Air Force)
A2	antiaccess
A2C2	Army airspace command and control
A-2	intelligence staff officer (Air Force)
A-3	operations directorate (COMAFFOR staff); operations staff officer (Air Force)
A-4	director of logistics (Air Force)
A-5	plans directorate (COMAFFOR staff)
A-6	communications staff officer (Air Force)
A-7	director of installations and mission support (Air Force)
AA	assessment agent; avenue of approach
AA&E	arms, ammunition, and explosives
AAA	antiaircraft artillery; arrival and assembly area; assign alternate area
AABB	American Association of Blood Banks
AABWS	amphibious assault bulk water system
AAC	activity address code
AACG	arrival airfield control group
AADC	area air defense commander
AADP	area air defense plan
AAEC	aeromedical evacuation control team
AAFES	Army and Air Force Exchange Service
AAFIF	automated air facility information file
AAFS	amphibious assault fuel system
AAFSF	amphibious assault fuel supply facility
AAG	aeronautical assignment group
AAGS	Army air-ground system
AAI	air-to-air interface
AAM	air-to-air missile
AAMDC	United States Army Air and Missile Defense Command
AAOE	arrival and assembly operations element
AAOG	arrival and assembly operations group
AAP	Allied administrative publication; assign alternate parent
AAR	after action report; after action review; air-to-air refueling area
AAS	amphibious assault ship
AAST	aeromedical evacuation administrative support team
AAT	automatic analog test; aviation advisory team
AATCC	amphibious air traffic control center

AAU	analog applique unit
AAV	amphibious assault vehicle
AAW	antiair warfare
AB	air base
ABCA	American, British, Canadian, Australian, and New Zealand
ABCS	Army Battle Command System
ABD	airbase defense
ABFC	advanced base functional component
ABFDS	aerial bulk fuel delivery system
ABFS	amphibious bulk fuel system
ABGD	air base ground defense
ABIS	Automated Biometric Identification System
ABL	airborne laser
ABLTS	amphibious bulk liquid transfer system
ABM	antiballistic missile
ABN	airborne
ABNCP	Airborne Command Post
ABO	air base operability; blood typing system
ABP	air battle plan
A/C	aircraft
AC	Active Component; alternating current
AC2	airspace command and control
AC-130	Hercules
ACA	air clearance authority; airlift clearance authority; airspace control authority; airspace coordination area
ACAA	automatic chemical agent alarm
ACAPS	area communications electronics capabilities
ACAT	aeromedical evacuation command augmentation team
ACB	amphibious construction battalion
ACC	Air Combat Command; air component commander; area coordination center; Army Contracting Command
ACCE	air component coordination element
ACCON	acoustic condition
ACCS	air command and control system
ACCSA	Allied Communications and Computer Security Agency
ACD	automated cargo documentation
ACDO	assistant command duty officer
ACE	airborne command element (USAF); air combat element (NATO); Allied Command Europe; aviation combat element (USMC)
ACEOI	automated communications-electronics operating instructions
ACF	air contingency force
ACI	assign call inhibit
ACIC	Army Counterintelligence Center
ACINT	acoustic intelligence

ACK	acknowledgement
ACL	access control list; allowable cabin load
ACLANT	Allied Command Atlantic
ACLP	affiliated contingency load planning
ACM	advanced conventional munitions; advanced cruise missile; air combat maneuver; air contingency Marine air-ground task force (MAGTF); airspace coordinating measure
ACMREQ	airspace control means request; airspace coordination measures request
ACN	assign commercial network
ACO	administrative contracting officer; airspace control order
ACOA	adaptive course of action
ACOC	area communications operations center
ACOCC	air combat operations command center
ACOS	assistant chief of staff
ACP	access control point; air commander's pointer; airspace control plan; Allied communications publication; assign common pool
ACR	armored cavalry regiment (Army); assign channel reassignment
ACS	agile combat support; air-capable ship; airspace control system; auxiliary crane ship
ACSA	acquisition and cross-servicing agreement; Allied Communications Security Agency
AC/S, C4I	Assistant Chief of Staff, Command, Control, Communications, Computers, and Intelligence (USMC)
ACT	activity; advance civilian team; Allied Command Transformation
ACU	assault craft unit
ACV	aircraft cockpit video; armored combat vehicle
ACW	advanced conventional weapons
A/D	analog-to-digital
AD	active duty; advanced deployability; air defense; area denial; automatic distribution; priority add-on
ADA	aerial damage assessment; air defense artillery; Antideficiency Act
A/DACG	arrival/departure airfield control group
ADAFCO	air defense artillery fire control officer
ADAL	authorized dental allowance list
ADAM	air defense airspace management
ADAM/BAE	air defense airspace management/brigade aviation element
ADAMS	Allied Deployment and Movement System
ADANS	Air Mobility Command Deployment Analysis System
ADC	air defense commander; area damage control
ADCAP	advanced capability
A/DCG	arrival/departure control group

ADCI/MS	Associate Director of Central Intelligence for Military Support
ADCON	administrative control
ADD	assign on-line diagnostic
ADDO	Assistant Deputy Director for Operations
ADDO(MS)	Assistant Deputy Director for Operations/Military Support
ADE	airdrop damage estimate; assign digit editing
ADF	automatic direction finding
ADIZ	air defense identification zone
ADKC/RCU	Automatic Key Distribution Center/Rekeying Control Unit
ADL	advanced distributed learning; assign XX (SL) routing
ADM	air defense measure
ADMIN	administration
ADN	Allied Command Europe desired ground zero number
ADNET	anti-drug network
ADOC	air defense operations center
ADP	air defense plan; Army doctrine publication; automated data processing
ADPE	automated data processing equipment
ADPS	automatic data processing system
ADR	accident data recorder; aircraft damage repair; airfield damage repair
ADRA	Adventist Development and Relief Agency
ADRP	Army doctrine reference publication
ADS	air defense section; air defense sector; amphibian discharge site; authoritative data source
ADSIA	Allied Data Systems Interoperability Agency
ADSW	active duty for special work
ADT	active duty for training; assign digital transmission group; automatic digital tester
ADUSD(TP)	Assistant Deputy Under Secretary of Defense, Transportation Policy
ADVON	advanced echelon
ADW	air defense warnings
ADWC	air defense warning condition
ADZ	amphibious defense zone
A/E	ammunition/explosives
AE	aeromedical evacuation; assault echelon; attenuation equalizer
AEC	aeromedical evacuation crew
AECA	Arms Export Control Act
AECM	aeromedical evacuation crew member
AECS	aeromedical evacuation command squadron
AECT	aeromedical evacuation control team
AEF	air expeditionary force

AEG	air expeditionary group
AEHF	advanced extremely high frequency
AELT	aeromedical evacuation liaison team
AEOS	aeromedical evacuation operations squadron
AEOT	aeromedical evacuation operations team
AEPS	aircrew escape propulsion system
AEPST	aeromedical evacuation plans and strategy team
AES	aeromedical evacuation squadron
AESC	aeromedical evacuation support cell
AET	airport emergency team
AETC	Air Education and Training Command
AETF	air expeditionary task force
A/ETF	automated/electronic target folder
AEU	assign essential user bypass
AEW	airborne early warning
AF	Air Force; Air Force (form); amphibious force
AF/A2	Air Force Director of Intelligence, Surveillance, and Reconnaissance
AFAARS	Air Force After Action Reporting System
AFAPD	Air Force Applications Program Development
AFARN	Air Force air request net
AFATDS	Advanced Field Artillery Tactical Data System
AFB	Air Force base
AFC	area frequency coordinator; automatic frequency control
AFCA	Air Force Communications Agency
AFCAP	Air Force contract augmentation program; Armed Forces contract augmentation program
AFCB	Armed Forces Chaplains Board
AFCC	Air Force Component Commander
AFCCC	Air Force Combat Climatology Center
AFCEC	Air Force Civil Engineer Center
AFCEE	Air Force Center for Engineering and the Environment
AFCERT	Air Force computer emergency response team
AFCESA	Air Force Civil Engineering Support Agency
AFD	assign fixed directory
AFDA	Air Force doctrine annex
AFDC	Air Force Doctrine Center
AFDD	Air Force doctrine document
AFDIGS	Air Force digital graphics system
AFDIL	Armed Forces DNA Identification Laboratory
AFDIS	Air Force Weather Agency Dial In Subsystem
AF/DP	Deputy Chief of Staff for Personnel, United States Air Force
AFE	Armed Forces Entertainment
AFEES	Armed Forces Examining and Entrance Station
AFFIS	Air Facilities File Information System
AFFMA	Air Force Frequency Management Agency

AFFOR	Air Force forces
AFH	Air Force handbook
AFHSC	Armed Forces Health Surveillance Center
AFI	Air Force instruction
AFIAA	Air Force Intelligence Analysis Agency
AFICA	Air Force Installation Contracting Agency
AFID	anti-fratricide identification device
AF/IL	Deputy Chief of Staff for Installations and Logistics, USAF
AFIP	Armed Forces Institute of Pathology
AFIRB	Armed Forces Identification Review Board
AFIS	American Forces Information Service
AFISRA	Air Force Intelligence, Surveillance, and Reconnaissance Agency
AFIWC	Air Force Information Warfare Center
AFJI	Air Force joint instruction
AFJMAN	Air Force Joint Manual
AFLC	Air Force Logistics Command
AFLE	Air Force liaison element
AFLNO	Air Force liaison officer
AFMAN	Air Force manual
AFMC	Air Force Materiel Command
AFMD	Air Force Mission Directive
AFME	Armed Forces Medical Examiner
AFMES	Armed Forces Medical Examiner System
AFMIC	Armed Forces Medical Intelligence Center
AFMLO	Air Force Medical Logistics Office
AFMS	Air Force Medical Service
AFNORTH	Air Force North; Allied Forces Northern Europe (NATO)
AFNORTHWEST	Allied Forces North West Europe (NATO)
AFNSEP	Air Force National Security and Emergency Preparedness Agency
AFO	advance force operations
AFOA	Air Force Operations Activity
AFOE	assault follow-on echelon
AFOSI	Air Force Office of Special Investigations
AFPAM	Air Force pamphlet
AFPC	Air Force Personnel Center
AFPD	Air Force policy directive
AFPEO	Armed Forces Professional Entertainment Overseas
AFR	Air Force Reserve; assign frequency for network reporting
AFRAT	Air Force Radiation Assessment Team
AFRC	Air Force Reserve Command; Armed Forces Recreation Center
AFRCC	Air Force Rescue Coordination Center
AFRL	Air Force Research Laboratory
AFRRI	Armed Forces Radiobiology Research Institute

AFRTS	American Forces Radio and Television Service
AFS	aeronautical fixed service
AFSATCOM	Air Force satellite communications (system)
AFSB	afloat forward staging base; Army field support brigade
AFSC	Armed Forces Staff College; Army Field Support Center; United States Air Force specialty code
AFSCN	Air Force Satellite Control Network
AFSMO	Air Force Spectrum Management Office
AFSOAC	Air Force special operations air component
AFSOAD	Air Force special operations air detachment
AFSOAE	Air Force special operations air element
AFSOC	Air Force Special Operations Command
AFSOCC	Air Force special operations control center
AFSOF	Air Force special operations forces
AFSOUTH	Allied Forces, South (NATO)
AFSPACE	United States Space Command Air Force
AFSPC	Air Force Space Command
AFSPOC	Air Force Space Operations Center
AFSTRAT	Air Forces Strategic
AFTAC	Air Force Technical Applications Center
AFTH	Air Force Theater Hospital
AFTN	Aeronautical Fixed Telecommunications Network
AFTO	Air Force technical order
AFTRANS	Air Force Transportation Component
AFTTP	Air Force tactics, techniques, and procedures; Air Force technical training publication
AFTTP(I)	Air Force tactics, techniques, and procedures (instruction)
AFW	Air Force Weather
AFWA	Air Force Weather Agency
AFWCF	Air Force working capital fund
AFWIN	Air Force Weather Information Network
AF/XO	Deputy Chief of Staff for Plans and Operations, United States Air Force
AF/XOI	Air Force Director of Intelligence, Surveillance, and Reconnaissance
AF/XOO	Director of Operations, United States Air Force
A/G	air to ground
AG	adjutant general (Army)
AGARD	Advisory Group for Aerospace Research and Development
AGE	aerospace ground equipment
AGIL	airborne general illumination lightself
AGL	above ground level
AGM-28A	Hound Dog
AGM-65	Maverick
AGM-69	short range attack missile
AGR	Active Guard and Reserve

AGS	aviation ground support
AH	attack helicopter
AHA	alert holding area
AHD	antihandling device
AI	acquisition instruction; airborne interceptor; air interdiction; area of interest
AIA	Air Intelligence Agency
AIASA	annual integrated assessment for security assistance
AIC	air intercept controller; assign individual compressed dial; Atlantic Intelligence Command
AICF/USA	Action Internationale Contre La Faim (International Action Against Hunger)
AIDS	acquired immunodeficiency syndrome
AIF	automated installation intelligence file
AIFA	AAFES Imprest Fund Activity
AIG	addressee indicator group
AIIRS	automated intelligence information reporting system
AIM	Airman's Information Manual
AIM-7	Sparrow
AIM-9	Sidewinder
AIM-54A	Phoenix
AIMD	aircraft intermediate maintenance department
AIMT	air interdiction of maritime targets
AIP	aeronautical information publication
AIQC	antiterrorism instructor qualification course
AIRBAT	Airborne Intelligence, Surveillance, and Reconnaissance Requirements-Based Allocation Tool
AIRCENT	Allied Air Forces Central Europe (NATO)
AIRCOR	air corridor
AIRES	advanced imagery requirements exploitation system
AIREVACCONFIRM	air evacuation confirmation
AIREVACREQ	air evacuation request
AIREVACRESP	air evacuation response
AIRNORTHWEST	Allied Air Forces North West Europe (NATO)
AIRREQRECON	air request reconnaissance
AIRSOUTH	Allied Air Forces Southern Europe (NATO)
AIRSUPREQ	air support request
AIS	automated information system
AIT	aeromedical isolation team; automatic identification technology; automated information technology
AIU	Automatic Digital Network Interface Unit
AJ	anti-jam
AJBPO	area joint blood program office
AJCC	alternate joint communications center
AJ/CM	anti-jam control modem
AJD	allied joint doctrine

AJF	allied joint force
AJFP	adaptive joint force packaging
AJMRO	area joint medical regulating office
AJNPE	airborne joint nuclear planning element
AJODWG	allied joint operations doctrine working group
AJP	allied joint publication
AK	commercial cargo ship
AKNLDG	acknowledge message
ALARA	as low as reasonably achievable
ALCC	airlift control center
ALCE	airlift control element
ALCF	airlift control flight
ALCG	analog line conditioning group
ALCM	air-launched cruise missile
ALCOM	United States Alaskan Command
ALCON	all concerned
ALCS	airlift control squadron
ALCT	airlift control team
ALD	airborne laser designator; available-to-load date
ALE	airlift liaison element
ALEP	amphibious lift enhancement program
ALERFA	alert phase (ICAO)
ALERT	attack and launch early reporting to theater
ALERTORD	alert order
ALLOREQ	air allocation request; allocation request
ALLTV	all light level television
ALMSNSCD	airlift mission schedule
ALN	ammunition lot number
ALNOT	alert notice
ALO	air liaison officer
ALOC	air line of communications
ALORD	alert launch order
ALP	allied logistic publication
ALSA	Air Land Sea Application (Center)
ALSE	aviation life support equipment
ALSS	advanced logistic support site
ALT	acquisition, logistics, and technology
ALTD	airborne laser target designator
ALTRV	altitude reservation
ALTTSC	alternate Tomahawk strike coordinator
A/M	approach and moor
AM	amplitude modulation
AMAL	authorized medical allowance list
AMB	air mobility branch; ambassador
AMBUS	ambulance bus
AMC	airborne mission coordinator; Air Mobility Command;

	Army Materiel Command: midpoint compromise search area
AMCC	allied movement coordination center; alternate military command center
AMCIT	American citizen
AMCM	airborne mine countermeasures
AMC/SGXM	Air Mobility Command/Command Surgeon's Office
AMCT	air mobility control team
AMD	air and missile defense; air mobility division
AMDC	air and missile defense commander
AME	antenna mounted electronics
AMEDD	Army Medical Department
AMEDDCS	U.S. Army Medical Department Center and School
AMedP	allied medical publication
AMEMB	American Embassy
AMETL	agency mission-essential task list
AMF(L)	ACE Mobile Force (Land) (NATO)
AMH	automated message handler
AMHS	automated message handling system
AMIO	alien migrant interdiction operations
AMLO	air mobility liaison officer
AMMO	ammunition
AMOC	Air and Marine Operations Center (DHS)
AMOCC	air mobility operations control center
AMOG	air mobility operations group
AMOPES	Army Mobilization and Operations Planning and Execution System
AMOPS	Army mobilization and operations planning system; Army mobilization operations system
AMOS	air mobility operations squadron
AMOSS	Air and Marine Operations Surveillance System
AMOW	air mobility operations wing
AMP	amplifier; analysis of mobility platform
AMPE	automated message processing exchange
AMPN	amplification
AMP-PAT	analysis of mobility platform suite of port analysis tools
AMPSSO	Automated Message Processing System Security Office (or Officer)
AMRAAM	advanced medium-range air-to-air missile
AMS	Aerial Measuring System (DOE); air mobility squadron; Army management structure; Asset Management System
AMSS	air mobility support squadron
AMS-TAC	Automated Manifesting System–Tactical
AMT	aerial mail terminal
amu	atomic mass unit

AMVER	automated mutual-assistance vessel rescue system
AMW	air mobility wing; amphibious warfare
AMX	air mobility express
AN	alphanumeric; analog nonsecure
ANCA	Allied Naval Communications Agency
ANDVT	advanced narrowband digital voice terminal
ANG	Air National Guard
ANGLICO	air-naval gunfire liaison company
ANGUS	Air National Guard of the United States
A/NM	administrative/network management
ANMCC	Alternate National Military Command Center
ANN	assign NNX routing
ANR	Alaskan North American Aerospace Defense Command Region
ANSI	American National Standards Institute
ANX	assign NNXX routing
ANY	assign NYX routing
ANZUS	Australia-New Zealand-United States Treaty
AO	action officer; administration officer; air officer; area of operations; aviation ordnance person
AO&M	administration, operation, and maintenance
AOA	amphibious objective area
AOB	aviation operations branch
AOC	air operations center; Army operations center
AOCC	air operations control center
AOC-E	Aviation Operations Center-East (USCS)
AOCU	analog orderwire control unit
AOC-W	Aviation Operations Center-West (USCS)
AOD	air operations directive; on-line diagnostic
AODB	air operations database
AOF	azimuth of fire
AOG	Army Operations Group
AOI	area of interest
AOP	air operations plan; area of probability
AOR	area of responsibility
AOS	aircraft on station
AOSS	aviation ordnance safety supervisor
AOTR	Aviation Operational Threat Response
AP	allied publication; antipersonnel; average power
APA	Army pre-positioned afloat
APAN	All Partners Access Network; Asia-Pacific Area Network
APC	aerial port commander; assign preprogrammed conference list
APCC	alternate processing and correlation center
APE	airfield pavement evaluation
APES	Automated Patient Evacuation System

APEX	Adaptive Planning and Execution
APF	afloat pre-positioning force
APG	aimpoint graphic
APHIS	Animal and Plant Health Inspection Service (USDA)
APIC	allied press information center
APL	antipersonnel land mine
APO	afloat pre-positioning operations; Air Force post office; Army post office
APOD	aerial port of debarkation
APOE	aerial port of embarkation
APORT	aerial port
APORTSREP	air operations bases report
APP	allied procedural publication
APPS	analytical photogrammetric positioning system
APR	assign primary zone routing
APS	Army pre-positioned stocks
APS-3	afloat pre-positioning stocks; Army pre-positioned stocks-3
APTD	aircraft position target designation
APU	auxiliary power unit
AR	air refueling; Army regulation; Army reserve
ARB	alternate recovery base; assign receive bypass lists
ARBS	angle rate bombing system
ARC	air Reserve Components; American Red Cross
ARCENT	United States Army Central Command
ARCT	air refueling control team
ARDF	automatic radio direction finding
AREC	air resource element coordinator
ARFOR	Army forces
ARG	Accident Response Group (DOE); amphibious ready group
ARGO	automatic ranging grid overlay
ARINC	Aeronautical Radio Incorporated
ARL-M	airborne reconnaissance low-multifunction
ARM	air reference measure; antiradiation missile
ARNG	Army National Guard
ARNGUS	Army National Guard of the United States
ARP	air refueling point
ARPERCEN	United States Army Reserve Personnel Center
ARQ	automatic request-repeat
ARRC	Allied Command Europe Rapid Reaction Corps (NATO)
ARRDATE	arrival date
ARS	acute radiation syndrome; air rescue service
ARSOA	Army special operations aviation
ARSOF	Army special operations forces
ARSOTF	Army special operations task force

ARSPACE	Army Space Command
ARSPOC	Army space operations center
ART	air reserve technician
ARTS III	Automated Radar Tracking System
ARTYMET	artillery meteorological
AS	analog secure
A/S	anti-spoofing
ASA	automatic spectrum analyzer
ASA(ALT)	Assistant Secretary of the Army for Acquisition, Logistics, and Technology
ASAP	as soon as possible
ASARS	Advanced Synthetic Aperture Radar System
ASAS	All Source Analysis System
ASAT	antisatellite weapon
ASB	naval advanced support base
ASBP	Armed Services Blood Program
ASBPO	Armed Services Blood Program Office
ASC	acting service chief; Aeronautical Systems Center; Air Systems Command; Army Sustainment Command; assign switch classmark; Automatic Digital Network switching center
ASCC	Air Standardization Coordinating Committee; Army Service component command; Army Service component commander
ASCIET	all Services combat identification evaluation team
ASCII	American Standard Code for Information Interchange
ASCOPE	areas, structures, capabilities, organizations, people, and events
ASCS	air support control section; air support coordination section
ASD	Assistant Secretary of Defense
ASD(A&L)	Assistant Secretary of Defense (Acquisition and Logistics)
ASD(C)	Assistant Secretary of Defense (Comptroller)
ASD(C3I)	Assistant Secretary of Defense (Command, Control, Communications, and Intelligence)
ASD(FM&P)	Assistant Secretary of Defense (Force Management and Personnel)
ASD(FMP)	Assistant Secretary of Defense (Force Management Policy)
ASD(GSA)	Assistant Secretary of Defense for Global Strategic Affairs
ASD(HA)	Assistant Secretary of Defense (Health Affairs)
ASD(HD)	Assistant Secretary of Defense (Homeland Defense)
ASD(HD&ASA)	Assistant Secretary of Defense (Homeland Defense and Americas' Security Affairs)
ASDI	analog simple data interface
ASDIA	All-Source Document Index

ASD(ISA)	Assistant Secretary of Defense (International Security Affairs)
ASD(ISP)	Assistant Secretary of Defense (International Security Policy)
ASD(LA)	Assistant Secretary of Defense (Legislative Affairs)
ASD(L&MR)	Assistant Secretary of Defense for Logistics and Materiel Readiness
ASD(NII)	Assistant Secretary of Defense (Networks and Information Integration)
ASD(OEPP)	Assistant Secretary of Defense for Operational Energy Plans and Programs
ASD(P&L)	Assistant Secretary of Defense (Production and Logistics)
ASD(PA)	Assistant Secretary of Defense (Public Affairs)
ASD(PA&E)	Assistant Secretary of Defense (Program Analysis and Evaluation)
ASD(RA)	Assistant Secretary of Defense (Reserve Affairs)
ASD(RSA)	Assistant Secretary of Defense (Regional Security Affairs)
ASD(S&R)	Assistant Secretary of Defense (Strategy and Requirements)
ASD(SO/LIC)	Assistant Secretary of Defense for Special Operations and Low-Intensity Conflict
ASD(SO/LIC&IC)	Assistant Secretary of Defense for Special Operations and Low-Intensity Conflict and Interdependent Capabilities
ASE	aircraft survivability equipment; automated stabilization equipment
ASF	aeromedical staging facility
ASG	Allied System for Geospatial Intelligence; area support group
ASH	Assistant Administrator for Security and Hazardous Materials; Assistant Secretary for Health (DHHS)
ASI	assign and display switch initialization
ASIC	Air and Space Interoperability Council
ASIF	Airlift Support Industrial Fund
ASL	allowable supply list; archipelagic sea lane; assign switch locator (SL) routing; authorized stockage list (Army)
ASLT	air support liaison team; assault support landing table
ASM	air-to-surface missile; armored scout mission; Army Spectrum Manager; automated scheduling message
ASMD	antiship missile defense
ASMO	Army Spectrum Management Office
ASN(RD&A)	Assistant Secretary of the Navy for Research, Development and Acquisition
ASO	advanced special operations; air support operations
ASOC	air support operations center
ASOFDTG	as of date/time group

ASP	ammunition supply point
ASPA	American Service-Members' Protection Act
A-Space	Analytic Space
ASPP	acquisition systems protection program
ASPPO	Armed Service Production Planning Office
ASPR	Office of Assistant Secretary for Preparedness and Response (DHHS)
ASR	air support request; available supply rate
ASSETREP	transportation assets report
AST	assign secondary traffic channels
ASTS	aeromedical staging squadron
ASW	antisubmarine warfare; average surface wind
ASWBPL	Armed Services Whole Blood Processing Laboratories
ASWC	antisubmarine warfare commander
AT	antitank; antiterrorism
At	total attainable search area
ATA	Airlift Tanker Association; antiterrorism assistance
ATAC	antiterrorism alert center (Navy)
ATACC	advanced tactical air command center
ATACMS	Army Tactical Missile System
ATACO	air tactical actions control officer
ATACS	Army Tactical Communications System
ATAF	Allied Tactical Air Force (NATO)
ATBM	antitactical ballistic missile
ATC	Air Threat Conference; air traffic control; air transportable clinic (USAF)
ATCA	Allied Tactical Communications Agency
ATCAA	air traffic control assigned airspace
ATCC	Antiterrorism Coordinating Committee
ATCC-SSG	Antiterrorism Coordinating Committee-Senior Steering Group
ATCM	air traffic control measure
ATCRBS	Air Traffic Control Radar Beacon System
ATCS	air traffic control section
ATDLS	Advanced Tactical Data Link System
ATDM	adaptive time division multiplexer
ATDS	airborne tactical data system
ATEP	Antiterrorism Enterprise Portal
ATF	Advanced Targeting FLIR; amphibious task force; Bureau of Alcohol, Tobacco, Firearms, and Explosives (DOJ)
AT/FP	antiterrorism/force protection
ATG	amphibious task group; assign trunk group cluster
ATGM	antitank guided missile; antitank guided munition
ATH	air transportable hospital; assign thresholds
ATHS	Airborne Target Handover System
ATI	asset target interaction

ATM	advanced trauma management; air target material; assign traffic metering
ATMCT	air terminal movement control team
ATMP	Air Target Materials Program
ATN	assign thresholds
AtN	attack the network
ATO	air tasking order; antiterrorism officer
ATOC	air tactical operations center; air terminal operations center
ATP	advanced targeting pod; allied tactical publication; Army tactical publication; Army technical publication; Army techniques publication
ATR	attrition reserve
ATS	air traffic service; assign terminal service
ATSD(AE)	Assistant to the Secretary of Defense (Atomic Energy)
ATSD(IO)	Assistant to the Secretary of Defense (Intelligence Oversight)
ATSD(NCB)	Assistant to the Secretary of Defense for Nuclear and Chemical and Biological Defense Programs
ATSDR	Agency for Toxic Substances and Disease Registry (DHHS)
ATT	assign terminal type
ATTP	Army tactics, techniques, and procedures
ATTU	air transportable treatment unit
ATWG	antiterrorism working group
AU	African Union
AUEL	automated unit equipment list
AUF	airborne use of force
AUG	application user group
AUIC	active duty unit identification code
AUSCANNZUKUS	Australian, Canadian, New Zealand, United Kingdom, United States
AUTODIN	Automatic Digital Network
AUX	auxiliary
AV	air vehicle; asset visibility
AV-8	Harrier
AVC	Bureau of Arms Control, Verification, and Compliance (DOS)
AVCAL	aviation consolidated allowance list
AVDTG	analog via digital trunk group
AVGAS	aviation gasoline
AVIM	aviation intermediate maintenance
AVL	anti-vehicle land mine; assign variable location
AVOU	analog voice orderwire unit
AVOW	analog voice orderwire
AVS	asset validation system; asset visibility system; audiovisual squadron
AVUM	aviation unit maintenance
AV/VI	audiovisual/visual information

AW	air warfare
AWACS	Airborne Warning and Control System
AWC	air warfare commander
AWCAP	airborne weapons corrective action program
AWDS	automated weather distribution system
AWG	Asymmetric Warfare Group (Army)
AWN	Automated Weather Network
AWNIS	Allied Worldwide Navigational Information System
AWOL	absent without leave
AWS	Air Weather Service
AWSE	armament weapons support equipment
AWSIM	air warfare simulation model
AWSR	Air Weather Service regulation
AXO	abandoned explosive ordnance
AXX	assign XXX routing
AZR	assign zone restriction lists

Intentionally Blank

B

B	cross-over barrier pattern
B-52	Stratofortress
B&A	boat and aircraft
BAE	brigade aviation element
BAF	backup alert force
BAG	baggage
BAH	basic allowance for housing
BAI	backup aircraft inventory; battlefield air interdiction
BALO	battalion air liaison officer
BALS	berthing and loading schedule
BAS	basic allowance for subsistence; battalion aid station
BATF	Bureau of Alcohol, Tobacco, and Firearms
B/B	baseband
BB	breakbulk
bbl	barrel (42 US gallons)
BC	bottom current
BCA	border crossing authority
BCAT	beddown capability assessment tool
BCC	battle control center
BCD	battlefield coordination detachment
BCG	beach control group
BCI	bit count integrity
BCL	battlefield coordination line
BCN	beacon
BCOC	base cluster operations center
BCR	baseline change request
BCT	brigade combat team
BCTP	battle command training program
BCU	beach clearance unit
BD	barge derrick
BDA	battle damage assessment
BDAREP	battle damage assessment report
BDC	blood donor center
BDE	brigade
BDL	beach discharge lighter
BDOC	base defense operations center
BDR	battle damage repair
BDRP	Biological Defense Research Program
BDZ	base defense zone
BE	basic encyclopedia
BEAR	base expeditionary airfield resources
BEE	bioenvironmental engineering officer
BEI	biometrics-enabled intelligence
BEN	base encyclopedia number

BE number	basic encyclopedia number
BER	bit error ratio
BES	budget estimate submission
BEST	border enforcement security task force
BfV	*Bundesamt für Verfassungsschutz (*federal office for defending the Constitution)
BGC	boat group commander
BHR	Bureau of Humanitarian Response
BI	battlefield injury; battle injury
BIA	behavioral influences analysis; Bureau of Indian Affairs
BIAR	biometric intelligence analysis report
BIAS	Battlefield Illumination Assistance System
BICES	battlefield information collection and exploitation system (NATO)
BICON	double container
BIDDS	Base Information Digital Distribution System
BIDE	basic identity data element
BIFC	Boise Interagency Fire Center
BIFS	Border Intelligence Fusion Section
BIH	International Time Bureau (Bureau International d'l'Heure)
BII	base information infrastructure
BIMA	Biometrics Identity Management Agency
BINM	Bureau of International Narcotics Matters
BIO	biological; Bureau of International Organizations
BIS	Bureau of Industry and Security
BISS	base installation security system
BIT	built-in test
BITE	built-in test equipment
BIU	beach interface unit
BKA	*Bundeskriminalamt* (federal criminal office)
BKB	blue kill box
BL	biocontainment level
BLCP	beach lighterage control point
BLDREP	blood report
BLDSHIPREP	blood shipment report
BLM	Bureau of Land Management
BLOS	beyond line-of-sight
BLT	battalion landing team
BM	ballistic missile; battle management; beach module
BMC4I	Battle Management Command, Control, Communications, Computers, and Intelligence
BMCT	begin morning civil twilight
BMD	ballistic missile defense
BMDO	Ballistic Missile Defense Organization
BMDS	ballistic missile defense system

BMET	biomedical electronics technician
BMNT	begin morning nautical twilight
BMU	beachmaster unit
BN	battalion
BND	*Bundesnachrichtendienst* (federal intelligence service)
BOA	basic ordering agreement
BOC	base operations center; bomb on coordinate
BOCCA	Bureau of Coordination of Civil Aircraft (NATO)
BOG	beach operations group
BOH	bottom of hill
BORFIC	Border Patrol Field Intelligence Center
BOS	base operating support; battlefield operating system
BOSG	base operations support group
BOS-I	base operating support-integrator
BOSS	base operating support service
BOT	bomb on target
BP	battle position; block parity
BPA	blanket purchase agreement
BPC	building partnership capacity
BPD	blood products depot
BPG	beach party group
BPI	bits per inch
BPLAN	base plan
BPO	blood program office
BPPBS	bi-annual planning, programming, and budget system
bps	bits per second
BPSK	biphase shift keying
BPT	beach party team
BPWRR	bulk petroleum war reserve requirement
BPWRS	bulk petroleum war reserve stocks
BR	budget review
BRAC	base realignment and closure
BRACE	Base Resource and Capability Estimator
BRC	base recovery course
BS	battle staff; broadcast source
BSA	beach support area; brigade support area
BSB	brigade support battalion
BSC	behavioral science consultant; black station clock
BSC ro	black station clock receive out
BSCT	behavioral science consultation team
BSD	blood supply detachment
BSI	base support installation
BSP	base support plan
BSRP	bureau strategic resource plan
BSSG	brigade service support group
BSU	blood supply unit

BSZ	base security zone
BT	bathythermograph
BTB	believed-to-be
BTC	blood transshipment center
BTG	basic target graphic
BTOC	battalion tactical operations center
BTS	Border and Transportation Security (DHS)
BTU	beach termination unit
BTWC	Biological and Toxin Weapons Convention
BULK	bulk cargo
BUMEDINST	Bureau of Medicine and Surgery instruction
BVR	beyond visual range
BW	biological warfare
BWC	Biological Weapons Convention
BZ	buffer zone

C

C	Celsius; centigrade; clock; compromise band; coverage factor; creeping line pattern
C&A	certification and accreditation
C&E	communications and electronics
C&LAT	cargo and loading analysis table
C2	command and control
C2-attack	an offensive form of command and control warfare
C2CRE	command and control chemical, biological, radiological, and nuclear response element
C2E	command and control element
C2IP	Command and Control Initiatives Program
C2IPS	Command and Control Information Processing System
C2P	command and control protection
C2-protect	a defensive form of command and control warfare
C2S	command and control support
C-2X	coalition Intelligence Directorate counterintelligence and human intelligence staff element
C3	command, control, and communications
C3AG	Command, Control, and Communications Advisory Group
C3CM	command, control, and communications countermeasures
C3I	command, control, communications, and intelligence
C3IC	coalition coordination, communications, and integration center
C3SMP	Command, Control, and Communications Systems Master Plan
C4CM	command, control, communications, and computer countermeasures
C4I	command, control, communications, computers, and intelligence
C4IFTW	command, control, communications, computers, and intelligence for the Warrior
C4S	command, control, communications, and computer systems
C4 systems	command, control, communications, and computer systems
C-5	Galaxy
C-17	Globemaster III
C-21	Learjet
C-27	Spartan
C-130	Hercules
C-141	Starlifter
CA	chaplain assistant; civil administration; civil affairs; combat assessment; coordinating altitude; credibility assessment; criticality assessment
C/A	course acquisition

CAA	civil air augmentation; combat aviation advisors; command arrangement agreement
CAAF	contractors authorized to accompany the force
CAB	combat aviation brigade
CAC	common access card; current actions center
CACOM	civil affairs command
CACTIS	community automated intelligence system
CAD	Canadian air division; cartridge actuated device; collective address designator; contract administration delegation
CADRS	concern and deficiency reporting system
CADS	containerized ammunition distribution system
CAF	Canadian Air Force; combat air forces; commander, airborne/air assault force; commander, amphibious force
CAFMS	computer-assisted force management system
CAG	carrier air group; civil affairs group; collective address group
CAGO	contractor-acquired, government-owned
CAIMS	conventional ammunition integrated management system
CAINS	carrier aircraft inertial navigation system
CAIS	civil authority information support
CAISE	civil authority information support element
CAL	caliber; critical asset list
CALA	Community Airborne Library Architecture
CALCM	conventional air-launched cruise missile
CALICS	communication, authentication, location, intentions, condition, and situation
CALMS	computer-aided load manifesting system
CAM	chemical agent monitor; crisis action module
CAMOC	Caribbean Air and Marine Operations Center
CAMPS	Consolidated Air Mobility Planning System
CAMT	countering air and missile threats
CANA	convulsant antidote for nerve agent
CANADA COM	Canada Command
CANR	Canadian North American Aerospace Defense Command Region
CANUS	Canada-United States
CANUS BDD	Canada-United States Basic Defense Document
CANUS CDP	Canada-United States Combined Defense Plan
CAO	chief administrative officer; civil affairs operations; counterair operation
CAOC	combat air operations center; combined air operations center
CAO SOP	standing operating procedures for coordination of atomic operations
CAP	Civil Air Patrol; civil augmentation program; combat air patrol; configuration and alarm panel; Consolidated Appeals Process (UN); crisis action planning

CAPM	credibility assessment program manager
CAPT	civil affairs planning team
CAR	Chief of the Army Reserve
CARA	chemical, biological, radiological, nuclear, and high-yield explosives analytical and remediation activity
CARDA	continental United States airborne reconnaissance for damage assessment; continental United States area reconnaissance for damage assessment
CARE	Cooperative for Assistance and Relief Everywhere (CAREUSA)
CARIBROC	Caribbean Regional Operations Center
CARP	computed air release point; contingency alternate route plan
CARS	combat arms regimental system
CARVER	criticality, accessibility, recuperability, vulnerability, effect, and recognizability
CAS	casualty; civil aviation security; close air support
CASEVAC	casualty evacuation
CASF	contingency aeromedical staging facility
CASP	computer-aided search planning
CASPER	contact area summary position report
CASREP	casualty report
CASREQ	close air support request
CAT	category; civil affairs team; crisis action team
CATCC	carrier air traffic control center
CATF	commander, amphibious task force
CAU	crypto ancillary unit; cryptographic auxiliary unit
CAVU	ceiling and visibility unlimited
CAW	carrier air wing
CAW/ESS	crisis action weather and environmental support system
CAX	computer-assisted exercise
C-B	chemical-biological
CB	chemical-biological; construction battalion (SEABEES)
CBBLS	hundreds of barrels
CBCP	Customs and Border Clearance Program (DOD)
CBD	chemical, biological defense
CBFS	cesium beam frequency standard
CBG	coalition building guide
CBIRF	Chemical-Biological Incident Response Force
CBLTU	common battery line terminal unit
CBMR	capabilities-based munitions requirements
CBMU	construction battalion maintenance unit
CBP	capabilities-based planning; Customs and Border Protection (DHS)
CBPO	Consolidated Base Personnel Office
CBPS	chemical biological protective shelter

CBR	chemical, biological, and radiological
CBRN	Caribbean Basin Radar Network; chemical, biological, radiological, and nuclear
CBRN CM	chemical, biological, radiological, and nuclear consequence management
CBRNE	chemical, biological, radiological, nuclear, and high-yield explosives
CBRN hazard	chemical, biological, radiological, and nuclear hazard
CBRT	chemical-biological response team
CBS	common battery signaling
CBSA	Canadian Border Services Agency
CBT	common battery terminal
CbT	combating terrorism
CbT-RIF	Combating Terrorism Readiness Initiatives Fund
CBTZ	combat zone
CBU	conference bridge unit; construction battalion unit
CBW	chemical and biological warfare
C/C	cabin cruiser; cast off and clear
CC	component command (NATO); component commander; critical capability
CC&D	camouflage, concealment, and deception
CCA	carrier-controlled approach; central contracting authority; circuit card assembly; close combat attack; combat cargo assistant; container control activity; contamination control area; contingency capabilities assessment; contract construction agent
CCAP	combatant command AFRTS planner
CCAS	contingency contract administration services
CCAS-C	contingency contract administration services commander
CCATT	critical care air transport team
CCB	Community Counterterrorism Board; configuration control board
CCC	coalition coordination cell; coalition coordination center; crisis coordination center; critical control circuit; cross-cultural communications course
CCD	camouflage, concealment, and deception
CCDB	consolidated counterdrug database
CCDR	combatant commander
CCE	container control element; continuing criminal enterprise
CCEB	Combined Communications-Electronics Board
CCF	collection coordination facility
CCG	combat communications group; crisis coordination group
CCGD	commander, Coast Guard district
CCIB	command center integration branch
CCICA	command counterintelligence coordinating authority
CCIF	Combatant Commander Initiative Fund

CCIP	continuously computed impact point
CCIR	commander's critical information requirement; International Radio Consultative Committee
CCIS	common channel interswitch signaling
CCITT	International Telegraph and Telephone Consultative Committee
CCIU	CEF control interface unit
CCJTF	commander, combined joint task force
CCL	communications/computer link
CCLI	commerce control list item; computer control list item
CCMD	combatant command
CCO	central control officer; combat cargo officer; command and control office; container control officer; contingency contracting officer
CCOI	critical contact of interest
CCP	casualty collection point; consolidated cryptologic program; consolidation and containerization point
CCPDS	command center processing and display system
CCR	closed circuit refueling
CCRD	combatant commander's required delivery date
C-CS	communication and computer systems
CCS	central control ship; commander's communication synchronization; container control site; core capability set
CCSA	combatant command support agent
CCSD	command communications service designator; control communications service designator
CCT	collaborative contingency targeting; combat control team
CCTI	Chairman of the Joint Chiefs of Staff commended training issue
CCTV	closed circuit television
CCW	1980 United Nations Convention on Conventional Weapons; continuous carrier wave
CD	channel designator; compact disc; counterdrug; customer direct
CDC	Centers for Disease Control and Prevention (DHHS)
CDD	chemical decontamination detachment
CDE	collateral damage estimation
CDEMA	Caribbean Disaster Emergency Management Agency
CDERA	Caribbean Disaster Emergency Response Agency
CDF	combined distribution frame
CDI	cargo disposition instructions; conditioned diphase
C di	conditioned diphase
CDHAM	Center for Disaster and Humanitarian Assistance Medicine
CDIP	combined defense improvement project

CDIPO	counterdrug intelligence preparation for operations
CDLMS	common data link management system
CDM	cable driver modem; collateral damage methodology
CDMGB	cable driver modem group buffer
CDN	compressed dial number
CDO	command duty officer; commander, detainee operations
CDOC	counterdrug operations center
CDOPS	counterdrug operations
CDP	commander's dissemination policy; landing craft air cushion departure point
CDR	commander; continuous data recording
CDRAFNORTH	Commander, Air Force North
CDRAFSOF	commander, Air Force special operations forces
CDRCFCOM	Commander, Combined Forces Command
CDRESC	commander, electronic security command
CDREUDAC	Commander, European Command Defense Analysis Center (ELINT) or European Data Analysis Center
CDRFORSCOM	Commander, Forces Command
CDRG	catastrophic disaster response group (FEMA)
CDRJSOTF	commander, joint special operations task force
CDRL	contract data requirements list
CDRMTMC	Commander, Military Traffic Management Command
CDRNORAD	Commander, North American Aerospace Defense Command
CD-ROM	compact disc read-only memory
CDRTSOC	commander, theater special operations command
CDRUNC	Commander, United Nations Command
CDRUSAFRICOM	Commander, United States Africa Command
CDRUSAINSCOM	Commander, United States Army Intelligence and Security Command
CDRUSARNORTH	Commander, United States Army, North
CDRUSCENTCOM	Commander, United States Central Command
CDRUSCYBERCOM	Commander, United States Cyber Command
CDRUSELEMNORAD	Commander, United States Element, North American Aerospace Defense Command
CDRUSEUCOM	Commander, United States European Command
CDRUSJFCOM	Commander, United States Joint Forces Command
CDRUSNAVEUR	Commander, United States Naval Forces, Europe
CDRUSNORTHCOM	Commander, United States Northern Command
CDRUSPACOM	Commander, United States Pacific Command
CDRUSSOCOM	Commander, United States Special Operations Command
CDRUSSOUTHCOM	Commander, United States Southern Command
CDRUSSTRATCOM	Commander, United States Strategic Command
CDRUSTRANSCOM	Commander, United States Transportation Command
CDS	Chief of Defence Staff (Canada); container delivery system
CDSSC	continuity of operations plan designated successor service chief

CDU	counterdrug update
C-E	communications-electronics
CE	casualty estimation; circular error; command element (USMC); communications-electronics; core element; counterespionage; critical element
CEA	captured enemy ammunition
CEB	combat engineer battalion
CEC	civil engineer corps
CECOM	communications-electronics command
CEDI	commercial electronic data interface
CEDREP	communications-electronics deployment report
CEE	captured enemy equipment
CEF	civil engineering file; common equipment facility
CEG	common equipment group
CEHC	Counter Explosive Hazards Center (Army)
CEI	critical employment indicator
CELLEX	cellular exploitation
CEM	combined effects munition
CEMC	communications-electronics management center
CEMIRT	civil engineer maintenance, inspection, and repair team
CENTRIXS	Combined Enterprise Regional Information Exchange System
CEOI	communications-electronics operating instructions
CEP	cable entrance panel; Chairman's Exercise Program
CEPOD	communications-electronics post-deployment report
CERF	Central Emergency Revolving Fund (UN)
CERFP	chemical, biological, radiological, nuclear, and high-yield explosives enhanced response force package
CERP	Commanders' Emergency Response Program
CERT	computer emergency response team; contingency engineering response team
CERTSUB	certain submarine
CES	coast earth station
CESE	civil engineering support equipment; communications equipment support element
CESG	communications equipment support group
CESO	civil engineer support office
CESPG	civil engineering support plan group; civil engineering support planning generator
CEXC	combined explosives exploitation cell
CEW	civilian expeditionary workforce
CF	Canadian forces; carrier furnished; causeway ferry; conventional forces; drift error confidence factor
CFA	Committee on Food Aid Policies and Programmes (UN); critical factors analysis
CFACC	combined force air component commander

CFB	Canadian forces base
CFC	Combined Forces Command, Korea
CF-COP	counterfire common operational picture
CFL	Contingency Planning Facilities List; coordinated fire line
CFLCC	coalition forces land component commander
CFM	cubic feet per minute
CFO	chief financial officer
CFPM	causeway ferry power module
CFR	Code of Federal Regulations
CFS	CI force protection source
CFSO	counterintelligence force protection source operations
CFST	coalition forces support team
CG	Chairman's guidance; Coast Guard; commanding general; Comptroller General
CG-652	Coast Guard Spectrum Management and Telecommunications Policy Division
CGAS	Coast Guard Air Station
CGAUX	Coast Guard Auxiliary
CGC	Coast Guard Cutter
CGCAP	Coast Guard capabilities plan
CGCG	Coast Guard Cryptologic Group
CGCIS	Coast Guard Counterintelligence Service
CGDEFOR	Coast Guard defense force
CGFMFLANT	Commanding General, Fleet Marine Forces, Atlantic
CGFMFPAC	Commanding General, Fleet Marine Forces, Pacific
CGIS	United States Coast Guard Investigative Service
CGLSMP	Coast Guard logistic support and mobilization plan
CGP	Coast Guard publication
CGRS	common geographic reference system
CGS	common ground station; continental United States ground station
CGUSAREUR	Commanding General, United States Army, Europe
CH	channel; contingency hospital
CH-53	Sea Stallion
CHAMPUS	Civilian Health and Medical Program for the Uniformed Services
CHARC	counterintelligence and human intelligence analysis and requirements cell
CHB	cargo-handling battalion
CHCS	composite health care system
CHCSS	Chief, Central Security Service
CHE	cargo-handling equipment; container-handling equipment
CHET	customs high endurance tracker
CHOP	change of operational control
CHPPM	US Army Center for Health Promotion and Preventive Medicine

CHRIS	chemical hazard response information system
CHRP	contaminated human remains pouch
CHSTR	characteristics of transportation resources
CHSTREP	characteristics of transportation resources report
CI	civilian internee; counterintelligence
CIA	Central Intelligence Agency
CIAP	Central Intelligence Agency program; central intelligence architecture plan; command intelligence architecture plan; command intelligence architecture program
CIAS	counterintelligence analysis section
CIAT	counterintelligence analytic team
CIB	combined information bureau; controlled image base
CIC	combat information center; combat intelligence center (Marine Corps); combined intelligence center; communications interface controller; content indicator code; counterintelligence center
CICA	counterintelligence coordinating authority
CICAD	Inter-American Drug Abuse Control Commission
CICC	counterintelligence coordination cell
CICR	counterintelligence collection requirement
CID	combat identification; combat intelligence division; criminal investigation division
CIDB	common intelligence database
CIDC	Criminal Investigation Division Command
CIDNE	Combined Information Data Network Exchange
CIE	collaborative information environment; cultural intelligence element
CIEA	classification, identification, and engagement area
C-IED	counter-improvised explosive device
CIEG/CIEL	common information exchange glossary and language
CIFA	counterintelligence field activity
CIG	communications interface group
CIHO	counterintelligence/human intelligence officer
CIIR	counterintelligence information report
CI/KR	critical infrastructure and key resources
CIL	command information library; critical information list; critical item list
CILO	counterintelligence liaison officer
CIM	civil information management; compartmented information management
CIMIC	civil-military cooperation
CIN	cargo increment number
CIO	chief information officer; command intelligence officer
CIOC	counterintelligence operations cell
CIOTA	counterintelligence operational tasking authority
CIP	communications interface processor; critical infrastructure

	protection
CIPSU	communications interface processor pseudo line
CIR	continuing intelligence requirement
CIRM	International Radio-Medical Center
CIRV	common interswitch rekeying variable
CIRVIS	communications instructions for reporting vital intelligence sightings
CIS	common item support; Commonwealth of Independent States; communications interface shelter
CISAR	catastrophic incident search and rescue
CISD	critical incident stress debriefing
CISO	counterintelligence staff office; counterintelligence support officer
CITE	computer intrusion technical exploitation
CITP	counter-improvised explosive device targeting program
CIV	civilian
CIVMAR	civil service mariner
CIVPOL	civilian police
CIWG	communications interoperability working group
CJ-4	combined-joint logistics officer
CJATF	commander, joint amphibious task force
CJB	Congressional Justification Book
CJCS	Chairman of the Joint Chiefs of Staff
CJCSAN	Chairman of the Joint Chiefs of Staff Alerting Network
CJCSI	Chairman of the Joint Chiefs of Staff instruction
CJCSM	Chairman of the Joint Chiefs of Staff manual
CJDA	critical joint duty assignment
CJE	component joint data networks operations officer equivalent
CJLOTS	combined joint logistics over-the-shore
CJMAB	Central Joint Mortuary Affairs Board
CJMAO	Central Joint Mortuary Affairs Office; Chief, joint mortuary affairs office
CJMISTF	combined joint military information support task force
CJMTF	combined joint military information support operations task force
CJOC	Canada Joint Operations Command
CJSART	Criminal Justice Sector Assessment Rating Tool
CJSMPT	Coalition Joint Spectrum Management Planning Tool
CJTF	combined joint task force (NATO); commander, joint task force
CJTF-CS	Commander, Joint Task Force - Civil Support
CJTF-NCR	Commander, Joint Task Force - National Capital Region
C-JWICS	Containerized Joint Worldwide Intelligence Communications System
CKT	circuit

CL	class; coordination level
CLA	landing craft, air cushion launch area
CLASSRON	class squadron
CLB	combat logistics battalion
CLD	compact laser designator
CLDP	Commercial Law Development Program
CLEA	civilian law enforcement agency
C-level	category level
CLF	combat logistics force; commander, landing force
CLG	combat logistics group
CLGP	cannon-launched guided projectile
CLIA	Clinical Laboratory Improvement Amendments
CLIPS	communications link interface planning system
CLPSB	combatant commander logistic procurement support board
CLPT	contingency load planning team
CLR	combat logistics regiment
CLS	contractor logistic support
CLSS	combat logistic support squadron
CLT	civil liaison team; combat lasing team
CLZ	craft landing zone; cushion landing zone; landing craft, air cushion landing zone
CM	Chairman's memorandum; collection manager; combination module; configuration management; control modem; countermine; cruise missile
Cm	mean coverage factor
cm	centimeter
CMA	collection management authority
CMAA	cooperative military airlift agreement
CMAH	commander of a combatant command's Mobile Alternate Headquarters
CM&D	collection management & dissemination
CMAOC	Casualty and Mortuary Affairs Operations Center
CMAT	consequence management advisory team
CMC	Commandant of the Marine Corps; crew management cell; Office of Civilian-Military Cooperation (USAID)
Cmc	midpoint compromise coverage factor
CMCB	civil-military coordination board
CMCC	combined movement coordination center
CMD	command; cruise missile defense
CMDO	command military deception officer
CME	civil-military engagement
CMHT	consequence management home team
CMM	Office of Conflict Management and Mitigation (USAID)
CMMA	collection management mission application

CMO	Central Measurement and Signature Intelligence (MASINT) Organization; chief medical officer; chief military observer; civil-military operations; collection management office(r); configuration management office
CMOC	Cheyenne Mountain Operations Center; civil-military operations center
CMOS	cargo movement operations system; Cargo Movement Operations System (USAF); complementary metal-oxide semiconductor
CMP	communications message processor; contractor management plan
CMPF	commander, maritime pre-positioned force
CMPT	consequence management planning team
CM R&A	consequence management response and assessment
CMRT	consequence management response team
CMS	cockpit management system; command management system; community management staff; community security materiel system; contingency mutual support; crisis management system
CMSE	civil-military support element
CMST	consequence management support team
CMTS	comments
CMTU	cartridge magnetic tape unit
CMV	commercial motor vehicle
CMX	crisis management exercise
CNAC	Customs National Aviation Center (USCS)
C-NAF	component numbered air force
CNASP	chairman's net assessment for strategic planning
CNBG	commander, naval beach group
CNC	Crime and Narcotics Center (CIA)
CNCE	communications nodal control element
CNCI	Comprehensive National Cybersecurity Initiative
CND	counternarcotics division
CNE	computer network exploitation; Counter Narcotics Enforcement
CNGB	Chief, National Guard Bureau
CNIC	Commander, Navy Installations Command
CNM	classified notice to mariners
CNMOC	Commander, Naval Meteorology and Oceanography Command
CNO	Chief of Naval Operations
CNOG	Chairman, Nuclear Operations Group
CNR	combat net radio
CNRF	Commander, Naval Reserve Forces
CNSG	Commander, Naval Security Group
CNTY	country

CNWDI	critical nuclear weapons design information
CO	commanding officer; cyberspace operations
COA	course of action
COAA	course-of-action analysis
COAMPS	Coupled Ocean Atmosphere Mesoscale Prediction System
COB	collocated operating base; contingency operating base
COBOL	common business-oriented language
COC	combat operations center
CoC	Code of Conduct
COCO	contractor-owned, contractor-operated
COCOM	combatant command (command authority)
COD	carrier onboard delivery; combat operations division
COE	Army Corps of Engineers; common operating environment; concept of employment
COEDMHA	Center for Excellence in Disaster Management and Humanitarian Assistance (USPACOM)
COF	chief of fires; conduct of fire
COFC	container on flatcar
COG	center of gravity; continuity of government
COGARD	Coast Guard
COI	community of interest; contact of interest
COIC	counter-improvised explosive device operations integration center; Counter-Improvised Explosive Device Operations/Intelligence Integration Center (JIEDDO)
COIN	counterinsurgency
COLDS	cargo offload and discharge system
COLISEUM	community on-line intelligence system for end-users and managers
COLPRO	collective protection
COLS	concept of logistic support
COLT	combat observation and lasing team
COM	chief of mission; collection operations management; command; commander
COMACC	Commander, Air Combat Command
COMAFFOR	commander, Air Force forces
COMAFSOAC	commander, Air Force special operations air component
COMAFSOC	Commander, Air Force Special Operations Command
COMAJF	commander, allied joint force
COMALF	commander airlift forces
COMALOC	commercial air line of communications
COMARFOR	commander, Army forces
COMCAM	combat camera
COMCARGRU	commander, carrier group
COMCRUDESGRU	commander, cruiser destroyer group
COMDCAEUR	Commander, Defense Communications Agency Europe

COMDESRON	commander destroyer squadron
COMDT COGARD	Commandant, United States Coast Guard
COMDTINST	Commandant of the Coast Guard instruction
COMFLTCYBERCOM	Commander, Fleet Cyber Command
COMICEDEFOR	Commander, United States Forces, Iceland
COMIDEASTFOR	Commander, Middle East Forces
COMINEWARCOM	Commander, Mine Warfare Command
COMINT	communications intelligence
COMJCSE	Commander, Joint Communications Support Element
COMJIC	Commander, Joint Intelligence Center
COMLANDFOR	commander, land forces
COMLANTAREACOGARD	Commander, Coast Guard Atlantic Area
COMLOGGRU	combat logistics group
COMM	communications
COMMARFOR	commander, Marine Corps forces
COMMARFORNORTH	Commander, Marine Corps Forces North
COMMDZ	Commander, Maritime Defense Zone
COMNAV	Committee for European Airspace Coordination Working Group on Communications and Navigation Aids
COMNAVAIRLANT	Commander, Naval Air Force, Atlantic
COMNAVAIRPAC	Commander, Naval Air Force, Pacific
COMNAVAIRSYSCOM	Commander, Naval Air Systems Command
COMNAVCOMTELCOM	Commander, Naval Computer and Telecommunications Command
COMNAVELSG	Commander, Navy Expeditionary Logistics Support Group
COMNAVFOR	commander, Navy forces
COMNAVMETOCCOM	Commander, Naval Meteorology and Oceanography Command
COMNAVSEASYSCOM	Commander, Naval Sea Systems Command
COMNAVSECGRP	Commander, United States Navy Security Group
COMNAVSURFLANT	Commander, Naval Surface Force, Atlantic
COMNAVSURFPAC	Commander, Naval Surface Force, Pacific
COMNET	communications network
COMP	component
COMPACAF	Commander, Pacific Air Forces
COMPACAREACOGARD	Commander, Coast Guard Pacific Area
COMPACFLT	Commander, Pacific Fleet
COMPASS	common operational modeling, planning, and simulation strategy; Computerized Movement Planning and Status System
COMPES	contingency operations mobility planning and execution system
COMPLAN	communications plan
COMSC	Commander, Military Sealift Command
COMSCINST	Commander, Military Sealift Command instruction
COMSEC	communications security

COMSOC	Commander, Special Operations Command
COMSOCCENT	Commander, Special Operations Command, United States Central Command
COMSOCEUR	Commander, Special Operations Command, United States European Command
COMSOCPAC	Commander, Special Operations Command, Pacific
COMSOCSOUTH	Commander Special Operations Command, United States Southern Command
COMSOF	commander, special operations forces
COMSTAT	communications status
COMSUBLANT	Commander Submarine Force, United States Atlantic Fleet
COMSUBPAC	Commander Submarine Force, United States Pacific Fleet
COMSUPNAVFOR	commander, supporting naval forces
COMTAC	tactical communications
COMTENTHFLT	Commander, Tenth Fleet
COMUSAFE	Commander, United States Air Force in Europe
COMUSARCENT	Commander, United States Army Forces, Central Command
COMUSFLTFORCOM	Commander, United States Fleet Forces Command
COMUSFORAZ	Commander, United States Forces, Azores
COMUSJ	Commander, United States Forces, Japan
COMUSK	Commander, United States Forces, Korea
COMUSMARCENT	Commander, United States Marine Forces, Central Command
COMUSNAVCENT	Commander, United States Navy, Central Command
COMUSPACFLT	Commander, United States Pacific Fleet
COMUSSOCJFCOM	Commander Special Operations Command, United States Joint Forces Command
CONCAP	construction capabilities contract (Navy); Construction Capabilities Contract Process; construction capabilities contract program
CONEX	container express
CONEXPLAN	contingency and exercise plan
CONOPS	concept of operations
CONPLAN	concept plan; operation plan in concept format
CONR	continental United States North American Aerospace Defense Command Region
CONUS	continental United States
CONUSA	Continental United States Army
COOP	continuity of operations
COP	common operational picture
COP-CSE	common operational picture-combat support enabled
COPG	chairman, operations planners group
COPPERHEAD	name for cannon-launched guided projectile
COPS	communications operational planning system
COR	contracting officer representative

CORE	contingency response program
COS	chief of staff; chief of station; critical occupational specialty
COSMIC	North Atlantic Treaty Organization (NATO) security category
COSPAS	*cosmicheskaya sistyema poiska avariynch sudov* - space system for search of distressed vessels (Russian satellite system)
COSR	combat and operational stress reactions
COT	commanding officer of troops; crisis operations team
COTP	captain of the port
COTS	cargo offload and transfer system; commercial off-the-shelf; container offloading and transfer system
COU	cable orderwire unit
counter C3	counter command, control, and communications
COVCOM	covert communications
CP	check point; collection point; command post; contact point; control point; counterproliferation
CP&I	coastal patrol and interdiction
CPA	closest point of approach
CPD	combat plans division
CPE	customer premise equipment
CPFL	contingency planning facilities list
CPG	central processor group; Commander, Amphibious Group; Contingency Planning Guidance
CPI	crash position indicator
CPIC	coalition press information center
CPM	civilian personnel manual
CPO	chief petty officer; complete provisions only
CPR	cardiopulmonary resuscitation
CPRC	coalition personnel recovery center
CPS	characters per second; collective protective shelter
CPT	common procedural terminology
CPU	central processing unit
CPX	command post exercise
CR	civil reconnaissance; critical requirement
CRA	command relationships agreement; continuing resolution authority; coordinating review authority
CRAF	Civil Reserve Air Fleet
CRAM	control random access memory
CRB	configuration review board
CRC	circuit routing chart; Civilian Response Corps (DOS); civil response corps; coastal riverine company; control and reporting center; CONUS replacement center; COOP response cell; crisis reaction center; cyclic redundancy rate
CRD	chemical reconnaissance detachment

CRE	contingency response element; control reporting element
CREAPER	Communications and Radar Electronic Attack Planning Effectiveness Reference
CREST	casualty and resource estimation support tool
CREW	counter radio-controlled improvised explosive device electronic warfare
CRF	channel reassignment function; coastal riverine force; contingency response force
CRG	contingency response group
CRI	collective routing indicator
CRIF	cargo routing information file
CRITIC	critical information; critical intelligence communication; critical message (intelligence)
CRITICOMM	critical intelligence communications system
CRM	collection requirements management; comment resolution matrix; crew resource management
CrM	crisis management
CRO	combat rescue officer
CROP	common relevant operational picture
CRP	control and reporting post
CRRC	combat rubber raiding craft
CRS	Catholic Relief Services; Chairman's readiness system; coastal radio station; coastal riverine squadron; community relations service; container recovery system; Coordinator for Reconstruction and Stabilization
CRSG	country reconstruction and stabilization group
CRSP	centralized receiving and shipping point
CRT	cathode ray tube; chemical, biological, radiological, nuclear, and high-yield explosives response team; contingency response team
CRTS	casualty receiving and treatment ship
CR-UAV	close-range unmanned aerial vehicle
CRW	contingency response wing
CRYPTO	cryptographic
CS	call sign; Chaplain Service (Air Force); circuit switch; coastal station; combat service; combat support; content staging; controlled space; creeping line single-unit; critical source
CSA	Chief of Staff, United States Army; combat support agency; container stuffing activity
CSAAS	combat support agency assessment system
CSADR	combat support agency director's report
CSAF	Chief of Staff, United States Air Force
CSAM	computer security for acquisition managers
CSAR	combat search and rescue

CSAR3	combat support agency responsiveness and readiness report
CSARTE	combat search and rescue task element
CSB	contracting support brigade
CSB (MEB)	combat support brigade (maneuver enhancement brigade)
CSC	combat support center; community support center; convoy support center; creeping line single-unit coordinated; International Convention for Safe Containers
CSCC	coastal sea control commander
CSE	client server environment; combat support enhanced; combat support equipment; contingency support element; cyberspace support element
CSEL	circuit switch select line; combat survivor evader locator; command senior enlisted leader
CSEP	Chairman of the Joint Chiefs of Staff-sponsored exercise program
CSG	carrier strike group; Chairman's Staff Group; coordinating subgroup; cryptologic services group; Cryptologic Support Group
CSGN	coordinating subgroup for narcotics
CSH	combat support hospital
CSIF	communications service industrial fund
CSIP	contract support integration plan
CSIPG	circuit switch interface planning guide
CSL	combat stores list; cooperative security location
C-SMPP	Consolidated Satellite Communications Management Policies and Procedures
CSNP	causeway section, nonpowered
CSNP(BE)	causeway section, nonpowered (beach end)
CSNP(I)	causeway section, nonpowered (intermediate)
CSNP(SE)	causeway section, nonpowered (sea end)
CSO	Bureau of Conflict and Stabilization Operations (DOS); Center for Special Operations (USSOCOM); communications support organization; controlled source operation
CSOA	combined special operations area
CSOB	command systems operations branch
CSOD	command systems operation division
CSOR	contract statement of requirement
CSP	call service position; career sea pay; causeway section, powered; commence search point; contracting support plan; crisis staffing procedures (JCS); cryptologic support package
CSPAR	combatant commander's preparedness assessment report

CSR	central source registry; combatant commander's summary report; commander's summary report; controlled supply rate
CSRF	common source route file
CSS	Central Security Service (NSA); combat service support; communications subsystem; coordinator surface search
CSSA	combat service support area
CSSAMO	combat service support automation management office
CSSB	combat sustainment support battalion
CSSC	coded switch set controller
C-SSE	consolidated satellite communications system expert
CSSM	contracted support synchronization matrix
CSST	combat service support team
CSSU	combat service support unit
CST	contingency support team; customer service team
CSW	compartment stowage worksheet; coordinate seeking weapons
CT	computed tomography; control telemetry; counterterrorism; country team
CTA	common table of allowance
CTAF	counterterrorism analytical framework
CTAPS	contingency Theater Air Control System automated planning system
CTBT	Comprehensive Nuclear Test-Ban Treaty
CTC	cargo transfer company (USA); counterterrorist center
CTDB	combating terrorism database
CTEP	combined training and education plan
CTF	combined task force; commander, task force; counter threat finance
CTF IAMD	commander, task force integrated air and missile defense
CTFP	Combating Terrorism Fellowship Program
CTG	commander, task group
CTID	communications transmission identifier
CTIP	combating trafficking in persons
CTKB	combating terrorism knowledge base
CTL	candidate target list
CTM	core target material
CTOC	corps tactical operations center
CTP	common tactical picture
CTR	cooperative threat reduction
CTRIF	Combating Terrorism Readiness Initiative Fund
CTS	commodity tracking system; Contingency Tracking System; controlled technical services
CTSS	central targeting support staff
CTU	commander, task unit
CU	cubic capacity; common unit

CUI	controlled unclassified information
CUL	common-user logistics
CULT	common-user land transportation
CV	aircraft carrier; carrier; critical vulnerability; curriculum vitae
CVAMP	Core Vulnerability Assessment Management Program
CVN	aircraft carrier, nuclear
CVR	cockpit voice recorder
CVS	commercial vendor services
CVSD	continuous variable slope delta
CVT	criticality-vulnerability-threat
CVW	carrier air wing; cryptovariable weekly (GPS)
CVWC	carrier strike group air wing commander
CW	carrier wave; chemical warfare; continuous wave
CWA	chemical warfare agent
CWC	Chemical Weapons Convention; composite warfare commander
CWDE	chemical warfare defense equipment
CWMD	countering weapons of mass destruction
CWO	communications watch officer
CWP	causeway pier
CWPD	Conventional War Plans Division, Joint Staff (J-7)
CWR	calm water ramp
CWT	combat weather team; customer wait time
CY	calendar year

D

D	total drift, data
d	surface drift
D&D	denial and deception
D&F	determinations and findings
D&M	detection and monitoring
D&R	debrief and reintegrate
D-2X	Department of Defense-level counterintelligence and human intelligence staff element
D3A	decide, detect, deliver, and assess
D/A	digital-to-analog
DA	data adapter aerospace drift; data administrator; Department of the Army; Development Assistance; direct action; Directorate for Mission Services (DIA); double agent
Da	aerospace drift
DA&M	Director of Administration and Management
DAA	designated approving authority; display alternate area routing lists
DAADC	deputy area air defense commander
DAADC(AMD)	deputy area air defense commander for air and missile defense
DAAS	defense automatic addressing system
DAASO	defense automatic addressing system office
DAB	Defense Acquisition Board
DAC	Defense Intelligence Agency (DIA) counterintelligence and security activity; Department of Army civilians; Development Assistance Committee (OECD)
DACAS	digitally aided close air support
DACB	data adapter control block
DACG	departure airfield control group
DACM	data adapter control mode
DADCAP	dawn and dusk combat air patrol
DAF	Department of the Air Force
DAFL	directive authority for logistics
DAICC	domestic air interdiction coordinator center
DAL	defended asset list
DALIS	Disaster Assistance Logistics Information System
DALS	downed aviator locator system
DAMA	demand assigned multiple access
DAMES	defense automatic addressing system (DAAS) automated message exchange system
DAN	Diver's Alert Network
DAO	defense attaché office; defense attaché officer; department/ agency/organization
DAP	designated acquisition program

DAR	Defense Acquisition Regulation; distortion adaptive receiver
DARO	Defense Airborne Reconnaissance Office
DARPA	Defense Advanced Research Projects Agency
DART	disaster assistance response team; downed aircraft recovery team; dynamic analysis and replanning tool
DAS	deep air support (USMC); defense attaché system; direct access subscriber; direct air support
DAS3	decentralized automated service support system
DASA	Department of the Army (DA) staff agencies
DASC	direct air support center
DASC(A)	direct air support center (airborne)
DASD	Deputy Assistant Secretary of Defense
DASD-CN	Deputy Assistant Secretary of Defense for Counternarcotics
DASD(H&RA)	Deputy Assistant Secretary of Defense (Humanitarian & Refugee Affairs)
DASD(I)	Deputy Assistant Secretary of Defense (Intelligence)
DASD(PK/HA)	Deputy Assistant Secretary of Defense (Peacekeeping and Humanitarian Affairs)
DASD(PS)	Deputy Assistant Secretary of Defense (Program Support)
DASD(S&IO)	Deputy Assistant Secretary of Defense (Security and Information Operations)
DASSS	decentralized automated service support system
DAT	deployment action team
DATT	defense attaché
DATU	data adapter termination unit
DAWIA	Defense Acquisition Workforce Improvement Act
dB	decibel
DBA	database administrator
DBDB	digital bathymetric database
DBDB-V	digital bathymetric database variable
DBG	database generation
DBI	defense budget issue
DBIDS	Defense Biometric Identification System
DBMS	database management system; Defense-Business Management System
DBSMC	Defense Business Systems Management Committee
DBSS	Defense Blood Standard System
DBT	design basis threat
DC3	Department of Defense Cyber Crime Center
D/C	downconverter
DC	Deputies Committee; direct current; Directorate of Counterintelligence (DIA); dislocated civilian
DCA	Defense Communications Agency; Defense Cooperation Agreements; defensive counterair; dual-capable aircraft

DCAA	Defense Contract Audit Agency
DCAM	Defense Medical Logistics Standard Support (DMLSS) customer assistance module
DCAPES	Deliberate and Crisis Action Planning and Execution Segments
DCC	damage control center; deployment control center
DCCC	defense collection coordination center
DCCEP	developing country combined exercise program
DCD	data collection device
DCE	defense coordinating element
D-cell	deployment cell
DCGS	distributed common ground/surface system
DCHA	Bureau for Democracy, Conflict, and Humanitarian Assistance (USAID)
DCHC	Defense Counterintelligence and Human Intelligence Center
DCHE	Defense Counterintelligence and Human Intelligence Enterprise
DCI	defense critical infrastructure; Director of Central Intelligence; dual channel interchange
D/CI&SP	Director, Counterintelligence and Security Programs
D/CIA	Director, Central Intelligence Agency
DCID	Director of Central Intelligence directive
DCIIS	Defense Counterintelligence Information System
DCIO	defense criminal investigative organization
DCIP	Defense Critical Infrastructure Program
DCIS	Defense Criminal Investigative Services
DCISE	Defense Industrial Base Collaborative Information Sharing Environment
DCJTF	deputy commander, joint task force
DCM	data channel multiplexer; deputy chief of mission
DCMA	Defense Contract Management Agency
DCMC	Office of Deputy Chairman, Military Committee
DCMO	deputy chief military observer
DCNO	Deputy Chief of Naval Operations
DCO	debarkation control officer; Defense Connect Online; defense coordinating officer; defensive cyberspace operations; dial central office
DCO-IDM	defensive cyberspace operations - internal defensive measures
DCO-RA	defensive cyberspace operations response actions
DCP	Defense Continuity Program; detainee collection point
DCPA	Defense Civil Preparedness Agency
DCPG	digital clock pulse generator
DCR	doctrine, organization, training, materiel, leadership and education, personnel, facilities and policy change recommendation

DCRF defense chemical, biological, radiological, and nuclear response force
DCS Defense Courier Service; deputy chief of staff; digital computer system
DCSCU dual capability servo control unit
DC/S for RA Deputy Chief of Staff for Reserve Affairs
DCSINT Deputy Chief of Staff for Intelligence
DCSLOG Deputy Chief of Staff for Logistics, US Army
DCSOPS Deputy Chief of Staff for Operations and Plans, United States Army
DCSPER Deputy Chief of Staff for Personnel, United States Army
DCST Defense Logistics Agency (DLA) contingency support team
DCTC Defense Combating Terrorism Center
DCTS Defense Collaboration Tool Suite
DCW Defense Collection Watch (DIA)
DD Department of Defense (form); deputy director; destroyer (Navy ship)
DDA deputy development advisor; Deputy Director for Administration (CIA); designated development activity
DDC data distribution center; defense distribution center
DDCI Deputy Director of Central Intelligence (CIA)
DDCI/CM Deputy Director of Central Intelligence for Community Management
DDED defense distribution expeditionary depot
DDG guided missile destroyer
DDI Deputy Director of Intelligence (CIA); Director of Defense Intelligence
DDL digital data link
DDM Defense Logistics Agency Distribution Mapping; digital data modem
DDMA Defense Distribution Mapping Activity
DDMS Deputy Director for Military Support (NRO)
DDO Deputy Director of Operations (CIA)
DDOC Deployment and Distribution Operations Center (USTRANSCOM)
DDP detailed deployment plan
DDR disarmament, demobilization, and reintegration
DDR&E director of defense research and engineering
DDRRR disarmament, demobilization, repatriation, reintegration, and resettlement
DDS defense dissemination system; Deployable Disbursing System
DDS&T Deputy Director for Science & Technology (CIA) **DDSBn** deployment and distribution support battalion
DDSM Defense Distinguished Service Medal

DDST	deployment and distribution support team
DDWSO	Deputy Director for Wargaming, Simulation, and Operations
DE	damage expectancy; decedent effects; delay equalizer; directed energy
De	total drift error
de	individual drift error
DEA	Drug Enforcement Administration (DOJ)
dea	aerospace drift error
DEACN	Drug Enforcement Administration Communications Network
DEAR	disease and environmental alert report
DEARAS	Department of Defense Emergency Authorities Retrieval and Analysis System
DeCA	Defense Commissary Agency
DEERS	Defense Enrollment Eligibility Reporting System
DEFSMAC	Defense Special Missile and Aerospace Center
DEL	deployable equipment list
DEMARC	demarcation
de max	maximum drift error
DEMIL	demilitarization
de min	minimum drift error
de minimax	minimax drift error
DeMS	deployment management system
DEMUX	demultiplex
DEP	Delayed Entry Program; deployed
DEP&S	Drug Enforcement Plans and Support
DEPCJTF	deputy commander, joint task force
DEPID	deployment indicator code
DEPMEDS	deployable medical systems
DepOpsDeps	Service deputy operations deputies
DEPORD	deployment order
DESC	Defense Energy Support Center
DESCOM	Depot System Command (Army)
DESIGAREA	designated area message
DEST	destination; domestic emergency support team
DET	detainee
DETRESFA	distress phase (ICAO)
DEW	directed-energy warfare
DF	direction finding; dispersion factor; disposition form
DFARS	Defense Federal Acquisition Regulation Supplement
DFAS	Defense Finance and Accounting Service
DFAS-DE	Defense Finance and Accounting Service-Denver
DFC	deputy force commander; detention facility commander

DFE	Defense Intelligence Agency forward element; Defense Joint Intelligence Operations Center forward element; division force equivalent
DFM	deterrent force module
DFO	disaster field office (FEMA)
DFR	Defense Fuel Region
DFR/E	Defense Fuel Region, Europe
DFRIF	Defense Freight Railway Interchange Fleet
DFR/ME	Defense Fuel Region, Middle East
DFSC	Defense Fuel Supply Center
DFSP	defense fuel support point
DFT	deployment for training
DG	defense guidance
DGIAP	Defense General Intelligence and Applications Program
DGM	digital group multiplex
DGT	designated ground target
DH	death due to hostilities; Directorate for Human Intelligence (DIA)
DHA	detainee holding area
DHB	Defense Health Board
DHE	defense human intelligence executor
DHE-M	Defense Human Intelligence Enterprise-manual
DHHS	Department of Health and Human Services
DHM	Department of Defense human intelligence manager
DHMO	Department of Defense human intelligence management office
DHP	Defense Health Program
DHS	Defense Human Intelligence (HUMINT) Service; Department of Homeland Security; Director of Health Services
DI	Defense Intelligence Agency (DIA) Directorate for Analysis; DIA Directorate for Intelligence Production; discrete identifier; dynamic interface
DI&E	data integration and exploitation
DIA	Defense Intelligence Agency
DIAC	Defense Intelligence Analysis Center
DIA/DHX	Defense Intelligence Agency, Directorate of Human Intelligence, Office of Document and Media Operations
DIAM	Defense Intelligence Agency manual; Defense Intelligence Agency memorandum
DIAP	Defense Intelligence Analysis Program; Drug Interdiction Assistance Program
DIAR	Defense Intelligence Agency (DIA) regulation
DIB	defense industrial base
DIBITS	digital in-band interswitch trunk signaling
DIBRS	defense incident-based reporting system

DIBTS	digital in-band trunk signaling
DICO	Data Information Coordination Office
DID	Defense Intelligence Digest
DIDHS	Deployable Intelligence Data Handling System
DIDO	designated intelligence disclosure official
DIDS	Defense Intelligence Dissemination System
DIEB	Defense Intelligence Executive Board
DIEPS	Digital Imagery Exploitation Production System
DIG	digital
DIGO	Defence Imagery and Geospatial Organisation (Australia)
DII-COE	defense information infrastructure-common operating environment
DIILS	Defense Institute of International Legal Studies
DIJE	Defense Intelligence Joint Environment (United Kingdom)
DILPA	diphase loop modem-A
DIMA	drilling individual mobilization augmentee
DIMOC	Defense Imagery Management Operations Center
DIN	defense intelligence notice
DINET	Defense Industrial Net
DINFOS	Defense Information School
DIOC	drug interdiction operations center
DIOCC	Defense Intelligence Operations Coordination Center
DIPC	defense industrial plant equipment center
DIPF	defense intelligence priorities framework
DIPFAC	diplomatic facility
DIPGM	diphase supergroup modem
DIRINT	Director of Intelligence (USMC)
DIRJIATF	director, joint inter-agency task force
DIRLAUTH	direct liaison authorized
DIRM	Directorate for Information and Resource Management
DIRMOBFOR	director of mobility forces
DIRNSA	Director, National Security Agency
DIRSPACEFOR	director of space forces (USAF)
DIS	defense information system; Defense Investigative Service; distributed interactive simulation
DISA	Defense Information Systems Agency
DISA-LO	Defense Information Systems Agency - liaison officer
DISANMOC	Defense Information Systems Agency Network Management and Operations Center
DisasterAWARE	Disaster All-Hazard Warnings, Analysis, and Risk Evaluation System
DISCOM	division support command (Army)
DISGM	diphase supergroup
DISN	Defense Information Systems Network
DISN-E	Defense Information Systems Network – Europe

DISO	deception in support of operations security; defense intelligence support office
DISP	drug investigation support program (FAA)
DITDS	defense information threat data system; defense intelligence threat data system
DITSUM	defense intelligence terrorist summary
DJ-7	Director, Joint Staff Directorate for Joint Force Development
DJIOC	Defense Joint Intelligence Operations Center
DJS	Director, Joint Staff
DJSM	Director, Joint Staff memorandum
DJTFS	deputy joint task force surgeon
DLA	Defense Logistics Agency
DLAM	Defense Logistics Agency manual
DLAR	Defense Logistics Agency regulation
DLEA	drug law enforcement agency
DLED	dedicated loop encryption device
DLD	digital liaison detachment
DLIS	Defense Logistics Information Service
DLM	defense logistics manual
DLMS	Department Logistics Management System
DLP	data link processor
DLPMA	diphase loop modem A
DLQ	deck landing qualification
DLR	depot-level repairable
DLSA	Defense Legal Services Agency
DLSS	Defense Logistics Standard Systems
DLTM	digital line termination module
DLTU	digital line termination unit
DM	detection and monitoring; docking module
DMA	Defense Media Activity
dmax	maximum drift distance
DMB	datum marker buoy
DMC	data mode control
DMD	digital message device
DMDC	defense management data center; Defense Manpower Data Center
DME	distance measuring equipment
DMHS	Defense Message Handling System
DMI	director military intelligence
DMIGS	Domestic Mobile Integrated Geospatial-Intelligence System
dmin	minimum drift distance
DML	data manipulation language
DMLSS	Defense Medical Logistics Standard Support
DMMPO	Defense Medical Materiel Program Office
DMO	directory maintenance official

DMORT	Disaster Mortuary Operational Response Team
DMOS	duty military occupational specialty
DMPI	designated mean point of impact
DMRD	defense management resource decision
DMRIS	defense medical regulating information system
DMS	defense meteorological system; director of military support
DMSB	Defense Medical Standardization Board
DMSM	Defense Meritorious Service Medal
DMSO	Defense Modeling and Simulation Office; director of major staff office; Division Medical Supply Office
DMSP	Defense Meteorological Satellite Program
DMSSC	defense medical systems support center
DMT	disaster management team (UN)
DMU	disk memory unit
DMZ	demilitarized zone
DN	digital nonsecure
DNA	Defense Nuclear Agency; deoxyribonucleic acid
DNAT	defense nuclear advisory team
DNBI	disease and nonbattle injury
DNC	digital nautical chart
DND	Department of National Defence (Canada)
DNDO	Domestic Nuclear Detection Office (DHS)
DNGA	Director of National Geospatial-Intelligence Agency
DNI	Director of National Intelligence; Director of Naval Intelligence
DNIF	duty not involving flying
DNMSP	driftnet monitoring support program
DNSO	Defense Network Systems Organization
DNVT	digital nonsecure voice terminal
DNY	display area code (NYX) routing
DOA	days of ammunition; dead on arrival; director of administration
DOB	date of birth; dispersal operating base
DOC	Department of Commerce; designed operational capability
DOCC	deep operations coordination cell
DOCDIV	documents division
DOCEX	document exploitation
DOCNET	Doctrine Networked Education and Training
DOD	Department of Defense
DODAAC	Department of Defense activity address code
DODAAD	Department of Defense Activity Address Directory
DODAC DOD	ammunition code
DODD	Department of Defense directive
DODDS	Department of Defense Dependent Schools

DODEX	Department of Defense intelligence system information system extension
DODFMR	Department of Defense Financial Management Regulation
DODI	Department of Defense instruction
DODIC	Department of Defense identification code
DODID	Department of Defense Intelligence Digest
DODIIS	Department of Defense Intelligence Information System
DODIN	Department of Defense information network
DODIPC	Department of Defense intelligence production community
DODIPP	Department of Defense Intelligence Production Program
DOD-JIC	Department of Defense Joint Intelligence Center
DODM	data orderwire diphase modem; Department of Defense manual
DODS-CWMD	Department of Defense Strategy for Countering Weapons of Mass Destruction
DOE	Department of Energy
DOEHRS	Defense Occupational and Environmental Health Reporting System
DOF	degree of freedom
DOI	Defense Special Security Communications System (DSSCS) Operating Instructions; Department of the Interior
DOJ	Department of Justice
DOL	Department of Labor
DOM	day of month
DOMEX	document and media exploitation
DOMS	director of military support
DON	Department of the Navy
DOPMA	Defense Officer Personnel Management Act
DOR	date of rank
DOS	date of separation; days of supply; denial of service; Department of State; disk operating system
DOT	Department of Transportation
DOTEO	Department of Transportation emergency organization
DOTMLPF	doctrine, organization, training, materiel, leadership and education, personnel, and facilities
DOTMLPF-P	doctrine, organization, training, materiel, leadership and education, personnel, facilities, and policy
DOW	data orderwire; died of wounds
DOX-T	direct operational exchange-tactical
DOY	day of year
DP	Air Force component plans officer (staff); decisive point; Directorate for Policy Support (DIA); displaced person
dp	parachute drift
DPA	danger pay allowance; Defense Production Act
DPAA	Defense Prisoner of War/Missing in Action Accounting

	Agency
DPAP	Defense Procurement and Acquisition Policy
DPAS	Defense Priorities and Allocation System
DPC	deception planning cell; Defense Planning Committee (NATO)
DPEC	displaced person exploitation cell
DPG	Defense Planning Guidance
DPI	desired point of impact
dpi	dots per inch
DPICM	dual purpose improved conventional munitions
DPIP	departing initial point
DPKO	Department of Peacekeeping Operations (UN)
DPLSM	dipulse group modem
DPM	dissemination program manager
DPMO	Defense Prisoner of War/Missing Personnel Office
DPO	Defense Press Office; distribution process owner
DPP	data patch panel; distributed production program
DPPDB	digital point positioning database
DPQ	defense planning questionnaire (NATO)
DPR	display non-nodal routing
DPRB	Defense Planning and Resources Board
DPRE	displaced persons, refugees, and evacuees
DPS	data processing system
DPSC	Defense Personnel Support Center
DPSK	differential phase shift keying
DR	dead reckoning; digital receiver; disaster relief
DRB	Defense Resources Board
DRe	dead reckoning error
DRL	Bureau of Democracy, Human Rights, and Labor (DOS)
DRMD	deployments requirements manning document
DRMO	Defense Reutilization and Marketing Office
DRMS	Defense Reutilization and Marketing Service; distance root-mean-square
DRN	Disaster Response Network
DRO	departmental requirements office; departmental requirements officer
DRRS	Defense Readiness Reporting System
DRS	detainee reporting system
DRSN	Defense Red Switched Network
DRT	dead reckoning tracer; decontamination and reconnaissance team
DRTC	designated reporting technical control
DS	Directorate for Management and Chief Information Officer (DIA); direct support; doctrine sponsor
DSA	defense special assessment (DIA)
DSAA	Defense Security Assistance Agency

DSAID defense sexual assault incident database
DSAR Defense Supply Agency regulation
DSB digital in-band trunk signaling (DIBTS) signaling buffer
DSC defensive space control; digital selective calling; dual-status commander
DSCA Defense Security Cooperation Agency; defense support of civil authorities
DSCP Defense Supply Center Philadelphia
DSCR Defense Supply Center Richmond
DSCS Defense Satellite Communications System
DSCSOC Defense Satellite Communications System operations center
DSDI digital simple data interface
DSE direct support element
DSF District Stability Framework (USAID)
DSG digital signal generator
DSI defense simulation internet
DSL display switch locator (SL) routing
DSM decision support matrix
DSMAC digital scene-matching area correlation
DSN Defense Switched Network
DSNET Defense Secure Network
DSNET-2 Defense Secure Network-2
DSO Defense Spectrum Organization; defensive systems officer
DSOE deployment schedule of events
DSP Defense Satellite Program; Defense Support Program
DSPD defense support to public diplomacy
DSPL display system programming language
DSPS Director, Security Plans and Service
DSR defense source registry
DSS Defense Security Service; Distribution Standard System
DSS/ALOC direct support system/air line of communications
DSSCS Defense Special Security Communications System
DSSM Defense Superior Service Medal
DSSO data system support organization; defense sensitive support office; defense systems support organization
DSSR Department of State Standardized Regulation
DST decision support template; Defense Logistics Agency support team; deployment support team; district support team
DSTP Director of Strategic Target Planning
DSTR destroy
DSTS-G Defense Information Systems Network (DISN) Satellite Transmission Services - Global
DSVL doppler sonar velocity log

DSVT	digital subscriber voice terminal
DT	Directorate for MASINT and Technical Collection (DIA)
DTA	Defense Threat Assessment; dynamic threat assessment
DTAM	defense terrorism awareness message
DTC	defense transportation coordination
DTCI	Defense Transportation Coordination Initiative
DTD	Deployable Training Division; detailed troop decontamination
DTE	data terminal equipment; developmental test and evaluation
DTED	digital terrain elevation data
DTG	date-time group; digital trunk group (digital transmission group)
D/T/ID	detect/track/identify
DTIP	Disruptive Technology Innovations Partnership (DIA)
DTL	designator target line
DTMF	dual tone multi-frequency
DTMR	defense traffic management regulation
DTO	division transportation office; drug trafficking organization
DTOC	division tactical operations center
DTR	defense transportation regulation
DTRA	Defense Threat Reduction Agency
DTRACS	Defense Transportation Reporting and Control System
DTRATCA	Defense Threat Reduction and Treaty Compliance Agency
DTS	Defense Transportation System; Defense Travel System; diplomatic telecommunications service
DTTS	Defense Transportation Tracking System
DTWR	defense terrorism warning report
DU	depleted uranium
DURC	dual-use research of concern
DUSD	deputy under Secretary of Defense
DUSD (CI&S)	Deputy Under Secretary of Defense for Counterintelligence and Security
DUSDL	Deputy Under Secretary of Defense for Logistics
DUSD(L&MR)	Deputy Under Secretary of Defense for Logistics and Materiel Readiness
DUSDP	Deputy Under Secretary of Defense for Policy
DV	distinguished visitor
DVA	Department of Veterans Affairs
DVD	digital video device; digital video disc
DVIDS	Defense Video and Imagery Distribution System
DVITS	Digital Video Imagery Transmission System
DVOW	digital voice orderwire
DVT	deployment visualization tool
DWAS	Defense Working Capital Accounting System

DWMCF	double-wide modular causeway ferry
DWT	deadweight tonnage
DWTS	Digital Wideband Transmission System
DX	Directorate for External Relations (DIA)
DZ	drop zone
DZC	drop zone controller
DZCO	drop zone control officer
DZSO	drop zone safety officer
DZST	drop zone support team
DZSTL	drop zone support team leader

E

E	total probable error
E&DCP	evaluation and data collection plan
E&E	emergency and extraordinary expense authority
E&EE	emergency and extraordinary expense
E&I	engineering and installation
E&M	ear and mouth; special signaling leads
E1	Echelon 1
E2	Echelon 2
E3	Echelon 3; electromagnetic environmental effects
E4	Echelon 4
E5	Echelon 5
E-8C	joint surveillance, target attack radar system (JSTARS) aircraft
EA	electronic attack; emergency action; evaluation agent; executive agent; executive assistant
ea	each
EAC	echelons above corps (Army); emergency action committee
EACS	expeditionary aeromedical evacuation crew member support
EACT	expeditionary aeromedical evacuation coordination team
EAD	earliest arrival date; echelons above division (Army); extended active duty
EADRU	Euro-Atlantic disaster response unit
EADS	Eastern Air Defense Sector
EAES	expeditionary aeromedical evacuation squadron
EAF	expeditionary aerospace forces; expeditionary airfield
EAI	executive agent instruction
EAM	emergency action message
EAP	emergency action plan; emergency action procedures
EAPC	Euro-Atlantic Partnership Council
EAP-CJCS	emergency action procedures of the Chairman of the Joint Chiefs of Staff
EARLY	evasion and recovery supplemental data report
E-ARTS	en route automated radar tracking system
EASF	expeditionary aeromedical staging facility
EAST	expeditionary aeromedical evacuation staging team
EASTPAC	eastern Pacific Ocean
EBCDIC	extended binary coded decimal interchange code
EBS	environmental baseline survey
EC	electronic combat; enemy combatant; error control; European Community
ECAC	Electromagnetic Compatibility Analysis Center
ECB	echelons corps and below (Army)
ECC	engineer coordination cell; evacuation control center

ECES	expeditionary civil engineer squadron
ECHA	Executive Committee for Humanitarian Affairs (UN)
ECHO	European Commission Directorate General for Humanitarian Aid and Civil Protection; European Community Humanitarian Aid Department
ECM	electronic countermeasures
ECN	electronic change notice; Minimum Essential Emergency Communications Network
ECO	electronic combat officer
ECOSOC	Economic and Social Council (UN)
ECP	emergency command precedence; engineering change proposal; entry control point
ECS	expeditionary combat support
ECU	environmental control unit
ED	envelope delay; evaluation directive
EDA	Economic Development Administration (DOC); excess defense articles
EDC	estimated date of completion
EDD	earliest delivery date
EDI	electronic data interchange
EDSS	equipment deployment and storage system
EE	emergency establishment
EEA	environmental executive agent
EEBD	emergency escape breathing device
EECT	end evening civil twilight
EED	electro-explosive device; emergency-essential designation
EEDAC	emergency essential Department of the Army civilian
EEE	emergency and extraordinary expense
EEFI	essential element of friendly information
EEI	essential element of information
EELV	evolved expendable launch vehicle
EENT	end of evening nautical twilight
EEO	equal employment opportunity
EEPROM	electronic erasable programmable read-only memory
EER	enlisted employee review; extended echo ranging
EEZ	exclusive economic zone
EFA	engineering field activity
EFAC	emergency family assistance center
EFD	engineering field division
EFP	explosively formed projectile
EFST	essential fire support task
EFT	electronic funds transfer
EFTO	encrypt for transmission only
EGAT	Bureau of Economic Growth, Agriculture, and Trade (USAID)
EGM	Earth Gravity Model

EGS	Earth ground station
EH	explosive hazard
EHCC	explosive hazards coordination cell
EHDB	explosive hazard database
EHF	extremely high frequency
EHO	environmental health officer
EHRA	environmental health risk assessment
EHSA	environmental health site assessment
EHT	explosive hazard team
EI	environmental information; exercise item
EIA	Electronic Industries Association
EID	electrically initiated device
EIS	Environmental Impact Statement
eJMAPS	electronic Joint Manpower and Personnel System
EJPME	enlisted joint professional military education
ELBA	emergency locator beacon
ELCAS	elevated causeway system
ELCAS(M)	elevated causeway system (modular)
ELCAS(NL)	elevated causeway system (Navy lighterage)
ELD	emitter locating data
ELINT	electronic intelligence
ELIST	enhanced logistics intratheater support tool
ELOS	extended line of sight
ELPP	equal level patch panel
ELR	extra-long-range aircraft
ELSEC	electronics security
ELT	emergency locator transmitter
ELV	expendable launch vehicle
ELVA	emergency low-visibility approach
EM	electromagnetic; emergency management; executive manager
EMAC	emergency management assistance compact
E-mail	electronic mail
EMALL	electronic mall
EMBM	electromagnetic battle management
EMC	electromagnetic compatibility
EMCON	emission control
EMD	effective miss distance; expeditionary military information support detachment
EME	electromagnetic environment
EMEDS	expeditionary medical support
EMF	expeditionary medical facility
EMI	electromagnetic interface; electromagnetic interference
EMIO	expanded maritime interception operations
EMOE	electromagnetic operational environment
EMP	electromagnetic pulse

EMR hazards	electromagnetic radiation hazards
EMS	electromagnetic spectrum; emergency medical services
EMSC	electromagnetic spectrum control
EMSEC	emanations security
EMSM	electromagnetic spectrum manager
EMT	emergency medical technician; emergency medical treatment; expeditionary military information support team
EMTF	expeditionary mobility task force
EMU	expeditionary medical unit
EMV	electromagnetic vulnerability
ENCOM	engineer command (Army)
ENDEX	exercise termination
ENL	enlisted
ENSCE	enemy situation correlation element
ENWGS	Enhanced Naval Warfare Gaming System
EO	electro-optical; end office; equal opportunity; executive order; eyes only
EOB	electromagnetic order of battle; electronic order of battle; enemy order of battle
EOC	early operational capability; emergency operating center; emergency operations center
EOCA	explosive ordnance clearance agent
EOD	explosive ordnance disposal
EODMU-1	explosive ordnance disposal mobile unit one
EOI	electro-optic(al) imagery
EO-IR	electro-optical-infrared
EO-IR CM	electro-optical-infrared countermeasure
EOL	end of link
EOM	end of message
EOP	emergency operating procedures
E-O TDA	electro-optical tactical decision aid
EOW	engineering orderwire
EP	electronic protection; emergency preparedness; emergency procedures; excess property; execution planning
EPA	Environmental Protection Agency; evasion plan of action
EPBX	electronic private branch exchange
EPBS	expeditionary prime base engineer emergency force squadron
EPC	Emergency Procurement Committee
EPF	enhanced palletized load system (PLS) flatrack
EPH	emergency planning handbook
EPIC	El Paso Intelligence Center
EPIRB	emergency position-indicating radio beacon
EPLO	emergency preparedness liaison officer
EPROM	erasable programmable read-only memory

EPU	expeditionary port unit
EPW	enemy prisoner of war
EPW/CI	enemy prisoner of war/civilian internee
ERC	emergency relief coordinator; exercise related construction
ERDC	Engineer Research and Development Center
ERG	Emergency Response Guidebook
ERGM	extended range guided munitions
ERO	engine running on or offload
ERPSS	En Route Patient Staging System
ERRO	Emergency Response and Recovery Office
ERSD	estimated return to service date
ERT	emergency response team (FEMA); engineer reconnaissance team
ERT-A	emergency response team - advance element
ERU	emergency response unit
ERW	explosive remnants of war
ES	electronic support; electronic warfare support; executive secretariat
ESAC	Electromagnetic-Space Analysis Center (NSA)
ESB	engineer support battalion
ESC	Electronics Systems Center; expeditionary sustainment command
ESF	Economic Support Fund; emergency support function
ESG	executive steering group; expeditionary strike group
ESGN	electrically suspended gyro navigation
ESI	extremely sensitive information
ESK	electronic staff weather officer kit
ESM	expeditionary site mapping
ESO	embarkation staff officer; environmental science officer; Expeditionary Support Organization (DFAS)
ESOC	Emergency Supply Operations Center
ESOH	environmental, safety, and occupational health
ESORTS	Enhanced Status of Resources and Training System
ESP	engineer support plan
E-Space	Electromagnetic-Space
ESR	external supported recovery
EST	embarked security team; emergency service team; emergency support team (FEMA); en route support team
ET	electronics technician
ETA	estimated time of arrival
ETAC	emergency tactical air control
ETD	estimated time of departure
ETF	electronic target folder
ETI	estimated time of intercept

ETIC	estimated time for completion; estimated time in commission
ETM	electronic transmission; essential tasks matrix
ETO	Emergency Transportation Operations (DOT)
ETPL	endorsed TEMPEST products list
ETR	export traffic release
ETS	European telephone system
ETSS	extended training service specialist
ETX	end of text
EU	European Union
E-UAV	endurance unmanned aerial vehicle
EUB	essential user bypass
EURV	essential user rekeying variable
EUSA	Eighth US Army
EUSC	effective United States control; effective United States controlled
EUSCS	effective United States-controlled ships
EVC	evasion chart
EVE	equal value exchange
EW	early warning; electronic warfare
EWC	electronic warfare cell; electronic warfare coordinator
EWCA	electronic warfare control authority
EWCC	electronic warfare coordination cell
EWCS	electronic warfare control ship
EWD	Electronic Warfare Directorate (USSTRATCOM)
EWE	electronic warfare element
EWG	electronic warfare group
EW/GCI	early warning/ground-controlled intercept
EWIR	electronic warfare integrated reprogramming
EWO	electronic warfare officer
EWWG	electronic warfare working group
EXCIMS	Executive Council for Modeling and Simulations
ExCom	executive committee
EXDIR	Executive Director (CIA)
EXDIR/ICA	Executive Director for Intelligence Community Affairs (USG)
EXECSEC	executive secretary
EXER	exercise
EXORD	execute order
EXPLAN	exercise plan
EZ	exchange zone
EZCO	extraction zone control officer
EZM	engagement zone manager

F

F	Fahrenheit; flare patterns; flash
F2T2EA	find, fix, track, target, engage, and assess
F3EAD	find, fix, finish, exploit, analyze, and disseminate
F&ES	fire and emergency services
FA	feasibility assessment; field artillery
FAA	Federal Aviation Administration (DOT); Foreign Assistance Act
FAAO	Federal Aviation Administration order
FAAR	facilitated after-action review
FAC	forward air controller
FAC(A)	forward air controller (airborne)
FACE	forward aviation combat engineering
FACSFAC	fleet area control and surveillance facility
FACT	field advance civilian team; field assessment and coordination team
FAD	feasible arrival date
F/AD	force/activity designator
FAE	fuel air explosive
FAH	final attack heading; foreign affairs handbook
FALD	Field Administration and Logistics Division
FALOP	Forward Area Limited Observing Program
FAM	functional area manager
FAMP	forward area minefield planning
FAO	Food and Agriculture Organization (UN); foreign area officer
FAPES	Force Augmentation Planning and Execution System
FAR	Federal Acquisition Regulation; Federal Aviation Regulation; formal assessment report
FARC	Revolutionary Armed Forces of Colombia
FARP	forward arming and refueling point
FAS	Foreign Agricultural Service (USDA); frequency assignment subcommittee; fueling at sea; functional account symbol
FASCAM	family of scatterable mines
FAST	field assessment surveillance team; fleet antiterrorism security team
FAX	facsimile
FB	forward boundary
FBI	Federal Bureau of Investigation (DOJ)
FBIS	Foreign Broadcast Information Service
FBO	faith-based organization
FC	field circular; final coordination; fires cell (Army); floating causeway; floating craft; force commander
FCA	Foreign Claims Act; functional configuration audit

FCC	Federal Communications Commission; Federal coordinating center; functional combatant commander
FCE	forward command element
FCG	foreign clearance guide
FCM	foreign consequence management
FCO	federal coordinating officer
FCP	fire control party
FCT	firepower control team
FD	first draft; from temporary duty
FDA	Food and Drug Administration
FDBM	functional database manager
FDC	fire direction center
FDESC	force description
FDL	fast deployment logistics
FDLP	flight deck landing practice
FDM	frequency division multiplexing
FDO	fire direction officer; flexible deterrent option; flight deck officer; foreign disclosure officer
FDP	forward distribution point
FDPMU	forward-deployable preventive medicine unit
FDR	foreign disaster relief
FDR/FA	flight data recorder/fault analyzer
FDS	fault detection system
FDSL	fixed directory subscriber list
FDSS	fault detection subsystem
FDSSS	flight deck status and signaling system
FDT	forward distribution team
FDUL	fixed directory unit list
FDX	full duplex
FE	facilities engineering; fires element
FEA	front-end analysis
FEBA	forward edge of the battle area
FEC	facilities engineering command; forward error correction
FECC	fires and effects coordination cell
FED-STD	federal standard
FEI	forensic-enabled intelligence
FEK	frequency exchange keying
FEMA	Federal Emergency Management Agency (DHS)
FEP	fleet satellite (FLTSAT) extremely high frequency (EHF) Package; foreign excess property
FEPP	federal excess personal property; foreign excess personal property
FES	fire emergency services
FEST	foreign emergency support team; forward engineer support team
FET	facility engineer team

FEU	forty-foot equivalent unit
FEZ	fighter engagement zone
FF	navy fast frigate
Ff	fatigue correction factor
FFA	free-fire area
FFC	force fires coordinator
FFCC	flight ferry control center; force fires coordination center (USMC)
FFD	foundation feature data
FFE	field force engineering; flame field expedients
FFG	guided missile frigate
FFH	fast frequency hopping
FFH-net	fast-frequency-hopping net
FFHT-net	fast-frequency-hopping training net
FFIR	friendly force information requirement
FFP	Food for Peace; fresh frozen plasma; Office of Food for Peace (DOS)
FFT	friendly force tracking
FFTU	forward freight terminal unit
FG	fighter group
FGMDSS	Future Global Maritime Distress and Safety System
FGS	final governing standard; Force Generation Service (UN)
FH	fleet hospital
FHA	Bureau for Food and Humanitarian Assistance; foreign humanitarian assistance
FHC	family help center
FHP	force health protection
FHWA	Federal Highway Administration (DOT)
FI	foreign intelligence
FIA	functional interoperability architecture
FIC	force indicator code
FID	foreign internal defense
FIDAF	foreign internal defense augmentation force
FIE	fly-in echelon; foreign intelligence entity
FIFO	first-in-first-out
FinCEN	Financial Crimes Enforcement Network
FIR	first-impressions report
FIRCAP	foreign intelligence requirements capabilities and priorities
1st IOC	1st Information Operations Command (Land)
FIS	Foreign Intelligence Service
FISC	fleet and industrial supply center
FISINT	foreign instrumentation signals intelligence
FISS	foreign intelligence and security services
FIST	fire support team; fleet imagery support terminal; fleet intelligence support team

FIWC	fleet information warfare center
FIXe	navigational fix error
FLAR	forward-looking airborne radar
FLC	fleet logistics center
FLENUMMETOCCEN	Fleet Numerical Meteorology and Oceanography Center
FLENUMMETOCDET	Fleet Numerical Meteorological and Oceanographic Detachment
FLETC	Federal Law Enforcement Training Center (DHS)
FLIP	flight information publication; flight instruction procedures
FLIR	forward-looking infrared
FLITE	federal legal information through electronics
FLO/FLO	float-on/float-off
FLOLS	fresnel lens optical landing system
FLOT	forward line of own troops
FLP	force level planning
FLS	forward logistic site
FLSG	force logistic support group
FLTCYBERCOM	Fleet Cyber Command (Navy)
FLTSAT	fleet satellite
FLTSATCOM	fleet satellite communications
FM	field manual (Army); financial management; flare multiunit; force module; frequency modulation; functional manager
FM/A	functional manager for analysis
FMA-net	frequency management A-net
FMAS	foreign media analysis subsystem
FMAT	financial management augmentation team
FMC	force movement characteristics; full mission-capable
FMCH	fleet multichannel
FMCR	Fleet Marine Corps Reserve
FMCSA	Federal Motor Carrier Safety Administration
FMI	field manual-interim
FMF	Fleet Marine Force
FMFP	foreign military financing program
FMID	force module identifier
FMO	frequency management office; functional manager office
FMP	foreign materiel program
FMS	force module subsystem; foreign military sales
FMSC	frequency management sub-committee
FMT-net	frequency management training net
FMV	full motion video
FN	foreign nation
FNMOC	Fleet Numerical Meteorology and Oceanography Center
FNMOD	Fleet Numerical Meteorological and Oceanographic Detachment
FNOC	Fleet Numerical Oceanographic Command

FNS	foreign nation support
FO	fiber optic; flash override; forward observer
FOB	forward operating base
FOC	full operational capability; future operations cell
FOD	field operations division; foreign object damage
FOFW	fiber optic field wire
FOG	Field Operations Guide for Disaster Assessment and Response
FOI	fault detection isolation
FOIA	Freedom of Information Act
FOIU	fiber optic interface unit
FOL	fiber optic link
FON	freedom of navigation (operations)
FORCE	fuels operational readiness capability equipment (Air Force)
FORMICA	foreign military intelligence collection activities
FORSCOM	United States Army Forces Command
FORSTAT	force status and identity report
FOS	forward operating site; full operational status
FOT	follow-on operational test
FOUO	for official use only
FOV	field of view
FP	firing point; force protection; frequency panel
FPA	foreign policy advisor
FPC	final planning conference; future plans cell
FPCON	force protection condition
FPD	force protection detachment; foreign post differential
FPF	final protective fire
FPM	Federal personnel manual
FPO	fleet post office
FPOC	focal point operations center
FPS	Federal Protective Service; force protection source
FPTAS	flight path threat analysis simulation
FPTS	forward propagation by tropospheric scatter
FPWG	force protection working group
FR	final report; frequency response
FRA	Federal Railroad Administration (DOT)
FRAG	fragmentation code
FRAGORD	fragmentary order
FRC	federal resource coordinator; forward resuscitative care
FRD	formerly restricted data
FREQ	frequency
FRERP	Federal Radiological Emergency Response Plan
FRF	fragment retention film
FRMAC	Federal Radiological Monitoring and Assessment Center (DOE)
FRN	force requirement number

FRO	flexible response option
FROG	free rocket over ground
FRP	Federal response plan (USG)
FRRS	frequency resource record system
FRTP	fleet response training plan
FS	fighter squadron; file separator; file server; flare single-unit
fs	search radius safety factor
FSA	fire support area
FSB	fire support base; forward staging base; forward support base; forward support battalion
FSC	fire support cell; fire support coordinator (USMC)
FSCC	fire support coordination center (USMC)
FSCL	fire support coordination line
FSCM	fire support coordination measure
FSCOORD	fire support coordinator (Army)
FSE	fire support element
FSEM	fire support execution matrix
FSF	foreign security forces
FSI	Foreign Service Institute
FSK	frequency shift key
FSN	foreign service national
FSO	fire support officer; flight safety officer; foreign service officer
FSP	functional support plan
FSR	field service representative
FSRT	fatality search and recovery team
FSS	fast sealift ship; fire support station; flight service station
FSSG	force service support group (USMC)
FSSP	fuel system supply point
FSST	forward space support to theater
FST	fire support task; fleet surgical team
FSU	former Soviet Union; forward support unit
FSW	feet of seawater
ft	feet; foot
ft3	cubic feet
FTC	Federal Trade Commission
FTCA	Foreign Tort Claims Act
FTN	force tracking number
FTP	file transfer protocol
FTRG	fleet tactical readiness group
FTS	Federal Telecommunications System; Federal telephone service; file transfer service
FTU	field training unit; freight terminal unit
FUAC	functional area code
FUNCPLAN	functional plan
F/V	fishing vessel

Fv	aircraft speed correction factor
FVT	Force Validation Tool
FW	fighter wing; fixed-wing; weather correction factor
FWA	fraud, waste, and abuse
FWC	fleet weather center
FWD	forward
FWDA	friendly weapon danger area
FWF	former warring factions
FY	fiscal year
FYDP	Future Years Defense Program

Intentionally Blank

G

G-1	Army or Marine Corps component manpower or personnel staff officer (Army division or higher staff, Marine Corps brigade or higher staff)
G-2	Army Deputy Chief of Staff for Intelligence; Army or Marine Corps component intelligence staff officer (Army division or higher staff, Marine Corps brigade or higher staff)
G-2X	Army counterintelligence and human intelligence staff element
G-3	Army or Marine Corps component operations staff officer (Army division or higher staff, Marine Corps brigade or higher staff); assistant chief of staff, operations
G-4	Army or Marine Corps component logistics staff officer (Army division or higher staff, Marine Corps brigade or higher staff); Assistant Chief of Staff for Logistics
G-5	assistant chief of staff, plans
G-6	Army or Marine Corps component command, control, communications, and computer systems staff officer; assistant chief of staff for communications; signal staff officer (Army)
G-7	Army component information operations staff officer; assistant chief of staff, information engagement; information operations staff officer (ARFOR)
G/A	ground to air
GA	geospatial analyst; Tabun, a nerve agent
GAA	general agency agreement; geospatial intelligence assessment activity
GAFS	General Accounting and Finance System
GAMSS	Global Air Mobility Support System
GAO	General Accounting Office; Government Accountability Office
GAR	gateway access request
GARS	Global Area Reference System
GAT	governmental assistance team
GATB	guidance, apportionment, and targeting board
GATES	Global Air Transportation Execution System
GB	group buffer; Sarin, a nerve agent
GBI	ground-based interceptor
GBL	government bill of lading
GBMD	global ballistic missile defense
GBR	ground-based radar
GBS	Global Broadcast Service; Global Broadcast System
GBU	guided bomb unit

GC	general counsel; Geneva Convention; Geneva Convention Relative to the Protection of Civilian Persons in Time of War
GC3A	global command, control, and communications assessment
GC4A	global command, control, communications, and computer assessment
GCA	ground controlled approach
GCC	geographic combatant commander; global contingency construction
GCCC	global contingency construction contract
GCCMAC	Global Contingency Construction Multiple Award Contract (Navy)
GCCS	Global Command and Control System
GCCS-A	Global Command and Control System-Army
GCCS-I3	Global Command and Control System Integrated Imagery and Intelligence
GCCS-J	Global Command and Control System-Joint
GCCS-M	Global Command and Control System-Maritime
GCE	ground combat element (USMC)
GCI	ground control intercept
GCM	global container manager; Global Information Grid (GIG) Content Management
GCP	global campaign plan; ground commander's pointer
GCP-CWMD	Global Campaign Plan for Combating Weapons of Mass Destruction
GCRI	general collective routing indicator (RI)
GCS	ground control station
GCSC	global contingency service contract
GCSMAC	Global Contingency Services Multiple Award Contract (Navy)
GCSS	Global Command Support System
GCSS-J	Global Combat Support System-Joint
GCTN	global combating terrorism network
GD	Soman, a nerve agent
GDF	gridded data field; Guidance for Development of the Force
GDIP	General Defense Intelligence Program
GDIPP	General Defense Intelligence Proposed Program
GDP	General Defense Plan (SACEUR): gross domestic product
GDSS	Global Decision Support System
GE	general engineering
GEF	Guidance for Employment of the Force
GEM	Global Information Grid (GIG) Enterprise Management
GENADMIN	general admin (message)
GENSER	general service (message)
GENTEXT	general text
GEO	geosynchronous Earth orbit

GEOCODE	geographic code
GEOFILE	geolocation code file; standard specified geographic location file
GEOINT	geospatial intelligence
GEOLOC	geographic location; geographic location code
GEOREF	geographic reference; world geographic reference system
GETS	geospatial enterprise tasking, processing, exploitation, and dissemination service
GF	a nerve agent
GFE	government-furnished equipment
GFI	government-furnished information
GFM	global force management; global freight management; government-furnished material
GFMAP	Global Force Management Allocation Plan
GFMB	Global Force Management Board
GFMIG	Global Force Management Implementation Guidance
GFMPL	Graphics Fleet Mission Program Library
GFOAR	global family of operation plans assessment report
GFP	government-furnished property
GFS	global fleet station; government-furnished support
GFU	group framing unit
GHz	gigahertz
GI	geomatics and imagery
GI&S	geospatial information and services
GIAC	graphic input aggregate control
GIANT	Global Positioning System Interference and Navigation Tool
GIBCO	geospatial-intelligence base for contingency operations
GIC	(*gabarit international de chargement)* international loading gauge
GICNT	Global Initiative to Combat Nuclear Terrorism
GIE	global information environment
GIMS	Geospatial Intelligence Information Management Services
GIO	Geospatial Intelligence Organisation (New Zealand)
GIP	gridded installation photograph
GIS	geographic information system; geospatial information systems
GL	government-leased
GLCM	ground-launched cruise missile
GLINT	gated laser intensifier
GLO	ground liaison officer
GLOC	ground line of communications
GLTD	ground laser target designator
GM	group modem
GMD	global missile defense; ground-based midcourse defense; group mux and/or demux

GMDSS	Global Maritime Distress and Safety System
GMF	ground mobile force
GMFP	global military force policy
GMI	general military intelligence
GMLRS	Global Positioning System Multiple Launch Rocket System
GMP	global maritime partnership
GMR	graduated mobilization response; ground mobile radar
GMRS	global mobility readiness squadron
GMS	global mobility squadron
GMSC	Global Mission Support Center (USSOCOM)
GMTI	ground moving target indicator
GNA	Global Information Grid (GIG) Network Assurance
GNCC	global network operations center
GND	Global Information Grid (GIG) Network Defense
GNSC	global network operations support center
GNSS	global navigation satellite system
GO	government-owned
GOCO	government-owned, contractor-operated
GOES	geostationary operational environmental satellite
GO/FO	general officer/flag officer
GOGO	government-owned, government-operated
GOS	grade of service
GOSG	general officer steering group
GOTS	government off-the-shelf
GP	general purpose; group
GPC	geospatial planning cell; government purchase card
GPD	gallons per day
GPE	geospatial intelligence preparation of the environment
GPEE	general purpose encryption equipment
GPL	Geospatial Product Library
GPM	gallons per minute; global pallet manager
GPMDM	group modem
GPMIC	Global Patient Movement Integration Center
GPMJAB	Global Patient Movement Joint Advisory Board
GPMRC	Global Patient Movement Requirements Center
GPS	Global Positioning System
GPSOC	Global Positioning System Operations Center
GPW	Geneva Convention Relative to the Treatment of Prisoners of War
GR	graduated response
GRASP	general retrieval and sort processor
GRCA	ground reference coverage area
GRG	gridded reference graphic
GRL	global reach laydown
GRREG	graves registration

GS	general service; general support; group separator
GSA	General Services Administration
GSE	ground support equipment
GSI	glide slope indicator
GSM	ground station module
GSO	general services officer
GSORTS	Global Status of Resources and Training System
GS-R	general support-reinforcing
GSR	general support-reinforcing; ground surveillance radar
GSSA	general supply support area
GSSC	global satellite communications (SATCOM) support center
GST	geospatial support team
gt	gross ton
GTA	graphic training aid
GTAS	ground-to-air signals
GTL	gun-target line
GTM	global transportation management
GUARD	US National Guard and Air Guard
GUARDS	General Unified Ammunition Reporting Data System
G/VLLD	ground/vehicle laser locator designator
GWC	global weather central
GWEN	Ground Wave Emergency Network
GWOT	global war on terrorism
GWS	Geneva Convention for the Amelioration of the Condition of the Wounded and Sick in Armed Forces in the Field
GWS Sea	Geneva Convention for the Amelioration of the Condition of the Wounded, Sick, and Shipwrecked Members of the Armed Forces at Sea

Intentionally Blank

H

H&I	harassing and interdicting
H&S	headquarters and service
HA	holding area; humanitarian assistance
HAARS	high-altitude airdrop resupply system
HAC	helicopter aircraft commander; human intelligence analysis cell
HACC	humanitarian assistance coordination center
HAHO	high-altitude high-opening parachute technique
HAP	humanitarian assistance program
HAP-EP	humanitarian assistance program-excess property
HARC	human intelligence analysis and reporting cell
HARM	high-speed antiradiation missile
HARP	high altitude release point
HAST	humanitarian assistance survey team
HATR	hazardous air traffic report
HAZ	hazardous cargo
HAZMAT	hazardous materials
HB	heavy boat
HBCT	heavy brigade combat team
HC	Directorate for Human Capital (DIA)
HCA	head of contracting activity; humanitarian and civic assistance
HCAS	hostile casualty
HCL	hydrochloride
HCO	helicopter control officer
HCP	hardcopy printer
HCS	helicopter combat support (Navy); helicopter coordination section
HCT	human intelligence (HUMINT) collection team
HD	a mustard agent; harbor defense; harmonic distortion; homeland defense
HDC	harbor defense commander; helicopter direction center
HDCU	harbor defense command unit
HDM	humanitarian demining
HDO	humanitarian demining operations
HDPLX	half duplex
HDR	humanitarian daily ration
HDTC	Humanitarian Demining Training Center
HE	heavy equipment; high explosives
HEAT	helicopter external air transport; high explosive antitank
HEC	helicopter element coordinator
HEFOE	hydraulic electrical fuel oxygen engine
HEI	high explosives incendiary
HEL-H	heavy helicopter

HEL-L	light helicopter
HEL-M	medium helicopter
HELO	helicopter
HEMP	high-altitude electromagnetic pulse
HEMTT	heavy expanded mobile tactical truck
HEO	highly elliptical orbit
HEPA	high efficiency particulate air
HERF	hazards of electromagnetic radiation to fuels
HERO	electromagnetic radiation hazards; hazards of electromagnetic radiation to ordnance
HERP	hazards of electromagnetic radiation to personnel
HET	heavy equipment transporter; human intelligence exploitation team
HEWSweb	Humanitarian Early Warning Service
HF	high frequency
HFA	human factors analysis
HFDF	high-frequency direction finding
HFP	hostile fire pay
HFRB	high frequency regional broadcast
HH	homing pattern
HHC	headquarters and headquarters company
HHD	headquarters and headquarters detachment
HHQ	higher headquarters
HHS	Department of Health and Human Services
HIC	humanitarian information center
HICAP	high-capacity firefighting foam station
HIDACZ	high-density airspace control zone
HIDTA	high-intensity drug trafficking area
HIFR	helicopter in-flight refueling
HIMAD	high-to-medium-altitude air defense
HIMARS	High Mobility Artillery Rocket System
HIMEZ	high-altitude missile engagement zone
HIRSS	hover infrared suppressor subsystem
HIRTA	high intensity radio transmission area
HIU	humanitarian information unit (DOS)
HIV	human immunodeficiency virus
HJ	crypto key change
HLPS	heavy-lift pre-position ship
HM	hazardous material
HMA	humanitarian mine action
HMCS	helmet-mounted cueing system
HMH	Marine heavy helicopter squadron
HMIRS	Hazardous Material Information Resource System
HMIS	Hazardous Material Information System
HMLA	Marine light/attack helicopter squadron
HMM	Marine medium helicopter squadron

HMMWV	high mobility multipurpose wheeled vehicle
HMOD	harbormaster operations detachment
HMW	health, morale, and welfare
HN	host nation
HNC	host-nation coordination
HNCC	host nation coordination center
HNS	host-nation support
HNSCC	host-nation support coordination cell
HNSF	host-nation security forces
HOB	height of burst
HOC	human intelligence operations cell; humanitarian operations center
HOCC	humanitarian operations coordination center
HOD	head of delegation
HOGE	hover out of ground effect
HOIS	hostile intelligence service
HOM	head of mission
HOSTAC	helicopter operations from ships other than aircraft carriers (USN publication)
HPA	high power amplifier
HPM	high-power microwave
HPMSK	high priority mission support kit
HPT	high-payoff target
HQ	HAVE QUICK; headquarters
HQCOMDT	headquarters commandant
HQDA	Headquarters, Department of the Army
HQFM-net	HAVE QUICK frequency modulation net
HQFMT-net	HAVE QUICK frequency modulation training net
HQMC	Headquarters, Marine Corps
HR	helicopter request; hostage rescue
HRB	high-risk billet
HRC	high-risk-of-capture; Human Resources Command
HRF	homeland response force
HRI	high risk of isolation
HRJTF	humanitarian relief joint task force
HRO	humanitarian relief organizations
HRP	high-risk personnel; human remains pouch
HRS	horizon reference system
HRT	health response team; hostage rescue team
HS	health services; helicopter antisubmarine (Navy); homeland security; homing single-unit
HSAC	Homeland Security Advisory Council
HSAS	Homeland Security Advisory System
HSB	high speed boat
HSC	helicopter sea combat (Navy); Homeland Security Council
HSCDM	high speed cable driver modem

HSC/PC	Homeland Security Council Principals Committee
HSC/PCC	Homeland Security Council Policy Coordination Committee
HSD	health service delivery; human intelligence support detachment
HSE	headquarters support element; human intelligence support element (DIA)
HSEP	hospital surgical expansion package (USAF)
HSI	hyperspectral imagery; Office of Homeland Security Investigations (DHS)
HSIN	Homeland Security Information Network (DHS)
HSIP	Homeland Security Infrastructure Program
HSM	humanitarian service medal
HSPD	homeland security Presidential directive
HSPR	high speed pulse restorer
HSS	health service support
HSSDB	high speed serial data buffer
HSV	high-speed vessel
HT	hatch team
HTERRCAS	hostile terrorist casualty
HTG	hard target graphic
HTH	high test hypochlorite
HU	hospital unit
HUD	head-up display
HUMINT	human intelligence
HUMRO	humanitarian relief operation
HUMRO OCP	humanitarian relief operation operational capability package
HUS	hardened unique storage
HVA	high-value asset
HVAA	high value airborne asset
HVAC	heating, ventilation, and air conditioning
HVCDS	high-velocity container delivery system
HVI	high-value individual
HVT	high-value target
HW	hazardous waste
HWM	high water mark
HYE	high-yield explosives
Hz	hertz

I

I	immediate; individual
I2	identity intelligence
I2WD	Intelligence and Information Warfare Division (Army)
I&A	Office of Intelligence and Analysis (DHS)
IA	imagery analyst; implementing arrangement; individual augmentee; information assurance
IAA	incident area assessment; incident awareness and assessment
IAC	Interagency Advisory Council
IACG	interagency coordination group
IADB	Inter-American Defense Board
IADS	integrated air defense system
IAEA	International Atomic Energy Agency (UN)
IAF	initial approach fix
IAIP	Information Analysis and Infrastructure Protection
IAM	inertially aided munition
IAMD	integrated air and missile defense
IAMSAR	International Aeronautical and Maritime Search and Rescue manual
IAP	incident action plan; international airport
IAPP	Interagency Partnership Program
IAR	interoperability assessment report
IAS	International Assistance System
IASC	Inter-Agency Standing Committee (UN); interim acting service chief
IATA	International Air Transport Association
IATACS	Improved Army Tactical Communications System
IATO	interim authority to operate
IAVM	information assurance vulnerability management
IAW	in accordance with
I/B	inboard
IBB	International Broadcasting Bureau
IBCT	infantry brigade combat team
IBES	intelligence budget estimate submission
IBET	integrated border enforcement team
IBM	International Business Machines
IBS	Integrated Booking System; integrated broadcast service; Integrated Broadcast System
IBS-I	Integrated Broadcast Service-Interactive
IBS-S	Integrated Broadcast Service-Simplex
IBU	inshore boat unit
IC	incident commander; intelligence community; intercept
IC3	integrated command, control, and communications
ICAD	individual concern and deficiency

ICAF	Interagency Conflict Assessment Framework
ICAO	International Civil Aviation Organization
ICAT	interagency conflict assessment team
ICBM	intercontinental ballistic missile
ICC	information confidence convention; information coordination center; Intelligence Coordination Center (USCG); International Criminal Court; Interstate Commerce Commission
ICD	international classifications of diseases; International Cooperation and Development Program (USDA)
ICDC	Intelligence Community Deputies Committee
ICDS	improved container delivery system
ICE	Immigration and Customs Enforcement (DHS)
ICEDEFOR	Iceland Defense Forces
ICEPP	Incident Communications Emergency Policy and Procedures
IC/EXCOM	Intelligence Community Executive Committee
ICG	interagency core group
ICIS	integrated consumable item support
ICITAP	International Criminal Investigative Training Assistance Program (DOJ)
ICM	image city map; improved conventional munitions; integrated collection management
ICN	idle channel noise; interface control net
ICNIA	integrated communications, navigation, and identification avionics
ICOD	intelligence cutoff data
ICODES	Integrated Computerized Deployment System
ICON	imagery communications and operations node; intermediate coordination node
ICP	intertheater communications security package; interface change proposal; inventory control point
ICPC	Intelligence Community Principals Committee
ICR	Intelligence Collection Requirements
ICRC	International Committee of the Red Cross
ICRI	interswitch collective routing indicator
ICS	incident command system; integrated country strategy; internal communications system; inter-Service chaplain support
ICSF	integrated command communications system framework
ICSAR	interagency committee on search and rescue
ICT	information and communications technology
ICU	intensive care unit; interface control unit
ICVA	International Council of Voluntary Agencies
ICW	in coordination with

ID	identification; identifier; initiating directive
IDAD	internal defense and development
IDB	integrated database
IDCA	International Development Cooperation Agency
IDDF	intermediate data distribution facility
IDEAS	Intelligence Data Elements Authorized Standards
IDEX	imagery data exploitation system
IDF	indirect fire; intermediate distribution frame
ID/IQ	indefinite delivery/indefinite quantity
IDL	integrated distribution lane
IDM	improved data modem; information dissemination management
IDNDR	International Decade for Natural Disaster Reduction (UN)
IDO	installation deployment officer
IDP	imagery derived product; imminent danger pay; internally displaced person
IDRA	infectious disease risk assessment
IDS	individual deployment site; integrated deployment system; interface design standards; intrusion detection system
IDSRS	Integrated Defense Source Registration System
IDSS	interoperability decision support system
IDT	inactive duty training
IDZ	inner defense zone
IEB	intelligence exploitation base
IED	improvised explosive device
IEDD	improvised explosive device defeat
IEEE	Institute of Electrical and Electronics Engineers
IEL	illustrative evaluation scenario
IEM	installation emergency management
IEMATS	improved emergency message automatic transmission system
IER	information exchange requirement
IES	imagery exploitation system
IESS	imagery exploitation support system
IEW	intelligence and electronic warfare
IF	intermediate frequency
IFC	intelligence fusion center
IFCS	improved fire control system
IFF	identification, friend or foe
IFFN	identification, friend, foe, or neutral
IFF/SIF	identification, friend or foe/selective identification feature
IFO	integrated financial operations; intermediate fuel oil
IFP	integrated force package
IFR	instrument flight rules
IFRC	International Federation of Red Cross and Red Crescent Societies

IFSAR	interferometric synthetic aperture radar
IG	inspector general
IGC	Integrated Data Environment/Global Transportation Network Convergence
IGL	intelligence gain/loss
IGO	intergovernmental organization
IGSM	interim ground station module (JSTARS)
IHADSS	integrated helmet and display sight system (Army)
IHC	international humanitarian community
IHO	industrial hygiene officer
IHS	international health specialist
IIB	interagency information bureau
IICL	Institute of International Container Lessors
IICT	Interagency Intelligence Committee on Counterterrorism
IIM	intelligence information management
IIP	Bureau of International Information Programs (DOS); interagency implementation plan; international information program; interoperability improvement program
IIR	imagery interpretation report; imaging infrared; intelligence information report
IJC3S	initial joint command, control, and communications system; Integrated Joint Command, Control, and Communications System
IL	intermediate location
ILAB	Bureau of International Labor Affairs (DOL)
ILO	in lieu of; International Labor Organization (UN)
ILOC	integrated line of communications
ILS	integrated logistic support
IM	information management; intermediate module
IMA	individual mobilization augmentee
IMAAC	Interagency Modeling and Atmospheric Assessment Center
IMC	instrument meteorological conditions; International Medical Corps
IMDC	isolated, missing, detained, or captured
IMDG	international maritime dangerous goods (UN)
IMET	international military education and training
IMETS	Integrated Meteorological System
IMF	International Monetary Fund (UN)
IMI	international military information
IMINT	imagery intelligence
IMIT	international military information team
IMLTU	intermatrix line termination unit
IMM	integrated materiel management; intelligence mission management

IMMDELREQ	immediate delivery required
IMO	information management officer; International Maritime Organization
IMOSAR	International Maritime Organization (IMO) search and rescue manual
IMOSS	interim mobile oceanographic support system
IMP	implementation; information management plan; inventory management plan
IMPP	integrated mission planning process
IMPT	incident management planning team; integrated mission planning team
IMRL	individual material requirements list
IMS	information management system; interagency management system; Interagency Management System for Reconstruction and Stabilization; international military staff; international military standardization
IMSP	information management support plan
IMSU	installation medical support unit
IMTF	integrated mission task force
IMU	inertial measuring unit; intermatrix unit
IN	Air Force component intelligence officer (staff); impulse noise; instructor
INCERFA	uncertainty phase (ICAO)
INCNR	increment number
INCSEA	incidents at sea
IND	improvised nuclear device
INDRAC	Interagency Combating Weapons of Mass Destruction Database of Responsibilities, Authorities, and Capabilities
INF	infantry
INFLTREP	inflight report
INFOCON	information operations condition
INID	intercept network in dialing
INJILL	injured or ill
INL	Bureau for International Narcotics and Law Enforcement Affairs (DOS)
INLS	improved Navy lighterage system
INM	international narcotics matters
INMARSAT	international maritime satellite
INR	Bureau of Intelligence and Research (DOS)
INREQ	information request
INRP	Initial National Response Plan
INS	Immigration and Naturalization Service; inertial navigation system; insert code
INSARAG	International Search and Rescue Advisory Group
INSCOM	United States Army Intelligence and Security Command
INTAC	individual terrorism awareness course

INTACS	integrated tactical communications system
INTELSAT	International Telecommunications Satellite Organization
INTELSITSUM	intelligence situation summary
InterAction	American Council for Voluntary International Action
INTERCO	International Code of signals
INTERPOL	International Criminal Police Organization
INTERPOL-USNCB	International Criminal Police Organization, United States National Central Bureau (DOJ)
INTREP	intelligence report
INU	inertial navigation unit; integration unit
INV	invalid
INVOL	involuntary
I/O	input/output
IO	information objectives; information operations; intelligence oversight
IOB	intelligence oversight board
IOC	Industrial Operations Command; initial operational capability; intelligence operations center; investigations operations center
IOCB	information operations coordination board
IO force	information operations force
IOI	injured other than hostilities or illness
IOII	information operations intelligence integration
IOM	installation, operation, and maintenance; International Organization for Migration
IOP	interface operating procedure
IOSS	Interagency Operations Security Support Staff
IOT	information operations team
IOU	input/output unit
IOW	information operations wing
IOWG	information operations working group
IP	initial point; initial position; instructor pilot; intelligence planning; internet protocol
IPA	intelligence production agency
IPB	intelligence preparation of the battlespace
IPBD	intelligence program budget decision
IPC	initial planning conference; integration planning cell; interagency planning cell; interagency policy committee
IPDM	intelligence program decision memorandum
IPDP	inland petroleum distribution plan
IPDS	imagery processing and dissemination system; inland petroleum distribution system (Army)
IPE	individual protective equipment; industrial plant equipment
IPG	isolated personnel guidance
IPI	indigenous populations and institutions

IPL	imagery product library; integrated priority list
IPO	International Program Office
IPOE	intelligence preparation of the operational environment
IPOM	intelligence program objective memorandum
IPP	impact point prediction; industrial preparedness program
IPR	in-progress review; intelligence production requirement
IPR F	plan approval in-progress review
IPRG	intelligence program review group
IPS	illustrative planning scenario; Integrated Planning System (DHS); Interim Polar System; interoperability planning system
IPSG	intelligence program support group
IPSP	intelligence priorities for strategic planning
IPT	integrated planning team; integrated process team; Integrated Product Team; intelligence planning team
I/R	internment/resettlement
IR	incident report; information rate; information requirement; infrared; intelligence requirement
IRA	Provisional Irish Republican Army
IRAC	Interdepartment Radio Advisory Committee (DOC)
IRBM	intermediate-range ballistic missile
I/R BN	internment/resettlement battalion
IRC	information-related capability; International Red Cross; International Rescue Committee; internet relay chat
IRCCM	infrared counter countermeasures
IRCM	infrared countermeasures
IRDS	infrared detection set
IRF	Immediate Reaction Forces (NATO); incident response force
IRINT	infrared intelligence
IRISA	Intelligence Report Index Summary File
IRO	international relief organization
IR pointer	infrared pointer
IRR	Individual Ready Reserve; integrated readiness report
IRS	Internal Revenue Service
IRSCC	interagency remote sensing coordination cell
IRST	infrared search and track
IRSTS	infrared search and track sensor; Infrared Search and Track System
IRT	Initial Response Team
IRTPA	Intelligence Reform and Terrorism Prevention Act
IS	information superiority; information system; interswitch
ISA	individual Service augmentee; international standardization agreement; inter-Service agreement
ISAC	information sharing and analysis center
ISAF	International Security Assistance Force
ISB	intermediate staging base

ISDB	integrated satellite communications (SATCOM) database
ISDDC	Integrated Mission Support for Surface Deployment and Distribution Command
ISE	Information Sharing Environment ;intelligence support element
ISG	information synchronization group; isolated soldier guidance
ISI2R	identify, separate, isolate, influence, and reintegrate
ISMCS	international station meteorological climatic summary
ISMMP	integrated continental United States (CONUS) medical mobilization plan
ISN	Bureau of International Security and Nonproliferation (DOS); internment serial number
ISO	International Organization for Standardization; isolation
ISOO	Information Security Oversight Office
ISOPAK	International Organization for Standardization package
ISOPREP	isolated personnel report
ISP	internet service provider
ISR	intelligence, surveillance, and reconnaissance
ISRD	intelligence, surveillance, and reconnaissance division
ISRLO	intelligence, surveillance, and reconnaissance liaison officer (USAF)
ISR WG	Intelligence, Surveillance, and Reconnaissance Wing
ISS	in-system select
ISSA	inter-Service support agreement
ISSG	Intelligence Senior Steering Group
ISSM	information system security manager
ISSO	information systems security organization
IST	integrated system test; interswitch trunk
ISU	internal airlift or helicopter slingable container unit
I/T	interpreter and translator
IT	information system technician; information technology
ITA	international telegraphic alphabet; International Trade Administration (DOC)
ITAC	intelligence and threat analysis center (Army)
ITALD	improved tactical air-launched decoy
ITAR	international traffic in arms regulation (coassembly)
ITF	intelligence task force (DIA)
ITG	infrared target graphic
ITL	intelligence task list
ITO	installation transportation officer
ITRO	inter-Service training organization
ITU	International Telecommunications Union
ITV	in-transit visibility
ITW/AA	integrated tactical warning and attack assessment
IUWG	inshore undersea warfare group
IV	intravenous

IVR	initial voice report
IVSN	Initial Voice Switched Network
IW	irregular warfare
IWC	information operations warfare commander
IW-D	defensive information warfare
IWG	intelligence working group; interagency working group
IWSC	Information Warfare Support Center
IWW	inland waterway
IWWS	inland waterway system

Intentionally Blank

J

J-1	manpower and personnel directorate of a joint staff; manpower and personnel staff section
J-2	intelligence directorate of a joint staff; intelligence staff section
J-2A	deputy directorate for administration of a joint staff
J2-CI	Joint Counterintelligence Office
J-2E	joint force exploitation staff element
J-2J	deputy directorate for support of a joint staff
J-2M	deputy directorate for crisis management of a joint staff
J-2O	deputy directorate for crisis operations of a joint staff
J-2P	deputy directorate for assessment, doctrine, requirements, and capabilities of a joint staff
J-2T	Deputy Directorate for Targeting, Joint Staff Intelligence Directorate
J-2T-1	joint staff target operations division
J-2T-2	Target Plans Division
J-2X	joint force counterintelligence and human intelligence staff element

J-7	engineering staff section of a joint staff; Joint Staff Directorate for Joint Force Development; operational plans and interoperability directorate of a joint staff
J-7/JED	exercises and training directorate of a joint staff
J-8	Joint Staff Directorate for Force Structure, Resource, and Assessment; force structure, resource, and assessment directorate of a joint staff
J-9	civil-military operations directorate of a joint staff; civil-military operations staff section
J-31	Joint Force Coordinator (Joint Staff)
J-35	future operations cell
J-39 DDGO	Joint Staff, Deputy Director for Global Operations
JA	judge advocate
J-A	judge advocate directorate of a joint staff
JAARS	Joint After-Action Reporting System
JAAT	joint air attack team
JA/ATT	joint airborne and air transportability training
JAC	joint analysis center
JACC	joint airspace control center
JACCC	joint airlift coordination and control cell

JACC/CP	joint airborne communications center/command post
JACCE	joint air component coordination element
JACE	joint air coordination element
JACS	joint automated communication-electronics operating instructions system
JADO	joint air defense operations
JADOC	Joint Air Defense Operations Center (NORAD)
JADOCS	Joint Automated Deep Operations Coordination System
JAFWIN	JWICS Air Force weather information network
JAG	judge advocate general
JAGIC	joint air-ground integration center
JAGMAN	Manual of the Judge Advocate General (US Navy)
JAI	joint administrative instruction; joint airdrop inspection
JAIC	joint air intelligence center
JAIEG	joint atomic information exchange group
JAMMS	Joint Asset Movement Management System
JAMPS	Joint Interoperability of Tactical Command and Control Systems (JINTACCS) automated message preparation system
JANAP	Joint Army, Navy, Air Force publication
JAO	joint air operations
JAOC	joint air operations center
JAOP	joint air operations plan
JAPO	joint area petroleum office
JAR	joint activity report
JARCC	joint air reconnaissance control center
JARN	joint air request net
JARS	joint automated readiness system
JASC	joint action steering committee
JASSM	joint air-to-surface standoff missile
JAT	joint acceptance test; joint assessment team
JATACS	joint advanced tactical cryptological support
JAT Guide	Joint Antiterrorism Program Manager's Guide
JAWS	Joint Munitions Effectiveness Manual (JMEM)/air-to-surface weaponeering system
JBP	Joint Blood Program
JBPO	joint blood program office
JC2WC	joint command and control warfare center
JCA	jamming control authority; joint capability area
JCASO	Joint Contingency Acquisition Support Office (DLA)
JCASREP	joint casualty report
JCAT	joint crisis action team
JCC	joint collaboration cell; joint command center; joint contracting center; joint course catalog; joint cyberspace center
JCCA	joint combat capability assessment

JCCB	Joint Configuration Control Board
JCCC	Joint Combat Camera Center; joint communications control center
JCCP	joint casualty collection point
JCCSE	Joint Continental United States Communications Support Environment
JCE	Joint Intelligence Virtual Architecture (JIVA) Collaborative Environment
JCEOI	joint communications-electronics operating instructions
JCET	joint combined exchange training; joint combined exercise for training
JCEWR	joint coordination of electronic warfare reprogramming
JCEWS	joint force commander's electronic warfare staff
JCGRO	joint central graves registration office
JCIDO	Joint Combat Identification Office
JCIOC	joint counterintelligence operations center
JCISA	Joint Command Information Systems Activity
JCISB	Joint Counterintelligence Support Branch
JCIU	joint counterintelligence unit
JCLL	joint center for lessons learned
JCMA	joint communications security monitoring activity
JCMB	joint collection management board
JCMC	joint crisis management capability
JCMEB	joint civil-military engineering board
JCMEC	Joint Captured Materiel Exploitation Center (DIA)
JCMO	joint communications security management office
JCMOTF	joint civil-military operations task force
JCMPO	Joint Cruise Missile Project Office
JCMS	Joint Construction Management System
JCMT	joint collection management tools
JCN	joint communications network; joint communications node
JCRM	Joint Capabilities Requirements Manager
JCS	Joint Chiefs of Staff
JCSAN	Joint Chiefs of Staff Alerting Network
JCSAR	joint combat search and rescue
JCSB	joint contracting support board
JCSC	joint communications satellite center
JCSE	joint communications support element; Joint Communications Support Element (USTRANSCOM)
JCSM	Joint Chiefs of Staff memorandum
JCSP	joint contracting support plan
JCSS	joint communications support squadron
JCTN	joint composite track network
JDA	joint duty assignment
JDAAP	Joint Doctrine Awareness Action Plan

JDAL	Joint Duty Assignment List
JDAM	Joint Direct Attack Munition
JDAMIS	Joint Duty Assignment Management Information System
JDAT	joint deployable analysis team
JDC	joint deployment community; Joint Doctrine Center
JDD	joint doctrine distribution
JDDC	joint doctrine development community
JDDE	joint deployment and distribution enterprise
JDDOC	joint deployment and distribution operations center
JDDT	joint doctrine development tool
JDEC	joint document exploitation center
JDEIS	Joint Doctrine, Education, and Training Electronic Information System
JDIG	Joint Drug Intelligence Group
JDIGS	Joint Digital Information Gathering System
JDISS	joint deployable intelligence support system
JDN	joint data network; joint doctrine note
JDNC	joint data network operations cell
JDNO	joint data network operations officer
JDOG	joint detention operations group
JDOMS	Joint Director of Military Support
JDPC	Joint Doctrine Planning Conference
JDPI	joint desired point of impact
JDPO	joint deployment process owner
JDSS	Joint Decision Support System
JDSSC	Joint Data Systems Support Center
JDTC	Joint Deployment Training Center
JE	joint experimentation
JEAP	Joint Electronic Intelligence (ELINT) Analysis Program
JECC	Joint Enabling Capabilities Command (USTRANSCOM)
JECE	Joint Elimination Coordination Element
JECG	joint exercise control group
JECPO	Joint Electronic Commerce Program Office
JED	Joint Education and Doctrine
JEDD	Joint Education and Doctrine Division
JEEP	joint emergency evacuation plan
JEFF	Joint Expeditionary Forensic Facility (Army)
JEL	Joint Electronic Library
JEL+	Joint Electronic Library Plus
JEM	joint exercise manual
JEMB	joint environmental management board
JEMP	joint exercise management package
JEMSMO	joint electromagnetic spectrum management operations
JEMSO	joint electromagnetic spectrum operations
JENM	joint enterprise network manager
JEP	Joint Exercise Program

JEPES	Joint Engineer Planning and Execution System
JET	joint expeditionary team; Joint Operation Planning and Execution System editing tool
JEWC	Joint Electronic Warfare Center
JEWCS	Joint Electronic Warfare Core Staff (NATO)
JEZ	joint engagement zone
JFA	joint field activity
JFACC	joint force air component commander
JFAST	Joint Flow and Analysis System for Transportation
JFC	joint force commander
JFCC	joint functional component command
JFCC-GS	Joint Functional Component Command for Global Strike
JFCC-IMD	Joint Functional Component Command for Integrated Missile Defense
JFCC-ISR	Joint Functional Component Command for Intelligence, Surveillance, and Reconnaissance (USSTRATCOM)
JFCC NW	Joint Functional Component Command for Network Warfare
JFCC-Space	Joint Functional Component Command for Space (USSTRATCOM)
JFCH	joint force chaplain
JFE	joint fires element
JFHQ	joint force headquarters
JFHQ–NCR	Joint Force Headquarters-National Capital Region
JFHQ–State	joint force headquarters-state
JFIIT	Joint Fires Integration and Interoperability Team
JFIP	Japanese facilities improvement project
JFLCC	joint force land component commander
JFMC	joint fleet mail center
JFMCC	joint force maritime component commander
JFMO	joint frequency management office
JFO	joint field office; joint fires observer
JFP	joint force package (packaging); joint force provider; Joint Frequency Panel (MCEB)
JFRB	Joint Foreign Release Board
JFRG	joint force requirements generator
JFRG II	joint force requirements generator II
JFS	joint force surgeon
JFSOC	joint force special operations component
JFSOCC	joint force special operations component commander
JFTR	joint Federal travel regulations
JFUB	joint facilities utilization board
JGWE	joint global warning enterprise
JHMCS	joint helmet-mounted cueing system
JHNS	Joint Hometown News Service
JHSV	joint high-speed vessel

JI	joint inspection
JIA	joint individual augmentation; joint individual augmentee
JIACG	joint interagency coordination group
JIADS	joint integrated air defense system
JIATF	joint interagency task force
JIATF-E	joint interagency task force - East
JIATF-S	Joint Interagency Task Force-South
JIATF-W	Joint Interagency Task Force-West
JIC	joint information center
JICC	joint information coordination center; joint interface control cell
JICO	joint interface control officer
JICPAC	Joint Intelligence Center, Pacific
JICTRANS	Joint Intelligence Center for Transportation
JIDC	joint intelligence and debriefing center; joint interrogation and debriefing center
JIEDDO	Joint Improvised Explosive Device Defeat Organization
JIEE	Joint Information Exchange Environment
JIEO	joint interoperability engineering organization
JIEP	joint intelligence estimate for planning
JIES	joint interoperability evaluation system
JIG	joint interrogation group
JILE	joint intelligence liaison element
JIMB	joint information management board
JIMP	joint implementation master plan
JIMPP	joint industrial mobilization planning process
JIMS	joint information management system
JINTACCS	Joint Interoperability of Tactical Command and Control Systems
JIO	joint interrogation operations
JIOC	joint information operations center; joint intelligence operations center
JIOCPAC	Joint Intelligence Operations Center, Pacific
JIOC-SOUTH	Joint Intelligence Operations Center, South
JIOC-TRANS	Joint Intelligence Operations Center–Transportation (USTRANSCOM)
JIOP	joint interface operational procedures
JIOP-MTF	joint interface operating procedures-message text formats
JIOWC	Joint Information Operations Warfare Center
JIPC	joint imagery production complex
JIPCL	joint integrated prioritized collection list
JIPOE	joint intelligence preparation of the operational environment
JIPTL	joint integrated prioritized target list
JIS	joint information system
JISE	joint intelligence support element
JITC	joint interoperability test command

JITF-CT	Joint Intelligence Task Force for Combating Terrorism
JIVA	Joint Intelligence Virtual Architecture
JIVU	Joint Intelligence Virtual University
JKDDC	Joint Knowledge Development and Distribution Capability
JKnIFE	Joint Improvised Explosive Device Defeat Organization Knowledge and Information Fusion Exchange
JLCC	joint lighterage control center; joint logistics coordination center
JLE	joint logistics environment
JLEnt	joint logistics enterprise
JLLIS	Joint Lessons Learned Information System
JLLP	Joint Lessons Learned Program
JLNCHREP	joint launch report
JLOA	joint logistics over-the-shore operation area
JLOC	joint logistics operations center
JLOTS	joint logistics over-the-shore
JLRC	joint logistics readiness center
JLSB	joint line of communications security board
JLSE	joint legal support element
JM&S	joint modeling and simulation
JMAARS	joint model after-action review system
JMAC	Joint Mortuary Affairs Center (Army)
JMAG	Joint METOC Advisory Group
JMAO	joint mortuary affairs office; joint mortuary affairs officer
JMAR	joint medical asset repository
JMAS	joint manpower automation system
JMAT	joint medical analysis tool; joint mobility assistance team
JMB	joint meteorology and oceanography board
JMC	joint military command; joint movement center
JMCC	joint meteorological and oceanographic coordination cell
JMCG	joint movement control group
JMCIS	Joint Maritime Command Information System
JMCO	joint meteorological and oceanographic coordination organization
JMCOMS	joint maritime communications system
JMD	joint manning document
JMeDSAF	joint medical semi-automated forces
JMEEL	joint mission-essential equipment list
JMEM	Joint Munitions Effectiveness Manual
JMET	joint mission-essential task
JMETL	joint mission-essential task list
JMIC	Joint Military Intelligence College; joint modular intermodal container
JMICS	Joint Worldwide Intelligence Communications System mobile integrated communications system
JMIE	joint maritime information element

JMIP	joint military intelligence program
JMISC	Joint Military Information Support Command
JMISTF	joint military information support task force
JMITC	Joint Military Intelligence Training Center
JMLO	joint medical logistics officer
JMMC	Joint Material Management Center
JMMT	joint military mail terminal
JMNA	joint military net assessment
JMO	joint maritime operations; joint meteorological and oceanographic officer; joint munitions office
JMO(AIR)	joint maritime operations (air)
JMOC	joint medical operations center
JMP	joint manpower program
JMPA	joint military postal activity; joint military satellite communications (MILSATCOM) panel administrator
JMPAB	Joint Materiel Priorities and Allocation Board
JMPS	Joint Mission Planning System
JMPT	Joint Medical Planning Tool
JMRC	joint mobile relay center
JMRO	Joint Medical Regulating Office
JMRR	Joint Monthly Readiness Review
JMSEP	joint modeling and simulation executive panel
JMSWG	Joint Multi-Tactical Digital Information Link (Multi-TADIL) Standards Working Group
JMT	joint military training
JMTCA	joint munitions transportation coordinating activity
JMTCSS	Joint Maritime Tactical Communications Switching System
JMTG	joint military information support operations task group
JMUA	Joint Meritorious Unit Award
JMV	joint METOC viewer
JMWG	joint medical working group
JNCC	joint network operations control center
JNMS	joint network management system
JNOCC	Joint Operation Planning and Execution System (JOPES) Network Operation Control Center
JNPE	joint nuclear planning element
JNSC	Joint Navigation Warfare Center Navigation Warfare Support Cell
JNWC	Joint Navigation Warfare Center
JOA	joint operations area
JOAF	joint operations area forecast
JOC	joint operations center; joint oversight committee
JOCC	joint operations command center
JOERAD	joint spectrum center ordnance electromagnetic environmental effects risk assessment database

JOG	joint operations graphic
JOGS	joint operation graphics system
JOPES	Joint Operation Planning and Execution System
JOPESIR	Joint Operation Planning and Execution System Incident Reporting System
JOPESREP	Joint Operation Planning and Execution System Reporting System
JOPG	joint operations planning group
JOPP	joint operation planning process
JOPPA	joint operation planning process for air
JOR	joint operational requirement
JORD	joint operational requirements document
JOSE	Joint Operations Security Support Element (Joint Staff)
JOSG	joint operational steering group
JOT&E	joint operational test and evaluation
JOTC	joint operations tasking center
JOTS	Joint Operational Tactical System
JP	joint publication
JP4	jet propulsion fuel, type 4
JP5	jet propulsion fuel, type 5
JP8	jet propulsion fuel, type 8
JPAC	joint planning augmentation cell; Joint POW/MIA Accounting Command
JPADS	joint precision airdrop system
JPAG	Joint Planning Advisory Group
JPARR	joint personnel accountability reconciliation and reporting
JPASE	joint public affairs support element; Joint Public Affairs Support Element (USTRANSCOM)
JPATS	joint primary aircraft training system
JPAV	joint personnel asset visibility
JPC	joint planning cell; joint postal cell
JPD	joint planning document
JPEC	joint planning and execution community
JPED	joint personal effects depot
JPEG	Joint Photographic Experts Group
JPERSTAT	joint personnel status and casualty report
JPG	joint planning group
JPME	joint professional military education
JPMRC	joint patient movement requirements center
JPMT	joint patient movement team
JPN	joint planning network
JPO	joint petroleum office; Joint Program Office
JPOC	joint personnel operations center; joint planning orientation course
JPOI	joint program of instruction
JPOM	joint preparation and onward movement

JPO-STC	Joint Program Office for Special Technology Countermeasures
JPRA	Joint Personnel Recovery Agency
JPRC	joint personnel reception center; joint personnel recovery center
JPS	joint processing system
JPSE	Joint Planning Support Element (USTRANSCOM)
JPTTA	joint personnel training and tracking activity
JQR	joint qualification requirements
JQRR	joint quarterly readiness review
JRADS	Joint Resource Assessment Data System
JRB	Joint Requirements Oversight Council (JROC) Review Board
JRC	joint reconnaissance center
JRCC	joint reception coordination center
JRERP	Joint Radiological Emergency Response Plan
JRFL	joint restricted frequency list
JRG	joint review group
JRIC	joint reserve intelligence center
JRIP	Joint Reserve Intelligence Program
JRMB	Joint Requirements and Management Board
JROC	Joint Requirements Oversight Council
JRRB	joint requirements review board
JRS	joint reporting structure
JRSC	jam-resistant secure communications; joint rescue sub-center
JRSOI	joint reception, staging, onward movement, and integration
JRTC	joint readiness training center
JRX	joint readiness exercise
JS	Joint Staff; the Joint Staff
JSA	joint security area
JSAC	joint strike analysis cell; joint strike analysis center
JSAM	joint security assistance memorandum; Joint Service Achievement Medal; joint standoff surface attack missile
JSAN	Joint Staff automation for the nineties
JSAP	Joint Staff action package; Joint Staff action processing
JSAS	joint strike analysis system
JSC	joint security coordinator; Joint Spectrum Center
JSCAT	joint staff crisis action team
JSCC	joint security coordination center; joint Services coordination committee
JSCM	Joint Service Commendation Medal
JSCP	Joint Strategic Capabilities Plan
JSDS	Joint Staff doctrine sponsor
JSEC	joint strategic exploitation center
JSETS	Joint Search and Rescue Satellite-Aided Tracking

	Electronic Tracking System
JSF	joint support force
JSHO	joint shipboard helicopter operations
JSIDS	joint Services imagery digitizing system
JSIR	joint spectrum interference resolution
JSISC	Joint Staff Information Service Center
JSIT	Joint Operation Planning and Execution System (JOPES) information trace
JSIVA	Joint Staff Integrated Vulnerability Assessment
JSM	Joint Staff Manual
JSME	joint spectrum management element
JSMS	joint spectrum management system
JSO	joint security operations
JSOA	joint special operations area
JSOAC	joint special operations air component; joint special operations aviation component
JSOACC	joint special operations air component commander
JSOC	joint special operations command
JSOFI	Joint Special Operations Forces Institute
JSOTF	joint special operations task force
JSOU	Joint Special Operations University
JSOW	joint stand-off weapon
JSPA	joint satellite communications panel administrator
JSPD	joint strategic planning document
JSPDSA	joint strategic planning document supporting analyses
JSPOC	Joint Space Operations Center
JSPS	Joint Strategic Planning System
JSR	joint strategy review
JSRC	joint subregional command (NATO)
JSS	joint surveillance system
JSSA	joint Services survival, evasion, resistance, and escape (SERE) agency
JSSIS	joint staff support information system
JSST	joint space support team
JSTAR	joint system threat assessment report
JSTARS	Joint Surveillance Target Attack Radar System
JSTE	joint system training exercise
JSTO	joint space tasking order
JT&E	joint test and evaluation
JTA	joint technical architecture
JTAC	joint terminal attack controller; Joint Terrorism Analysis Center
JTACE	joint technical advisory chemical, biological, radiological, and nuclear element
JTADS	Joint Tactical Air Defense System (Army); Joint Tactical

	Display System
JTAGS	joint tactical ground station (Army); joint tactical ground station (Army and Navy); joint tactical ground system
JTAIC	Joint Technical Analysis and Integration Cell (Army)
JTAO	joint tactical air operations
JTAR	joint tactical air strike request
JTASC	joint training analysis and simulation center
JTASG	Joint Targeting Automation Steering Group
JTAV-IT	joint total asset visibility-in theater
JTB	Joint Transportation Board
JTC	joint technical committee; Joint Training Confederation
JTCB	joint targeting coordination board
JTCC	joint transportation coordination cell; joint transportation coordination center; joint transportation corporate information management center
JTCOIC	Joint Training Counter-Improvised Explosive Device Operations Integration Center
JTD	joint table of distribution; joint theater distribution
JTDC	joint track data coordinator
JTF	joint task force
JTF-6	joint task force-6
JTF-AK	Joint Task Force-Alaska
JTF-B	joint task force-Bravo
JTFCEM	joint task force contingency engineering management
JTF-CM	joint task force - consequence management
JTF-CS	Joint Task Force-Civil Support
JTF-E	joint task force - elimination
JTF-GNO	Joint Task Force-Global Network Operations
JTF-GTMO	Joint Task Force-Guantanamo
JTF-HD	Joint Task Force-Homeland Defense
JTF HQ	joint task force headquarters
JTF-MAO	joint task force - mortuary affairs office
JTF-N	Joint Task Force-North
JTFP	Joint Tactical Fusion Program
JTF-PO	joint task force-port opening
JTFS	joint task force surgeon
JTF-State	joint task force-state
JTIC	joint transportation intelligence center
JTIDS	Joint Tactical Information Distribution System
JTL	joint target list
JTLM	joint theater logistics management
JTLS	joint theater-level simulation
JTM	joint training manual
JTMD	joint table of mobilization and distribution; Joint Terminology Master Database
JTMP	joint training master plan

JTMS	joint theater movement staff; joint training master schedule
JTP	joint test publication; joint training plan
JTR	Joint Travel Regulations
JTRB	joint telecommunication resources board
JTS	Joint Targeting School; Joint Training System
JTSCC	joint theater support contracting command
JTSSCCB	Joint Tactical Switched Systems Configuration Control Board
JTSST	joint training system support team
JTT	joint targeting toolbox; joint training team
JTTF	joint terrorism task force
JTWG	joint targeting working group
JU	Joint Tactical Information Distribution System unit
JUH-MTF	Joint User Handbook-Message Text Formats
JUIC	joint unit identification code
JUO	joint urban operation
JUON	joint urgent operational need
JUSMAG	Joint United States Military Advisory Group
JUWTF	joint unconventional warfare task force
JV	Joint Vision
JV 2020	Joint Vision 2020
JVB	joint visitors bureau
JVIDS	Joint Visual Integrated Display System
JVSEAS	Joint Virtual Security Environment Assessment System
JWAC	Joint Warfare Analysis Center
JWARS	Joint Warfare Analysis and Requirements System
JWC	Joint Warfare Center
JWFC	Joint Warfighting Center
JWG	joint working group
JWICS	Joint Worldwide Intelligence Communications System
JWID	joint warrior interoperability demonstration

Intentionally Blank

K

k	thousand
Ka	Kurtz-above band
KAL	key assets list
KAPP	Key Assets Protection Program
kb	kilobit
kbps	kilobits per second
KC-135	Stratotanker
KEK	key encryption key
KG	key generator
kg	kilogram
kHz	kilohertz
K-Kill	catastrophic kill
KLE	key leader engagement
KLIP	key doctrine element-linked information package
km	kilometer
KMC	knowledge management center
KNP	Korean National Police
KP	key pulse
kph	kilometers per hour
KPP	key performance parameter
KQ ID	tactical location identifier
kt	kiloton(s); knot (nautical miles per hour)
Ku	Kurtz-under band
kVA	kilo Volt-Amps
KVG	key variable generator
kW	kilowatt
KWOC	keyword-out-of-context

Intentionally Blank

L

L	length
l	search subarea length
LA	lead agent; legal adviser; line amplifier; loop key generator (LKG) adapter
LAADS	low altitude air defense system
LAAM	light anti-aircraft missile
LABS	laser airborne bathymetry system
LACV	lighter, air cushioned vehicle
LAD	latest arrival date; launch area denied
LAMPS	Light Airborne Multipurpose System (helicopter)
LAN	local area network
LANDCENT	Allied Land Forces Central Europe (NATO)
LANDSAT	land satellite
LANDSOUTH	Allied Land Forces Southern Europe (NATO)
LANTIRN	low-altitude navigation and targeting infrared for night
LAO	limited attack option
LARC	lighter, amphibious resupply, cargo
LARC-V	lighter, amphibious resupply, cargo, 5 ton
LARS	lightweight airborne recovery system
LASH	lighter aboard ship
LAT	latitude
LAV	light armored vehicle
lb	pound
lbs.	pounds
LBR	Laser Beam Rider
LC	lake current; legal counsel
LCAC	landing craft, air cushion
LCADS	low-cost aerial delivery system
LCAP	low combat air patrol
LCB	line of constant bearing
LCC	amphibious command ship; land component commander; launch control center; lighterage control center; link communications circuit; logistics component command
LCCS	landing craft control ship
LCE	logistics capability estimator; logistics combat element (USMC)
LCES	line conditioning equipment scanner
LCM	landing craft, mechanized; letter-class mail; life-cycle management
LCMC	life cycle management command
LCO	landing craft air cushion control officer; lighterage control officer
LCP	lighterage control point
LCPL	landing craft, personnel, light

LCS	landing craft air cushion control ship
LCSR	life cycle systems readiness
LCU	landing craft, utility; launch correlation unit
LCVP	landing craft, vehicle, personnel
LD	line of departure
LDA	limited depository account
LDF	lightweight digital facsimile
LDI	line driver interface
LDO	laser designator operator
LDR	leader; low data rate
LE	law enforcement; low-order explosives
LEA	law enforcement agency
LEAP	Light ExoAtmospheric Projectile
LEASAT	leased satellite
LEAU	Law Enforcement Assistance Unit (FAA)
LEC	lead environmental component
LECIC	Law Enforcement and Counterintelligence Center (DOD)
LED	law enforcement desk; light emitting diode
LEDET	law enforcement detachment (USCG)
LEGAT	legal attaché
LEIP	Law Enforcement Intelligence Program (USCG)
LEMP	low-altitude electromagnetic pulse
LEO	law enforcement operations; low Earth orbit
LEP	laser eye protection; law enforcement professional; linear error probable
LERSM	lower echelon reporting and surveillance module
LERTCON	alert condition
LES	law enforcement sensitive; leave and earnings statement; Lincoln Laboratories Experimental Satellite
LESO	Law Enforcement Support Office
LET	light equipment transport
L-EWE	land-electronic warfare element
LF	landing force; low frequency
LFA	lead federal agency
LFOC	landing force operations center
LFORM	landing force operational reserve material
LFSP	landing force support party
LfV	*Landesamt für Verfassungsschutz* (regional authority for constitutional protection)
LG	deputy chief of staff for logistics
LGB	laser-guided bomb
LGM	laser-guided missile; loop group multiplexer
LGM-30	Minuteman
LGW	laser-guided weapon
LHA	amphibious assault ship (general purpose)
LHD	amphibious assault ship (multipurpose)

LHT	line-haul tractor
LIDAR	light detection and ranging
LIF	light interference filter
LIMDIS	limited distribution
LIMFAC	limiting factor
LIPS	Logistics Information Processing System
LIS	logistics information system
LIWA	land information warfare activity
LJDAM	laser-guided joint direct attack munition
LKG	loop key generator
LKP	last known position
LL	lessons learned
LLLGB	low-level laser-guided bomb
LLLTV	low-light level television
LLSO	low-level source operation
LLTR	low-level transit route
LM	loop modem
LMARS	Logistics Metrics Analysis Reporting System
LMAV	laser MAVERICK
LMF	language media format
LMSR	large, medium-speed roll-on/roll-off
LN	lead nation; local national
LNA	low voice amplifier
LNI	Library of National Intelligence
LNO	liaison officer
LO	low observable
LOA	Lead Operational Authority; letter of assist; letter of authorization; letter of offer and acceptance; lodgment operational area; logistics over-the-shore operation area
LOAC	law of armed conflict
LOAL	lock-on after launch
LOBL	lock-on before launch
LOC	line of communications; logistics operations center
LOC ACC	location accuracy
LOCAP	low combat air patrol
LOCE	Linked Operational Intelligence Centers Europe; Linked Operations-Intelligence Centers Europe
LOD	line of departure
LOE	letter of evaluation; line of effort
LOG	logistics
LOGAIR	logistics aircraft
LOGAIS	logistics automated information system
LOGCAP	logistics civil augmentation program (Army)
LOGCAT	logistics capability assessment tool
LOGDET	logistics detail

LOGEX	logistics exercise
LOGFAC	Logistics Feasibility Assessment Capability
LOGFOR	logistics force packaging system
LOGMARS	logistics applications of automated marking and reading symbols
LOGMOD	logistics module
LOGPLAN	logistics planning system
LOGSAFE	logistic sustainment analysis and feasibility estimator
LOI	letter of instruction; loss of input
LO/LO	lift-on/lift-off
LOMEZ	low-altitude missile engagement zone
LONG	longitude
LOO	line of operation
LOP	line of position
LORAN	long-range aid to navigation
LO/RO	lift-on/roll-off
LOROP	long range oblique photography
LOS	line of sight
LOTS	logistics over-the-shore
LOX	liquid oxygen
LP	listening post
LPD	amphibious transport dock; low probability of detection
LPH	amphibious assault ship, landing platform helicopter
LPI	low probability of intercept
LPSB	logistics procurement support board
LPU	line printer unit
LPV	laser-protective visor
LRC	logistics readiness center
LRD	laser range finder-detector
LRF	laser range finder
LRF/D	laser range finder/detector
LRG	long-range aircraft
LRM	low rate multiplexer
LRN	Laboratory Response Network (DHHS)
LRO	lighterage repair officer
LRP	load and roll pallet
LRRP	long range reconnaissance patrol
LRS	launch and recovery site
LRST	long-range surveillance team
LRSU	long-range surveillance unit
LRT	logistics response time
LSA	logistic support analysis; logistics supportability analysis
LSB	landing support battalion; lower sideband
LSC	lead Service for contracting
LSCC	lead Service for contracting coordination
LSCDM	low speed cable driver modem

LSD	dock landing ship; least significant digit
LSE	landing signalman enlisted; logistic support element
LSO	landing safety officer; landing signals officer
LSPR	low speed pulse restorer
LSS	laser spot search; local sensor subsystem; logistics support system
LST	laser spot tracker; tank landing ship
LSU	logistics civil augmentation program support unit
LSV	logistics support vessel
LT	large tug; local terminal; long ton
L/T	long ton
LTD	laser target designator
LTD/R	laser target designator/ranger
LTF	logistics task force
LTG	local timing generator
LTIOV	latest time information is of value
LTL	laser-to-target line
LTON	long ton
LTS	low-altitude navigation and targeting infrared for night (LANTIRN) targeting system
LTT	loss to theater
LTU	line termination unit
LUT	local user terminal
LVS	Logistics Vehicle System (USMC)
LW	leeway
LWR	Lutheran World Relief
LZ	landing zone
LZCO	landing zone control officer

Intentionally Blank

M

M	million
M&E	monitoring and evaluation
M&S	modeling and simulation
M88A1	recovery vehicle
MA	medical attendant; military action; mortuary affairs
mA	milliampere(s)
MAAG	military assistance advisory group
MAAP	master air attack plan
MAC	mobility assault company; Mortuary Affairs Center
MACB	multinational acquisition and contracting board
MACCS	Marine air command and control system
MACG	Marine air control group
MACOM	major command (Army)
MACP	mortuary affairs collection point
MACRMS	mortuary affairs contaminated remains mitigation site
MACS	Marine air control squadron
MACSAT	multiple access commercial satellite
MAD	*Militärischer Abschirmdienst* (military protection service); military air distress
MADCP	mortuary affairs decontamination collection point
MADS	military information support operations automated data system
MAEB	mean area of effectiveness for blast
MAEF	mean area of effectiveness for fragments
MAF	mobility air forces
MAFC	Marine air-ground task force (MAGTF) all-source fusion center
MAG	Marine aircraft group; maritime assessment group; military assignment group
MAGTF	Marine air-ground task force
MAGTF ACE	Marine air-ground task force aviation combat element
MAJCOM	major command (USAF)
MANFOR	manpower force packaging system
MANPADS	man-portable air defense system
MANPER	manpower and personnel module
MAOC-N	Maritime Analysis and Operations Center-Narcotics
MAP	Military Assistance Program; missed approach point; missed approach procedure
MAR	METOC assistance request
MARAD	Maritime Administration
MARAD RRF	Maritime Administration Ready Reserve Force
MARCORLOGCOM	Marine Corps Logistics Command
MARCORMATCOM	Marine Corps Materiel Command

MARCORSYSCOM	Marine Corps Systems Command
MARDIV	Marine division
MARFOR	Marine Corps forces
MARFOREUR	Marine Corps Forces, Europe
MARFORLANT	Marine Corps Forces, Atlantic
MARFORNORTH	Marine Corps Forces, North
MARFORPAC	Marine Corps Forces, Pacific
MARFORSOUTH	Marine Corps Forces, South
MARFORSTRAT	United States Marine Corps Forces, United States Strategic Command
MARINCEN	Maritime Intelligence Center
Marine TACC	Marine Corps tactical air command center
MARLE	Marine liaison element
MARLO	Marine liaison officer
MARO	mass atrocity response operations
MAROP	marine operators
MARPOL	International Convention for the Prevention of Pollution from Ships
MARS	Military Auxiliary Radio System
MARSA	military assumes responsibility for separation of aircraft
MARSOC	United States Marine Corps Forces, Special Operations Command
MARSOF	Marine Corps special operations forces
MART	mobile Automatic Digital Network (AUTODIN) remote terminal
MARTS	Mortuary Affairs Reporting and Tracking System
MAS	maritime air support; military information support operations automated system
MASCAL	mass casualty
MASF	mobile aeromedical staging facility
MASH	mobile Army surgical hospital
MASINT	measurement and signature intelligence
MASLO	measurement and signature intelligence liaison officer
MAST	military assistance to safety and traffic; mobile ashore support terminal
MAT	medical analysis tool
MATCALS	Marine air traffic control and landing system
MATCS	Marine air traffic control squadron
M/ATMP	Missiles/Air Target Materials Program
MAW	Marine aircraft wing
MAX	maximum
MAXORD	maximum ordinate
MB	medium boat; megabyte; military information support operations battalion
MBBLs	thousands of barrels
MBCDM	medical biological chemical defense materiel

MBI	major budget issue
Mbps	megabytes per second
Mbs	megabits per second
MC	Military Committee (NATO); military community; mission-critical
MC-130	Combat Talon (I and II)
MC4EB	Military Command, Control, Communications and Computers Executive Board
MCA	mail control activity; maximum calling area; military civic action; mission concept approval; movement control agency
MCAG	maritime civil affairs group
MCAP	maximum calling area precedence
MCAS	Marine Corps air station
MCAST	maritime civil affairs and security training
MCAT	maritime civil affairs team
MCB	movement control battalion
MCBAT	medical chemical biological advisory team
MCC	Marine component commander; maritime component commander; master control center; military cooperation committee; military coordinating committee; military counterintelligence collections; mission control center; mobility control center; movement control center
MCCC	mobile consolidated command center
MCCDC	Marine Corps Combat Development Command
MCCISWG	military command, control, and information systems working group
MCD	medical crew director
MCDA	military and civil defense assets (UN)
MCDP	Marine Corps doctrine publication
MCDS	modular cargo delivery system
MCEB	Military Communications-Electronics Board
MCESG	Marine Corps Embassy Security Group
MCEWG	Military Communications-Electronics Working Group
MC/FI	mass casualty/fatality incident
MCI	multinational communications integration
MCIA	Marine Corps Intelligence Activity
MCIO	military criminal investigative organization
MCIOC	Marine Corps Information Operations Center
MCIP	Marine Corps interim publication; military command inspection program; military customs inspection program
MCJSB	Military Committee Joint Standardization Board
MCM	maneuver control measure; Manual for Courts-Martial; military classification manual; mine countermeasures
MCMC	mine countermeasures commander

MCMG	Military Committee Meteorological Group (NATO)
MCMO	medical civil-military operations
MCMOPS	mine countermeasures operations
M/CM/S	mobility, countermobility, and/or survivability
MCMREP	mine countermeasure report
MCMRON	mine countermeasures squadron
MCO	major combat operation; Mapping Customer Operations (Defense Logistics Agency); Marine Corps order
MCOO	modified combined obstacle overlay
MCRP	Marine Corps reference publication
MCS	maneuver control system; Military Capabilities Study; mine countermeasures ship; modular causeway system
MCSB	Marine Cryptologic Support Battalion
MCSF	mobile cryptologic support facility
MCSFB	Marine Corps security force battalion
MCSFR	Marine Corps Security Force Regiment
MCT	movement control team
MCTC	Midwest Counterdrug Training Center
MCTFT	Multijurisdictional Counterdrug Task Force Training
MCTOG	Marine Corps Tactics and Operations Group
MCU	maintenance communications unit
MCW	modulated carrier wave
MCWL	Marine Corps Warfighting Lab
MCWP	Marine Corps warfighting publication
MCX	Marine Corps Exchange
MDA	Magen David Adom (Israeli equivalent of the Red Cross); maritime domain awareness; Missile Defense Agency
M-DARC	military direct access radar channel
MDBS	blood support medical detachment
MDCI	multidiscipline counterintelligence
MDCO	Military Department counterintelligence organization
MDDOC	Marine air-ground task force deployment and distribution operations center
MDF	Main Defense Forces (NATO); main distribution frame
MDITDS	migration defense intelligence threat data system; Modernized Defense Intelligence Threat Data System
MDM	maritime defense measure
MDMA	methylenedioxymethamphetamine
MDR	medium data rate
MDRO	mission disaster response officer
MDS	Message Dissemination Subsystem; mission design series
MDSS II	Marine air-ground task force Deployment Support System II
MDSU	mobile diving and salvage unit
MDU	military information support operations distribution unit

MDW	Military District of Washington
MDZ	maritime defense zone
MEA	munitions effect assessment; munitions effectiveness assessment
MEAS	military information support operations effects analysis subsystem
MEB	maneuver enhancement brigade; Marine expeditionary brigade
MEBU	mission essential backup
MEC	medium endurance cutter
ME/C	medical examiner and/or coroner
MED	manipulative electronic deception
MEDAL	Mine Warfare Environmental Decision Aids Library
MEDCAP	medical civic action program
MEDCC	medical coordination cell
MEDCOM	medical command; US Army Medical Command
MEDCOM (DS)	medical command (deployment support) (Army)
MEDEVAC	medical evacuation
MEDINT	medical intelligence
MEDLOG	medical logistics (USAF AIS)
MEDLOGCO	medical logistics company
MEDLOG JR	medical logistics, junior (USAF)
MEDLOG support	medical logistics support
MEDMOB	Medical Mobilization Planning and Execution System
MEDNEO	medical noncombatant evacuation operation
MEDREG	medical regulating
MEDREGREP	medical regulating report
MEDRETE	medical readiness training exercise
MEDS	meteorological data system
MEDSOM	medical supply, optical, and maintenance unit
MEDSTAT	medical status
MEF	Marine expeditionary force
MEFPAKA	manpower and equipment force packaging
MEJA	Military Extraterritorial Jurisdiction Act
MEL	maintenance expenditure limit; minimum equipment list
MEO	medium Earth orbit; military equal opportunity
MEP	mobile electric power
MEPCOM	military entrance processing command
MEPES	Medical Planning and Execution System
MEPRS	Military Entrance Processing and Reporting System
MERCO	merchant ship reporting and control
MERSHIPS	merchant ships
MES	medical equipment set
MESAR	minimum-essential security assistance requirements
MESF	maritime expeditionary security force
MESFC	maritime expeditionary security force commander

MESO	maritime expeditionary security operations
MET	medium equipment transporter; mobile environmental team
METAR	meteorological airfield report; meteorological aviation report
METARS	routine aviation weather report (roughly translated from French; international standard code format for hourly surface weather observations)
METCON	control of meteorological information (roughly translated from French); meteorological control (Navy)
METL	mission-essential task list
METMF	meteorological mobile facility
METMR(R)	meteorological mobile facility (replacement)
METOC	meteorological and oceanographic
METSAT	meteorological satellite
METT-T	mission, enemy, terrain and weather, troops and support available-time available
METT-TC	mission, enemy, terrain and weather, troops and support available-time available and civil considerations (Army)
METWATCH	meteorological watch
MEU	Marine expeditionary unit
MEVA	mission essential vulnerable area
MEWSG	Multi-Service Electronic Warfare Support Group (NATO)
MEZ	missile engagement zone
MF	medium frequency; mobile facility; multi-frequency
MFC	multinational force commander
MFDS	Modular Fuel Delivery System
MFE	manpower force element; mobile field exchange
MFFIMS	mass fatality field information management system
MFO	multinational force and observers
MFP	major force program
MFPC	maritime future plans center
MFPF	minefield planning folder
MFS	multifunction switch
MG	military information support operations group
MGB	medium girder bridge
MGM	master group multiplexer
MGRS	military grid reference system
MGS	mobile ground system
MGT	management
MGW	maximum gross weight
MHC	management headquarters ceiling
MHD	maritime homeland defense
MHE	materials handling equipment
MHS	maritime homeland security; Military Health System
MHU	modular heat unit
MHW	mean high water
MHz	megahertz

MI	military intelligence; movement instructions
MIA	missing in action
MIAC	maritime intelligence and analysis center
MIB	Military Intelligence Board
MIC	Multinational Interoperability Council
MICAP	mission capable/mission capability
MICON	mission concept
MICRO-MICS	micro-medical inventory control system
MICRO-SNAP	micro-shipboard non-tactical automated data processing system
MIDAS	model for intertheater deployment by air and sea
MIDB	modernized integrated database; modernized intelligence database
MIDDS-T	Meteorological and Oceanographic (METOC) Integrated Data Display System-Tactical
MIF	maritime interception force
MIJI	meaconing, interference, jamming, and intrusion
MILAIR	military airlift
MILALOC	military air line of communications
MILCON	military construction
MILDEC	military deception
MILDEP	Military Department
MILGP	military group (assigned to American Embassy in host nation)
MILOB	military observer
MILOC	military oceanography group (NATO)
MILPERS	military personnel
MILSATCOM	military satellite communications
MILSPEC	military specification
MILSTAMP	military standard transportation and movement procedures
MILSTAR	military strategic and tactical relay system
MIL-STD	military standard
MILSTRAP	military standard transaction reporting and accounting procedure
MILSTRIP	military standard requisitioning and issue procedure
MILTECH	military technician
MILU	multinational integrated logistic unit
MILVAN	military van (container)
MIM	maintenance instruction manual
MIMP	Mobilization Information Management Plan
MINEOPS	joint minelaying operations
MIO	maritime interception operations
MIOC	maritime interception operations commander
MIO-9	information operations threat analysis division (DIA)
MIP	military intelligence program
MIPE	mobile intelligence processing element

MIPOE	medical intelligence preparation of the operational environment
MIPR	military interdepartmental purchase request
MIR	multisensor imagery reconnaissance
MIRCS	mobile integrated remains collection system
MIS	maritime intelligence summary; military information support
MISAS	military information support automated system
MISCAP	mission capability
MISG	military information support group
MISO	military information support operations
MISREP	mission report
MIST	military information support team
MISTF	military information support task force
MITAM	mission tasking matrix
MITASK	mission tasking
MITO	minimum interval takeoff
MITT	mobile integrated tactical terminal
MIUW	mobile inshore undersea warfare
MIW	mine warfare
MIWC	mine warfare commander
MIWG	multinational interoperability working group
MJCS	Joint Chiefs of Staff memorandum
MJLC	multinational joint logistic center
M-Kill	mobility kill
MLA	mission load allowance
MLAYREP	mine laying report
MLE	maritime law enforcement
MLEA	Maritime Law Enforcement Academy
MLEM	Maritime Law Enforcement Manual
MLG	Marine logistics group
MLI	munitions list item
MLMC	medical logistics management center
MLO	military liaison office
MLP	message load plan; mobile landing platform
MLPP	multilevel precedence and preemption
MLPS	Medical Logistics Proponent Subcommittee
MLRS	multiple launch rocket system
MLS	microwave landing system; multilevel security
MLSA	mutual logistics support agreement
MLW	mean low water
MMA	military mission area
MMAC	military mine action center
MMC	materiel management center
MMG	Department of Defense Master Mobilization Guide
MMI	man/machine interface

MMIS	military information support operations management information subsystem
MMLS	mobile microwave landing system
MMS	mast-mounted sight
MMT	military mail terminal
MNC	multinational corporation
MNCC	multinational coordination center
MNF	multinational force
MNFACC	multinational force air component commander
MNFC	multinational force commander
MNFLCC	multinational force land component commander
MNFMCC	multinational force maritime component commander
MNFSOCC	multinational force special operations component commander
MNJLC	multinational joint logistics component
MNL	master net list; multinational logistics
MNLC	multinational logistic center
MNP	master navigation plan
MNS	mine neutralization system (USN); mission needs statement
MNTF	multinational task force
MO	month
MOA	memorandum of agreement; military operating area
MOADS	maneuver-oriented ammunition distribution system
MOB	main operating base; mobilization
MOBCON	mobilization control
MOBREP	military manpower mobilization and accession status report; mobilization report
MOC	maritime operations center; media operations center
MOCC	measurement and signature intelligence (MASINT) operations coordination center; mobile operations control center
MOD	Minister of Defense; ministry of defense; modification
MODEM	modulator/demodulator
MODLOC	miscellaneous operational details, local operations
MOD T-AGOS	modified tactical auxiliary general ocean surveillance
MOE	measure of effectiveness
MOEI	measure of effectiveness indicator
MOG	maximum (aircraft) on ground; movement on ground (aircraft); multinational observer group
MOGAS	motor gasoline
MOLE	multichannel operational line evaluator
MOMAT	mobility matting
MOMSS	mode and message selection system
MOP	measure of performance; memorandum of policy

MOPP	mission-oriented protective posture
MOR	memorandum of record
MOS	military occupational specialty
MOSC	meteorological and oceanographic operations support community
MOTR	maritime operational threat response
MOU	memorandum of understanding
MOUT	military operations in urban terrain; military operations on urbanized terrain
MOVREP	movement report
MOW	maintenance orderwire
MP	military police (Army and Marine); multinational publication
MPA	maritime patrol aircraft; mission and payload assessment; mission planning agent
MPAT	military patient administration team; Multinational Planning Augmentation Team
MPC	mid-planning conference; military personnel center
MPE/S	maritime pre-positioning equipment and supplies
MPF	maritime pre-positioning force
MPFUB	maritime pre-positioning force utility boat
MPG	maritime planning group; mensurated point graphic
mph	miles per hour
MPICE	measuring progress in conflict environments
MPLAN	Marine Corps Mobilization Management Plan
MPM	medical planning module
MPNTP	Master Positioning Navigation and Timing Plan
MPO	military post office
MPP	maritime procedural publication
MPR	maritime patrol and reconnaissance
MPRS	multipoint refueling system
MPS	maritime pre-positioning ship; message processor shelter; Military Planning Service (UN); Military Postal Service
MPSRON	maritime pre-positioning ships squadron
MR	milliradian; mobile reserve
MRAALS	Marine remote area approach and landing system
MRAT	medical radiobiology advisory team
MRBM	medium-range ballistic missile
MRCI	maximum rescue coverage intercept
MRE	meal, ready to eat
MRG	movement requirements generator
MRI	magnetic resonance imaging
MRMC	US Army Medical Research and Materiel Command
MRO	mass rescue operation; materiel release order; medical regulating office; medical regulating officer
MROC	multicommand required operational capability

MRR	minimum-risk route
MRRR	mobility requirement resource roster
MRS	measurement and signature intelligence (MASINT) requirements system; meteorological radar subsystem; movement report system
MRSA	Materiel Readiness Support Agency
MRT	maintenance recovery team
MRU	mountain rescue unit
MRX	mission readiness exercise
MS	message switch; Microsoft
ms	millisecond
MSA	Maritime Security Act
MSC	major subordinate command; maritime support center; Military Sealift Command; military staff committee; mission support confirmation
MSCA	military support to civilian authorities
MSCAT	maritime security center augment team
MSCD	military support to civil defense
MSCO	Military Sealift Command Office
MSD	marginal support date; mobile security division
MS-DOS	Microsoft disk operating system
MSE	mission support element; mobile subscriber equipment
MSECR	HIS 6000 security module
MSEL	master scenario events list
MSF	*Medicins Sans Frontieres* (“Doctors Without Borders”); mission support force; mobile security force; multiplex signal format
MSG	Marine security guard; message
MSGID	message identification
MSHARPP	mission, symbolism, history, accessibility, recognizability, population, and proximity
MSI	modified surface index; multispectral imagery
MSIC	Missile and Space Intelligence Center
MSIS	Marine safety information system
MSK	mission support kit
MSL	master station log; mean sea level; military shipping label
MSNAP	merchant ship naval augmentation program
MSO	map support office; marine safety office(r); maritime security operations; military satellite communications (MILSATCOM) systems organization; military source operation; military strategic objective; military support operations
MSOAG	Marine special operations advisor group
MSOC	Marine special operations company
MSOR	Marine Special Operations Regiment
MSP	Maritime Security Program; mission support plan;

	mobile sensor platform
MSPA	Missing Service Personnel Act
MSPES	mobilization stationing, planning, and execution system
MSPS	military information support operations studies program subsystem; mobilization stationing and planning system
MSR	main supply route; maritime support request; mission support request
MSRON	maritime expeditionary security squadron
MSRP	mission strategic resource plan
MSRR	modeling and simulation resource repository
MSRT	Maritime Security Response Team (USCG)
MSRV	message switch rekeying variable
MSS	medical surveillance system; meteorological satellite subsystem
MSSG	Marine expeditionary unit (MEU) service support group
MST	Marine expeditionary force (MEF) weather support team; meteorological and oceanographic support team; mission support team
MT	military technician; ministry team
MTA	military training agreement
MTAC	Multiple Threat Alert Center (DON)
MTBF	mean time between failures
MT Bn	motor transport battalion
MTCR	Missile Technology Control Regime
MT/D	measurement tons per day
mtDNA	mitochondrial deoxyribonucleic acid
MTF	medical treatment facility; message text format; military information support operations task force
MTG	master timing generator; military information support operations task group
MTI	moving target indicator
MTIC	Military Targeting Intelligence Committee
MTL	mission tasking letter
MTMS	maritime tactical message system
MTN	multi-tactical data link network
MTO	message to observer; mission type order
MTOE	modified table of organization and equipment
MTON	measurement ton
MTP	Marine tactical publication; maritime task plan; mission tasking packet
MTS	Marine tactical system; Movement Tracking System
MTS/SOF-IRIS	multifunction system
MTT	magnetic tape transport
MTTP	multi-Service tactics, techniques, and procedures
MTW	major theater war
MTX	message text format

MU	marry up
MUL	master urgency list (DOD)
MULE	modular universal laser equipment
MUOS	Mobile Users Object System
MUREP	munitions report
MUSARC	major United States Army reserve commands
MUSE	mobile utilities support equipment
MUST	medical unit, self-contained, transportable
MUX	multiplex
MV	merchant vessel; motor vessel
mV	millivolt
MWBP	missile warning bypass
MWC	Missile Warning Center (NORAD)
MWD	military working dog
MWDT	military working dog team
MWF	medical working file
MWG	mobilization working group
MWOD	multiple word-of-day
MWR	missile warning receiver; morale, welfare, and recreation
MWSD	Marine wing support detachment
MWSG	Marine wing support group
MWSS	Marine wing support squadron
MWT	modular warping tug

Intentionally Blank

N

N	number of required track spacings; number of search and rescue units (SRUs)
N-1	Navy component manpower or personnel staff officer
N-2	Director of Naval Intelligence; Navy component intelligence staff officer
N-3	Navy component operations staff officer
N-4	Navy component logistics staff officer
N-5	Navy component plans staff officer
N-6	Navy component communications staff officer
NA	nation assistance
NA5CRO	non-Article 5 crisis response operation (NATO)
NAAG	North Atlantic Treaty Organization (NATO) Army Armaments Group
NAC	North American Aerospace Defense Command (NORAD) Air Center; North Atlantic Council (NATO)
NACE	National Military Command System (NMCS) Automated Control Executive
NACISA	North Atlantic Treaty Organization (NATO) Communications and Information Systems Agency
NACISC	North Atlantic Treaty Organization (NATO) Communications and Information Systems Committee
NACSEM	National Communications Security/Emanations Security (COMSEC/EMSEC) Information Memorandum
NACSI	national communications security (COMSEC) instruction
NACSIM	national communications security (COMSEC) information memorandum
NAD 83	North American Datum 1983
NADEFCOL	North Atlantic Treaty Organization (NATO) Defense College
NADEP	naval aircraft depot
NAE	Navy acquisition executive
NAEC-ENG	Naval Air Engineering Center - Engineering
NAF	naval air facility; nonappropriated funds; numbered air force
NAFAG	North Atlantic Treaty Organization (NATO) Air Force Armaments Group
NAI	named area of interest
NAIC	National Air Intelligence Center
NAK	negative acknowledgement
NALC	Navy ammunition logistics code
NALE	naval and amphibious liaison element
NALSS	naval advanced logistic support site
NAMP	North Atlantic Treaty Organization (NATO) Annual Manpower Plan

NAMS	National Air Mobility System
NAMTO	Navy material transportation office
NAOC	national airborne operations center (E-4B aircraft)
NAPCAP	North Atlantic Treaty Organization (NATO) Allied Pre-Committed Civil Aircraft Program
NAPMA	North Atlantic Treaty Organization (NATO) Airborne Early Warning and Control Program Management Agency
NAPMIS	Navy Preventive Medicine Information System
NAR	nonconventional assisted recovery; notice of ammunition reclassification
NARAC	national atmospheric release advisory capability; National Atmospheric Release Advisory Center (DOE)
NARC	non-automatic relay center
NARP	Nuclear Weapon Accident Response Procedures
NAS	naval air station
NASA	National Aeronautics and Space Administration
NASAR	National Association for Search and Rescue
NAS computer	national airspace system computer
NASIC	National Air and Space Intelligence Center
NAT	nonair-transportable (cargo)
NATO	North Atlantic Treaty Organization
NATOPS	Naval Air Training and Operating Procedures Standardization
NAU	Narcotics Assistance Unit
NAVAID	navigation aid
NAVAIDS	navigational aids
NAVAIR	naval air; Naval Air Systems Command
NAVAIRSYSCOM	Naval Air Systems Command (Also called NAVAIR)
NAVATAC	Navy Antiterrorism Analysis Center; Navy Antiterrorist Alert Center
NAVCHAPDET	naval cargo handling and port group detachment
NAVCHAPGRU	Navy cargo handling and port group
NAVCOMSTA	naval communications station
NAVCYBERFOR	Navy Cyber Forces
NAVELSG	Navy expeditionary logistic support group
NAVEODTECHDIV	Naval Explosives Ordnance Disposal Technology Division
NAVEURMETOCCEN	Naval Europe Meteorology and Oceanography Center
NAVFAC	Naval Facilities Engineering Command
NAVFACENGCOM	Navy Facilities Engineering Command
NAVFAC EXWC	Naval Facilities Engineering and Expeditionary Warfare Center
NAVFAC-X	Naval Facilities Engineering Command-expeditionary
NAVFAX	Navy facsimile
NAVFOR	Navy forces

NAVICECEN	Naval Ice Center
NAVLANTMETOCCEN	Naval Atlantic Meteorology and Oceanography Center
NAVMAG	naval magazine
NAVMED	Navy Medical (Command); Navy medicine
NAVMEDCOMINST	Navy medical command instruction
NAVMEDLOGCOM	Navy Medical Logistics Command
NAVMEDP	Navy medical pamphlet
NAVMETOCCOM	Naval Meteorology and Oceanography Command
NAVMTO	naval military transportation office; Navy Material Transportation Office
NAVOCEANO	Naval Oceanographic Office
NAVORD	naval ordnance
NAVORDSTA	naval ordnance station
NAVPACMETOCCEN	Naval Pacific Meteorology and Oceanography Center
NAVSAFECEN	naval safety center
NAVSAT	navigation satellite
NAVSEA	Naval Sea Systems Command
NAVSEAINST	Naval Sea Systems Command instruction
NAVSEALOGCEN	naval sea logistics center
NAVSEASYSCOM	Naval Sea Systems Command
NAVSO	United States Navy Forces, Southern Command
NAVSOC	Naval Satellite Operations Center; naval special operations command
NAVSOF	Navy special operations forces
NAVSPACECOM	Naval Space Command
NAVSPECWARCOM	Naval Special Warfare Command
NAVSPOC	Naval Space Operations Center
NAVSUP	Naval Supply Systems Command
NAVSUPINST	Navy Support Instruction
NAVSUPSYSCOM	Naval Supply Systems Command
NAVWAR	navigation warfare
NAWCAD	Naval Air Warfare Center, Aircraft Division
Navy TACC	Navy tactical air control center
NB	narrowband
NBC	nuclear, biological, and chemical
NBCCS	nuclear, biological, and chemical (NBC) contamination survivability
NBDP	narrow band direct printing
NBG	naval beach group
NBI	nonbattle injury
NBS	National Bureau of Standards
NBST	narrowband secure terminal
NBVC	Naval Base Ventura County
NC3A	nuclear command, control, and communications (C3) assessment
NCAA	North Atlantic Treaty Organization (NATO) Civil Airlift

	Agency
NCAGS	naval cooperation and guidance for shipping
NCAPS	naval coordination and protection of shipping
NCB	national central bureau; naval construction brigade; noncompliant boarding
NCC	National Coordinating Center; naval component commander; Navy component command; Navy component commander; network control center; North American Aerospace Defense Command (NORAD) Command Center
NCCS	Nuclear Command and Control System
NCD	net control device
NCDC	National Climatic Data Center
NCES	Net-Centric Enterprise Services
NCESGR	National Committee of Employer Support for the Guard and Reserve
NCF	naval construction force
NCFSU	naval construction force support unit
NCG	naval construction group
NCHB	Navy cargo-handling battalion
NCIC	National Crime Information Center
NCIJTF-AG	National Cyber Investigative Joint Task Force-Analytical Group (DOD)
NCIS	Naval Criminal Investigative Service
NCISRA	Naval Criminal Investigative Service resident agent
NCISRO	Naval Criminal Investigative Service regional office
NCISRU	Naval Criminal Investigative Service resident unit
NCIX	National Counterintelligence Executive
NCMI	National Center for Medical Intelligence
NCMP	Navy Capabilities and Mobilization Plan
NCO	noncombat operations; noncommissioned officer
NCOB	National Counterintelligence Operations Board
NCOIC	noncommissioned officer in charge
NCOS	naval control of shipping
NCP	National Oil and Hazardous Substances Pollution Contingency Plan
NCPC	National Counterproliferation Center
NCR	National Capital Region (US); national cryptologic representative; National Security Agency/Central Security Service representative; naval construction regiment
NCRCC	National Capital Region Coordination Center; United States Northern Command Rescue Coordination Center
NCRCG	National Cyber Response Coordination Group
NCRDEF	national cryptologic representative defense
NCR-IADS	National Capital Region-Integrated Air Defense System

NCS	National Clandestine Service; National Communications System; naval control of shipping; net control station
NCSC	National Computer Security Center
NCSD	National Cyber Security Division (DHS)
NCSE	national intelligence support team (NIST) communications support element
NCT	network control terminal
NCTAMS	naval computer and telecommunications area master station
NCTC	National Counterterrorism Center; North East Counterdrug Training Center
NCTS	naval computer and telecommunications station
NCWS	naval coastal warfare squadron
NDAA	national defense authorization act
NDAF	Navy, Defense Logistics Agency, Air Force
NDB	nondirectional beacon
NDCS	national drug control strategy
NDDOC	North American Aerospace Defense Command and United States Northern Command Deployment and Distribution Operations Cell
NDHQ	National Defence Headquarters, Canada
NDIC	National Defense Intelligence College; National Drug Intelligence Center
NDL	national desired ground zero list
NDMC	North Atlantic Treaty Organization (NATO) Defense Manpower Committee
NDMS	National Disaster Medical System (DHHS)
NDOC	National Defense Operations Center
NDP	national disclosure policy
NDPB	National Drug Policy Board
NDPC	National Disclosure Policy Committee
NDRC	National Detainee Reporting Center
NDRF	National Defense Reserve Fleet
NDS	national defense strategy
NDSF	National Defense Sealift Fund
NDT	nuclear disablement team
NDU	National Defense University
NEA	Northeast Asia
NEAT	naval embarked advisory team
NEC	National Economic Council
NECC	Navy Expeditionary Combat Command
NEIC	Navy Expeditionary Intelligence Command
NELR	Navy expeditionary logistics regiment
NEMT	National Emergency Management Team
NEO	noncombatant evacuation operation
NEOCC	noncombatant evacuation operation coordination center

NEP	National Exercise Program
NEPA	National Environmental Policy Act
NEREP	Nuclear Execution and Reporting Plan
NES	National Exploitation System
NESDIS	National Environmental Satellite, Data and Information Service (DOC)
NEST	nuclear emergency support team (DOE)
NETS	Nationwide Emergency Telecommunications System
NETT	new equipment training team
NETWARCOM	Naval Network Warfare Command
NEW	net explosive weight
NEWAC	North Atlantic Treaty Organization (NATO) Electronic Warfare Advisory Committee
NEWCS	NATO electronic warfare core staff
NEXCOM	Navy Exchange Command
NFA	no-fire area
NFC	numbered fleet commander
NFD	nodal fault diagnostics
NFELC	Naval Facilities Expeditionary Logistics Center
NFESC	Naval Facilities Engineering Service Center
NFI	national foreign intelligence
NFIB	National Foreign Intelligence Board
NFIP	National Flood Insurance Program (FEMA); National Foreign Intelligence Program
NFLIR	navigation forward-looking infrared
NFLS	naval forward logistic site
NFN	national file number
NFO	naval flight officer
NG	National Guard
NGA	National Geospatial-Intelligence Agency
NGB	National Guard Bureau
NGB-OC	National Guard Bureau-Office of the Chaplain
NGCC	National Guard coordination center
NGCDP	National Guard Counterdrug Program
NGCSP	National Guard Counterdrug Support Program
NGF	naval gun fire
NGFS	naval gunfire support
NGIC	National Ground Intelligence Center
NG JFHQ-State	National Guard joint force headquarters-state
NGLO	naval gunfire liaison officer
NGO	nongovernmental organization
NGP	National Geospatial-Intelligence Agency Program
NGRF	National Guard reaction force
NI	national identification (number); noted item
NIBRS	National Incident-Based Reporting System
NIC	National Intelligence Council; naval intelligence center

NICC	National Intelligence Coordination Center
NICCL	National Incident Communications Conference Line
NICCP	National Interdiction Command and Control Plan
NICI	National Interagency Counternarcotics Institute
NID	naval intelligence database
NIDMS	National Military Command System (NMCS) Information for Decision Makers System
NIDS	National Military Command Center (NMCC) information display system
NIE	national intelligence estimate
NIEX	no-notice interoperability exercise
NIEXPG	No-Notice Interoperability Exercise Planning Group
NIH	National Institutes of Health (DHHS)
NIIB	National Geospatial Intelligence Agency imagery intelligence brief
NIL	National Information Library
NIMCAMP	National Information Management and Communications Master Plan
NIMS	National Incident Management System
NIOC	Navy Information Operations Command
NIP	National Intelligence Program
NIPF	National Intelligence Priority Framework
NIPRNET	Nonsecure Internet Protocol Router Network
NIPS	Naval Intelligence Processing System
NIRT	Nuclear Incident Response Team
NISH	noncombatant evacuation operation (NEO) intelligence support handbook
NISP	national intelligence support plan; Nuclear Weapons Intelligence Support Plan
NIST	National Institute of Standards and Technology
NIT	nuclear incident team
NITES	Navy Integrated Tactical Environmental System
NITF	national imagery transmission format
NIU	North Atlantic Treaty Organization (NATO) interface unit
NIWA	naval information warfare activity
NJOIC	National Joint Operations and Intelligence Center
NJTTF	National Joint Terrorism Task Force
NL	Navy lighterage
NLO	naval liaison officer
.NL.	not less than
NLT	not later than
NLW	nonlethal weapon
NM	network management
nm	nautical mile
NMAWC	Naval Mine and Anti-Submarine Warfare Command
NMB	North Atlantic Treaty Organization (NATO) military

	body
NMC	Navy Munitions Command
NMCB	naval mobile construction battalion
NMCC	National Military Command Center
NMCS	National Military Command System; not mission capable, supply
NMCSO	Navy and Marine Corps spectrum office
NMD	national missile defense
NMEC	National Media Exploitation Center
NMFS	National Marine Fisheries Services
NMIC	National Maritime Intelligence Center
NMIO	National Maritime Intelligence-Integration Office
NMIST	National Military Intelligence Support Team (DIA)
NMO	National Measurement and Signature Intelligence Office
NMOC	network management operations center
NMOSW	Naval METOC Operational Support Web
NMP	national media pool
NMPS	Navy mobilization processing site
NMRC	Naval Medical Research Center
NMS	national military strategy
NMSA	North Atlantic Treaty Organization (NATO) Mutual Support Act
NMSC	Navy and Marine Corps Spectrum Center
NMS-CO	National Military Strategy for Cyberspace Operations
NMS-CWMD	National Military Strategy to Combat Weapons of Mass Destruction
NMSP-WOT	National Military Strategic Plan for the War on Terrorism
NNAG	North Atlantic Treaty Organization (NATO) Naval Armaments Group
NNSA	National Nuclear Security Administration (DOE)
NNWC	Naval Network Warfare Command
NOAA	National Oceanic and Atmospheric Administration
NOACT	Navy overseas air cargo terminal
NOC	National Operations Center (DHS); network operations center
NOCONTRACT	not releasable to contractors or consultants
NODDS	Naval Oceanographic Data Distribution System
NOE	nap-of-the-earth
NOEA	nuclear operations emergency action
NOFORN	not releasable to foreign nationals
NOG	Nuclear Operations Group
NOGAPS	Navy Operational Global Atmospheric Prediction System
NOHD	nominal ocular hazard distance
NOIC	Naval Operational Intelligence Center
NOK	next of kin
NOLSC	Naval Operational Logistics Support Center

NOMS	Nuclear Operations Monitoring System
NOMWC	Navy Oceanographic Mine Warfare Center
NOP	nuclear operations
NOPLAN	no operation plan available or prepared
NORAD	North American Aerospace Defense Command
NORM	normal; not operationally ready, maintenance
NORS	not operationally ready, supply
NOSC	network operations and security center
NOSSA	Navy Ordnance Safety and Security Activity
NOTAM	notice to airmen
NOTMAR	notice to mariners
NP	nonproliferation
NPC	Nonproliferation Center
NPES	Nuclear Planning and Execution System
NPG	nonunit personnel generator
NPOESS	National Polar-orbiting Operational Environmental Satellite System
NPPD	National Protection and Programs Directorate (DHS)
NPS	National Park Service; nonprior service; Nuclear Planning System
NPT	national pipe thread; Treaty on the Nonproliferation of Nuclear Weapons
NPWIC	National Prisoner of War Information Center
NQ	nonquota
NR	North Atlantic Treaty Organization (NATO) restricted; number
NRAT	nuclear/radiological advisory team
NRC	National Response Center (USCG); non-unit-related cargo
NRCHB	Naval Reserve cargo-handling battalion
NRCHF	Naval Reserve cargo handling force
NRCHTB	Naval Reserve cargo handling training battalion
NRF	National Response Framework
NRFI	not ready for issue
NRG	notional requirements generator
NRL	nuclear weapons (NUWEP) reconnaissance list
NRO	National Reconnaissance Office
NROC	Northern Regional Operations Center (CARIBROC-CBRN)
NRP	National Response Plan; non-unit-related personnel
NRPC	Naval Reserve Personnel Center
NRT	near real time
NRTD	near-real-time dissemination
NRZ	non-return-to-zero
NS	nuclear survivability
NSA	national security act; National Security Agency; national security area; national shipping authority; North Atlantic Treaty Organization (NATO) Standardization Agency

NSABB	National Science Advisory Board for Biosecurity (NIH)
NSA/CSS	National Security Agency/Central Security Service
NSARC	National Search and Rescue Committee
NSAT	United States Northern Command situational awareness team
NSAWC	Naval Strike and Air Warfare Center
NSC	National Security Council
NSC/DC	National Security Council/Deputies Committee
NSCID	National Security Council intelligence directive
NSC/IPC	National Security Council/interagency policy committee
NSC/IWG	National Security Council/Interagency Working Group
NSC/PC	National Security Council/Principals Committee
NSC/PCC	National Security Council Policy Coordinating Committee
NSCS	National Security Council System
NSCTI	Naval Special Clearance Team One
NS-CWMD	National Strategy to Combat Weapons of Mass Destruction
NSD	National Security Directive; National Security Division (FBI)
NSDA	non-self deployment aircraft
NSDD	national security decision directive
NSDM	national security decision memorandum
NSDS-E	Navy Satellite Display System-Enhanced
NSE	Navy support element
NSEP	national security emergency preparedness
NS/EP	national security and emergency preparedness
NSF	National Science Foundation; national security forces; National Strike Force (USCG)
NSFS	naval surface fire support
NSG	National System for Geospatial Intelligence; north-seeking gyro
NSGI	National System for Geospatial Intelligence
NSHS	National Strategy for Homeland Security
NSL	no-strike list
NSM	national search and rescue (SAR) manual
NSMS	National Strategy for Maritime Security
NSN	national stock number
NSO	non-Single Integrated Operational Plan (SIOP) option
NSOC	National Security Operations Center; National Signals Intelligence (SIGINT) Operations Center; Navy Satellite Operations Center
NSOOC	North Atlantic Treaty Organization (NATO) Staff Officer Orientation Course
NSP	National Search and Rescue Plan
N-Sp/CC	North American Aerospace Defense Command (NORAD)-US Space Command/Command Center
NSPD	national security Presidential directive
NSPI	National Strategy for Pandemic Influenza
NSRL	national signals intelligence (SIGINT) requirements list

NSS	National Search and Rescue Supplement; national security strategy; national security system; non-self-sustaining
NSSA	National Security Space Architect
NSSE	national special security event
NSST	naval space support team
NST	National Geospatial-Intelligence Agency support team
NSTAC	National Security Telecommunications Advisory Committee
NSTISSC	National Security Telecommunications and Information Systems Security Committee
NSTL	national strategic targets list
NSTS	National Secure Telephone System
NSW	naval special warfare
NSWCDD	Naval Surface Warfare Center Dahlgren Division
NSWCOM	Naval Special Warfare Command
NSWG	naval special warfare group
NSWTF	naval special warfare task force
NSWTG	naval special warfare task group
NSWTU	naval special warfare task unit
NT	nodal terminal
NTA	nontraditional agent
NTACS	Navy tactical air control system
NTAP	National Track Analysis Program
NTB	national target base
NTBC	National Military Joint Intelligence Center Targeting and Battle Damage Assessment Cell
NTC	National Training Center
NTCS-A	Navy Tactical Command System-Afloat
NTDS	naval tactical data system
NTF	nuclear task force
N-TFS	New Tactical Forecast System
NTIA	National Telecommunications and Information Administration
NTIC	Navy Tactical Intelligence Center
NTISS	National Telecommunications and Information Security System
NTISSI	National Telecommunications and Information Security System (NTISS) Instruction
NTISSP	National Telecommunications and Information Security System (NTISS) Policy
NTM	national or multinational technical means of verification; notice to mariners
NTMPDE	National Telecommunications Master Plan for Drug Enforcement
NTMS	national telecommunications management structure
NTPS	near-term pre-positioned ships

NTRP	Navy tactical reference publication
NTS	night targeting system; noncombatant evacuation operation tracking system
NTSB	National Transportation Safety Board
NTSS	National Time-Sensitive System
NTTP	Navy tactics, techniques, and procedures
NTU	new threat upgrade
NUC	non-unit-related cargo; nuclear
NUDET	nuclear detonation
NUFEA	Navy-unique fleet essential aircraft
NUP	non-unit-related personnel
NURP	non-unit-related personnel
NUWEP	policy guidance for the employment of nuclear weapons
NVD	night vision device
NVDT	National Geospatial-Intelligence Agency voluntary deployment team
NVG	night vision goggle
NVS	night vision system
NW	network warfare; not waiverable
NWARS	National Wargaming System
NWB	normal wideband
NWBLTU	normal wideband line termination unit
NWDC	Navy Warfare Development Command
NWFP	Northwest Frontier Province (Pakistan)
NWP	Navy warfare publication; numerical weather prediction
NWREP	nuclear weapons report
NWS	National Weather Service
NWT	normal wideband terminal

O

1MC	general announcing system
1NCD	1st Naval Construction Division
O	contour pattern
O&I	operations and intelligence
O&M	operation and maintenance
OA	objective area; operating assembly; operational area; Operations Aerology shipboard METOC division
OADR	originating agency's determination required
OAE	operational area evaluation
OAF	Operation ALLIED FORCE
OAFME	Office of the Armed Forces Medical Examiner
OAG	operations advisory group
OAI	oceanographic area of interest
OAJCG	Operation Alliance joint control group
OAM	Office of Air and Marine (DHS)
OAP	offset aimpoint
OAR	Chairman of the Joint Chiefs of Staff operation plans assessment report
OAS	offensive air support; Organization of American States
OASD	Office of the Assistant Secretary of Defense
OASD(NII/CIO)	Office of the Assistant Secretary of Defense (Networks and Information Integration/Chief Information Officer)
OASD(PA)	Office of the Assistant Secretary of Defense (Public Affairs)
OASD(RA)	Office of the Assistant Secretary of Defense (Reserve Affairs)
OAU	Organization of African Unity
O/B	outboard
OB	operating base; order of battle
OBA	Office of Biotechnology Activities (NIH); oxygen breathing apparatus
OBFS	offshore bulk fuel system
OBST	obstacle
OBSTINT	obstacle intelligence
OC	oleoresin capsicum; operations center
OCA	offensive counterair; operational control authority
OCBD	Office of Capacity Building and Development (USDA)
OCC	Operations Computer Center (USCG)
OCCA	ocean cargo clearance authority
OCD	orderwire clock distributor
OCDETF	Organized Crime and Drug Enforcement Task Force
OCE	officer conducting the exercise
OCEANCON	control of oceanographic information
OCHA	Office for the Coordination of Humanitarian Affairs
OCIE	organizational clothing and individual equipment
OCJCS	Office of the Chairman of the Joint Chiefs of Staff

OCJCS-PA	Office of the Chairman of the Joint Chiefs of Staff-Public Affairs
OCMI	officer in charge, Marine inspection
OCO	offensive cyberspace operations; offload control officer
OCONUS	outside the continental United States
OCOP	outline contingency operation plan
OCP	operational capability package; operational configuration processing
OCR	Office of Collateral Responsibility
OCS	operational contract support
OCSIC	operational contract support integration cell
OCU	orderwire control unit (Types I, II, and III)
OCU-1	orderwire control unit-1
OD	operational detachment; other detainee
ODA	operational detachment-Alpha
ODATE	organization date
ODB	operational detachment-Bravo
ODC	Office of Defense Cooperation
ODCSLOG	Office of the Deputy Chief of Staff for Logistics (Army)
ODCSOPS	Office of the Deputy Chief of Staff for Operations and Plans (Army)
ODCSPER	Office of the Deputy Chief of Staff for Personnel (Army)
ODIN	Operational Digital Network
ODJS	Office of the Director, Joint Staff
ODNI	Office of the Director of National Intelligence
ODR	Office of Defense representative
ODZ	outer defense zone
OE	operational environment
OE&AS	organization for embarkation and assignment to shipping
OEBGD	Overseas Environmental Baseline Guidance Document
OEC	Office of Emergency Communications (DHS)
OECD	Organisation for Economic Co-operation and Development
OEF	Operation ENDURING FREEDOM
OEG	operational experts group; operational exposure guidance operations security executive group
OEH	occupational and environmental health
OEM	original equipment manufacturer
OER	officer evaluation report; operational electronic intelligence (ELINT) requirements
OES	office of emergency services
OET	Office of Emergency Transportation (DOT)
OF	officer (NATO)
OFAC	Office of Foreign Assets Control (TREAS)
OFCO	offensive counterintelligence operation
OFDA	Office of United States Foreign Disaster Assistance (USAID)
OFHIS	operational fleet hospital information system

OFOESA	Office of Field Operational and External Support Activities
OFSC	Organizational and Force Structure Construct
OGS	overseas ground station
OH	overhead
OHDACA	Overseas Humanitarian, Disaster, and Civic Aid (DSCA)
OHDM	Office of Humanitarian Assistance, Disaster Relief, and Mine Action
OI	Office of Intelligence (USCS); operating instruction; operational interest
OIA	Office of International Affairs (TREAS)
OI&A	Office of Intelligence and Analysis (DHS)
OIC	officer in charge
OICC	officer in charge of construction; operational intelligence coordination center
OID	operation order (OPORD) identification
OIF	Operation IRAQI FREEDOM
OIIL	Office of Intelligence and Investigative Liaison (CBP)
OIR	operational intelligence requirements; other intelligence requirements
OJT	on-the-job training
OL	operating location
OLD	on-line tests and diagnostics
OLS	operational linescan system; optical landing system
OM	contour multiunit
OMA	Office of Military Affairs (CIA and USAID)
OMB	Office of Management and Budget; operations management branch
OMC	Office of Military Cooperation; optical memory card
OMF	officer master file
OMS	Office of Mission Support
OMSPH	Office of Medicine, Science, and Public Health (DHHS)
OMT	operations management team; orthogonal mode transducer
OMT/OMTP	operational maintenance test(ing)/test plan
ONDCP	Office of National Drug Control Policy
ONE	Operation NOBLE EAGLE
ONI	Office of Naval Intelligence
OOB	order of battle
OOD	officer of the deck
OODA	observe, orient, decide, act
OOS	out of service
OP	observation post; operational publication (USN); ordnance publication
OPARS	Optimum Path Aircraft Routing System
OPBAT	Operation Bahamas, Turks, and Caicos
OPC	Ocean Prediction Center (DOC)
OPCEN	operations center (USCG)

OPCOM	operational command (NATO)
OPCON	operational control
OPDAT	Office of Overseas Prosecutorial Development, Assistance, and Training (DOJ)
OPDEC	operational deception
OPDS	offshore petroleum discharge system (USN)
OPDS-Future	offshore petroleum discharge system-future (USN)
OPDS-L	offshore petroleum discharge system-legacy (USN)
OPE	operational preparation of the environment
OPELINT	operational electronic intelligence
OPEO	Office of Preparedness and Emergency Operations (DHHS)
OPFOR	opposing force; opposition force
OPG	operations planning group
OPGEN	operation general matter
OPIR	overhead persistent infrared
OPLAN	operation plan
OPLAW	operational law
OPM	Office of Personnel Management; operations per minute
OPMG	Office of the Provost Marshal General
OPNAVINST	Chief of Naval Operations instruction
OPORD	operation order
OPP	orderwire patch panel
OPR	office of primary responsibility
OPREP	operational report
OPROJ	operational project
OPS	operational project stock; operations; operations center
OPSCOM	Operations Committee
OPSDEPS	Service Operations Deputies
OPSEC	operations security
OPSTK	operational stock
OPSUM	operation summary
OPT	operational planning team
OPTAR	operating target
OPTASK	operation task
OPTASKLINK	operations task link
OPTEMPO	operating tempo
OPTINT	optical intelligence
OPZONE	operation zone
OR	operational readiness; other rank(s) (NATO)
ORBAT	order of battle
ORCON	originator controlled
ORDREF	order reference
ORDTYP	order type
ORG	origin (GEOLOC)
ORIG	origin
ORM	operational risk management

ORP	ocean reception point
ORS	operationally responsive space
ORSA	operations research and systems analysis
OS	operating stocks; operating system
OSA	operational support airlift
OSAT	out-of-service analog test
OSC	offensive space control; on-scene commander; on-site commander; Open Source Center (CIA); operational support command; operations support center
OSCE	Organization for Security and Cooperation in Europe
OSD	Office of the Secretary of Defense
OSD/DMDPO	Office of the Secretary of Defense, Defense Military Deception Program Office
OSE	on scene endurance; operations support element
OSEI	operational significant event imagery
OSG	operational support group
OSI	open system interconnection; operational subsystem interface
OSIA	on-site inspection activity
OSINT	open-source information; open-source intelligence
OSIS	open-source information system
OSM	Office of Spectrum Management (NTIA)
OSO	operational support office
OSOCC	on-site operations coordination center
OSP	operations support package
OSPG	overseas security policy group
OSR	on-station report
OSRI	originating station routing indicator
OSV	ocean station vessel
OT	operational test
OT&E	operational test and evaluation
OTA	Office of Technical Assistance (TREAS)
OTC	officer in tactical command; over the counter
OTG	operational target graphic
OTH	other; over the horizon
OTH-B	over-the-horizon backscatter (radar)
OTHT	over-the-horizon targeting
OTI	Office of Transition Initiatives (USAID)
OTS	Officer Training School; one-time source
OUB	offshore petroleum discharge system utility boat
OUSD	Office of the Under Secretary of Defense
OUSD(AT&L)	Office of the Under Secretary of Defense (Acquisition, Technology, and Logistics)
OUSD(C)	Office of the Under Secretary of Defense (Comptroller)
OUSD(C/CFO)	Office of the Under Secretary of Defense (Comptroller/Chief Financial Officer)

OUSD(I)	Office of the Under Secretary of Defense (Intelligence)
OUSD(P)	Office of the Under Secretary of Defense for Policy
OUT	outsize cargo
OVE	on-vehicle equipment
OVER	oversize cargo
OVM	Operation VIGILANT MARINER
OW	orderwire
OWS	operational weather squadron

P

P	parallel pattern; priority; publication
PA	parent relay; physician assistant; primary agency; probability of arrival; public affairs
PAA	position area of artillery
PABX	private automatic branch exchange (telephone)
PACAF	Pacific Air Forces
PAD	patient administration director; positional adjustment; precision aircraft direction
PADD	person authorized to direct disposition of human remains
PADRU	Pan American Disaster Response Unit
PADS	position azimuth determining system
PAG	public affairs guidance
PAL	personnel allowance list; program assembler language
PALCON	pallet container
PALS	precision approach landing system
PAM	preventive and aerospace medicine; pulse amplitude modulation
PaM	passage material
PANS	procedures for air navigation services
PAO	public affairs office; public affairs officer
PAR	performance assessment report; population at risk; precision approach radar
PARC	principal assistant for contracting
PARKHILL	high frequency cryptological device
PARPRO	peacetime application of reconnaissance programs
PARS	Personnel and Accountability System
PAS	personnel accounting symbol
PAT	public affairs team
PAV	policy assessment visit
PAWS	phased array warning system
PAX	passengers; public affairs plans
PB	particle beam; patrol boat; peace building; President's budget
PB4T	planning board for training
PBA	performance-based agreement; production base analysis
PBCR	portable bar code recorder
PBD	program budget decision
PBIED	person-borne improvised explosive device
PBOS	Planning Board for Ocean Shipping
PC	patrol craft; personal computer; pilot in command; preliminary coordination; Principals Committee
Pc	cumulative probability of detection
P,C,&H	packing, crating, and handling
PC&S	post, camp, and station

PCA	Posse Comitatus Act
PCASS	Preliminary Credibility Assessment Screening System
PCC	policy coordination committee; primary control center
PCF	personnel control facility
PCL	positive control launch
PC-LITE	processor, laptop imagery transmission equipment
PCM	pulse code modulation
PCO	primary control officer; procuring contracting officer
PCRTS	primary casualty receiving and treatment ship
PCS	permanent change of station; personal communications system; primary control ship; processing subsystem; processor controlled strapping
PCT	personnel control team
PCTC	pure car and truck carrier
PCZ	physical control zone
PD	position description; Presidential directive; priority designator; probability of damage; probability of detection; procedures description; program definition; program directive; program director; public diplomacy
Pd	drift compensated parallelogram pattern
PDA	preliminary damage assessment
PDAI	primary development/test aircraft inventory
PDC	Pacific Disaster Center
PDD	Presidential decision directive
PDDA	power driven decontamination apparatus
PDDG	program directive development group
PDG	positional data graphic
PDM	program decision memorandum
PDOP	position dilution of precision
PDS	position determining system; primary distribution site; protected distribution system
PDSC	public diplomacy and strategic communication
PDSS	predeployment site survey
PDT	partnership development team
PDUSD(P&R)	Principal Deputy Under Secretary of Defense (Personnel and Readiness)
PE	peace enforcement; peacetime establishment; personal effects; preparation of the environment; program element
PEAD	Presidential emergency action document
PEC	program element code
PECK	patient evacuation contingency kit
PECP	precision engagement collaboration process
PED	processing, exploitation, and dissemination
PEDB	planning and execution database

PEGEO	personnel geographic location
PEI	principal end item
PEIO	personnel effects inventory officer
PEM	program element monitor
PEO	peace enforcement operations; program executive office; program executive officer
PEP	personnel exchange program
PER	personnel
PERE	person eligible to receive effects
PERID	period
PERMA	planning, embarkation, rehearsal, movement, and action
PERMREP	permanent representative (NATO)
PERSCO	personnel support for contingency operations
PERSCOM	personnel command (Army)
PERSINS	personnel information system
PES	preparedness evaluation system
PFA	primary federal agency
PFD	personal flotation device
PFDB	planning factors database
PFIAB	President's Foreign Intelligence Advisory Board
PFID	positive friendly identification
PFO	principal federal official
PfP	Partnership for Peace (NATO)
PGI	procedures, guidance, and information
PGM	precision-guided munition
pH	potential of hydrogen
PHEO	public health emergency officer
PHIBCB	amphibious construction battalion
PHIBGRU	amphibious group
PHIBOP	amphibious operation
PHIBRON	amphibious squadron
PHIT	port handling/in-land transportation
PHO	posthostilities operations
PHS	Public Health Service
PI	pandemic influenza; point of impact ; procedural item; purposeful interference
P_i	probability of incapacitation
PI&ID	pandemic influenza and infectious disease
PIAB	President's Intelligence Advisory Board
PIC	parent indicator code; payment in cash; person identification code; pilot in command; press information center (NATO)
PID	plan identification number; positive identification
PIDD	planned inactivation or discontinued date
PIF	problem identification flag
PII	pre-incident indicators
PIM	pretrained individual manpower

PIN	personnel increment number
PINS	precise integrated navigation system
PIO	press information officer; public information officer
PIPS	plans integration partitioning system
PIR	priority intelligence requirement
PIREP	pilot report
PIRT	purposeful interference response team
PISA	post isolation support activity
PIW	person in water
PJ	pararescue jumper
PK	peacekeeping; probability of kill
PKB	purple kill box
PKG-POL	packaged petroleum, oils, and lubricants
PKI	public key infrastructure
PKO	peacekeeping operations
PKP	purple k powder
PKSOI	Peacekeeping and Stability Operations Institute
PL	phase line; public law
PLA	plain language address; post-launch abort
PLAD	plain language address directory
PLANORD	planning order
PLAT	pilot's landing aid television
PLB	personal locator beacon
PLC	power line conditioner
PLGR	precise lightweight global positioning system (GPS) receiver
PLL	phase locked loop
PLL/ASL	prescribed load list/authorized stock level
PLRS	position location reporting system
PLS	palletized load system; pillars of logistic support; precision location system
PLT	platoon; program library tape
PM	Bureau of Political-Military Affairs (DOS); parallel track multiunit; passage material; patient movement; peacemaking; political-military affairs; preventive medicine; program management; program manager; provost marshal
PMA	political/military assessment
PMAA	Production Management Alternative Architecture
PMAI	primary mission aircraft inventory
P/M/C	passengers/mail/cargo
PMC	parallel multiunit circle; private military company
PMCF	post maintenance check flight
PMCT	port movement control team
PMD	program management directive
PME	professional military education

PMEL	precision measurement equipment laboratory
PMESII	political, military, economic, social, information, and infrastructure
PMGM	program manager's guidance memorandum
PMI	patient movement item; prevention of mutual interference
PMITS	Patient Movement Item Tracking System
PMN	parallel track multiunit non-return
PMO	production management office(r); program management office
PMOS	primary military occupational specialty
PMR	parallel track multiunit return; patient movement request; patient movement requirement
PMRC	patient movement requirements center
PMS	portable meteorological subsystem
PN	partner nation; pseudonoise
PNA	postal net alert
PNID	precedence network in dialing
PNT	positioning, navigation, and timing
PNVS	pilot night vision system
P/O	part of
PO	peace operations; petty officer
POA	plan of action
POAI	primary other aircraft inventory
POB	persons on board
POC	point of contact
POCD	port operations cargo detachment
POD	plan of the day; port of debarkation; probability of detection
POE	port of embarkation; port of entry
POES	polar operational environment satellite
POF	priority of fires
POG	port operations group
POI	program of instruction
POL	petroleum, oils, and lubricants
POLAD	policy advisor; political advisor
POLCAP	bulk petroleum capabilities report
POLMIL	political-military
POM	program objective memorandum
POMCUS	pre-positioning of materiel configured to unit sets
POMSO	Plans, Operations, and Military Support Office(r) (NG)
POP	performance oriented packaging
POPS	port operational performance simulator
POR	proposed operational requirement
PORTS	portable remote telecommunications system
PORTSIM	port simulation model

POS	point of sale; probability of success
POSF	port of support file
POSSUB	possible submarine
POSTMOB	post mobilization
POTUS	President of the United States
POV	privately owned vehicle
POW	prisoner of war
POW/MIA	prisoner of war/missing in action
P/P	patch panel
p-p	peak-to-peak
PPA	personnel information system (PERSINS) personnel activity
PPAG	proposed public affairs guidance
PPBE	Planning, Programming, Budgeting, and Execution
PPD	Presidential policy directive; program planning document
PPDB	point positioning database
PPE	personal protective equipment
PPF	personnel processing file
Pplan	programming plan
PPLI	precise participant location and identification
ppm	parts per million
PPP	power projection platform; primary patch panel; priority placement program
PPR	prior permission required
PPS	precise positioning service
PPTO	petroleum pipeline and terminal operating
PR	personnel recovery; Phoenix Raven; primary zone; production requirement; program review
PRA	patient reception area; primary review authority
PRANG	Puerto Rican Air National Guard
PRBS	pseudorandom binary sequence
PRC	populace and resources control; Presidential Reserve Call-up
PRCC	personnel recovery coordination cell; personnel recovery coordination center
PRCS	personnel recovery coordination section
PRD	personnel readiness division; Presidential review directive
PRDO	personnel recovery duty officer
PREMOB	pre-mobilization
PREPO	pre-positioned force, equipment, or supplies; pre-positioning
PREREP	pre-arrival report
PRF	personnel resources file; pulse repetition frequency
PRG	personnel recovery guidance; program review group
PRI	movement priority for forces having the same latest arrival date (LAD); priority; progressive routing indicator

PRIFLY	primary flight control
Prime BEEF	prime base engineer emergency force
PRISM	Planning Tool for Resource, Integration, Synchronization, and Management
PRM	Bureau of Population, Refugees, and Migration (DOS); Presidential review memorandum
PRMFL	perm file
PRMS	personnel recovery mission software
PRN	pseudorandom noise
PRO	personnel recovery officer
PROBSUB	probable submarine
PROC	processor; Puerto Rican Operations Center
PROFIS	professional officer filler information system
PROM	programmable read-only memory
PROPIN	caution - proprietary information involved
PROVORG	providing organization
proword	procedure word
PRP	personnel reliability program; Personnel Retrieval and Processing
PRRIS	Puerto Rican radar integration system
PRRP	personnel recovery reference product
PRSL	primary zone/switch location
PRT	patient reception team; provincial reconstruction team
PRTF	personnel recovery task force
PRU	pararescue unit; primary reporting unit
PS	parallel track single-unit; port security; processing subsystem
PSA	port support activity; principal staff assistant
PSB	poststrike base
PSC	port security company; principal subordinate command; private security contractor
PSD	planning systems division; port security detachment
PSE	peculiar support equipment
PS/HD	port security/harbor defense
PSHDGRU	port security and harbor defense group
PSI	personnel security investigation; Proliferation Security Initiative
psi	pounds per square inch
PSK	phase-shift keying
PSL	parallel track single-unit long-range aid to navigation (LORAN)
PSMS	Personnel Status Monitoring System
PSN	packet switching node; public switch network
PSO	peace support operations (NATO); post security officer
PSP	perforated steel planking; portable sensor platform; power support platform

PSS	parallel single-unit spiral; personnel services support
PSS-SOF	Precision Strike Suite-Special Operations Forces
P-STATIC	precipitation static
PSTN	public switched telephone network
PSU	port security unit
PSV	pseudosynthetic video
PTA	position, time, altitude
PTAI	primary training aircraft inventory
PTC	peace through confrontation; primary traffic channel
PTDO	prepare to deploy order
PTM	personnel transport module
PTT	postal telephone and telegraph; public telephone and telegraph; push-to-talk
PTTI	precise time and time interval
pub	publication
PUK	packup kit
PUL	parent unit level
PV	prime vendor
PVNTMED	preventive medicine
PVT	positioning, velocity, and timing
PW	prisoner of war
pW	picowatt
PWB	printed wiring board (assembly)
PWD	programmed warhead detonation
PWF	personnel working file
PWG	protection working group
PWIS	Prisoner of War Information System
PWR	pre-positioned wartime reserves
PWRMR	pre-positioned war materiel requirement
PWRMS	pre-positioned war reserve materiel stock
PWRR	pre-positioned war reserve requirements
PWRS	petroleum war reserve stocks; pre-positioned war reserve stock
PWS	performance work statement
PWT	precision weapons team
PZ	pickup zone

Q

QA	quality assurance
QAM	quadrature amplitude modulation
QAR	quality assurance representative
QAT	quality assurance team
QC	quality control
QD	quality distance
QDR	quadrennial defense review; quality deficiency report
QEEM	quick erect expandable mast
QHDA	qualified hazardous duty area
QIP	quick impact project
QM	quartermaster
QPSK	quadrature phase shift keying
QRA	quick reaction antenna
QRCT	quick reaction communications terminal
QRE	quick reaction element
QRF	quick reaction force; quick response force
QRG	quick response graphic
QRP	quick response posture
QRS	quick reaction strike
QRSA	quick reaction satellite antenna
QRT	quick reaction team
QS	quality surveillance
QSR	quality surveillance representative
QSTAG	quadripartite standardization agreement
QTY	quantity
QUADCON	quadruple container

Intentionally Blank

R

R	routine
R&D	research and development
R&R	rest and recuperation
R&S	reconnaissance and surveillance; reconstruction and stabilization
R2P2	rapid response planning process
RA	response action; risk analysis; risk assessment
RAA	redeployment assembly area
RABFAC	radar beacon forward air controller
RAC	responsible analytic center
RAC-OT	readiness assessment system - output tool
RAD	routine aerial distribution
RADAY	radio day
RADBN	radio battalion
RADC	regional air defense commander
RADCON	radiological control team
RADF	radarfind
RADHAZ	electromagnetic radiation hazards
RADS	rapid area distribution support (USAF)
RAE	right of assistance entry
RAF	Royal Air Force (UK)
R-AFF	regimental affiliation
RAM	raised angle marker; random access memory; random antiterrorism measure
RAMCC	regional air movement control center
RAOB	rawindsonde observation
RAOC	regional air operations center
RAP	Radiological Assistance Program (DOE); rear area protection; Remedial Action Projects Program (JCS)
RAS	replenishment at sea
RAS-OT	readiness assessment system-output tool
RAST	recovery assistance, securing, and traversing systems
RASU	random access storage unit
RATE	refine, adapt, terminate, execute
RATT	radio teletype
RB	short-range coastal or river boat
RBA	reimbursable budget authority
RBC	red blood cell
RBE	remain-behind equipment
RBECS	Revised Battlefield Electronic Communications, Electronics, Intelligence, and Operations (CEIO) System
RBI	RED/BLACK isolator
RB std	rubidium standard

RC	receive clock; regional coordinator; Reserve Component; resident coordinator (UN); river current
RCA	riot control agent
RCAT	regional counterdrug analysis team
RCC	regional contracting center; relocation coordination center; rescue coordination center
RCCPDS	Reserve Component common personnel data system
RCD	regional collection detachment
RCEM	regional contingency engineering management
RCHB	reserve cargo handling battalion
RCIED	radio-controlled improvised explosive device
RCM	Rules for Courts-Martial
RCMP	Royal Canadian Mounted Police
RC NORTH	Regional Command North (NATO)
RCO	regional contracting office
RCP	resynchronization control panel
RCS	radar cross section
RC SOUTH	Regional Command South (NATO)
RCSP	remote call service position
RCT	regimental combat team; rescue coordination team (Navy)
RCTA	Regional Counterdrug Training Academy
RCU	rate changes unit; remote control unit
RCVR	receiver
RD	receive data; ringdown
RDA	research, development, and acquisition
RDCFP	Regional Defense Counterterrorism Fellowship Program
RDCTFP	Regional Defense Combating Terrorism Fellowship Program
RDD	radiological dispersal device; required delivery date
RDECOM	US Army Research, Development, and Engineering Command
RDF	radio direction finder; rapid deployment force
RDO	request for deployment order
RDT&E	research, development, test and evaluation
REACT	rapid execution and combat targeting
REAC/TS	radiation emergency assistance center/training site (DOE)
READY	resource augmentation duty program
RECA	Residual Capability Assessment
RECAS	residual capability assessment system
RECAT	residual capability assessment team
RECCE	reconnaissance
RECMOB	reconstitution-mobilization
RECON	reconnaissance
RED	radiological exposure device
RED HORSE	rapid engineer deployable heavy operational repair squadron engineer

REF	Rapid Equipping Force (Army); reference(s)
REGT	regiment
REL	relative
RELCAN	releasable to Canada
REMT	regional emergency management team
REMUS	remote environmental monitoring unit system
REPOL	bulk petroleum contingency report; petroleum damage and deficiency report; reporting emergency petroleum, oils, and lubricants
REPSHIP	report of shipment
REPUNIT	reporting unit
REQCONF	request confirmation
REQSTATASK	air mission request status tasking
RES	radiation exposure status
RESA	research, evaluation, and system analysis
RESCAP	rescue combat air patrol
RESCORT	rescue escort
RESPROD	responsible production
RET	retired
RF	radio frequency; reserve force
RFA	radio frequency authorization; request for assistance; restrictive fire area
RFC	request for capabilities; response force commander; revision final coordination
RF CM	radio frequency countermeasures
RFD	revision first draft
RF/EMPINT	radio frequency/electromagnetic pulse intelligence
RFF	request for feedback; request for forces
RFI	radio frequency interference; ready for issue; request for information
RFID	radio frequency identification
RFL	restrictive fire line
RFP	request for proposal
RFS	request for service; request for support
RFW	request for waiver
RG	reconstitution group
RGR	Rangers
RGS	remote geospatial intelligence services
RH	reentry home
Rh	Rhesus
RHIB	rigid hull inflatable boat
RI	Refugees International; routing indicator
RIB	rubberized inflatable boat
RIC	routing indicator code
RICO	regional interface control officer
RIG	recognition identification group

RIK	replacement in kind
RIMS	registrant information management system
RIP	register of intelligence publications
RIS	reconnaissance information system
RISOP	red integrated strategic offensive plan
RISTA	reconnaissance, intelligence, surveillance, and target acquisition
RIT	remote imagery transceiver
RIVRON	riverine squadron
RJTD	reconstitution joint table of distribution
RLD	ready-to-load date
RLE	rail liaison element
RLG	ring laser gyro
RLGM	remote loop group multiplexer
RLGM/CD	remote loop group multiplexer/cable driver
RLP	remote line printer
RM	ramp module; recovery mechanism; resource management; risk management
RMC	remote multiplexer combiner; rescue mission commander; Resource Management Committee (CSIF); returned to military control
RMKS	remarks
RMO	regional Marine officer
RMP	religious ministry professional
RMS	requirements management system; root-mean-square
RMT	response management team
RMU	receiver matrix unit
RNAV	area navigation
RNP	remote network processor
R/O	receive only
Ro	search radius rounded to next highest whole number
ROC	regional operations center; rehearsal of concept; required operational capability
ROCU	remote orderwire control unit
ROE	rules of engagement
ROEX	rules of engagement exercise
ROG	railhead operations group
ROICC	resident officer in charge of construction
ROK	Republic of Korea
ROM	read-only memory; restriction of movement; rough order of magnitude
ROMO	range of military operations
RON	remain overnight
RO/RO	roll-on/roll-off
ROS	reduced operating status
ROTC	Reserve Officer Training Corps

ROTHR	relocatable over-the-horizon backscatter radar (USN)
ROWPU	reverse osmosis water purification unit
ROZ	restricted operations zone
RP	reconstitution priority; release point (road); religious program specialist; retained personnel
RPG	rocket propelled grenade
RPM	revolutions per minute
RPO	rendezvous and proximity operations
RPOE	rapid port opening element
RPPO	Requirements, Plans, and Policy Office
RPT	report
RPTOR	reporting organization
RPV	remotely piloted vehicle
RQMT	requirement
RQT	rapid query tool
RR	reattack recommendation
RRC	regional reporting center
RRCC	regional response coordination center
RRDF	roll-on/roll-off discharge facility
RRF	rapid reaction force; rapid response force; Ready Reserve Fleet; Ready Reserve Force
RRPP	rapid response planning process
RS	rate synthesizer; religious support; requirement submission
RSA	retrograde storage area
RSC	red station clock; regional service center; rescue sub-center
RSD	reporting of supply discrepancy
RSE	retrograde support element
RSG	reference signal generator
RSI	rationalization, standardization, and interoperability
RSL	received signal level
RSN	role specialist nation
RSO	reception, staging, and onward movement; regional security officer; remote split operations
RSOC	regional signals intelligence (SIGINT) operations center
RSOI	reception, staging, onward movement, and integration
RSP	recognized surface picture; Red Switch Project (DOD); religious support policy
RSPA	Research and Special Programs Administration
RSS	radio subsystem; really simple syndication; remote sensors subsystem; root-sum-squared
RSSC	regional satellite communications support center; regional satellite support cell; regional signals intelligence (SIGINT) support center (NSA); regional space support center
RSSC-LO	regional satellite communications support center liaison officer; regional space support center liaison officer

RST	religious support team
RSTA	reconnaissance, surveillance, and target acquisition
RSTV	real-time synthetic video
RSU	rapid support unit; rear support unit; remote switching unit
R/T	receiver/transmitter
RT	recovery team; remote terminal; rough terrain
RTA	residual threat assessment
RTB	return to base
RTCC	rough terrain container crane
RTCH	rough terrain container handler
RTD	returned to duty
RTF	regional task force; return to force
RTFL	rough terrain forklift
RTG	radar target graphic
RTL	restricted target list
RTLP	receiver test level point
RTM	real-time mode
RTS	remote transfer switch
RTTY	radio teletype
RU	release unit; rescue unit
RUF	rules for the use of force
RUIC	Reserve unit identification number
RUSCOM	rapid ultrahigh frequency (UHF) satellite communications
RV	long-range seagoing rescue vessel; rekeying variable; rendezvous
RVR	runway visibility recorder
RVT	remote video terminal
RW	rotary-wing
RWCM	regional wartime construction manager
RWR	radar warning receiver
RWS	rawinsonde subsystem
RX	receive; receiver
RZ	return-to-zero

S

618 AOC (TACC)	618 Air Operations Center (Tanker Airlift Control Center)
S&F	store-and-forward
S&R	search and recovery
S&T	science and technology; scientific and technical
S&TI	scientific and technical intelligence
S-1	battalion or brigade manpower and personnel staff officer (Marine Corps battalion or regiment)
S-2	battalion or brigade intelligence staff officer (Army; Marine Corps battalion or regiment)
S-3	battalion or brigade operations staff officer (Army; Marine Corps battalion or regiment)
S-4	battalion or brigade logistics staff officer (Army; Marine Corps battalion or regiment)
SA	security assistance; selective availability (GPS); senior adviser; situational awareness; staging area; stand-alone switch
SAA	senior airfield authority
SAAFR	standard use Army aircraft flight route
SAAM	special assignment airlift mission
SAB	scientific advisory board (USAF)
SABER	situational awareness beacon with reply
SAC	special actions cell; special agent in charge; supporting arms coordinator
SACC	supporting arms coordination center (USMC)
SACEUR	Supreme Allied Commander, Europe (NATO)
SACLANT	Supreme Allied Command, Atlantic
SACS	secure telephone unit (STU) access control system
SACT	Supreme Allied Commander Transformation
SADC	sector air defense commander
SADL	situation awareness data link
SADO	senior air defense officer
SAF	Secretary of the Air Force
SAFE	secure analyst file environment; selected area for evasion; sexual assault forensic examination
SAFE-CP	selected area for evasion-contact point
SAFER	evasion and recovery selected area for evasion (SAFE) area activation request
SAFWIN	secure Air Force weather information network
SAG	surface action group
SAI	sea-to-air interface; single agency item
SAL	small arms locker
SAL-GP	semiactive laser-guided projectile (USN)
SALM	single-anchor leg mooring
SALT	supporting arms liaison team

SALTS	streamlined automated logistics transfer system; streamlined automated logistics transmission system
SALUTE	size, activity, location, unit, time, and equipment
SAM	special airlift mission; surface-to-air missile
SAMM	security assistance management manual
SAMS	School of Advanced Military Studies
SAO	security assistance office; security assistance officer; selected attack option
SAOC	sector air operations center
SAP	special access program
SAPI	special access program for intelligence
SAPO	subarea petroleum office
SAPR	sexual assault prevention and response
SAR	satellite access request; search and rescue; site access request; special access requirement; suspicious activity report; synthetic aperture radar
SARC	sexual assault response coordinator; surveillance and reconnaissance center
SARDOT	search and rescue point
SARIR	search and rescue incident report
SARMIS	search and rescue management information system
SARNEG	search and rescue numerical encryption group
SAROPS	Search and Rescue Optimal Planning System
SARREQ	search and rescue request
SARSAT	search and rescue satellite-aided tracking
SARSIT	search and rescue situation summary report
SARTEL	search and rescue (SAR) telephone (private hotline)
SARTF	search and rescue task force
SAS	sealed authenticator system; special ammunition storage
SASP	special ammunition supply point
SASS	supporting arms special staff
SASSY	supported activities supply systems
SAT	satellite
SATCOM	satellite communications
SAW	surface acoustic wave
SB	standby base
SBCT	Stryker brigade combat team
SBL	space-based laser
SBPO	Service blood program officer
SBRPT	subordinate reporting organization
SBS	senior battle staff; support battle staff
SBSS	science-based stockpile stewardship
SBSO	sustainment brigade special operations
SBU	sensitive but unclassified; special boat unit
SC	sea current; search and rescue coordinator; security cooperation; station clock; strategic communication

SCA	sociocultural analysis; space coordinating authority; support to civil administration
SCAR	strike coordination and reconnaissance
SCAS	stability control augment system
SCATANA	security control of air traffic and navigation aids
SC ATLANTIC	Strategic Command, Atlantic (NATO)
SCATMINE	scatterable mine
SCATMINEWARN	scatterable minefield warning
SCC	security classification code; service cryptologic Component; shipping coordination center; Standards Coordinating Committee
SCC-WMD	United States Strategic Command Center for Combating Weapons of Mass Destruction
SCDL	surveillance control data link
SCE	Service cryptologic element
SC EUROPE	Strategic Command, Europe (NATO)
SCF(UK)	Save the Children Fund (United Kingdom)
SCF(US)	Save the Children Federation (United States)
SCG	Security Cooperation Guidance; switching controller group
SCHBT	shape, clear, hold, build, and transition
SCI	security and counterintelligence interviews; sensitive compartmented information
SCIF	sensitive compartmented information facility
SCL	standard conventional load
SCM	security countermeasure; Service container manager
SCMP	strategic command, control, and communications (C3) master plan
SCNE	self-contained navigation equipment
SCO	secondary control officer; security cooperation organization; senior contracting official; state coordinating officer
SCOC	systems control and operations concept
SCONUM	ship control number
SCP	secure conferencing project; security cooperation plan; service control point; system change proposal
SCPT	strategic connectivity performance test
SCRB	software configuration review board
S/CRS	Office of the Coordinator for Reconstruction and Stabilization (DOS)
SCT	shipping coordination team; single channel transponder
S/CT	Office of the Coordinator for Counterterrorism (DOS)
SCTIS	single channel transponder injection system
SCTS	single channel transponder system
SCT-UR	single channel transponder ultrahigh frequency (UHF) receiver
SCUD	surface-to-surface missile system

SD	strategy division
SDA	senior development advisor; Seventh-Day Adventist (ADRA)
SDB	Satellite Communications Database; small diameter bomb
SDDC	Military Surface Deployment and Distribution Command
SDDCTEA	Surface Deployment and Distribution Command Transportation Engineering Agency
SDF	self defense force
SDIO	Strategic Defense Initiative Organization
SDLS	satellite data link standards
SDMX	space division matrix
SDN	system development notification
SDNRIU	secure digital net radio interface unit
SDO	senior defense official; ship's debarkation officer
SDO/DATT	senior defense official/defense attaché
SDP	strategic distribution platform
SDR	system design review
SDSG	space division switching group
SDSM	space division switching matrix
SDV	SEAL team delivery vehicle; submerged delivery vehicle
SDZ	self-defense zone
SE	site exploitation; spherical error
SEA	ships' bunkers easy acquisition; Southeast Asia
Seabee	Navy construction engineer
SEAD	suppression of enemy air defenses
SEC	submarine element coordinator
SECAF	Secretary of the Air Force
SECARMY	Secretary of the Army
SecDef	Secretary of Defense
SECDHS	Secretary of the Department of Homeland Security
SECHS	Secretary of Homeland Security
SECNAV	Secretary of the Navy
SECNAVINST	Secretary of the Navy instruction
SECOMP	secure en route communications package
SECORD	secure cord switchboard
SECRA	secondary radar data only
SECSTATE	Secretary of State
SECTRANS	Secretary of Transportation
SED	signals external data
SEDAS	spurious emission detection acquisition system
SEF	sealift enhancement feature
SEI	specific emitter identification
SEL	senior enlisted leader
SEL REL	selective release
SELRES	Selected Reserve

SEMA	special electronic mission aircraft
SEMS	standard embarkation management system
SEO/SEP	special enforcement operation/special enforcement program
SEP	signal entrance panel; spherical error probable
SEPLO	state emergency preparedness liaison officer
SERE	survival, evasion, resistance, and escape
SERER	survival, evasion, resistance, escape, recovery
SES	senior executive service
SETA	system engineering and technical assistance
SEW	shared early warning
S/EWCC	signals intelligence/electronic warfare coordination center
SEWG	Special Events Working Group
SEWOC	signals intelligence/electronic warfare operations centre (NATO)
SEWS	satellite early warning system
SF	security force; security forces (Air Force or Navy); single frequency; special forces; standard form
SFA	security force assistance
SFAF	standard frequency action format
SFAT	spectrum flyaway team
SFC	single-fuel concept
SFCP	shore fire control party
SFG	security forces group; special forces group
SFI	spectral composition
SFLEO	senior federal law enforcement official
SFMS	special forces medical sergeant
SFOD-A/B/C	special forces operational detachment-A/B/C
SFOR	Stabilization Force
SFS	security forces squadron
SG	steering group; strike group; supergroup; surgeon general
SGEMP	system-generated electromagnetic pulse
SGS	strategic guidance statement
SGSA	squadron group systems advisor
SGXM	Headquarters, Air Mobility Command/Surgeon
SHAPE	Supreme Headquarters Allied Powers, Europe
SHD	special handling designator
SHF	super-high frequency
SHORAD	short-range air defense
SHORADEZ	short-range air defense engagement zone
SI	special intelligence; United States Strategic Command strategic instruction
SIA	station of initial assignment
SIAGL	survey instrument azimuth gyroscope lightweight
SIC	subject identification code; supporting intelligence center
SICO	sector interface control officer

SID	standard instrument departure
SIDAC	single integrated damage analysis capability
SIDL	standard intelligence documents list
SIDO	senior intelligence duty officer
SIDS	secondary imagery dissemination system
SIF	selective identification feature; strategic internment facility
SIG	signal
SIGINT	signals intelligence
SII	statement of intelligence interest
SIM	system impact message
SIMLM	single integrated medical logistics management; single integrated medical logistics manager
SINCGARS	single-channel ground and airborne radio system
SINS	ship's inertial navigation system
SIO	senior intelligence officer
SIOC	Strategic Information and Operations Center (FBI)
SIOP	Single Integrated Operational Plan
SIOP-ESI	Single Integrated Operational Plan-Extremely Sensitive Information
SIPRNET	SECRET Internet Protocol Router Network
SIR	serious incident report; specific information requirement; Strategic Military Intelligence Review
SIRADS	stored imagery repository and dissemination system
SIRMO	senior information resources management official
SIS	special information systems
SITREP	situation report
SIV	special interest vessel
SJA	staff judge advocate
SJFHQ	standing joint force headquarters
SJFHQ(CE)	standing joint force headquarters (core element)
SJFHQ-E	standing joint force headquarters – elimination
SJFHQ-N	Standing Joint Force Headquarters - North
SJS	Secretary, Joint Staff
SKE	station-keeping equipment
SL	sea level; switch locator
SLA	service level agreement; special leave accrual
SLAM	stand-off land attack missile
SLBM	submarine-launched ballistic missile
SLC	satellite laser communications; single line concept
SLCM	sea-launched cruise missile
SLCP	ship lighterage control point; ship's loading characteristics pamphlet
SLD	system link designator
SLEP	service life extension program
SLGR	small, lightweight ground receiver (GPS)
SLIT	serial-lot item tracking

SLO	space liaison officer
SLOC	sea line of communications
SLRP	survey, liaison, and reconnaissance party
SLWT	side loadable warping tug
SM	Secretary, Joint Staff, memorandum; Service manager; spectrum management; staff memorandum; system manager
SMA	special military information support operations assessment
SMART	special medical augmentation response team
SMART-AIT	special medical augmentation response - aeromedical isolation team
SMB	spectrum management branch
SMC	midpoint compromise track spacing; search and rescue mission coordinator; system master catalog
SMCA	single manager for conventional ammunition
SMCC	strategic mobile command center
SMCM	surface mine countermeasures
SMCOO	spectrum management concept of operations
SMCR	Selected Marine Corps Reserve
SMD	strategic missile defense
SMDC	Space & Missile Defense Command (Army)
SMDC/ARSTRAT	United States Army Space and Missile Defense Command/United States Army Forces Strategic Command
SME	subject matter expert
SMEB	significant military exercise brief
SMEO	small end office
SMFT	semi-trailer mounted fabric tank
SMI	security management infrastructure
SMIO	search and rescue (SAR) mission information officer
SMO	senior meteorological and oceanographic officer; strategic mobility office(r); support to military operations
SMP	sub-motor pool
SMPT	School of Military Packaging Technology
SMRC	Specialized Medical Response Capabilities
SMRI	service message routing indicator
SMS	Single Mobility System; special military information support operations study
SMTP	simple message transfer protocol
SMU	special mission unit; supported activities supply system (SASSY) management unit
S/N	signal to noise
SN	serial number
SNA	social network analysis
SNCO	staff noncommissioned officer

SNF	strategic nuclear forces
SNIE	special national intelligence estimates
SNLC	Senior North Atlantic Treaty Organization (NATO) Logisticians Conference
SNM	system notification message
SNOI	signal not of interest
SO	safety observer
SOA	separate operating agency; special operations aviation (Army); status of action; sustained operations ashore
SOAF	status of action file
SOAGS	special operations air-ground system
SOC	security operations center; special operations commander; special operations component
SOCA	special operations communications assembly
SOCC	Sector Operations Control Center (NORAD)
SOCCE	special operations command and control element
SOCCENT	Special Operations Component, United States Central Command
SOCCET	special operations critical care evacuation team
SOCEUR	Special Operations Component, United States European Command
SOCEX	special operations capable exercise
SOC-FWD	special operations command-forward
SOCJFCOM	Special Operations Command, Joint Forces Command
SOCM	special operations combat medic
SOCOORD	special operations coordination element
SOCP	special operations communication package
SOCPAC	Special Operations Command, Pacific
SOCRATES	Special Operations Command, Research, Analysis, and Threat Evaluation System
SOCSOUTH	Special Operations Component, United States Southern Command
SOD	special operations division; strategy and options decision (Planning, Programming, and Budgeting System)
SODARS	special operations debrief and retrieval system
SOE	special operations executive
SOF	special operations forces; supervisor of flying
SOFA	status-of-forces agreement
SOFAR	sound fixing and ranging
SOF-CF	special operations forces-conventional forces
SOFLAM	special operations laser marker
SOFLE	special operations forces liaison element
SOFME	special operations forces medical element
SOFSA	special operations forces support activity
SOG	special operations group

SOI	signal of interest; signal operating instructions; space object identification
SOIC	senior officer of the intelligence community
SOJTF	special operations joint task force
SOLAS	safety of life at sea
SOLE	special operations liaison element
SOLIS	signals intelligence (SIGINT) On-line Information System
SOLL	special operations low-level
SOLO	special operations liaison officer
SOM	satellite communications (SATCOM) operational manager; start of message; system operational manager
SOMA	status of mission agreement
SOMARDS	Standard Operation and Maintenance Army Research and Development System
SOMARDS NT	Standard Operation and Maintenance Army Research and Development System Non-Technical
SoO	ship of opportunity
SOOP	Center for Operations, Plans, and Policy
SOP	standard operating procedure
SOR	statement of requirement
SORTIEALOT	sortie allotment message
SORTS	Status of Resources and Training System
SOS	special operations squadron
SOSB	special operations support battalion
SOSC	special operations support command (theater army)
SOSCOM	special operations support command
SOSE	special operations staff element
SOSG	station operations support group
SOSR	suppress, obscure, secure, and reduce
SOST	special operations support team
SOTA	signals intelligence operational tasking authority
SOTF	special operations task force
SOTSE	special operations theater support element
SOUTHAF	Southern Command Air Forces
SOUTHROC	Southern Region Operational Center (USSOUTHCOM)
SOW	special operations wing; standoff weapon; statement of work
SOWT	special operations weather team
SP	security police
SPACEAF	Space Air Forces
SPACECON	control of space information
SPCC	ships parts control center (USN)
SPE	senior procurement executive
SPEAR	strike protection evaluation and antiair research
SPEC	specified
SPECAT	special category

SPECWAR	special warfare
SPG	Strategic Planning Guidance
SPI	sensor point of interest; special investigative (USAF)
SPINS	special instructions
SPINTCOMM	special intelligence communications handling system
SPIREP	spot intelligence report
SPLX	simplex
SPM	service postal manager; single point mooring; single port manager
SPMAGTF	special purpose Marine air-ground task force
SPO	system program office
SPOC	search and rescue (SAR) points of contact; space command operations center
SPOD	seaport of debarkation
SPOE	seaport of embarkation
SPOT	Synchronized Predeployment and Operational Tracker
SPOTREP	spot report
SPP	Security and Prosperity Partnership of North America; shared production program; State Partnership Program (NG)
SPR	software problem report
SPRINT	special psychiatric rapid intervention team
SPS	standard positioning service
SPSC	system planning and system control
SPTCONF	support confirmation
SPTD CMD	supported command
SPTG CMD	supporting command
SPTREQ	support request
sqft	square feet
SR	special reconnaissance
SRA	specialized-repair activity
SRAM	short-range air-to-surface attack missile; system replacement and modernization
SRB	software release bulletin; system review board (JOPES)
SRBM	short-range ballistic missile
SRC	security risk category; service reception center; Single Integrated Operational Plan (SIOP) response cell; standard requirements code; survival recovery center
SRCC	service reserve coordination center
SRF	secure Reserve force
SRG	Seabee readiness group; short-range aircraft
SRI	surveillance, reconnaissance, and intelligence (Marine Corps)
SRIG	surveillance, reconnaissance, and intelligence group (USMC)
SRM	sustainment, restoration, and modernization
SROC	Senior Readiness Oversight Council; Southern Region

	Operational Center, United States Southern Command
SROE	standing rules of engagement
SRP	sealift reserve program; Single Integrated Operational Plan (SIOP) reconnaissance plan
SRP/PDS	stabilization reference package/position determining system
SRR	search and rescue region
SRS	search and rescue sector
SRSG	special representative of the Secretary-General
SRT	scheduled return time; special reaction team; standard remote terminal; strategic relocatable target
SRTD	signals research and target development
S/RTF	search and recovery task force
SRU	search and rescue unit
SR-UAV	short-range unmanned aerial vehicle
SRUF	standing rules for the use of force
SRWBR	short range wide band radio
S/S	steamship
SS	submarine
SSA	software support activity; space situational awareness; special support activity (NSA); strapdown sensor assembly; supply support activity; supply support area
SSB	single side band; support services branch; surveillance support branch
SSB-SC	single sideband-suppressed carrier
SSC	small scale contingency; special security center surveillance support center
SSCO	shipper's service control office
SSCRA	Soldiers and Sailors Civil Relief Act
SSD	strategic studies detachment
SSE	satellite communications (SATCOM) systems expert; space support element
SSF	software support facility
SSI	standing signal instruction
SSM	surface-to-surface missile
SSMI	special sensor microwave imager
SSMS	single shelter message switch
SSN	attack submarine, nuclear; Social Security number; space surveillance network
SS (number)	sea state (number)
SSO	special security office(r); spot security office
SSP	signals intelligence (SIGINT) support plan
SSPM	single-service postal manager
SSPO	strategic systems program office
SSR	security sector reform

SSS	Selective Service System; shelter subsystem
SSSC	surface, subsurface search surveillance coordination
SST	special support team (National Security Agency)
SSTR	stability, security, transition, and reconstruction
SSWG	space support working group
ST	short ton; small tug; strike team
S/T	short ton
ST&E	security test and evaluation
STA	system tape A
STAB	space tactical awareness brief
STA clk	station clock
STAMMIS	standard Army multi-command management information system
STAMP	standard air munitions package (USAF)
STANAG	standardization agreement (NATO)
STANAVFORLANT	Standing Naval Forces, Atlantic (NATO)
STAR	scheduled theater airlift route; sensitive target approval and review; standard attribute reference; standard terminal arrival route; surface-to-air recovery; system threat assessment report
STARC	state area coordinators
STARS	Standard Accounting and Reporting System
START	Strategic Arms Reduction Treaty
STARTEX	start of exercise
STB	super tropical bleach
STC	secondary traffic channel
STD	sexually transmitted disease
STDM	synchronous time division multiplexer
STE	secure telephone equipment
S-Team	staff augmentation team
STEL STU III	Standford telecommunications (secure telephone)
STEP	software test and evaluation program; standardized tactical entry point; standard tool for employment planning
STG	seasonal target graphic
STICS	scalable transportable intelligence communications system
STO	special technical operations
STOC	special technical operations coordinator
STOD	special technical operations division
STOL	short takeoff and landing
STOMPS	stand-alone tactical operational message processing system
STON	short ton
STP	security technical procedure
STR	strength
STRAPP	standard tanks, racks and pylons packages (USAF)
STRATOPS	strategic operations division
STREAM	standard tensioned replenishment alongside method

STS	special tactics squadron
STT	small tactical terminal; special tactics team
STU	secure telephone unit
STU-III	secure telephone unit III
STW	strike warfare
STWC	strike warfare commander
STX	start of text
SU	search unit
SUBJ	subject
sub-JIB	subordinate-joint information bureau
SUBOPAUTH	submarine operating authority
sub-PIC	subordinate-press information center
SUBROC	submarine rocket
SUC	surf current
SUIC	service unit identification code
SUMMITS	scenario unrestricted mobility model of intratheater simulation
SUPE	supervisory commands program
SUPP	supplement
SUPPO	supply officer
SURG	surgeon
SUROBS	surf observation
SURPIC	surface picture
SUST BDE	sustainment brigade
SUW	surface warfare
SUWC	surface warfare commander
S/V	sailboat
SVC	Service; stored value card
SVIP	secure voice improvement program
SVLTU	service line termination unit
SVR	surface vessel radar
SVS	secure voice system
Sw	switch
SWA	Southwest Asia
SWAT	special weapons and tactics
SWBD	switchboard
SWC	strike warfare commander; swell/wave current
SWI	special weather intelligence
SWO	staff weather officer
SWORD	submarine warfare operations research division
SWPC	Space Weather Prediction Center
SWSOCC	Southwest Sector Operation Control Center North American Aerospace Defense Command (NORAD)
SWXS	Space Weather Squadron
SXXI	SPECTRUM XXI
SXXI-O	SPECTRUM XXI-Online

SYDP	six year defense plan
SYG	Secretary-General (UN)
SYNC	synchronization
SYS	system
SYSCOM	systems command
SYSCON	systems control
SZ	surf zone

T

2-D	two-dimensional
2E	Role 2 enhanced
2LM	Role 2 light maneuver
3-D	three-dimensional
T	search time available; short ton; trackline pattern
T&DE	test and diagnostic equipment
T&E	test and evaluation
T2	technology transfer
TA	target acquisition; target audience; technical arrangement; theater Army; threat assessment
TAA	tactical assembly area; target audience analysis
TAACOM	theater Army area command
TAADS	The Army Authorization Document System
TAAMDCOORD	theater Army air and missile defense coordinator
TAB	tactical air base
TAC	tactical advanced computer; terminal access controller; terminal attack control; terminal attack controller
TAC(A)	tactical air coordinator (airborne)
TACAIR	tactical air
TACAMO	take charge and move out (E-6A/B aircraft)
TACAN	tactical air navigation
TACC	tanker airlift control center
TAC-D	tactical deception
TACDAR	tactical detection and reporting
TACINTEL	tactical intelligence
TACLAN	tactical local area network
TACLOG	tactical-logistical
TACM	tactical air command manual
TACO	theater allied contracting office
TACON	tactical control
TACOPDAT	tactical operational data
TA/CP	technology assessment/control plan
TACP	tactical air control party
TACRON	tactical air control squadron
T-ACS	auxiliary crane ship
TACS	tactical air control system; theater air control system
TACSAT	tactical satellite
TACSIM	tactical simulation
TACSTANS	tactical standards
TACT	tactical aviation control team
TACTRAGRULANT	Tactical Training Group, Atlantic
TAD	tactical air direction; temporary additional duty (non-unit-related personnel); theater air defense; time available for delivery

TADC	tactical air direction center
TADCS	tactical airborne digital camera system
TADS	Tactical Air Defense System; target acquisition system and designation sight
TAES	theater aeromedical evacuation system
TAF	tactical air force
TAFIM	technical architecture framework for information management
TAFS	tactical aerodrome forecasts
TAFT	technical assistance field team
TAG	technical assessment group; technical assistance group; the adjutant general; Tomahawk land-attack missile aimpoint graphic
T-AGOS	tactical auxiliary general ocean surveillance
TAGS	theater air-ground system
T-AH	hospital ship
TAI	target area of interest; total active inventory
TAIS	transportation automated information systems
TAK	cargo ship
T-AKR	fast logistics ship
TALD	tactical air-launched decoy
TALON	Threat and Local Observation Notice
TAMCA	theater Army movement control agency
TAMCO	theater Army movement control center
TAMD	theater air and missile defense
TAMMC	theater army material management command
TAMMIS	theater Army medical management information system
TAMS	transportation analysis, modeling, and simulation
tanalt	tangent altitude
TAO	tactical action officer; tactical air officer
TAOC	tactical air operations center (USMC)
TAP	troopship
TAR	tactical air request; Training and Administration of the Reserve
TARBS	transportable amplitude modulation and frequency modulation radio broadcast system
TARBUL	target bulletin
TARE	tactical record evaluation
TAREX	target exploitation; target plans and operations
TARS	tethered aerostat radar system
TARWI	target weather and intelligence
TAS	tactical atmospheric summary; true air speed
T-ASA	Television Audio Support Agency
TASCID	tactical Automatic Digital Network (AUTODIN) satellite compensation interface device
TASCO	tactical automatic switch control officer

TASIP	tailored analytic intelligence support to individual electronic warfare and command and control warfare projects
TASKORD	tasking order
TASMO	tactical air support for maritime operations
TASOSC	theater Army special operations support command
TASS	tactical automated security system; tactical automated switch system
TASWC	theater antisubmarine warfare commander
TAT	tactical analysis team; technical assistance team
TATC	tactical air traffic control
T-AVB	aviation logistics support ship
TAW	tactical airlift wing
TBC	theater business clearance
TBD	to be determined
TBM	tactical ballistic missile; theater ballistic missile
TBMCS	theater battle management core system
TBMD	theater ballistic missile defense
TB MED	technical bulletin medical
TBP	to be published
TBSL	to be supplied later
TBTC	transportable blood transshipment center
TC	tidal current; transmit clock and/or telemetry combiner; training circular; Transportation Corps (Army)
TCA	time of closest approach; traditional combatant commander activity
TC-ACCIS	Transportation Coordinator's Automated Command and Control Information System
TC-AIMS	Transportation Coordinator's Automated Information for Movement System
TC-AIMS II	Transportation Coordinator's Automated Information for Movement System II
TCAM	theater Army medical management information system (TAMMIS) customer assistance module
TCC	transmission control code; transportation component command
TCCF	tactical communications control facility
TCEM	theater contingency engineering management
TCF	tactical combat force; technical control facility
TCM	theater construction manager; theater container manager
TCMD	transportation control and movement document
TCN	third country national; transportation control number; troop contributing nations
TCO	termination contracting office;r transnational criminal organization
TCP	theater campaign plan

TCPED	tasking, collection, processing, exploitation, and dissemination
TCS	theater communications system
TCSEC	trusted computer system evaluation criteria
TCSP	theater consolidation and shipping point
TD	temporary duty; theater distribution; tie down; timing distributor; total drift; transmit data
TDA	Table of Distribution and Allowance
TDAD	Table of Distribution and Allowance (TDA) designation
TDBM	technical database management
TDBSS	Theater Defense Blood Standard System
TDC	target development cell
TDD	target desired ground zero (DGZ) designator; time-definite delivery
TDF	tactical digital facsimile; theater detention facility
TDIC	time division interface controller
TDIG	time division interface group
TDIM	time division interface module
TDL	tactical data link
TDM	time division multiplexed
TDMA	time division multiple access
TDMC	theater distribution management cell
TDMF	time division matrix function
TDMM	time division memory module
TDMX	time division matrix
TDN	tactical data network; target development nomination
TDP	theater distribution plan
TDR	transportation discrepancy report
TDRC	theater detainee reporting center
TDSG	time division switching group
TDSGM	time division switching group modified
TDT	theater display terminal
TDY	temporary duty
TE	transaction editor
TEA	Transportation Engineering Agency
TEC	theater engineer command
tech	technical
TECHCON	technical control
TECHELINT	technical electronic intelligence
TECHEVAL	technical evaluation
TECHINT	technical intelligence
TECHOPDAT	technical operational data
TECS II	Treasury Enforcement Communications System
TED	trunk encryption device
TEDAC	Terrorist Explosive Device Analytical Center (FBI)
TEK	TeleEngineering Kit

TEL	transporter-erector-launcher
TELEX	teletype
TELINT	telemetry intelligence
TELNET	telecommunication network
TEMPER	tent extendible modular personnel
TENCAP	tactical exploitation of national capabilities program
TEO	team embarkation officer
TEOB	tactical electronic order of battle
TEP	test and evaluation plan; theater engagement plan
TERCOM	terrain contour matching
TERPES	tactical electronic reconnaissance processing and evaluation system
TERPROM	terrain profile matching
TERS	tactical event reporting system
TES	theater event system
TESS	Tactical Environmental Support System
TET	targeting effects team
TETK	TeleEngineering Toolkit
TEU	technical escort unit; twenty-foot equivalent unit
TEWLS	Theater Enterprise Wide Logistics System
TF	task force
TFA	toxic free area
TFADS	Table Formatted Aeronautic Data Set
TFC	threat finance cell
TFCICA	task force counterintelligence coordinating authority
TFE	tactical field exchange; threat finance exploitation; transportation feasibility estimator
TFF	total force fitness
TFLIR	targeting forward-looking infrared
TFMS-M	Transportation Financial Management System-Military
TFR	temporary flight restriction
TFS	tactical fighter squadron; Tactical Forecast System
TG	task group
TGC	trunk group cluster
TGEN	table generate
TGM	terminally guided munitions; trunk group multiplexer
TGMOW	transmission group module and/or orderwire
TGO	terminal guidance operations
TGT	target
TGTINFOREP	target information report
TGU	trunk compatibility unit
THAAD	Terminal High Altitude Area Defense
THT	tactical human intelligence team
THX	theater express
TI	threat identification; training instructor
TIA	theater intelligence assessment

TIAP	theater intelligence architecture program
TIB	theater intelligence brigade; toxic industrial biological
TIBS	tactical information broadcast service
TIC	target information center; toxic industrial chemical
TIDE	Terrorist Identities Datamart Environment
TIDP	technical interface design plan
TIDS	tactical imagery dissemination system
TIF	theater internment facility
TIFF	tagged image file format
TII	total inactive inventory
TIM	theater information management; toxic industrial material
TIO	target intelligence officer
TIP	target intelligence package; trafficking in persons
TIPG	telephone interface planning guide
TIPI	tactical information processing interpretation
TIPS	tactical optical surveillance system (TOSS) imagery processing system
TIR	toxic industrial radiological
TIROS	television infrared observation satellite
TIS	technical interface specification; thermal imaging system
TISG	technical interoperability standards group
TISS	thermal imaging sensor system
TJAG	the judge advocate general
T-JMC	theater-joint movement center
T-JTB	theater-joint transportation board
TJTN	theater joint tactical network
TL	team leader
TLA	theater logistics analysis
TLAM	Tomahawk land-attack missile
TLAMM	theater lead agent for medical materiel
TLAM/N	Tomahawk land attack missile/nuclear
TLC	traffic load control
TLE	target location error
TLM	target list management; topographic line map
TLO	theater logistics overview
TLP	transmission level point
TLR	trailer
TLX	teletype
TM	tactical missile; target materials; team member; technical manual; TROPO modem
TMAO	theater mortuary affairs office; theater mortuary affairs officer
TMB	tactical military information support operations battalion
TMD	tactical munitions dispenser; theater missile defense
TMEP	theater mortuary evacuation point
TMG	timing

TMIP	theater medical information program
TMIS	theater medical information system
TML	terminal
TMLMC	theater medical logistic management center
TMMMC	theater medical materiel management center
TMN	trackline multiunit non-return
TMO	traffic management office; transportation management office
TMP	target materials program; telecommunications management program; theater manpower forces
TMR	trackline multiunit return
T/M/S	type, model, and/or series
TMT	time-phased force and deployment data management tool
TNAPS	tactical network analysis and planning system
TNAPS+	tactical network analysis and planning system plus
TNC	theater network operations center
TNCC	theater network operations control center
TNCO	transnational criminal organization
T-net	training net
TNF	theater nuclear force
TNL	target nomination list
T/O	table of organization
TO	technical order; theater of operations
TO&E	table of organization and equipment
TOA	table of allowance
TOC	tactical operations center; tanker airlift control center (TALCE) operations center
TOCU	tropospheric scatter (TROPO) orderwire control unit
TOD	tactical ocean data; time of day
TOE	table of organization and equipment
TOF	time of flight
TOFC	trailer on flatcar
TOH	top of hill
TOI	track of interest
TOPINT	technical operational intelligence
TOR	term of reference; time of receipt
TOS	time on station
TOSS	tactical optical surveillance system
TOT	time on target
TOW	tube launched, optically tracked, wire guided
TP	technical publication; transportation priority; turn point
TPC	tactical pilotage chart
TPC/PC	tactical pilotage chart and/or pilotage chart
TPE	theater provided equipment

TPED	tasking, processing, exploitation, and dissemination; theater personal effects depot
TPERS	type personnel element
TPFDD	time-phased force and deployment data
TPFDL	time-phased force and deployment list
TPL	technical publications list; telephone private line
TPME	task, purpose, method, and effects
TPMRC	theater patient movement requirements center
TPO	task performance observation
TPRC	theater planning response cell
TPT	tactical petroleum terminal
TPTRL	time-phased transportation requirements list
TPU	tank pump unit
TQ	tactical questioning
TRA	technical review authority
TRAC2ES	United States Transportation Command Regulating and Command and Control Evacuation System
TRACON	terminal radar approach control facility
TRADOC	United States Army Training and Doctrine Command
TRAM	target recognition attack multisensor
Trans BDE	transportation brigade
Trans Det RPO	transportation detachment rapid port opening
TRANSEC	transmission security
TRAP	tactical recovery of aircraft and personnel (Marine Corps); tactical related applications; tanks, racks, adapters, and pylons; terrorism research and analysis program
TRC	tactical radio communication; transmission release code
TRCC	tactical record communications center
TRE	tactical receive equipment
TREAS	Department of the Treasury
TREE	transient radiation effects on electronics
TRIADS	Tri-Wall Aerial Distribution System
TRICON	triple container
TRI-TAC	Tri-Service Tactical Communications Program
TRK	truck; trunk
TRNG	training
TRO	training and readiness oversight
TROPO	troposphere; tropospheric scatter
TRP	target reference point
TRS	tactical reconnaissance squadron
TS	terminal service; time-sensitive; top secret
TSA	target system analysis; theater storage area; Transportation Security Administration (DHS); travel security advisory
TSB	technical support branch; trunk signaling buffer
TSBn	transportation support battalion (USMC)

TSC	theater security cooperation; theater support command; theater sustainment command (Army)
TSCIF	tactical sensitive compartmented information facility
TSCM	technical surveillance countermeasures
TSCO	target selection confusion of the operator; top secret control officer
TSCP	theater security cooperation plan
TSCR	time sensitive collection requirement
TSE	tactical support element
TSEC	transmission security
TSG	targeting support group; test signal generator
TSGCE	tri-Service group on communications and electronics
TSGCEE	tri-Service group on communications and electronic equipment (NATO)
TSM	trunk signaling message
TSN	trackline single-unit non-return; track supervision net
TSO	technical standard order; telecommunications service order
TSOC	tactical special operations command; theater special operations command
TSP	telecommunications service priority
TSR	telecommunications service request; theater source registry; theater support representative; trackline single-unit return
TSS	tactical shelter system; target sensing system; timesharing system; time signal set; traffic service station
TSSP	tactical satellite signal processor
TSSR	tropospheric scatter (TROPO)-satellite support radio
TST	tactical support team; terminal support team; theater support team; time-sensitive target
TSWA	temporary secure working area
TT	terminal transfer
TT&C	telemetry, tracking, and commanding
TTAN	transportation tracking account number
TTB	transportation terminal battalion
TTD	tactical terrain data; technical task directive
TTFACOR	targets, threats, friendlies, artillery, clearance, ordnance, restrictions
TTG	thermally tempered glass
TTL	tagging, tracking, and locating; transistor-transistor logic
TTM	threat training manual; training target material
TTN	transportation tracking number
TTP	tactics, techniques, and procedures; trailer transfer point
TTR	tactical training range
TTT	time to target
TTU	transportation terminal unit
TTY	teletype
TUBA	transition unit box assembly

TUCHA	type unit characteristics file
TUCHAREP	type unit characteristics report
TUDET	type unit equipment detail file
TV	television
TVA	Tennessee Valley Authority
TW&A	threat warning and assessment
TWC	Office for Counterterrorism Analysis (DIA); total water current
TWCF	Transportation Working Capital Fund
TWCM	theater wartime construction manager
TWD	transnational warfare counterdrug analysis
TWDS	tactical water distribution system
TWI	Office for Information Warfare Support (DIA)
TWPL	teletypewriter private line
TWX	teletypewriter exchange
TX	transmitter; transmit
TYCOM	type commander

U

U	wind speed
UA	unmanned aircraft
UAOBS	upper air observation
UAR	unconventional assisted recovery
UARCC	unconventional assisted recovery coordination cell
UAS	unmanned aircraft system
UAV	unmanned aerial vehicle
U/C	unit cost; upconverter
UCFF	Unit Type Code Consumption Factors File
UCMJ	Uniform Code of Military Justice
UCP	Unified Command Plan
UCT	underwater construction team
UDAC	unauthorized disclosure analysis center
UDC	unit descriptor code
UDESC	unit description
UDL	unit deployment list; unit designation list
UDP	unit deployment program
UDT	underwater demolition team
UE	unit equipment
UEWR	upgraded early warning radar
UFAC	Underground Facilities Analysis Center
UFC	Unified Facilities Criteria
UFO	ultrahigh frequency follow-on
UFR	unfunded requirement
UGA	ungoverned area
UGIRH	Urban Generic Information Requirements Handbook
UGM-84A	Harpoon
UGM-96A	Trident I
UGO	unified geospatial-intelligence operations
UHF	ultrahigh frequency
UHV	Upper Huallaga Valley
UIC	unit identification code
UICIO	unit identification code information officer
UIRV	unique interswitch rekeying variable
UIS	unit identification system
UJTL	Universal Joint Task List
UK	United Kingdom
UK(I)	United Kingdom and Ireland
ULC	unit level code
ULF	ultra low frequency
ULLS	unit level logistics system
ULN	unit line number
ULSD	ultra-low sulfur diesel
UMCC	unit movement control center

UMCM	underwater mine countermeasures
UMD	unit manning document; unit movement data
UMIB	urgent marine information broadcast
UMMIPS	uniform material movement and issue priority system
UMO	unit movement officer
UMPR	unit manpower personnel record
UMT	unit ministry team
UN	United Nations
UNAMIR	United Nations Assistance Mission in Rwanda
UNC	United Nations Command
UNCLOS	United Nations Convention on the Law of the Sea
UN CMCoord	United Nations humanitarian civil-military coordination
UNCTAD	United Nations Conference on Trade and Development
UND	urgency of need designator
UNDAC	United Nations disaster assessment and coordination
UNDFS	United Nations Department of Field Support
UNDHA	United Nations Department of Humanitarian Affairs
UN-DMT	United Nations disaster management team
UNDP	United Nations development programme
UNDPKO	United Nations Department for Peacekeeping Operations
UNEF	United Nations emergency force
UNEP	United Nations environment programme
UNESCO	United Nations Educational, Scientific, and Cultural Organization
UNHAS	United Nations Humanitarian Air Service
UNHCHR	United Nations High Commissioner for Human Rights
UNHCR	United Nations Office of the High Commissioner for Refugees
UNHQ	United Nations Headquarters
UNICEF	United Nations Children's Fund
UNIFIL	United Nations Interim Force in Lebanon
UNIL	unclassified national information library
UNITAF	unified task force
UNITAR	United Nations Institute for Training and Research
UNITREP	unit status and identity report
UNJLC	United Nations Joint Logistic Centre
UNLOC	United Nations logistic course
UNMEM	United Nations military expert on mission
UNMIH	United Nations Mission in Haiti
UNMILPOC	United Nations military police course
UNMOC	United Nations military observers course
UNMOVCC	United Nations movement control course
UNO	unit number
UNOCHA	United Nations Office for the Coordination of Humanitarian Affairs
UNODC	United Nations Office on Drugs and Crime

UNODIR	unless otherwise directed
UNOSOM	United Nations Operations in Somalia
UNPA	United Nations Participation Act
UNPROFOR	United Nations protection force
UNREP	underway replenishment
UNREP CONSOL	underway replenishment consolidation
UNRWA	United Nations Relief and Works Agency for Palestine Refugees in the Near East
UNSC	United Nations Security Council
UNSCR	United Nations Security Council resolution
UNSG	United Nations Secretary-General
UNSOC	United Nations staff officers course
UNTAC	United Nations Transition Authority in Cambodia
UNTSO	United Nations Truce and Supervision Organization
UNV	United Nations volunteer
UOF	use of force
UON	urgent operational need
UP&TT	unit personnel and tonnage table
URDB	user requirements database
URL	uniform resource locater
URN	unit reference number
US&R	urban search and rescue
USA	United States Army
USAB	United States Army barracks
USACCSA	United States Army Command and Control Support Agency
USACE	United States Army Corps of Engineers
USACFSC	United States Army Community and Family Support Center
USACHPPM	United States Army Center for Health Promotion and Preventive Medicine
USACIDC	United States Army Criminal Investigation Command
USAEDS	United States Atomic Energy Detection System
USAF	United States Air Force

USMILREP	United States military representative
USML	United States Munitions List
USMOG-W	United States Military Observer Group - Washington
USMS	United States Marshals Service
USMTF	United States message text format
USMTM	United States military training mission
USN	United States Navy
USNAVCENT	United States Naval Forces, Central Command
USNAVEUR	United States Naval Forces, Europe
USNAVSO	US Naval Forces Southern Command

USNCB	United States National Central Bureau (INTERPOL)
USNMR	United States National Military representative
USNMTG	United States North Atlantic Treaty Organization (NATO) Military Terminology Group
USNO	United States Naval Observatory
USNORTHCOM	United States Northern Command
USNR	United States Navy Reserve
USNS	United States Naval Ship
USPACAF	United States Air Forces, Pacific Command
USPACFLT	United States Pacific Fleet
USPACOM	United States Pacific Command
USPFO(P&C)	United States Property and Fiscal Office (Purchasing and Contracting)
USPHS	United States Public Health Service
USPS	United States Postal Service
USREPMC	United States representative to the military committee (NATO)
USSOCOM	United States Special Operations Command
USSOUTHAF	United States Air Force, Southern Command
USSOUTHCOM	United States Southern Command
USSS	United States Secret Service (TREAS); United States Signals Intelligence (SIGINT) System
USSTRATCOM	United States Strategic Command
USTRANSCOM	United States Transportation Command
USUN	United States Mission to the United Nations
USW	undersea warfare
USW/USWC	undersea warfare and/or undersea warfare commander
USYG	under secretary general
UT1	unit trainer; Universal Time
UTC	Coordinated Universal Time; unit type code
UTM	universal transverse mercator
UTO	unit table of organization
UTR	underwater tracking range
UUV	unmanned underwater vehicle; unmanned underwater vessel
UVEPROM	ultraviolet erasable programmable read-only memory
UW	unconventional warfare
UWOA	unconventional warfare operating area
UXO	unexploded explosive ordnance; unexploded ordnance

V

V	search and rescue unit ground speed; sector pattern; volt
v	velocity of target drift
VA	Veterans Administration; victim advocate; vulnerability assessment
V&A	valuation and availability
VAAP	vulnerability assessment and assistance program
VAC	volts, alternating current
VARVAL	vessel arrival data, list of vessels available to marine safety offices and captains of the port
VAT B	(weather) visibility (in miles), amount (of clouds, in eighths), (height of cloud) top (in thousands of feet), (height of cloud) base (in thousands of feet)
VBIED	vehicle-borne improvised explosive device
VBS	visit, board, search
VBSS	visit, board, search, and seizure
VCC	voice communications circuit
VCG	virtual coordination group
VCJCS	Vice Chairman of the Joint Chiefs of Staff
VCNOG	Vice Chairman, Nuclear Operations Group
VCO	voltage controlled oscillator
VCOPG	Vice Chairman, Operations Planners Group
VCR	violent crime report
VCXO	voltage controlled crystal oscillator; voltage controlled oscillator
VDC	volts, direct current
VDJS	Vice Director, Joint Staff
VDL	video downlink
VDR	voice digitization rate
VDS	video subsystem
VDSD	visual distress signaling device
VDU	visual display unit
VDUC	visual display unit controller
VE	vertical error
VEE	Venezuelan equine encephalitis
VEH	vehicle; vehicular cargo
VEO	violent extremist organization
VERTREP	vertical replenishment
VF	voice frequency
VFR	visual flight rules
VFS	validating flight surgeon
VFTG	voice frequency telegraph
VHF	very high frequency
VI	visual information
VICE	advice

VID	visual identification; visual identification information display

APPENDIX B
ADMINISTRATIVE INSTRUCTIONS

1. User Comments

Users are highly encouraged to submit comments on this publication to the Directorate for Joint Force Development, J-7, Joint Doctrine and Education Division, Joint Doctrine Branch, ATTN: Chairman, US NATO Military Terminology Group, 7000 Joint Staff, Pentagon, Washington, DC 20318-7000; Tel (703) 692-7255, DSN 222-7255; Fax (703) 692-5224, DSN 222-5224. All comments recommending modifications, deletions, or additions to terminology in JP 1-02 must be made in accordance with DODI 5025.12, *Standardization of Military and Associated Terminology*, and CJCSI 5705.01, *Standardization of Military and Associated Terminology*.

2. Authorship

The lead agent and the Joint Staff doctrine sponsor for this publication is the Director for Joint Force Development (J-7).

3. Supersession

a. This publication supersedes JP 1-02, *Department of Defense Dictionary of Military and Associated Terms*, 12 April 2001. The terms and definitions in JP 1-02 will be updated on a monthly basis with modifications, deletions, or additions that have been approved in accordance with DODI 5025.12 and CJCSI 5705.01.

b. Record of Updates:

31 December 2010: JP 3-02.1, JP 3-07.2, and DODD 3025.18 added.

31 January 2011: JP 3-68, JP 4-03, and SecDef Memo 12401-10 added.

15 April 2011: JP 2-01.2 added.

15 May 2011: JP 3-05 added.

15 July 2011: JP 3-08, JP 3-15, and JP 3-34 added.

15 August 2011: JP 3-0 and JP 5-0 added.

15 September 2011: JP 1-04 added.

15 October 2011: JP 3-03, JP 3-07, and JP 4-06 added.

15 November 2011: JP 1-0 added.

15 January 2012: JP 2-01, JP 3-13.2, JP 3-13.3, JP 3-15,1, JP 3-50, CJCSI 5120.02C, and CJCSM 5120.01 added.

15 February 2012: JP 3-13.1 and JP 3-13.4 added.

15 March 2012: JP 1-06 added.

15 April 2012: JP 3-01, JP 4-01.5, and JP 6-01 added.

15 July 2012: JP 3-41 and JP 4-01.2 added.

15 August 2012: JP 3-07.3, JP 3-33, and JP 4-02 added.

15 November 2012: JP 2-03 added.

15 December 2012: JP 3-04, JP 3-13, JP 3-18, JP 3-59, and JP 4-01.6 added.

15 February 2013: JP 3-12, JP 3-35, and JP 3-60 added.

15 March 2013: JP 4-08 added.

15 April 2013: JP 1 added.

15 June 2013: JP 3-14 and JP 4-01 added.

16 July 2013: JP 3-16 added.

15 August 2013: JP 3-07.4, JP 3-27, JP 3-28, and JP 3-32 added.

15 September 2013: JP 3-57 added.

15 October 2013: JP 3-11 and JP 3-17 added.

15 November 2013: JP 2-0 and JP 4-0 added.

15 December 2013: JP 1-05, JP 3-06, and JP 3-24 added.

15 January 2014: JP 3-29 and JP 4-09 added.

15 February 2014: JP 3-30 added.

15 March 2014: JP 4-05, JP 3-07.2, JP 3-31, and DODI 8260.03 added.

15 June 2014: JP 2-01.3 and DODI 1342.22 added.

16 July 2014: JP 3-05 and JP 4-10 added.

15 August 2014: JP 3-02 added.

15 November 2014: JP 3-10, JP 3-26, JP 3-40, JP 3-52, and JP 3-63 added.

15 December 2014: JP 3-02.1, JP 3-09, JP 3-09.3, and JP 3-13.2 added.

15 January 2015: CJCSI 5120.02D and CJCSM 5120.01A added.

15 March 2015: DODI 6025.22, DODI 8500.01, and JP 2-01.2 Change 1 added.

15 June 2015: DODD 3000.10, DODI 8260.04, and JP 6-0 added.

15 September 2015: JP 3-05.1 added.

15 October 2015: JP 3-50 added.

15 November 2015: JP 4-01.5 added.

15 December 2015: JP 3-61 and JP 3-68 added.

15 January 2016: JP 1-06, JP 3-13.3, JP 3-34, JP 4-01.2, JP 4-03 added.

15 February 2016: DODD 4715.21.

7. Distribution

Joint Staff J-7 does not print copies of JP 1-02 for distribution. Electronic versions are available on JDEIS Joint Electronic Library Plus (JEL+) at https://jdeis.js.mil/jdeis/index.jsp (NIPRNET) and http://jdeis.js.smil.mil/jdeis/index.jsp (SIPRNET), and on the JEL at http://www.dtic.mil/doctrine (NIPRNET).

JOINT
CHIEFS OF STAFF

ST 2-50.4 (FM 34-8)

COMBAT COMMANDERS HANDBOOK ON INTELLIGENCE

US Army Intelligence Center and Fort Huachuca
Fort Huachuca, Arizona 85613-6000

SEPTEMBER 2001

DISTRIBUTION RESTRICTION: Approved for public release; distribution is unlimited.

PREFACE

Combat commanders need timely and accurate intelligence. In order to drive intelligence as a part of the intelligence operating system, commanders must understand what intelligence can do, how to focus it on specific requirements, and how you can integrate it with other operating systems.

This handbook addresses these requirements, expanding on the doctrine in FM 2-0 (FM 34-1), FM 3-0 (FM 100-5), FM 5-0 and FM 6-0 (FM 101-5), and FM 2-01.3 (FM 34-1 30).

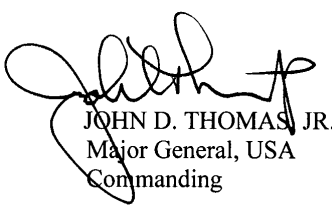
This handbook is written primarily for maneuver commanders and executive officers at brigade or regiment and battalion or squadron levels to include Active Components (AC) and Reserve Component (RC) commanders. It should also be useful to principal staff officers and combat support (CS) and combat service support (CSS) commanders.

Unless this publication states otherwise, masculine nouns and pronouns do not refer exclusively to men. Throughout the manual, “you” refers to the combat commander and also applies to the executive officer as he integrates and synchronizes the orders process and directs and supervises the staff.

The proponent of this publication is the US Army Intelligence Center and Fort Huachuca. We consider this a living manual and will dynamically revise this doctrine as frequently as necessary based on comments and suggestions from the field. Under normal circumstances appropriate revisions will be made within two weeks of receipt. While the initial (one time) distribution of this field manual will be made on CD-ROM, users should realize that to capture the dynamic changes/revisions of the manual as soon as they occur, they should check the Intelligence Center Homepage frequently for the most current version. We welcome your comments and recommended changes at any time. You may email them directly to the proponent at edd.goodmanc@hua.army.mil or mail them to: Commander, US Army Intelligence Center and Fort Huachuca (ATZS-FDRCD), Fort Huachuca, Arizona 85613-6000. You can also access the Doctrine Division Homepage at http://usaic.hua.army.mil/doctrine.htm and leave your comments or changes with the webmaster.

This handbook does not implement any international Standardization Agreements (STANAG5). It complies with all applicable STANAGs and Quadripartite Standardization Agreements. This document contains copyrighted material.

This manual incorporates the emerging intelligence and operational doctrine and terminology from FM 3-0, Operations, dated 14 June 2001. It uses the new manual numbers with the old manual numbers in parentheses. Although not all manuals have been updated to the new numbering system, this was done to transition the force to the new numbering system.



JOHN D. THOMAS, JR.
Major General, USA
Commanding

Chapter 1

The Intelligence Challenge for Commanders

Intelligence is your tool; it is the foundation for synchronizing operations, massing combat power and effects, and protecting the force. There is no such thing as perfect intelligence but, when properly focused and planned and executed, intelligence operations are invaluable. To effectively use intelligence, you must understand—

- The capabilities and limitations of the intelligence operating system.
- The intelligence architecture (which includes command and control (C^2); processing; collaborative and distributed analysis; intelligence, surveillance, and reconnaissance [ISR] operations; and intelligence networks and communications).
- How you focus ISR operations.
- How you and your staff synchronize ISR with other operations.

INTELLIGENCE OPERATING SYSTEM

1-1. The mission of your intelligence operating system is to provide timely, relevant, accurate, and predictive intelligence support to you, your staff, and subordinates when planning, preparing, and executing decisive actions within the area of operations (AO). Implied within this mission, or associated with intelligence, are—

- Integrated ISR planning (focused through the S2 and S3 but thoroughly planned by the entire staff).
- Changes and adjustments to ISR collection.
- Analysis, production, and dissemination (to include presentation) of intelligence and combat information—the heart of the intelligence operating system.
- Electronic Warfare (EW), which is an integrated part of fires, targeting, and effects. EW should always be employed as an integrated and complementary capability.
- Counterintelligence (CI) is critical to your ability to protect the force in terms of supporting counterreconnaissance, analyzing the threat's multidiscipline ISR operations, and recommending countermeasures to those threat operations. There is a symbiotic relationship between counter-human intelligence (HUMINT) CI operations and human intelligence (HUMINT) collection. In the future, CI functionality will include analysis of threat information operations (IO) and other full-dimensional counter-ISR tasks.

ISR OPERATIONS

1-2. ISR planning and execution do not reflect a change to fundamental Army doctrine. Recent emphasis on ISR operations reflects the importance of a unified, integrated, and synchronized effort to—

- Plan and direct the ISR effort.
- Collect and process information.
- Produce intelligence.
- Disseminate intelligence and combat information to those who need it, when they need it.

1-3. Two concepts are imbedded in recent ISR doctrine:

- There are a finite number of "traditional intelligence collection" and "traditional reconnaissance and surveillance (R&S)" assets, but there are many potential ISR assets.
- There is a different "mindset" among each operating systems or proponent on how to plan, task, and control assets; how and where to report information; and how to use the information. However, ISR doctrine is designed to break the operating system or functional "stovepipes" for planning, reporting, processing, and analyzing information.

EMERGING DOCTRINE (IBCT)
(See Chapter 4)

In recognition of the importance of ISR operations and the unique challenges of small-scale contingencies, the initial brigade combat team (IBCT) is uniquely organized to facilitate ISR operations:

- The Military Intelligence (MI) Company (subordinate to the brigade) includes an ISR integration platoon, HUMINT platoon, more robust analytical capability, and organic control teams (specifically the operational management team [OMT] to help the commander control tactical HUMINT operations).
- The reconnaissance, surveillance, and target acquisition (RSTA) squadron S2 is supported by an ISR Integration Team (from the Surveillance Squadron).
- The surveillance troop (subordinate to the RSTA squadron) consists of soldiers and assets that execute nuclear, biological, and chemical (NBC) surveillance and other ISR operations (operations traditionally described as intelligence operations—from three disciplines). Another new characteristic is multi-sensor teams that employ sensors from more than one intelligence discipline.
- The reconnaissance troop (subordinate to the RSTA squadron) includes an organic HUMINT collection capability.

CRITICAL ELEMENTS OF ISR OPERATIONS

1-4. **Focus the ISR effort:**

- Clearly articulate your priority intelligence requirements (PIR) with a latest time intelligence is of value (LTIOV).

- Drive the IPB process throughout the military decision-making process (MDMP) (see Chapter 2).

1-5. **Carefully plan ISR operations.** You must ensure that intelligence preparation of the battlefield (IPB) drives the rest of the planning process and that all ISR operations are thoroughly planned (to include synchronized) and controlled as an integrated staff effort through the C^2 system. Although the G2 (S2) is the IPB and ISR integrator and the G3 (S3) plays a critical role in synchronizing ISR with the operation, every staff member plays an important role in both tasks. Your primary tool in accomplishing these integration tasks is the Chief of Staff (CofS) or executive officer (XO). The CofS (XO) is responsible to ensure all staff members participate in and provide their functional expertise into the IPB process and ISR planning and execution under the direction of the G2 (S2). There are a number of different techniques that the CofS (XO) can employ to facilitate interaction among the entire staff during the IPB process and ISR integration. However, the desired endstate is an efficient process that supports planning and helps facilitate the commander's visualization and understanding.

1-6. **Ensure ISR operations are continuous.** Your S2 (through the intelligence architecture) continuously performs intelligence tasks to meet your requirements before deploying and during operations. No echelon has enough time, ISR assets, and analytical tools to satisfy all of its requirements. Therefore, never keep your ISR assets in reserve.

1-7. **Use the C^2 system (as described in FM 5-0 and FM 6-0 (FM 101.5)).** Clear C^2 through centralized planning and decentralized execution is important. (This extends beyond collection management, as described in FM 2-33.4 (FM 34-2)). Command and support relationships for ISR units are developed by thorough staff planning (through mission, enemy, terrain and weather, troops, time available, and civilians [METT-TC] analysis). Use habitual relationships, when possible, to optimize effective operations as a combined arms team.

1-8. **Ensure ISR is a distributed operation.** Timely reporting to the right analytical element at the right echelon is critical to ISR operations. Intelligence Reach is a process by which deployed military forces rapidly access information from, receive support from, and conduct collaboration and information sharing with other units (deployed in theater and from outside the theater) unconstrained by geographic proximity, echelon, or command. G2s, S2s, and intelligence analytical elements (for example, the analysis and control element [ACE] and the analysis and control team [ACT] within the direct support [DS] MI company) utilize Intelligence Reach to collaborate, participate in distributed analysis, and share access to the intelligence between echelons and units. Every echelon must work together and tailor the intelligence architecture so that it is as close to seamless as possible—no barriers.

ISR TRAINING

1-9. **Integrate ISR training into garrison ("day-to-day") operations, exercises, and training events**. An increase in the importance of intelligence and the recent complexity of unique environments (urban operations and other complex terrain) and missions (stability operations and support operations) requires well-trained ISR commanders, leaders, soldiers, and organizations to produce superior results. You are responsible for training your portion of the intelligence operating system—the G2/S2. Your G2/S2 is

responsible for training his section and helping you train your unit on ISR issues. However, the G2/S2 (Senior Intelligence Officer) and intelligence commanders and leaders also train a significant portion of the intelligence operating system.

INTELLIGENCE TASKS

1-10. The intelligence battlefield operations system (BOS) is divided into the following four intelligence tasks. It is important that you understand the tasks that the S2 section performs during operations. Each task corresponds with a critical aspect of operations.

- **Facilitate commander's visualization and understanding of the threat and the environment.** This task provides information and intelligence to the commander to support his achievement of battlefield visualization. This task is comprised of three subtasks:

  — **Perform Intelligence Preparation of the Battlefield (IPB)** - IPB is the staff planning activity undertaken to understand the battlefield and the options it presents to friendly and threat forces. It is a systematic process of analyzing the threat and environment in a specific geographic area for a specific mission. By applying IPB, the commander gains the information necessary to selectively apply and maximize his combat power at critical points in time and space.

  — **Perform Indications and Warnings (I&W)** – I&W provide the commander with early warning and prevents surprise through anticipation of significant changes in threat activities. I&W provide the commander the ability to quickly reorient his forces on unexpected major contingencies and shape the battlefield.

  — **Perform Situation Development** – This subtask confirms or denies threat courses of action (COAs), explains what the threat is doing in relation to the friendly force commander's intent, and provides an estimate of threat combat effectiveness. Commanders use situation development to help understand the AO, thereby reducing risk and uncertainty. Situation development helps the commander make decisions and execute branches and sequels.

- **Counter the Threat** - This task provides the commander information and intelligence support for targeting of the threat's forces, threat organizations, units and systems through lethal and non-lethal fires to include electronic attack (EA) and information operations. It also includes the tactics, techniques, and procedures (TTPs) to deny or degrade the threat ISR capabilities to access and collect information and intelligence on friendly forces. This task is comprised of two subtasks:

  — **Support Targeting** - Targeting is supported by the staff to develop target systems, locate the targets, and perform battle damage assessment (BDA) on engaged targets. Included in this task is the use of EA against threat forces.

  — **Perform Counterintelligence** - CI is designed to defeat or degrade threat intelligence collection capabilities. The intelligence staff will provide CI to the commander outlining the capabilities and limitation of threat intelligence services and TTPs to limit or eliminate these capabilities.

- **Intelligence, Surveillance, and Reconnaissance Integration.** This task integrates ISR assets into an effort that produces intelligence, which leads to the commander's gaining situational understanding. These capabilities to collect, process, analyze and produce, and disseminate are critical to successful planning and conducting operations. Intelligence requirements are identified, prioritized, and validated; an ISR plan is developed and synchronized with the scheme of maneuver. This task is comprised of four subtasks:

  — **Develop Requirements** - Intelligence officers develop a prioritized list of what information needs to be collected and produced into intelligence. This list is placed against an LTIOV to ensure intelligence and information are reported to the unit in order for operations to proceed as planned.

  — **Analyze Requirements and Resources Available** - The entire staff under the direction of the intelligence staff analyzes each requirement to determine how best to satisfy it. The staff will receive orders and requests for information (RFIs) from both subordinate and adjacent units and higher headquarters. These requests are then balanced with resources available for tasking to ensure requirements can be met with available assets and their specific capabilities.

  — **Develop Specific Information Requirements (SIRs)** - SIRs break requirements into specific questions which, when answered, can satisfy the larger intelligence requirements. The requirements manager will develop sets of SIRs for each requirement with an LTIOV associated with each one.

  — **Develop ISR Plan.** The XO integrates and supervises the entire staff under the direction of the intelligence staff and develops an integrated and synchronized plan that places requirements to include time with recommended ISR assets. The ISR plan creates a collection strategy and employment scheme that will produce the intelligence required to effectively answer the commander's PIR.

- **Manage Intelligence Support to Information Operations** - Intelligence, both in offensive and defensive operations, provides the critical links for engagement with offensive IO. Intelligence also provides the capabilities and limitation of threat IO. This forms the basis of the defensive IO plan. Intelligence supports IO through its intelligence tasks and subtasks focusing on the target of IO.

EFFECTIVE INTELLIGENCE

1-11. The effectiveness of intelligence is measured against the following standards:

- **Timely:** Intelligence is useful only if you receive it soon enough to support planning, influence decisions, and prevent surprise.

- **Relevant:** Intelligence must answer your requirements and the requirements of your staff about the environment and threat in the format you designate. Your S2 must present you some basic products that help you visualize your battlespace (proportionate to his resources and the time available).

- **Accurate:** Intelligence must provide a balanced, complete, and objective picture of the threat and the operational environment. Alternative or contradictory assessments should be presented to ensure balance and bias-free intelligence.

When a certain degree of doubt exists, your S2 must capture and present that uncertainty.

- **Predictive**: Intelligence should advise you of present and future threat intent, objectives, capabilities, and COAs (with a description of supporting events by each threat operating system).

Chapter 2

Intelligence Preparation of the Battlefield

Longstreet looked up the long rise. He could begin to see it. When the troops came out of the woods the artillery would open up. Long-range artillery, percussion and solid shot, every gun on the hill. The guns to the right, on the Rocky Hill, would enfilade the line. The troops would be under fire with more than a mile to walk. And so they would go. A few hundred yards out, still in the open field, they would come within range of skirmish, aimed rifles. Losses would steadily increase. When they reached the road they would be slowed by the fence there, and the formation, if it still held would begin to come apart. Then they would be in range of the rifles on the crest. When they crossed the road, they would begin to take canister fire and thousands of balls of shrapnel wiping huge holes in the line. As they got close, there would be double canister. If they reached the wall without breaking, there would not be many left. It was a mathematical equation.

—Shaara, Michael. *Killer Angels.* New York, NY: Ballantine Books, 1974, p. 303.

RESPONSIBILITIES

2-1. The above passage details the vision General Longstreet had prior to the assault on Cemetery Ridge during the battle of Gettysburg. Because General Longstreet understood the critical elements of the terrain and the enemy, he was able to visualize this battle before it occurred. You rely on your S2 and staff to provide IPB analysis and graphic products that enable you to effectively visualize the battlefield and make decisions.

2-2. To visualize the battlefield, it is important that you and your XO take the lead to ensure that the IPB process is really an integrated staff effort (this is sometimes referred to as the cross-BOS IPB effort). Your S2 and staff must participate in initial IPB by—

- Analyzing the threat equivalent for their staff or functional area (red hat analysis). For example, the Engineer Officer will help analyze threat mobility, countermobility, and survivability capabilities.

- Helping the S2 capture any threat equivalent actions within the threat COAs for their staff or functional area (red hat actions) within standard or unique IPB products.

- Ensuring that their staff or functional area information requirements are answered or captured as an intelligence gap (in order to support planning and operations).

2-3. Although IPB is a G2/S2 responsibility, the entire staff contributes to the IPB process as shown in the Figure 2-1. However, Figure 2-2 shows the three most important MDMP steps for the commander to drive IPB.

FIRE SUPPORT OFFICER	**ENGINEER OFFICER**
▪ Provides templated locations for threat artillery and rocket systems. ▪ Provides the mission, task, and purpose of threat artillery and rocket systems. ▪ Assists the G2/S3 to accurately portray the threat's use of indirect fires, such as types and phases of threat fire.	▪ Provides templated locations for mobility, countermobility threat obstacles, and manmade obstacles. ▪ Provides information on the threat's preferred construct of survivability positions. ▪ Assists the G2/S2 to accurately portray the task and purpose of threat obstacles and threat mobility assets.
CHEMICAL OFFICER	AIR DEFENSE OFFICER
▪ Provides templated locations for NBC strikes. ▪ Provides information for manmade obstacles, such as NBC contaminated areas. ▪ Assists the G2/S2 to accurately portray the threat's use, intent, and purpose in the use of NBC units and capabilities.	▪ Provides templated locations for threat (air defense) assets. ▪ Provides assistance in identifying air corridors and avenues of approach (AAs). ▪ Provides assistance in identifying threat missions, tasks, and purpose of threat air defense artillery (ADA) and aerial assets. ▪ Assists the G2/S2 to accurately portray the threat's purpose and intent using ADA and aerial systems.

Figure 2-1. Example of staff IPB contributions to the G2/S2

COMMANDER'S INITIAL GUIDANCE - (STEP 1: RECEIPT OF MISSION)

2-4. In order to drive the IPB process, you must answer several questions:

- Do you disagree with or question any significant portions of the higher echelon's IPB products, analysis, facts, or assumptions? If so, you and your S2 must quickly resolve any issues to preclude problems between echelons.

- Does the staff need to focus on any particular part of the IPB process?

MDMP Steps	Commander's Output	The Commander Drive IPB
Step 1: Receipt of Mission	Initial Guidance	Disagree with higher IPB? Abbreviated initial IPB? Initial ISR support? Additional IPB analysis (besides normal procedures)?
Step 2: Mission Analysis	Restarted Mission. Commander's Intent. Commander's Guidance.	Area of interest (AOI). Significant characteristics of the environment. Important environment factors. Choose threat models and identify any refinements. How many threat COAs and their specifics? Initial threat culmination criteria.
Step 6: COA Approval	Approved COA. Refined Commander's Intent. Specified Type of Order. Specified Type of Rehearsal. HPTL.	Final threat culmination criteria. Guidance on refining IPB analysis and products.

- Are there any immediate ISR requirements that need to be addressed early?

Figure 2-2. Driving IPB

COMMANDER'S INTENT AND GUIDANCE - (STEP 2: MISSION ANALYSIS)

2-5. You must allocate adequate time and guidance to your S2 and staff to perform the initial IPB. Successful mission analysis requires a thorough initial IPB to provide the staff with the impact of the environment, weather, and threat for use in subsequent steps of mission analysis.

2-6. In this step the staff starts to convert your visualization of the battlefield into an operational framework. Focus the efforts of your S2 and staff on IPB.

- **Define the Battlefield Environment.** Provide guidance on the AO, AOI, and the significant characteristics of the environment. For example, during a friendly offensive operation, characteristics such as location and activities of threat reserves, reinforcements, and fire support assets are typically significant. During a humanitarian assistance operation, however, the location and activities of civilian relief organizations may be a significant characteristic. Articulate your view so your staff can build the correct framework for the rest of the IPB process.

Why is this important? Failure to focus on only the relevant significant characteristics wastes time and the IPB process will not influence mission success. On the other hand, failure to identify all the significant characteristics may result in your unit's failure to deal with a feature of the battlefield that you and your staff overlooked.

- **Describe the Battlefield Effects.** The S2 and staff use the factors defined in Step 1 and other characteristics to evaluate the battlefield thoroughly and to describe the

  battlefield effects. In stability operations and support operations, you and your battlestaff must view terrain in a unique way and keep in mind the political, economic, ethnic, and other characteristics of the population (the key terrain).

Why is this important? Commanders with a poor understanding of the battlefield effects will probably fail to exploit the opportunities the environment provides, and the threat will find and exploit opportunities in a way the command did not anticipate.

- **Evaluate the Threat.** Most of the analytical work for this step is performed prior to deployment; it is a part of intelligence readiness activities and contingency planning. It is at this point that your S2 and staff clearly define who the threat is and what the threat looks like. In stability operations and support operations the threat could range from conventional military forces to paramilitary forces, insurgents, terrorists, political groups, refugees, or environmental disasters. Understanding the threat's intent provides focus to the S2 so that as he moves to step 4, the threat COAs make sense.

  Why is this important? Failure to evaluate the threat adequately may result in—

  — A lack of intelligence, which is needed for planning.

  — Wasted time and effort in planning against threat capabilities that do not exist.

  — Surprise because of an unknown threat capability.

- **Determine Threat COAs.** Dictate how many and to what level of detail you want the S2 and staff to develop threat COAs, then provide macro-level guidance on how you visualize your intent in relationship to threat objectives and endstate. Finally, provide the S2 and staff guidance on criteria that will lead to culmination of the threat. For example, you could intend to defeat the threat by destroying 75 percent of his organic and attached artillery and 50 percent of the lead motorized rifle battalions (MRBs).

Why is this important? Failure to adequately determine threat COAs will allow the threat to surprise you and your staff. Viable and tactically sound threat COAs provides the framework required to build a successful friendly COA.

2-7. After the mission analysis briefing you approve a restated mission (which becomes the unit's mission) and the initial PIR. (The integrated ISR plan comes from these initial requirements.) Your S2 and staff will continue to refine the PIR (with your approval)

throughout the MDMP. You can also modify your intent (this provides the link between the mission and the concept of operations). Your last responsibility is to provide your staff with enough additional guidance to focus staff activities during the remainder of planning.

COMMANDER'S DECISION BRIEFING - (STEP 6: COA APPROVAL)

2-8. After the decision briefing, you approve the COA you believe to be the most advantageous; you then modify your intent statement and your commander's critical information requirements (CCIR) to support this selected COA and issue further guidance:

- State the final threat culmination criteria.
- Direct refinements for the IPB analysis and products to include greater detail on threat branches and sequels.

WHAT YOU SHOULD EXPECT

2-9. Your S2 and staff must complete IPB early in the MDMP because this process lays the groundwork for COA development and the subsequent steps of the MDMP. IPB analysis and products must help you and your staff do the following:

- Visualize the battlefield.
- Complete COA development, the wargame process, and COA refinement (to include building flexibility into the operation).
- Plan ISR operations.
- Provide the framework so your S2 can perform situation development and your XO/S3 can provide the common operational picture during the operation.

2-10. To meet these requirements, your S2 and staff perform IPB analysis and produce graphic products that—

- Describe the threat's mission, intent (two levels up), and how they see us.
- Portray an adaptive, cunning, and uncooperative threat. Provide a detailed picture of how the threat will operate with all of his combat multipliers (not just a template of how and where he will move).
- Include the task and purpose of all relevant threat ISR systems.
- Supply the level of detail appropriate for the audience in a user-friendly manner.

2-11. The lessons learned discussed herein are from the National Training Center but apply to any brigade or regiment and battalion or squadron level S2.

2-12. During mission analysis, expect your S2 and staff to "paint a picture" you can remember. Require your S2 to begin with the bottom line up front. They should produce the following during mission analysis and present it during the mission analysis brief.

- Battlefield environment visualization analysis and products to include terrain and current weather and weather effect charts.
- Threat organization and timelines: macro to micro. Develop the threat picture from the largest echelon given all the way down to individual vehicle, time permitting. The timelines should also reflect from largest echelon to smallest element.
- Threat commander's intent (two levels up in terms of strategic and tactical missions).
- Threat COA sketches (macro-level).
- Threat COA snapshots. This includes sketches and overlays consisting of the task and purpose of all relevant threat intelligence operating systems (for example, detailed situation templates).

BATTLEFIELD ENVIRONMENT VISUALIZATION ANALYSIS AND PRODUCTS

Terrain

2-13. Expect your staff (led by the S2 and supported by the Engineer Officer) to clearly illustrate how terrain will affect the movement of friendly and threat forces.

- Include the entire AOI.
- Demonstrate the terrain's effects (line of sight, covered and concealed mobility corridors) on combat, CS, and CSS operations.
- Emphasize the significance of key and decisive terrain.

2-14. When possible, your S2 and staff should use and brief from 1:12,500 or 1:25,000 scale maps or photographs to supplement standard 1:50,000 scale maps—a higher resolution map provides a better depiction of the terrain. The divisional terrain team is the primary source of terrain data. Some other products available include digital terrain elevation data (DTED), Arc Digitized Raster Graphics (ADRG), satellite imagery, and the Urban Tactical Planner (UTP) (see FM 5-33).

2-15. In stability operations and support operations, your S2 and staff must analyze and describe those population characteristics that are important to your mission (for example, knowing the routes that are off limits to US forces but available for the threat to accomplish house bombings and theft of building supply materials).

Weather

2-16. Expect your S2 to communicate how weather affects operations in the initial IPB analysis and products. An example of an important impact of weather is the increased effectiveness of obscuration during an operation because of a low wind speed and temperature inversion.

2-17. Weather may have a unique impact on stability operations and support operations in both threat and friendly operational patterns. For example, weather could—

- Cause the threat to cancel demonstrations or rallies during inclement weather.
- Affect friendly psychological operations (PSYOP) because rain and heavy winds disrupt leaflet drops.
- Impact civil affairs (CA) operations; heavy rain could disrupt construction projects or a medical and veterinary assistance program.

THE THREAT

2-18. The S2 should remember that the threat will be capable of adaptive operations, asymmetric methods of attack, hiding their operational patterns from friendly forces, and conducting atypical operations. An asymmetric approach is the employment of non-conventional forces, means, or technology (such as weapons of mass destruction [WMD], small-scale chemical attacks or computer network attacks) to offset the advantage of a superior military force. One possible threat COA would be to apply an asymmetrical method and attack US Forces at a critical point when we are vulnerable in order to prevent us from synchronizing our operations. For example, a terrorist attack on the infrastructure of a port of debarkation just as US Forces start to deploy could have a devastating impact.

2-19. Within the current operational environment, friendly forces face the probability of deploying with few or no threat models (that consist of doctrinal templates with a description of tactics and options and type high-value target [HVTs]). During staff operations the CofS (XO) ensures all staff members participate in and provide their functional expertise into the IPB process and ISR planning and execution under the direction of the G2 (S2). In many operations, your staff will have to perform detailed analysis over a period of time in order to determine threat patterns and develop threat models. However, the staff must develop a modified combined obstacle overlay (MCOO), multiple situation and event templates, and other IPB products. In order to support planning, the staff adapts these products based on the particular operation. The staff must develop these products in spite of the difficulty of developing threat models and predicting threat actions for an adaptive adversary.

2-20. One technique to deal with the uncertainty of making predictions without a threat template for an adaptive adversary is to develop more tailored threat models and templates for specific types of smaller scale activities than the staff produces for conventional offensive operations. While some of the models and templates will contain less level of detail, these products can cover more “worst case” and “most likely” threat operational patterns and COAs. Like most staff planning processes, IPB only reflects the staff’s best assessment. In these circumstances operational planners may use techniques to accept less or mitigate risk in the conduct of operations (for example, developing more branches and sequels). Even after the intelligence staff identifies threat patterns and develops threat models, analysts must remain vigilant and try to predict those operational changes an adaptive threat is most likely to adopt. The IPB discussion within most of the rest of this chapter is based on Krasnovian Opposing Forces (the Army’s standard training and simulations tool) and the use of threat models and the other mandatory IPB.

Threat Organization And Timelines: Macro to Micro

2-21. Expect the S2 to describe those forces the threat will use, or potentially use, in the conduct of his operations. An order of battle (OB) chart, as shown in Figure 2-3, is a good tool. The chart should include the unit designation, if known, the type of unit such as a tank regiment, and the equipment by nomenclature and number within the unit (for example, 104 x T-72's; 33 x BMP-3's), and unit subordination.

2-22. Some threats could use indirect, often subtle methods to attack US Forces. The assumption that the adversary will “fight fair,” consider delivery methods or collateral damage, or comply with the current “laws of warfare” is not necessarily true.

2-23. Your S2 can also produce a graphic timeline, as depicted in Figure 2-4, to assist in developing your own COAs and associated decisions. The threat COA matrix in Figure 2-5 shows a comprehensive breakdown of several different threat COAs.

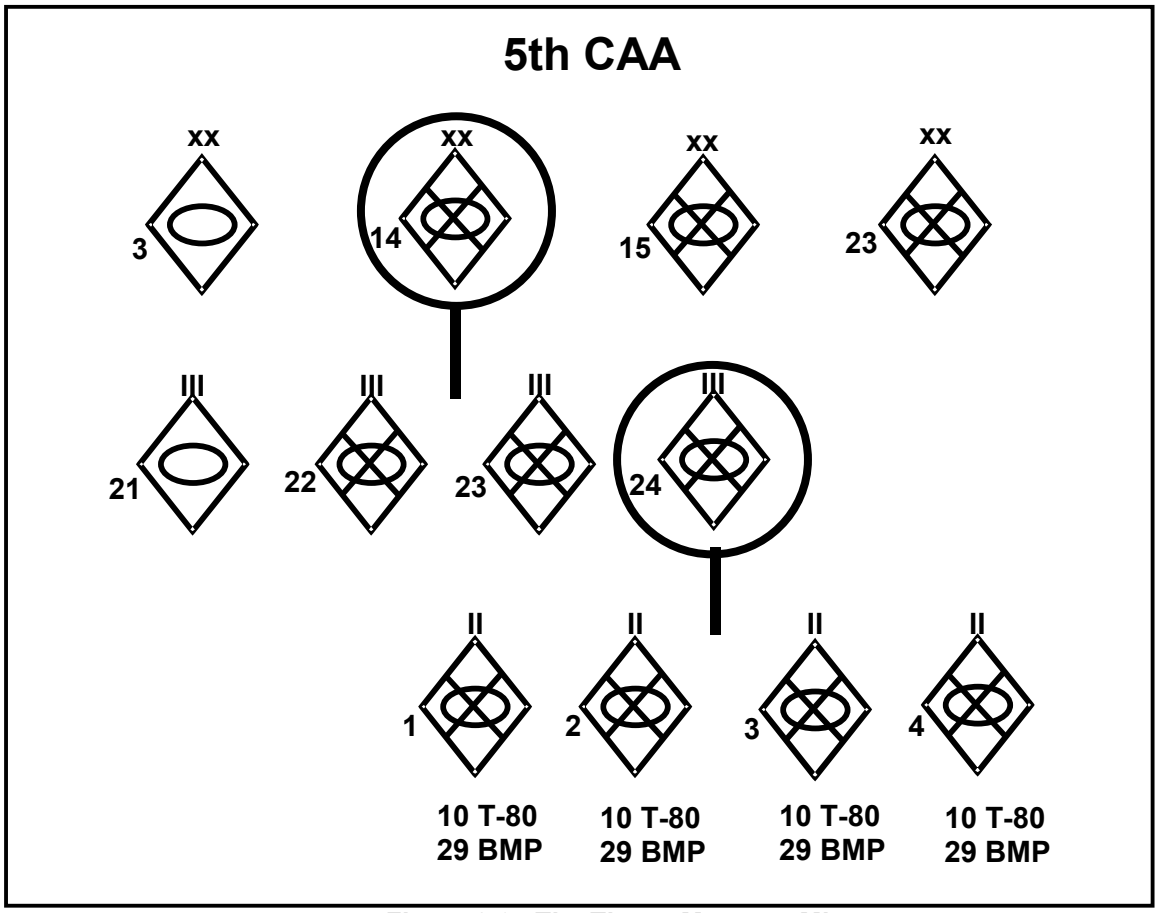

Figure 2-3. The Threat-Macro to Micro

2-24. The threat COA matrix works equally well in stability operations and support operations. The threat COA may include demonstrations causing US casualties, interrupting relocation efforts, or disrupting elections. The rest of the matrix should reflect friendly actions to counter threat actions.

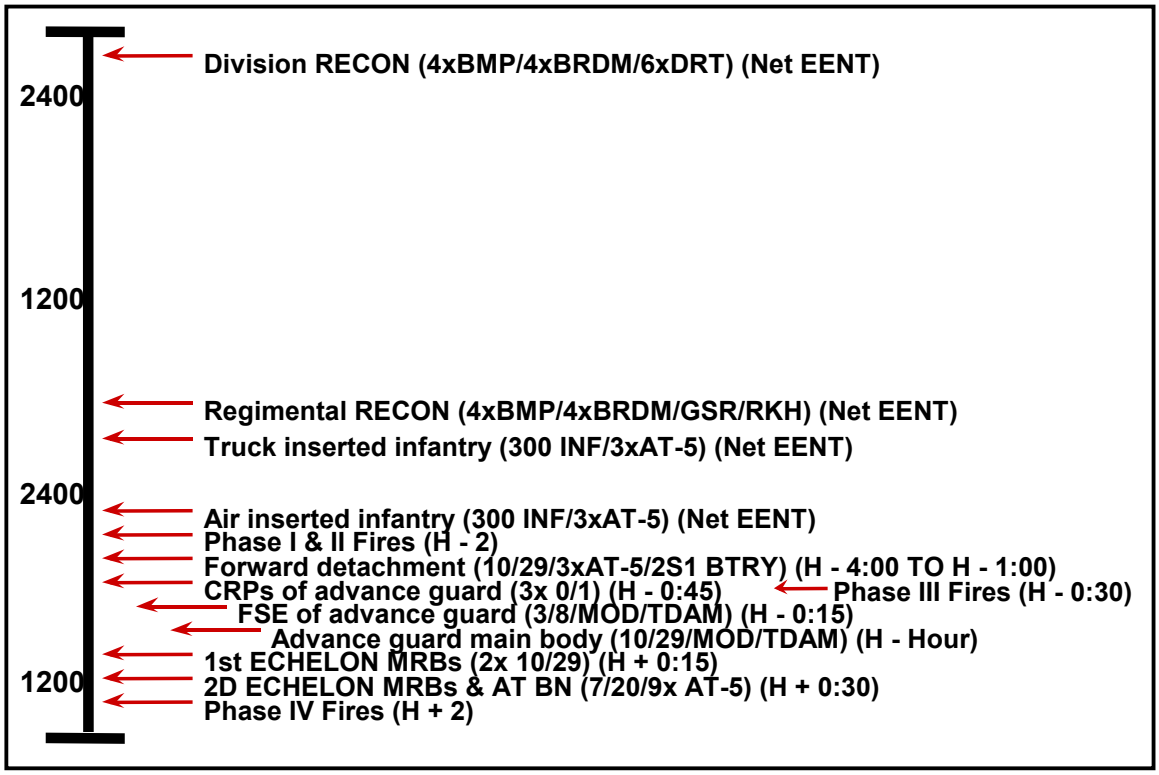

Figure 2-4. Threat timeline

	Threat COA 1 (Brown Pass)	Threat COA 2 (Debnam Pass)	Threat COA 3 (South Wall)
TF Destroyer	Truck insert and infiltrate to goat trail to attrit CO/TM	Truck insert and infiltrate to Debnam Pass to breach and facilitate movement of the regiment main body	Truck insert and infiltrate to secure Hill 899 to facilitate the movement of the AGMB
TF Angel	Air insert and infiltrate through Bruno Escarpment to attrit northern CO/TM	Air insert vic Matterhorn and infiltrate to attrit CO/TM	Air insert vic Matterhorn and infiltrate to prevent repositioning
FD	Atk to secure Brown Pass to open point of penetration	Atk to Brigade Hill to facilitate movement of regiment main body	FD: Atk to fix two CO/TMs of northern TF
Special Munitions	Prevent forces from repositioning north out of Colorado/Washboard	Prevent forces repositioning out of Colorado/Washboard and protect the north flank of the regiment	Protect the north flank of the regiment
FSE of AG	Atk to secure Brown cut or reinforce FD	Atk to secure Debnam Pass to facilitate movement of the regiment main body	Atk to Brigade Hill to facilitate movement of regiment main body
AGMB	Atk to secure Crash Hill to protect the south flank of the regiment	Atk to secure Debnam Pass to facilitate movement of the regiment main body	Atk to Hill 899 to facilitate movement of regiment main body
1st Echelon North	Atk to seize the regiment subsequent objective	Atk to secure Crash Hill to protect the north flank of the regiment	Atk to secure firing lines to protect the north flank of the regiment
1st Echelon South	Atk to seize the regimental subsequent objective; O/O protect the south flank of the regiment	Atk to secure firing lines vic Matterhorn to protect the south flank of the regiment	Atk to secure the regimental subsequent objective
AT Bn	Protect the south flank of the regiment	Protect the south flank of the regiment	Protect the north flank of the regiment
2d Echelon	Follow and assume main effort	Follow and assume main effort	Follow and assume main effort

Figure 2-5. Threat COA matrix

Threat Commander's Intent

2-25. Expect your S2 to clearly articulate how the threat perceives our operations and the threat commander's intent (from one echelon down to two echelons up). The threat commander's intent should be loosely based off your intent. The threat's perception of us and the threat intent drives how the S2 develops each threat COA (by identifying logical options).

2-26. Your S2 should develop the threat intent and the initial threat COA from macro to micro resolution. Many threats use some form of doctrine to conduct operations (for example, fixing a part of a defensive position, while suppressing, and flanking another part of the same position).

Threat COA Sketches (Macro-Level)

2-27. Expect your S2 to use cartoon sketches to show all feasible threat COAs. These sketches should show the threat mission statement and how the threat will fight. You

should address all the sketches to better prepare you to deal with a thinking and adaptive threat.

2-28. Although the S2 can develop a full set (five or more) of broad sketches, he rarely has the time to develop that many detailed threat COAs (for example, detailed situation templates). Your S2 should provide you with two or three detailed threat COAs and two or three broad threat COAs. The total package helps build more flexibility into the plan. At a minimum, the detailed threat COAs must include the most dangerous and most likely threat COAs. Remember, the most likely and most dangerous threat COAs can change based on your actions or COA and how much information the threat collects about you.

Example for Most Probable Threat COA

During mission analysis the S2 decides the threat's most probable COA is to attack into the northern part of the friendly sector. The IPB process drives a friendly COA to defend with a heavily weighted effort in the north. Successful threat reconnaissance reports that the bulk of the engineer effort, especially obstacle work, is occurring in the north.
The threat may have initially planned to attack north but decided against it once his reconnaissance confirmed your strength. Expect your S2 to consider and articulate this type of possibility when briefing.

2-29. Figures 2-6 through 2-9 show a method of using a combination of text and graphics to communicate several feasible threat COAs quickly and clearly.

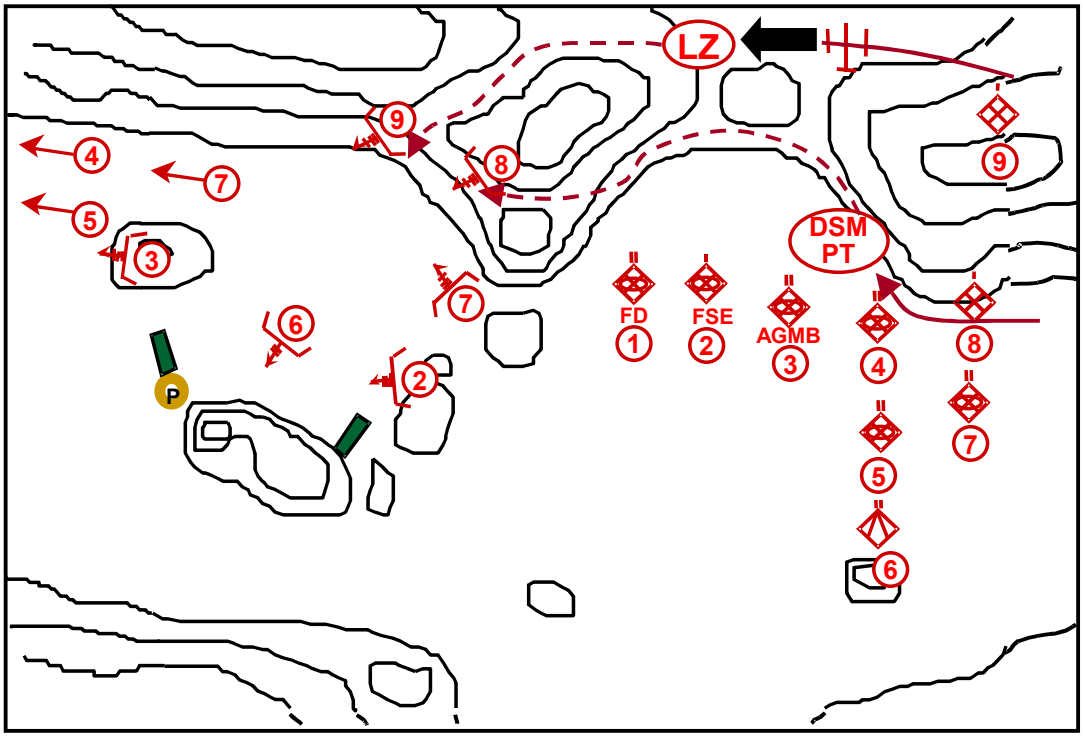

Figure 2-6. Brown Pass (Threat)

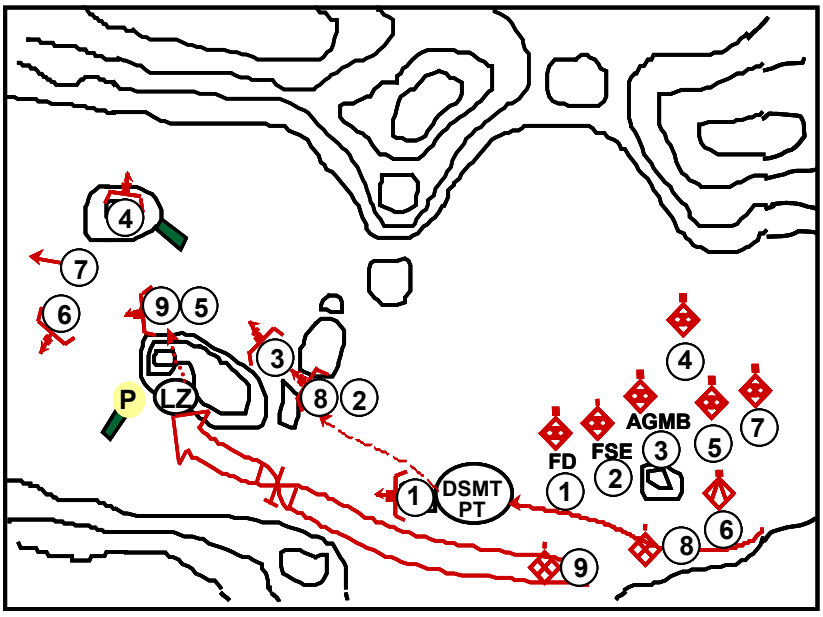

Figure 2-7. Debnam Pass (Threat COA 2)

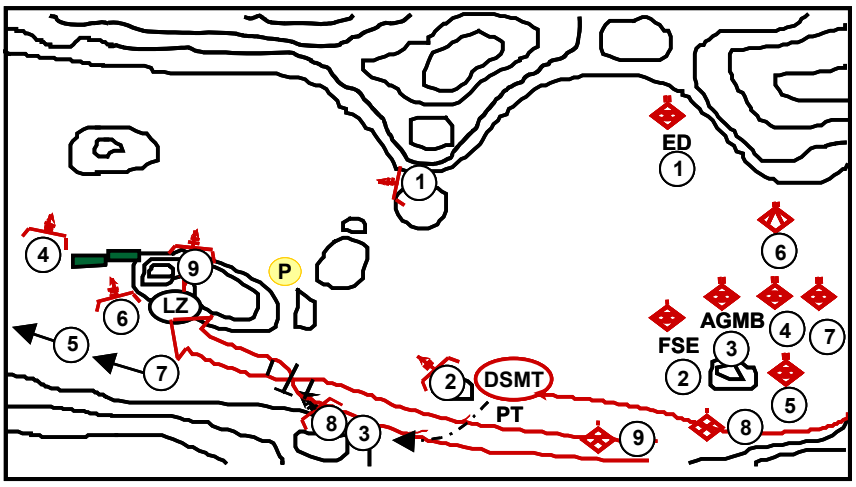

Figure 2-8. Southwall (Threat COA 3)

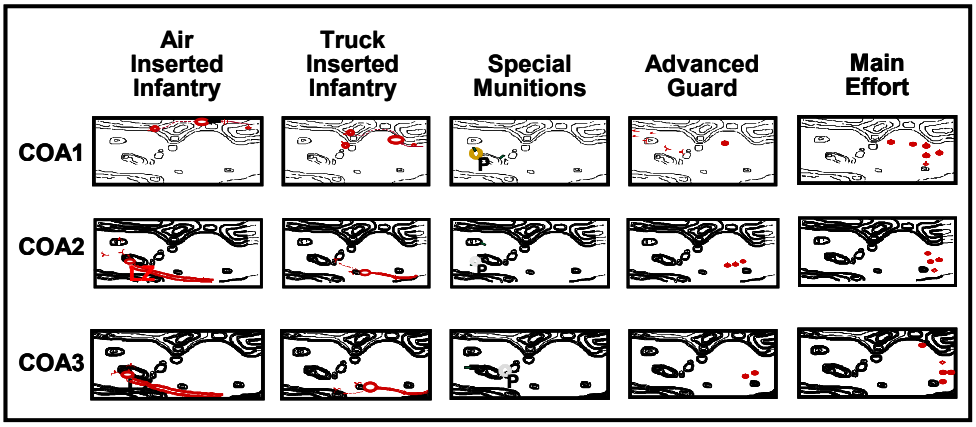

Figure 2-9. The Storyboard

2-30. Figure 2-9 is a storyboard that shows broad threat COAs during a motorized rifle regiment (MRR) attack. Similar map sketches showing the necessary terrain are pasted in each square. Threat critical events are labeled across the top of the chart and each box provides a space for your S2 to sketch out different threat options. Each sketch should include composition, task, and purpose.

2-31. In a stability operation or support operation, intelligence may reveal that the intent of the threat is to force the US military to leave. Based on this intent, the S2 develops a threat COA for inflicting US casualties. The S2 expects the attack will come from a paramilitary organization and describes the threat COA using a sketch (see Figure 2-10).

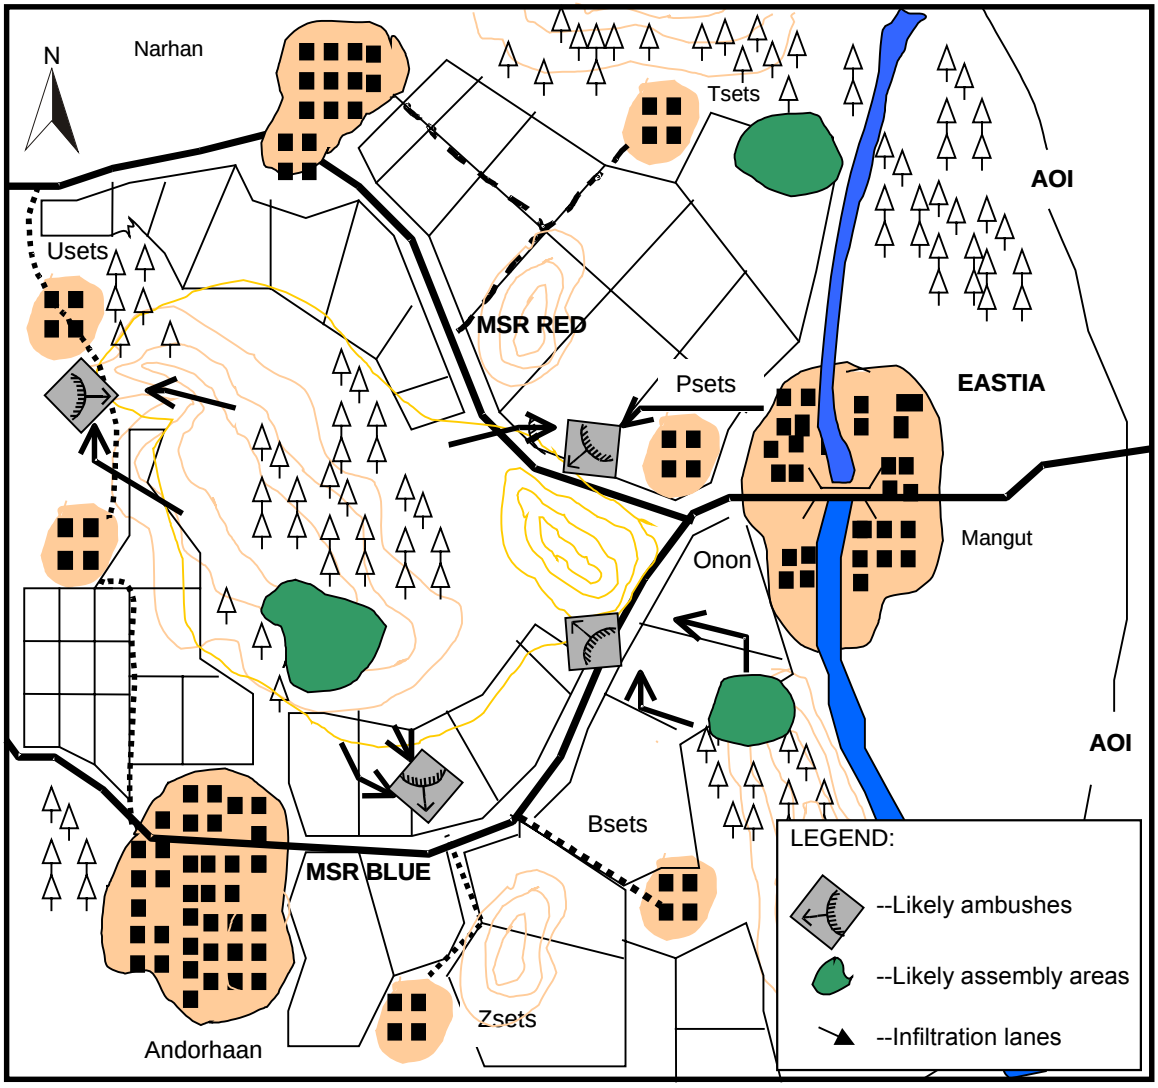

Figure 2-10. Threat COA

2-32. Every option should indicate something critical (an indicator) to the threat's plan. Once the threat starts their operation your S2 can quickly confirm and/or deny threat COAs.

Threat COA Snapshots

2-33. Without an accurate depiction of how and when threat forces will deploy, it is difficult to adequately plan operations (in accordance with your intent). If possible, your S2 should develop threat models before deployment. If your S2 "front loads" this work, he can easily build a detailed situation template.

2-34. It is also important that your XO takes the lead and ensures that the IPB process is really an integrated staff effort. Every staff or functional area representative should fully participate in each step of IPB (this is sometimes referred to as the cross-BOS IPB effort). The bottom line of this participation is "red hat" analysis of their staff or functional equivalent and integrating the results into existing or additional IPB products. For example, the brigade fire support coordinator (FSCOORD) should help the S2 template threat artillery, identify the threat's high-payoff targets (HPTs) (friendly assets whose destruction is critical to support the threat mission), and timeline important phases of fire. This type of staff interaction is critical to the quality of the IPB process and products and to meet the short timelines for initial IPB.

2-35. Expect your S2 and staff to provide you with the threat's method of employment to include dispositions, main effort, scheme of maneuver, and his use of a full range of combat multipliers. An effective way to do this is to create predictive snapshots of the threat at critical places and times. Figures 2-11 through 2-13 illustrate a technique to display the critical events of an MRR attack. Figure 2-14 shows these figures in a consolidated format.

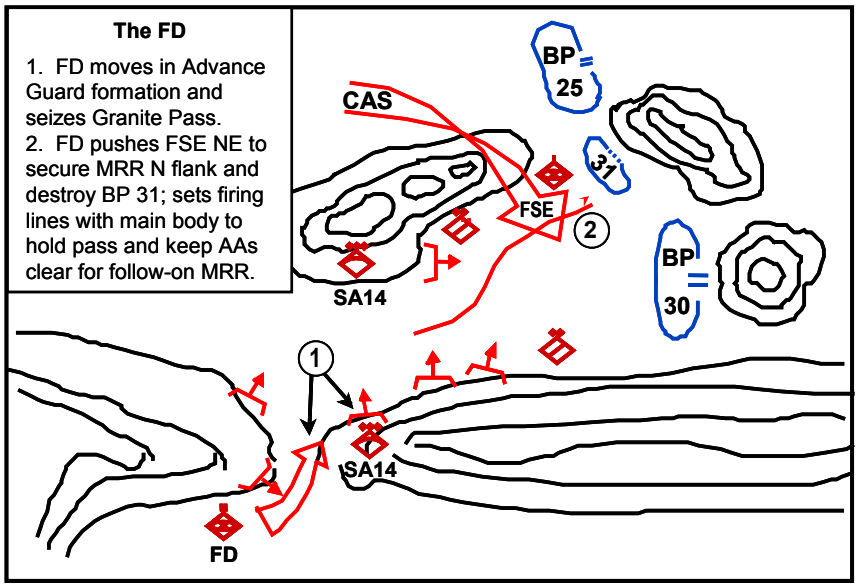

Figure 2-11. Snapshot Sketch #1

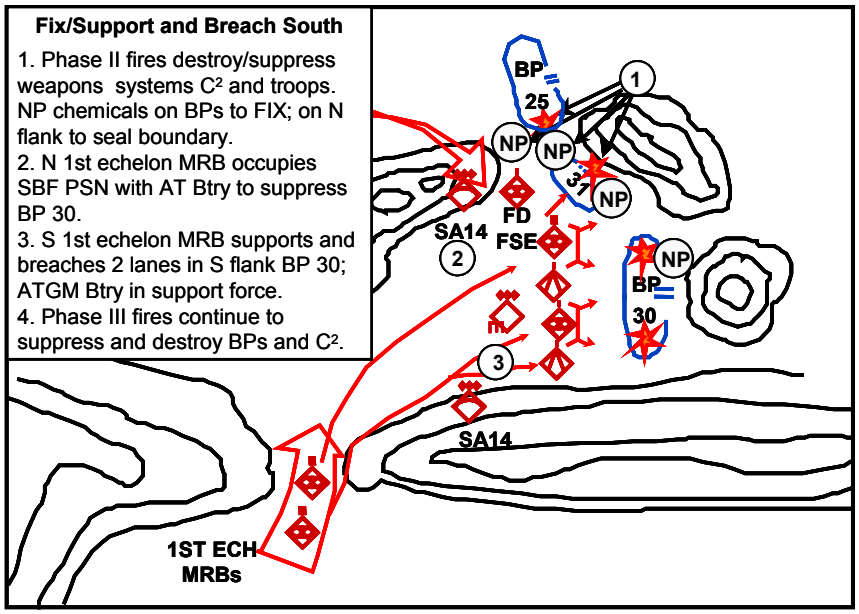

Figure 2-12. Snapshot Sketch #2

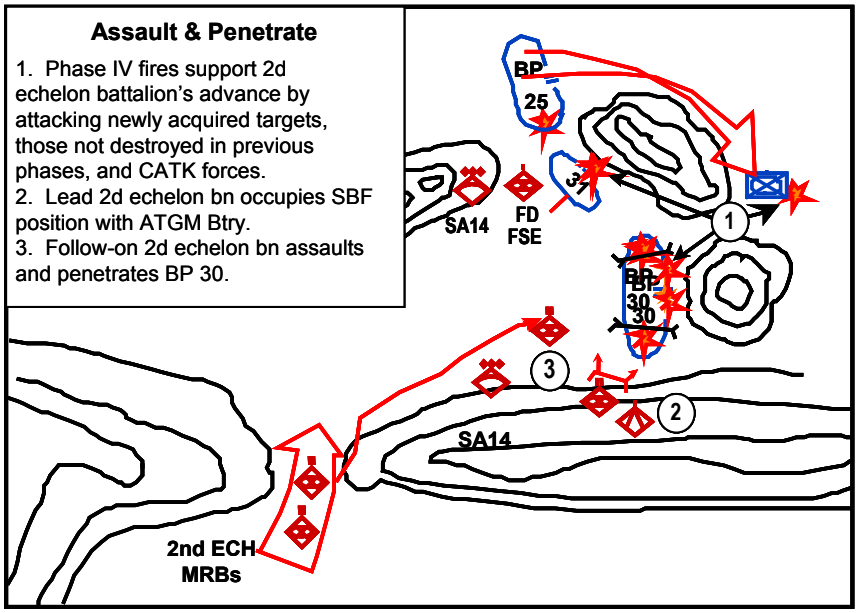

Figure 2-13. Snapshot Sketch #3

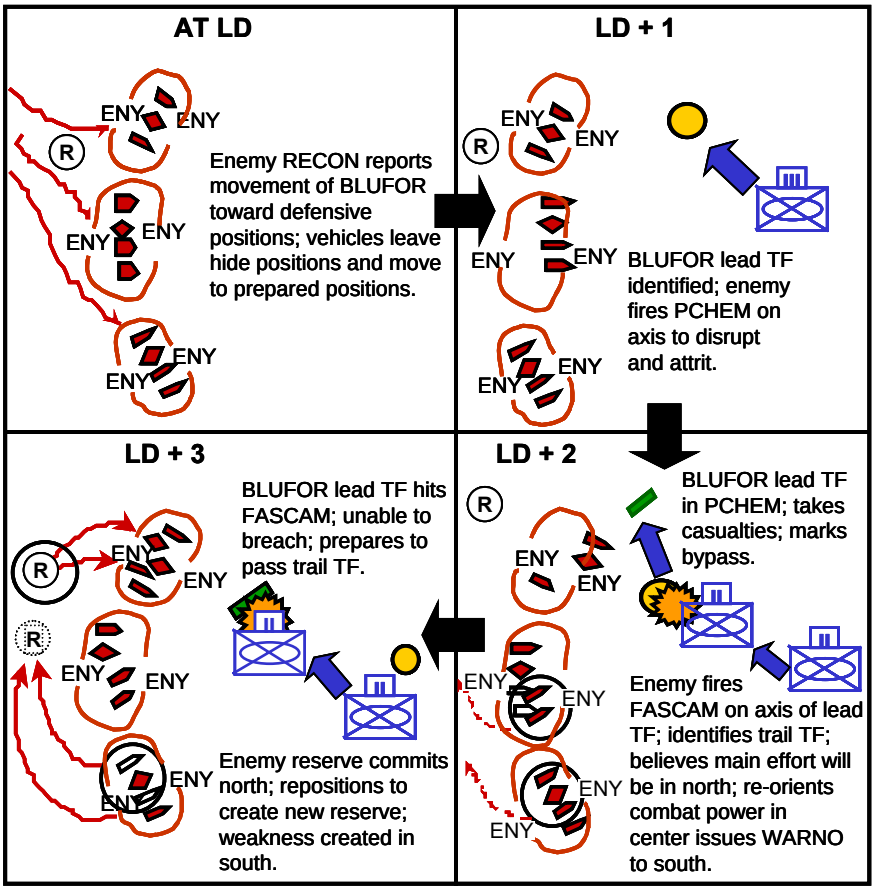

Figure 2-14. Threat COA sketch

FRIENDLY VULNERABILITES

2-36. Your S2 is responsible to provide a detailed description of how the threat can exploit any friendly vulnerabilities. There are three questions that your S2 uses to predict how the threat will try to exploit friendly vulnerabilities.

- Where are we vulnerable? The S2 must determine where (for example, critical systems or world opinion) the threat believes we are vulnerable and also looks at where you and your staff assess you are vulnerable.

- What will they attack? The S2 then looks at the friendly plan and threat capabilities and COAs to determine what the threat commander will most likely attack. This analysis supports the determination of essential elements of friendly information (EEFI) and friendly operations security (OPSEC) measures. Additionally, at higher echelons this helps drive CI analysis.

- When and how? By analyzing what the threat will attack, the S2 then uses threat doctrine or a reasonable prediction of likely actions to answer how and when the threat will attack.

Chapter 3

S2/G2 Organizations and Functions

THE BATTALION S2

3-1. Your battalion S2 section is austere. Even when fully staffed, your S2 section is not resourced to conduct sustained operations at both the tactical operations center (TOC) and tactical command post (TAC). Battalion S2 operations usually provide few detailed products because of the lack of time and resources.

OPERATIONS

3-2. Every member of the S2 section should be able to perform any of the intelligence functions. Your S2's priorities are to—

- Perform mature IPB (for more information, see Chapter 2).
- Plan, task (through your S3), and control ISR operations as part of an integrated effort by your staff. You must protect your scant resources and focus on your PIR.

3-3. The S2 must carefully drive planning that leads to the scout platoon mission. The fragmentary order (FRAGO) that the scout platoon uses to begin its mission must include precise guidance on the infiltration method, collection tasks, reporting criteria and timelines, fire support, casualty evacuation plan, and many other aspects of the mission. The S2 should also debrief scouts and patrols, when time permits, to obtain all relevant information. The S2 should also—

- Task frontline troops and combat patrols for collection.
- Perform a very basic level of situation development to advise you on threat actions, capabilities, and vulnerabilities.

3-4. Reports from scout platoons and every company or company team vary in accuracy. The S2 must conduct analysis to integrate all the information from many means (for example, the scouts, fire support net, and command net) to provide you timely, relevant, accurate, and predictive intelligence as you execute the operation.

STAFF INTERACTION

3-5. Although the XO is responsible for integrating and synchronizing operations plans (OPLANs) and operations orders (OPORDs); directing and supervising the staff's planning process; and ensuring all staff members provide IPB input to the S2/G2, your XO, S2, S3, Fire Support Officer (FSO), and Engineer Officer should work closely in planning and synchronizing battalion operations. Through the XO, train your S2 on the products you expect him to produce and your standards. You and your XO must also train your staff on intelligence capabilities, limitations, and operations.

PRODUCTS

3-6. Your S2 does not have the time nor the resources to develop many detailed IPB products. Once you and your S2 accept the brigade IPB results, the S2 section starts to develop those products to the level of detail needed to support battalion operations.

3-7. Your S2 should always produce (and modify when necessary) the following:

- A set of detailed situation templates or other threat model for at least two threat COAs (most dangerous and most likely).
- An event template.
- An integrated ISR plan to answer your PIR in a timely manner.
- The intelligence portion of the decision support template (DST).

MI SUPPORT AND ATTACHMENTS

3-8. Except for ground surveillance radar (GSR) and the Remotely Monitored Battlefield Sensor System (REMBASS), you will probably not have MI assets attached to your unit. Ensure your staff fully integrates any MI assets you receive into the ISR plan. However, you can expect additional MI support and assets operating in your AO during stability operations and support operations (particularly tactical HUMINT teams).

THE BRIGADE S2

3-9. The S2 section is much larger at the brigade level than at the battalion. However, light brigades will have fewer personnel than heavy brigades.

OPERATIONS

3-10. IPB is a more systematic process at brigade level than at battalion level. A significant amount of training is necessary at the brigade level to bring the section together as a team. Your S2 will have to conduct a more thorough and comprehensive IPB and situation development (this includes accepting risks with the predictive nature of IPB). These tasks require a confident, experienced tactical MI officer who understands friendly operations and the threat.

3-11. If you do not have organic scout assets (like the brigade reconnaissance troop), you will have to either use subordinate unit soldiers and equipment to perform that function or rely on subordinate battalions and the division to provide you information and intelligence. When scouts are organic to the brigade, the brigade S2 should drive the planning just like the battalion S2.

STAFF INTERACTION

3-12. Although the XO is responsible for integrating and synchronizing OPLANs and OPORDs; directing and supervising the staff's planning process; and ensuring all staff members provide IPB input to the S2/G2, your XO, S2, S3, FSO, and Engineer Officer should work closely in planning and synchronizing brigade operations. Due to the size of the brigade staff, it is not as easy for you, the XO, and the S2 to educate the entire staff on intelligence operations. An aggressive series of officer and noncommissioned officer (NCO) professional development classes can help train your staff on intelligence. The S2 section must carefully disseminate intelligence to many users to include using short but

effective briefings. Through the XO, train your S2 on the products you expect him to produce and your standards. You and your XO must also train your staff on intelligence capabilities, limitations, and operations.

3-13. As a rule, the S2 sends an assistant S2 with an analyst to the brigade TAC to perform limited analysis and advise the commander and any staff (when they are present). For detailed analysis the TAC must depend on the TOC.

PRODUCTS

3-14. Your brigade S2 develops more products (representing a larger area and some with more detail) than the battalion S2. When your brigade S2 completes his products and forwards them to the battalion S2, he should expect to explain the results, answer questions on his analysis and products, and change any products as appropriate. Your S2 should always produce (and modify when necessary) the following:

- Basic products to describe the battlefield's effects to include weather and terrain. In stability operations and support operations, the S2 must produce more complex products that graphically depict key characteristics of the local population.
- A set of detailed situation templates or other threat models for at least three threat COAs (to include the most dangerous and most likely).
- An event template, the intelligence estimate, and an integrated ISR plan (with a supporting ISR matrix) to answer your PIR in a timely manner.
- The intelligence portions of the DST and operating system synchronization matrix (for example, PIR, named areas of interest [NAIs], and R&S collection).
- A separate ISR synchronization matrix that ties the integrated ISR plan with the operating system matrix.
- Appendix B, Intelligence to the OPORD (a good matrix appendix is acceptable).

TYPICAL MI SUPPORT TO A BRIGADE

3-15. Your brigade is normally supported by a direct support (DS) MI company with a habitual relationship to your brigade (see Chapter 4). The DS MI Company provides several significant capabilities:

- A commander to help the S2 plan.
- C^2 for all MI assets (to include any other assets or units attached or supporting the brigade). The MI company command post serves as the control mechanism for all MI assets. Any additional control teams that support the brigade (for example, a tactical HUMINT control team during some types of operations) collocate and operate with the analysis and control team (ACT).
- Analytical support to the S2 and processing and fusion systems.
- Organic intelligence collection systems.

THE DIVISION AND CORPS G2

3-16. The G2 sections at division and corps are significantly larger staff organizations than the brigade S2 section. For example, the G2 section functionality normally includes

a Deputy G2, Operations, Plans, Training, special security officer (SSO), CI, terrain team, and the ACE, and is supported by the staff weather officer (SWO).

OPERATIONS

3-17. The G2 operations officer directs and coordinates intelligence, the division SSO, the staff weather team, and the terrain team based on G2 guidance. He is responsible for proper integration and dissemination of all intelligence and combat information that the ACE and subordinate S2s report. He combines that intelligence and combat information and presents the current intelligence (the threat portion of the common operational picture) to the commander and staff. This helps the division commander visualize his battlespace, by graphically and effectively depicting the environment, and depict current threat actions and predicted threat capabilities, intentions, and COAs.

ANALYSIS AND CONTROL ELEMENT (OPCON)

3-18. The ACE is the focal point for all division ISR operations (to include planning, processing, producing, and dissemination). It consists of a single-source analysis section, an all-source analysis section, a collection management team, and a targeting team. The ACE is under operational control (OPCON) to the G2 (from the MI battalion). ACE personnel perform all of the tactical intelligence tasks (see Chapter 1) in support of division operations. The ACE fuses information from all ISR assets and units into intelligence products and the all-source correlated database. The ACE also provides an accurate, relevant picture of the battlefield to the G2 operations section. The G2, terrain team, SWO, and ACE work together to develop, present, and distribute IPB products across the division.

PLANS

3-19. The G2 plans is responsible for all products required for mission analysis and wargaming. (He is supported by the all-source production section of the ACE.) The G2 plans drives the MDMP because he understands and describes the environment and the threat. During mission analysis, the planner also relies on the electronic warfare officer (EWO), SWO, and terrain team for products and integrates the products into the wargame and targeting sessions.

TRAINING

3-20. The G2 training office can help you train your S2 and his section. The training officer prepares and consolidates the intelligence requirements for field training exercises, command post exercises, joint training support, and other training events. Along with the G3, this office develops the training requirements and standards for the division intelligence system and interfaces with intelligence simulation systems. The training office also manages the division's readiness training and other valuable intelligence training programs.

STAFF WEATHER OFFICER (SPECIAL STAFF UNDER THE G2)

3-21. The Air Force provides an SWO and a supporting combat weather team (CWT) to major subordinate commands, corps, divisions, and separate brigades to work under the supervision of the G2. The CWT can provide tailored tactical decision aids and overlays depicting the effects of weather on systems, personnel, and equipment.

TERRAIN TEAM (NO COMMAND OR SUPPORT RELATIONSHIP)

3-22. The G2 is the primary "customer" for terrain analysis. The terrain team supports

the G2 by providing terrain analysis and analysis products to describe the battlefield's effects. The terrain team can provide unique products for use by the intelligence analysts in determining AAs, axis of advance, and mobility corridors. (NOTE: the G4, and not the terrain team, is responsible for supplying Army units with maps.)

ELECTRONIC WARFARE OFFICER (NO COMMAND OR SUPPORT RELATIONSHIP)

3-23. Although the EWO works directly for the G3 and is integral to integrating EW into the targeting process, he is an intelligence officer and works closely with the ACE and G2 plans officer. He is also involved in coordinating frequency management and deconfliction with the division signal officer prior to planning and executing EA missions.

OPERATIONS

3-24. The division and corps G2s work together to build a complementary intelligence architecture within the corps. Each echelon has unique collection capabilities and requirements, but both G2s (and their ACEs) rely on a distributed and collaborative environment that allows users to share both information and intelligence down to the battalion level (through your S2).

3-25. Depending on the intelligence architecture and who is designated the joint task force (JTF) and/or the Army force (ARFOR), the division G2 coordinates with the corps or ARFOR G2 to—

- Maintain the integrity of most intelligence databases.
- Provide detailed, thorough, and "long-term" analysis.
- Conduct more robust ISR collection and processing (through more capable downlinks like certain Tactical Exploitation of National Capabilities [TENCAP] systems). Some of these units and/or systems may operate in your AO, especially during stability operations and support operations. They also may provide you with tactical HUMINT teams.

Chapter 4

Military Intelligence Capabilities

No single echelon has sufficient organic intelligence capabilities to satisfy all of your requirements. In order to efficiently use the intelligence operating system, you must understand the following:

- Intelligence disciplines.
- Intelligence functions.
  - Combat information and intelligence.
  - Electronic warfare.
- MI organizations.
- Limitations of intelligence.

To clearly describe the intelligence operating system, intelligence is divided into five disciplines and two multidiscipline functions (CI and Technical intelligence [TECHINT]).

- HUMINT.
- Imagery intelligence (IMINT).
- Measurement and signature intelligence (MASINT).
- Signals intelligence (SIGINT).
- All-source intelligence.

INTELLIGENCE DISCIPLINES

4-1. The first five disciplines are directed toward the collection, processing, and analysis of information from a specific category of sources. The two multidiscipline functions are directed toward the integration of the information collected through the first five disciplines and the production of a category or categories of intelligence. Intelligence production includes the intelligence categories of I&W, current, general military, target, and scientific and technical intelligence (S&TI). CI produces the intelligence category of CI.

4-2. Single-discipline collection or analysis rarely produces a comprehensive picture of the threat and is subject to deception. However, all-source intelligence that is produced from an adequate amount and mix of information (from the different disciplines) will meet your requirements. Each discipline must complement and cross-cue each other for maximum effectiveness. All disciplines use a combination of open and closed sources in the process of their collection and/or production.

HUMAN INTELLIGENCE (HUMINT)

4-3. HUMINT is the intelligence derived from the analysis of information obtained from a human source or a related document by a HUMINT collector. The HUMINT discipline

includes those personnel and organizations directed toward the collection, processing, analysis, and production of HUMINT.

- A HUMINT source is a person from whom information can be obtained. The source may either possess first- or second-hand knowledge normally obtained through sight or hearing. HUMINT sources include literally every human being (non-US citizens). Potential HUMINT sources include threat, neutral, and friendly military and civilian personnel; people of all ages, occupation, ethnic, religious, economic, and political groups.

- A HUMINT collector is a person who by training is tasked with and engages in the collection of information from individuals (HUMINT sources) for the purpose of answering intelligence information requirements. HUMINT collectors specifically include personnel in military occupation specialty (MOS) 97E (HUMINT) and Warrant Officers in MOS 351E (HUMINT). Other personnel that can perform HUMINT collection tasks are unit S2s acting in the capacity of tactical questioners, CI agents involved in counterintelligence force protection source operations (CFSO) and Special Forces personnel engaged in low-level source operations.

- HUMINT collection involves the use of tactical questioning, interrogation, debriefing, elicitation, and document exploitation (DOCEX) techniques to extract information from a HUMINT source. For more information on HUMINT, refer to FM 34-5(S) and FM 2-22.3 (FM 34-52).

EMERGING DOCTRINE (TACTICAL HUMINT)

Tactical HUMINT is the combination of HUMINT collection assets and CI assets using HUMINT collection techniques to support a tactical commander. This package provides a unique ability to support force protection, conduct HUMINT collection (to include counter-HUMINT), or to perform vulnerability assessments and is more common in stability operations and support operations than in war. Tactical HUMINT platoons and teams are task organized based on METT-TC. When supported by a platoon or team, it is important that you—

- Understand the capabilities, control requirements, and limitations.
- Weigh your requirements for intelligence and force protection against the risk to the platoon or teams.
- Approve the best mix of HUMINT collectors and CI personnel (through the DS MI company and employment techniques).

IMAGERY INTELLIGENCE

4-4. IMINT is the intelligence derived from the analysis of imagery derived from, but is not limited to, radar, infrared, optical, and electro-optical (E-O) sensors. The IMINT discipline includes the

following personnel and organizations directed toward the collection, processing, analysis, and production of IMINT:

- Imagery Sources (LRS, Apache, Kiowa Warrier, HUMINT).

- Imagery Collectors (U2R Advanced Synthetic Aperture Radar System [ASARS), Joint Surveillance Target Attack Radar System [Joint STARS], unmanned aerial

vehicle [UAV], TENCAP systems, and airborne reconnaissance low-multifunction [ARL-M]).

4-5. For more information on IMINT, refer to FM 2-50.1 (FM 34-25-1), FM 2-55.1 (FM 34-25-2), and TC 34-55.

MEASUREMENTS AND SIGNATURE INTELLIGENCE

4-6. MASINT is the intelligence derived from the analysis of information gathered by technical instruments such as radars, lasers, passive E-O sensors, radiation detectors, seismic, and other sensors to measure objects or events to identify them by their signatures. The MASINT discipline includes those personnel and organizations directed toward the collection, processing, analysis, and production of MASINT. REMBASS is an example of a MASINT collector. (For more information on REMBASS, refer to FM 2-00.10 (FM 34-10-1.)

SIGNALS INTELLIGENCE

4-7. SIGINT is the intelligence derived from the analysis of information obtained through the intercept of adversary communications and noncommunications emitters. The SIGINT discipline includes those personnel and organizations directed toward the collection, processing, analysis, and production of SIGINT. SIGINT is subdivided into—

- Communications intelligence (COMINT).
- Electronic intelligence (ELINT).
- Foreign instrumentation signals intelligence (FISINT).

4-8. Examples of SIGINT ground-based intercept and direction finding (DF) systems are the AN/MLQ-40(V)2 Prophet, AN/PRD-12/13, the AN/TRQ-32A (V) 2 (TEAMMATE), and the AN/TRQ-152 (TRACKWOLF) systems. The GUARDRAIL common sensor (GRCS) is an example of an airborne intercept and DF system for both communications and noncommunications emitters. The AN/FSQ-144V (TROJAN) is the Army's remote collection system supporting in-garrison collection by tactical MI units.

COUNTERINTELLIGENCE

4-9. CI is derived from the analysis of all-source information concerning the threat posed by activities of foreign intelligence and security services and the intelligence activities of non-state entities such as organized crime, terrorist groups, and drug traffickers. The CI discipline includes those personnel and organizations directed toward CI investigations and the collection, processing, analysis, and production of CI. The CI discipline also involves the recommendation of methods to counter the threat intelligence collection effort to include support to OPSEC and deception. CI personnel advise deception planners on the vulnerabilities of threat foreign intelligence services (FISs) and associated battlefield collection systems to various friendly deception capabilities and techniques. For more information on CI functions and activities, refer to FM 2-00.5 (FM 34-5)(S) and FM 2-01.2 (FM 34-60).

TECHNICAL INTELLIGENCE

4-10. TECHINT is the intelligence derived from the scientific analysis of adversary materiel to include its composition, performance, and operational capabilities. The TECHINT discipline includes those personnel and organizations directed toward the

collection, processing, analysis, and production of TECHINT.

ALL SOURCE INTELLIGENCE

4-11. All-Source intelligence is the intelligence derived from the analysis and fusing of all relevant information and single discipline intelligence products. The All-Source intelligence discipline includes those personnel and organizations directed toward the production of all-source intelligence products.

INTELLIGENCE FUNCTIONS

COMBAT INFORMATION AND INTELLIGENCE

4-12. Combat information is unevaluated data, gathered by or provided directly to the tactical commander, which due to its highly perishable nature or the criticality of the situation cannot be processed into tactical intelligence in time to satisfy your intelligence requirements. Every soldier in an operation can contribute to intelligence operations or can provide combat information through timely reporting. Some common sources of valuable and reliable information include—

- Scouts, cavalry, patrols, and individual soldiers, who can provide you with critical and exact information based upon reliable visual contact.

- Long-range surveillance (LRS) units, which provide reliable information against deep targets. LRS units conduct stationary surveillance and limited reconnaissance. They are uniquely equipped and trained to deploy deep into the threat area to observe and report threat dispositions, movement and activities, and battlefield conditions. They are not equipped or trained to conduct direct-action missions.

- Open sources, depending on the operation, are often numerous with information of varying degrees of timeliness, relevancy, and accuracy. An analyst's ability to collect, analyze, and use open-source information, however, is limited by his workload and the time available. Common open sources include news reports, Cable News Network, the Internet, magazines, textbooks, archives, and tours.

ELECTRONIC WARFARE

4-13. EW is one of your multipliers. It can disrupt threat C^2 and fire support communications during a critical phase of operations. There are three elements of EW:

- Electronic warfare support (ES) provides immediate threat intention and targeting information. It also supports all-source analysis, EA, and EP by providing threat recognition, combat information, and target acquisition as well as the specific frequencies and radio nets you want to jam.

- Electronic attack (EA) uses lethal (directed energy) and non-lethal (jamming) electromagnetic energy to disrupt, damage, destroy, and kill threat forces. MI units use non-lethal EA to jam threat C^2 and targeting systems. Electronic deception can also cause a threat to misinterpret your intentions. Used properly EA complements lethal fires.

- Electronic protection (EP) consists of measures to protect your command, control, and communications (C^3) . Your signal officer is responsible for EP.

MI ORGANIZATIONS

MI COMPANY (SEPARATE BRIGADE OR ARMORED CAVALRY REGIMENT)

4-14. This MI company has fewer capabilities than the MI battalion but more capabilities than a DS MI company. The MI company in support of the armored cavalry regiment (ACR) or separate brigade provides—

- Communications intercept, DF, and EA.
- CI.
- HUMINT collection.
- Ground surveillance. This is an interim capability and will end with the fielding of the tactical UAV systems. (Tactical UAVs will be fielded to this organization in the future.)
- Personnel to staff the S2/S3. These soldiers conduct—
  - ISR planning.
  - All-source analysis and dissemination.
  - Technical control and tasking.
  - Intelligence support to force protection and OPSEC support.

EMERGING DOCTRINE (IBCT)

MI COMPANY (INITIAL BRIGADE)

The MI Company conducts intelligence analysis, ISR integration, and HUMINT collection in support of the IBCT. This company supports the planning, preparation, and execution of multiple, simultaneous decisive actions across the distributed AOs. Additionally, it contains a much more robust analytical and HUMINT control and collection capability than the MI companies that support divisional maneuver brigades, separate brigades, and ACRs. This company consists of a—

- Small headquarters element.
- ISR analysis platoon that conducts situation development, target development, and BDA in support of the Brigade S2 section.
- ISR integration platoon that serves as the focal point for intelligence support to planning, situation awareness, and targeting. ISR integration encompasses the tasking, processing, redirecting, and fusion of information derived from sensors across all combat information, target acquisition, and intelligence assets. The most unique feature of this platoon is an organic S2X team that provides dedicated mission management for tactical HUMINT collection—a critical intelligence capability in small-scale contingency operations.
- Tactical HUMINT platoon with both operational management teams and tactical

HUMINT teams.

- US Air Force Combat Weather Team.

SURVEILLANCE TROOP (RSTA SQUADRON – INITIAL BRIGADE)

The surveillance troop is organic to the RSTA squadron of the Initial Brigade. It conducts IMINT, MASINT, SIGINT, and NBC surveillance operations in support of the Initial Brigade's planning, preparation, and execution of multiple, simultaneous decisive actions across the distributed AOs. Successful planning, preparation, and execution of these operations requires the troop's leadership and soldiers to have a clear understanding of the brigade commander's ISR requirements as well as the squadron commander's intent and concept of operations. The surveillance troop consists of a—

- Headquarters section.
- ISR integration team which is collocated with the S2 section at the squadron command post. It supports the S2 in developing, monitoring, and recommending changes to the squadron's operations. Additionally, this team assists the S2 in tracking the execution of the squadron's R&S tasks by receiving and fusing the combat information from RSTA squadron assets into a current threat picture.
- Air reconnaissance platoon (tactical UAV).
- Multi-sensor platoon which includes four multi-sensor sections. Each section consists of a SIGINT team and MASINT team. The platoon depends upon the ISR Integration Team for SIGINT mission management, technical support, and direction finding analysis.
- NBC reconnaissance platoon which can locate and identify life threatening chemical and radiological contaminants, and some forms of biological warfare. The platoon also performs extensive planning and analysis to determine threat WMD capabilities in the brigade's AO.

Additionally, the troop may receive a TROJAN Special Purpose Intelligence Remote Integrated Terminal (SPIRIT) (Light) team from the signal company to support UAV video dissemination.

MI BATTALION (DIVISION)

4-15. The MI battalion at division level provides ground-based communications intercept, DF capability, EA, HUMINT collection, ground-based surveillance, and UAV imagery support (in the future). Specifically, the MI battalion includes—

- LRS teams are deployed 15 to 80 kilometers (km) beyond the division forward line of own troops (FLOT) to observe selected NAIs. Their insertions are time phased to ensure continuous coverage of selected deep divisional NAIs. LRS teams are organic only to light, airborne, and air assault divisions.
- Ground surveillance systems are frequently attached to the maneuver units to locate moving targets. UAV assets (in the DS MI company) will replace these in the future.
- The MI Battalion will also support the division with GS UAV assets in the future.
- The present MI battalion organization includes a battlefield deception cell. That

responsibility will probably transfer to the RC in the future organization.

GS MI Company

4-16. The GS MI company provides intelligence and electronic warfare (IEW) support to the division.

- Deploys ground-based assets throughout the battlefield.
- Will include one UAV baseline GS to the division.
- Is tasked by the MI battalion commander and S3 as directed by the G2 or ACE.
- Responds to centralized control by the MI battalion, which—

— Increases system-tasking flexibility (available systems).

— Allows for coordinated DF operations.

— Contributes to more coordinated and survivable EW operations.

DS MI Company

4-17. The DS MI company provides IEW support to the division's brigades.

- Responds first to the brigades.
- Brigade (through the DS MI company) tasks and moves assets.
- Has CI and HUMINT collection assets.
- Will have UAV imagery capabilities through organic UAV assets.
- Will have a Common Ground Station (CGS) which provides a significant broadcast downlink capability to include Joint STARS moving target indicators.

MI BRIGADE (CORPS)

4-18. The MI brigade provides aerial SIGINT, HUMINT collection, and links to national and theater intelligence systems. The MI brigade can provide IEW assets to subordinate commands to weight the main effort. The corps MI brigade has three battalions: operations battalion, tactical exploitation battalion (TEB), and aerial exploitation battalion (AEB).

Operations Battalion

4-19. The operations battalion provides the ACE that performs IEW analytical, processing, and management functions in support of overall corps operations (see Chapter 3).

Tactical Exploitation Battalion

4-20. The TEB provides CI, HUMINT collection, and LRS support to corps operations. It

provides—

- GS collection to the corps in response to corps taskings.
- CI and HUMINT assets for intelligence support to force protection, OPSEC, HUMINT collection (to include DOCEX), and can be deployed throughout the corps and subordinate divisions.
- The LRS company is reliable and is deployed 60 to 150 km beyond the corps FLOT. Team deployment is time phased based on the friendly concept of the operation, number of NAIs, availability of insertion and extraction means, unique insertion skills, and need for continuous coverage.

Aerial Exploitation Battalion

4-21. The AEB allows the commander to visualize the battlefield well beyond the depth of the AO. The battalion gives you "deep look" aerial R&S and SIGINT collection capability. It provides—

- The ability to weight the main effort by prioritizing intelligence support and responsiveness to subordinate commanders.
- SIGINT data that can be sent in near real time (NRT) to multiple corps and divisional nodes to support situation and target development. With the fielding of the CGS, this information is broadcasted and downlinked through your CGS (in the DS MI company).

LIMITATIONS OF INTELLIGENCE

4-22. Your intelligence operating system has some limitations:

- Intelligence reduces uncertainty on the battlefield but cannot entirely eliminate it—"the fog of war." You will always have to accept some risk.
- You will never have enough organic and DS intelligence assets to satisfy all of your intelligence requirements.
- Limited communications systems within the intelligence architecture which, if not aggressively and proactively managed, can delay the dissemination of intelligence and combat information.
- Single-source collectors are sometimes susceptible to deception. The balanced and focused use of collection assets from multiple intelligence disciplines and careful distributed or collaborative all-source analysis are required to guard against deception.
- Degraded SIGINT collection if the threat chooses not to use communications and noncommunications systems. For example, during Operation DESERT STORM, Iraq did not employ tactical communications for fear of being intercepted and located (by DF systems).
- Adverse weather degradation on ISR operations, antenna arrays, aerial collection, and EA systems.

- Inability of ground-based SIGINT systems to operate on the move. Positioning and integration of mutually supporting ground and aerial SIGINT systems are critical to provide continuous support.

Appendix A

Intelligence and the Military Decision-Making Process

A-1. As the commander and XO, use the seven steps of MDMP to execute actions. This appendix focuses on the role of intelligence and how intelligence supports each step of the MDMP. It provides the commander and XO a checklist to use during the MDMP on what the S2 and intelligence staff provide.

- Step 1. Receipt of the Mission
- Step 2. Mission Analysis
- Step 3. COA Development
- Step 4. COA Analysis (Wargame)
- Step 5. COA Comparison
- Step 6. COA Approval
- Step 7. Orders Production

A-2. The targeting process is closely related to MDMP. The S2 conducts the **detect** and **assess** portions of the targeting process.

WHAT TO EXPECT FROM YOUR S2

STEP 1. RECEIPT OF THE MISSION

A-3. Task the S2 to start work as soon as you get the mission. (See Table A-1.)

Table A-1. Receipt of the mission

Commander's Interaction	
Initial Guidance. • Disagree with higher IPB? • Abbreviated initial IPB? • Initial ISR support? Additional IPB analysis (besides normal procedures)	
Commander's Checklist	
❑ Did the S2 begin parallel planning and collaborate with higher HQ before and during receipt of the mission to facilitate the IPB process? ❑ Did the S2 identify gaps in higher HQ ISR plan, intelligence database, and IPB products? ❑ Did the entire staff identify specified and implied intelligence tasks from higher HQ order to begin the ISR collection effort? ❑ Did the S2 start the terrain products: weather, light, and climatology data?	❑ Is the S2 continuously updating the MCOO and doctrinal templates and maintaining the threat situation? ❑ Did the S2 alert ISR assets of impending mission in order to provide sufficient time to begin troop-leading procedures? ❑ Did the S2 develop and submit initial requests for information based on gaps in the intelligence?

STEP 2. MISSION ANALYSIS

A-4. Ask the S2 for a complete analysis. Understand that everyone, not just the S2, performs IPB. Ask for a staff briefing on these products: complete MCOO, weather and light analysis, situation templates, threat COAs, initial event template, and an initial ISR plan. **Ask the staff where the higher HQ intent is captured in the products.**

Table A-2. Mission analysis

<table>
<tr><th colspan="2">Commander's Interaction</th></tr>
<tr><td colspan="2">Restated mission.

Commander's intent.

Commander's guidance—
• AO.
• AOI.
• Significant characteristics of the environment.
• Who is the threat and what it looks like?
• Choose threat models and identify any refinements.
• How many threat COAs and to what specificity?
• Initial threat culmination criteria.</td></tr>
<tr><th colspan="2">Commander's Checklist</th></tr>
<tr><td>❑ Did the S2 use the other staff officers' areas of expertise in conducting the IPB process?

❑ Did the AOI consider all threat forces— committed, supporting, reinforcing— that can impact your operation from start to finish?

❑ Did the S2 assist in the identification of the initial PIR?

❑ Did the S2 assist in the determination of the initial OPSEC or EEFI requirements to include CI considerations?

❑ Did the entire staff produce a MCOO that—
• Defines defensible terrain?
• Identifies—
– Key or decisive terrain?
– Mobility corridors (air and ground)?
– Restricted or severely restricted terrain?
– Infiltration lanes? Landing zone (LZ) and pickup zone (PZ)?

❑ Did the S2, in conjunction with the entire staff—
• Develop situation templates of the threat based on the constraints of the terrain?</td><td>❑ Do the situation templates—
• Include all committed and reinforcing forces as well as combat multipliers?
• Focus two levels down in detail to include all threat operating systems?
• Identify OB, weaknesses and peculiarities, activities, and capabilities for each COA with graphics?

❑ Do the IPB products identify facts and assumptions that assist in the determination of likely threat COAs?

❑ Did the S2 prepare terrain and weather analysis products to describe what effects will significantly impact the upcoming battlefield on both threat and friendly forces?

❑ Did the S2 develop a line-and-block chart with the number of killing systems depicting the threat composition?

❑ Did the initial ISR plan—
• Consider the AO and the mission statement?
• Consider the current event template?

❑ Is the initial ISR plan based on the—
• PIR?
• Information requirements (IR)?
• NAIs?

❑ Did the S2 provide ISR assets with an initial ISR plan that facilitated dissemination of orders, conduct of rehearsals, and ensured ISR activities in support of the decisionmaking process by ongoing ISR</td></tr>
</table>

• Prepare threat situation templates depicting the threat disposition? • Prepare as many situation templates as time allowed? ❑ Do the event templates identify and focus on— • NAIs? • Time phased lines? • Time distance analysis? • Critical actions? • Threat decision plan? ❑ Did the S2 provide subordinate units with a copy of all intelligence products to facilitate their IPB process?	operations? ❑ Did the S2 incorporate higher HQ collection requirements? ❑ Did the S2 forward intelligence requirements that cannot be answered by assigned collection assets to higher HQ? ❑ Did the MI battalion or DS MI company commander brief the collection status and capabilities?

STEP 3. COA DEVELOPMENT

A-5. Ask for and expect a thorough analysis of the threat on combat organization (composition and disposition) and possible threat COAs. Ask the S2, in conjunction with the entire staff, to provide intelligence about the threat's main effort and how they will employ their combat multipliers (fires, ADA, engineers, C^2, intelligence, CSS, and chemical) to support their COAs. Ask what key indicators are used to confirm or deny threat COAs, critical decision points (DPs), and friendly and threat vulnerabilities. Ask how often the S2 updates intelligence-related products. (See Table A-3.)

Table A-3. COA development decision points

Commander's Interaction	
Has the S2 provided intelligence about— • The threat main effort? • Employment of their combat multipliers (fires, ADA, engineers, C^2, intelligence, CSS, and chemical) to support their COAs? Ask the S2 what the key indicators are used to confirm threat COAs, critical DPs, and friendly and threat vulnerabilities. Ask how often the S2 updates intelligence-related products.	
Commander's Checklist	
❑ Has the S2— • Refined and prioritized the situation templates? • Refined the event template and matrixes? • Developed an initial EW target list (EWTL)? ❑ Did the S2 take an active part in analyzing combat power by providing all available information on the current threat forces and situation? ❑ As time permits, while analyzing relative combat power, did the S2 provide the staff with information on threat vulnerabilities?	❑ Did the S2 consider as many possible COAs as time permits, starting with the most likely and including the worst case (most dangerous)? ❑ Did the S2 provide critical input to the MDMP through continual analysis of information provided by ongoing ISR operations? ❑ Did the S2 and S3 task ISR assets without overtasking them? ❑ Did the S2 and S3 allocate sufficient assets to conduct the ISR plan?

STEP 4. COA ANALYSIS (WARGAME)

A-6. During the wargame each staff member is responsible for his area of expertise. It is recommended that the S2 play the role of the threat commander. (See Table A-4.)

Table A-4. COA analysis (wargame)

Commander's Interaction	
No interaction necessary at this point.	
Commander's Checklist	
❑ Did the S2— • Refine the PIR with the LTIOV? • Assist in the development of the HPTL? • Finalize the situation template? • Redefine the threat COAs based on the developed DPs and finalize the situation template? ❑ Did the S2 develop critical threat DPs in relation to the friendly COA? ❑ Did the S2 fight as an uncooperative threat to develop DPs and project threat losses? ❑ Did the S2, in conjunction with the entire staff, address all relevant threat operating system activities? ❑ Did the S2 assist in developing the target selection standards and attack guidance matrix from the wargamed COAs?	❑ Did the S2 update the collection and ISR plan? ❑ As a result from the wargame, did the S2 identify IR and refine the event template to include NAIs and refine the event matrix with corresponding decision points? ❑ Did the S2 indicate target areas of interest (TAIs) and HVTs? ❑ Did the S2 refine the situation templates from the results? ❑ Did the S2 participate in the targeting process and identify and prioritize HVTs as determined by IPB? ❑ Did the assistant S2 (from the wargame) determine what information to collect, who is to collect, as well as when and where to collect it?

STEP 5. COA COMPARISON

A-7. Although your S2 plays the uncooperative threat commander, he still has requirements to deliver various intelligence products to you and the staff. (See Table A-5.)

Table A-5. COA Comparison.

Commander's Interaction	
No interaction necessary at this point.	
Commander's Checklist	
❑ Did the S2 coordinate with the other staff elements in order to start developing the integrated ISR plan and the intelligence portion of the synchronization matrix?	❑ Did the S2 update the IPB products for the decision briefing?

STEP 6. COA APPROVAL

A-8. Refine the intent statement and CCIR to support the selected COA. The staff refines its products in anticipation of the orders production. (See Table A-6.)

Table A-6. COA approval

Commander's Interaction	
Approved COA. Refined commander's intent. Specified type of order. Integrated ISR plan. Specified type of rehearsal.	
Commander's Checklist	
❑ Did the S2— • Update the PIR with LTIOV for your approval supporting the approved COA? • Finalize the event template matrixes and the ISR plan? • Plan for BDA support in coordination with the ISR plan?	❑ Did the staff refine— • The DST? • The operating system synchronization matrix? • ISM based on the approved COA? • Integrated ISR plan

STEP 7. ORDERS PRODUCTION

A-9. After you issue final guidance, the staff begins preparing the order for dissemination. (See Table A-7.)

Table A-7. Orders protection

Commander's Interaction	
No interaction necessary at this time.	
Commander's Checklist	
❑ Did the S2— • Assist in preparing the order? • Submit the Intelligence Annex (B) as part of the order? • Finalize the ISR plan and provide an ISR Annex (L) and overlay?	• Assist with the C^2 Warfare Annex (P), OPSEC Annex (Q), Deception Annex (S), and the EW Annex (T)? ❑ Did the S2 integrate the ISR plan with the S3's scheme of maneuver and fires?

TARGETING MEETING

A-10. Each participant should bring the essential information to the targeting meeting. After the targeting meeting, each participant should leave with some critical information. (See Table A-8.)

Table A-8. Targeting meeting

Commander's Interaction	
No interaction necessary at this time.	
Commander's Checklist	
❑ Did the S2 have— • The current situation map? • Situation templates with detailed information on each BOS and capability? • HVTs and recommended HPTs? • Information about the collection assets available? • Intelligence synchronization matrix (ISM) and event template? • Plan for tracking BDA? • Current BDA on hand? • Current PIR and CCIR? ❑ Did the S2 provide the proposed threat activity within the current 24-hour period?	❑ Did the S2 provide the proposed threat activity within the next 24 to 48 hours? ❑ Did the entire staff plan the use of lethal and non-lethal fires to support the operation? **After the Targeting Meeting** ❑ Did the S2— • Have the updated PIR? • Know who will collect what, where, when, and have the taskings for them? • As a result of the targeting meeting provide the intelligence portion to the upcoming FRAGO? • Know his role, the S3 role, and FSO role in the sensor-to-shooter links and controls?

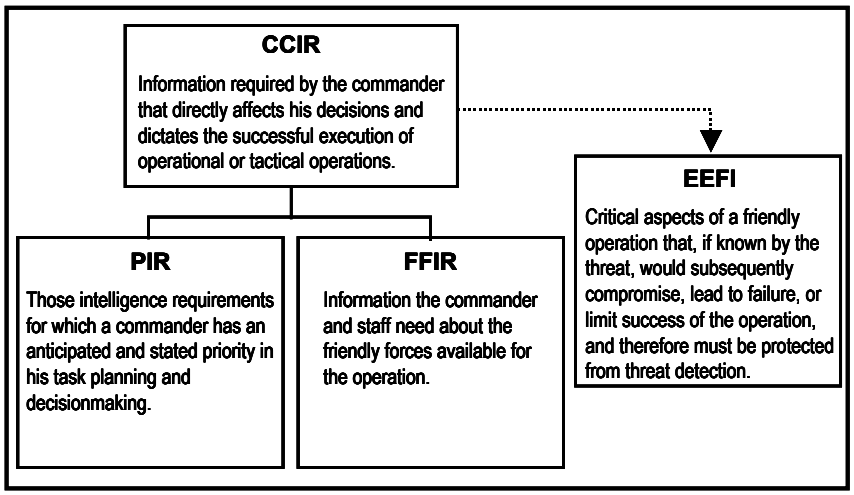
Appendix B

Commander's Critical Information Requirements

B-1. CCIR is information required by the commander that directly affects his decisions and dictates the successful execution of tactical operations. You can get more information than you need or want. Your CCIR will allow you and your staff to focus on the information that is important to your decisions. The CCIR help to focus your staff so they can produce timely and accurate information and a common operational picture (COP). CCIR are—

- Applicable only to you.
- Situation-dependent.
- Events or activities that are predictable.
- Specified by you for each operation.
- Time-sensitive information that must be immediately reported to the commander, staff, and subordinate commanders.
- Always included in paragraph 5 of an OPORD or OPLAN.
- Transmitted by a communications system specified in the standard operating procedures (SOPs).

B-2. Limit CCIR to 10 or fewer items so the staff can focus its efforts better. The CCIR are expressed as two types of requirements: PIR and friendly forces information requirements (FFIR). Although EEFI are not a part of CCIR anymore, they become a commander's priority when he states them. Figure B-1 shows the



elements of CCIR.

Figure B-1. Elements of CCIR.

PRIORITY INTELLIGENCE REQUIREMENTS

B-3. These are intelligence requirements for which you have an anticipated and stated priority for planning and decisionmaking. PIR support your DPs. Without the answer, you accept a greater level of risk during operations. You dictate the format of the answer (for example, a graphic product, verbal report, or image) and you must set an LTIOV.

B-4. Base most of your PIR on a specific fact, event, or activity that the threat has or is known to do (or specific to the environment) but remember to consider how the threat could surprise you (an atypical threat)—potentially one of their greatest advantages. PIR are listed and ranked in order from most to least important. Do not give multiple questions in a single PIR or you will not focus on your real requirement and may not satisfy your requirement. Do not ask questions that have been answered.

B-5. Examples of **Good** PIR:

- Will the threat defend OBJ Bruno using a forward slope defense 121630Z JUL 99 LTIOV? (DP: Fire artillery preparation).
- Will the threat reserve tank battalion reach PL Mike before 121630Z JUL 99 LTIOV? (DP: Commitment of the reserve).
- Will the 43d MRD send its main attack along the AA 121630Z JUL 99 LTIOV? (DP: Commitment of deep strike).
- What size force is defending OBJ Gun LTIOV? (DP: Composition of the main attack).

B-6. Examples of **Bad** PIR:

- When, where, and in what strength will the threat attack?
- What are the fuel levels in the threat's depots?
- What is the current readiness of all threat armor, artillery, and anti-tank units?
- What is the morale of the threat rear echelon units?

B-7. The above PIR are bad because they reflect multiple questions, not focused on the real requirement, and do not satisfy the requirement.

B-8. There are other requirements that entail collection. They are of lower importance than any PIR but are still an important part of the ISR plan. Information requests, indicators, specific information requirements (SIRs), and specific orders and requests (SORs) are closely related to PIR.

INFORMATION REQUIREMENTS

B-9. IR are those items of information regarding the threat and his environment which need to be collected and processed. These requirements are necessary to perform situation development, support to targeting, IPB, and support to force protection but are less critical than PIR.

INDICATORS

B-10. Indictors are threat actions, activities, or signatures whose absence or presence

show evidence of threat intentions, capabilities, and vulnerabilities, and help to confirm or deny a threat COA. The predictions and projections within the situation and event templates are an important factor in performing situation development based on threat activities. A thorough knowledge of when and where activity is likely to occur on the battlefield helps an analyst develop indicators. The indicators in turn help the analyst develop PIR and build SIRs.

SPECIFIC INFORMATION REQUIREMENTS

B-11. A complete SIR describes the information required, the location where the required information can be collected, and the time during which it can be collected. Generally, each PIR or IR generates sets of SIRs. These may partially or fully answer a PIR or IR and provide the analyst the information necessary to confirm or deny threat COAs.

SPECIFIC ORDERS AND REQUESTS

B-12. This is the specific tasking orders approved by the S3 or request for support higher that generates planning and execution of a collection mission or analysis of database information. Specific orders (for example, S3 approved taskings) are orders for subordinate commands; requests (for example, for support) are sent to other commands or higher echelons.

FRIENDLY FORCES INFORMATION REQUIREMENTS

B-13. This is information you and your staff need about the friendly forces available for the operation. This includes personnel, maintenance, supply, ammunition, and petroleum, oils and lubricants (POL) status, and experience and leadership capabilities.

ESSENTIAL ELEMENTS OF FRIENDLY INFORMATION

B-14. The EEFI help protect your operation. They are critical aspects of a friendly operation that, if known by the threat, would subsequently compromise, lead to failure, or limit success of the operation and therefore must be protected from threat detection. EEFI help commanders understand what threat commanders want to know about friendly forces and why. They tell commanders what cannot be compromised. EEFI provide the basis for indirectly assessing the quality of the threat's situational understanding: if the threat does not know an element of EEFI, it degrades his situational understanding.

Appendix C

ISR Integration Within the Synchronization Matrix

C-1. Successful synchronization of ISR collection with operational decisionmaking results in effective, timely intelligence. Failure to synchronize ISR results in the waste of valuable ISR assets against requirements that are not critical to the commander's decisions. This waste results in making a decision with erroneous intelligence or no intelligence at all.

C-2. The intelligence BOS has responsibility for the portion of the synchronization matrix that deals with intelligence collection. The S2 should always contribute to the production of the synchronization matrix. The S2 inputs all information for NAIs or TAIs, to include timeline, task, mission, purpose for collection, and DPs tied to the collection or lack of information collected.

C-3. The synchronization matrix is produced after wargaming, when the commander has established a COA and DPs supported by intelligence. The G2/S2 then determines the LTIOV for each NAI and event, based on those DPs and targeting requirements identified during wargaming.

C-4. The S2 links each PIR to a DP. Each PIR should be linked to only one operational decision. The S2 then develops the ISR plan for the unit, and checks that each PIR will be answered in time to influence operational decisions.

C-5. The S2 selects ISR assets based on the situation, asset capabilities, and availability. The ISM in Figure C-1 depicts how each NAI and TAI will be covered by an ISR system while that NAI or TAI is active.

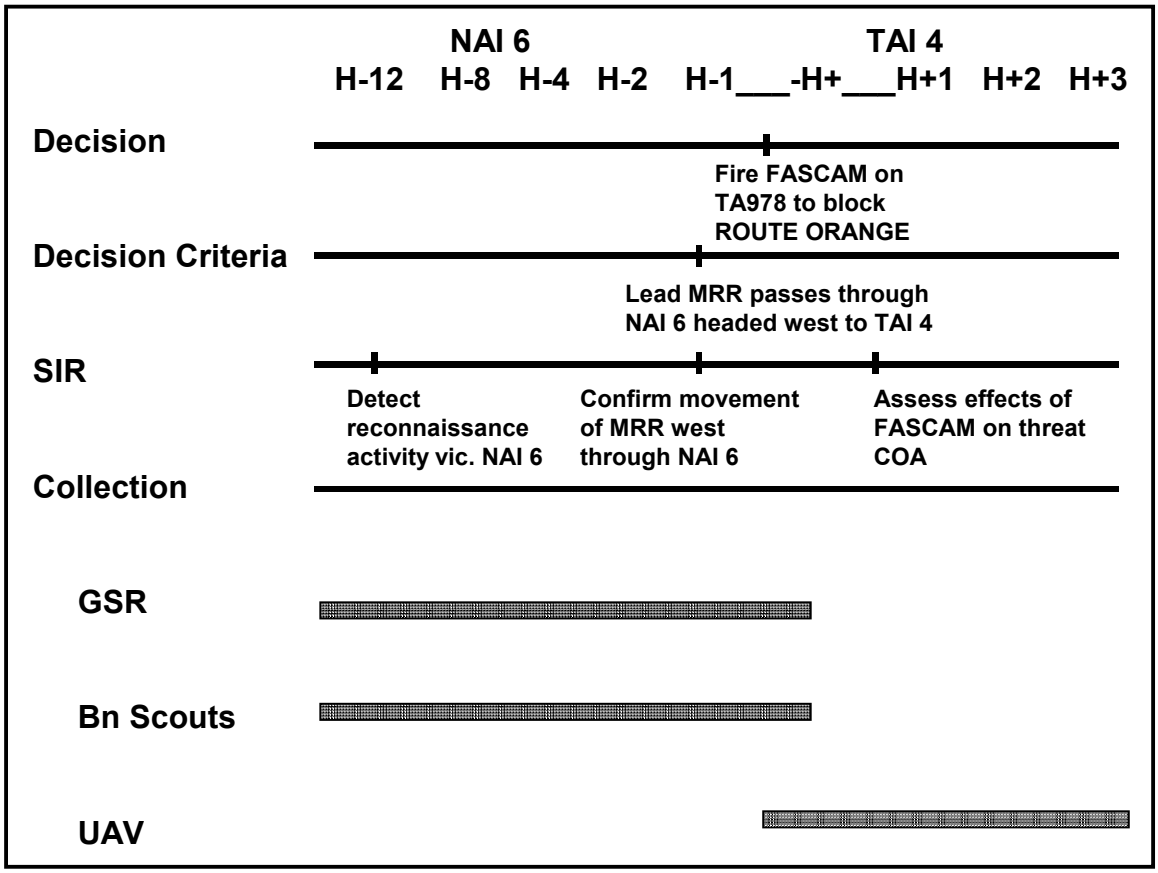


Figure C-1. Sample of intelligence portion of the synchronization matrix

Appendix D

Intelligence, Surveillance, and Reconnaissance Planning

D-1. ISR is essential to gain and maintain contact with the threat. In certain situations gaining contact with the threat can include a combination of technical means and traditional contact as defined in cavalry doctrine. Many battles at the combat training centers prove that successful ISR operations are critical to successful operations.

D-2. During operations you should task your ISR assets to find and report—

- Gaps or vulnerabilities in the threat's operations.
- Defensive preparations to include primary and secondary positions and prepositioned supplies.
- Location of any threat reserves and supporting forces (for example, a supporting artillery or air defense positions).
- Obstacles, threat engagement areas, and potential ambush areas.
- Information that answers threat intentions and capabilities.

D-3. During operations, you must focus your staff on blinding the threat through an aggressive counterreconnaissance. This effort requires an active, predictive intelligence effort. CI analysis of threat multidiscipline ISR operations is integral to counterreconnaissance analysis and operations. Your S2 should use any threat assessment and other CI products, as appropriate, and forward analytical requirements to the CI analytical element at division and above (through standard procedures).

D-4. In the future, CI functionality will include analysis of threat IO and other full-dimensional counter-ISR tasks. CI analysis is especially important during stability operations and support operations, and is one of the primary contributors to the counterreconnaissance effort.

D-5. In order to drive ISR planning ask the following:

- Did the S2 develop threat COAs and event templates based on your initial guidance?
- Did you refine your PIR and the ISR plan (tasks) based on the friendly COA?
- Did the S2 and S3 integrate the ISR plan with the scheme of maneuver? Are the NAIs and TAIs the focus of the ISR plan and do they support the DST for the friendly COA? At brigade level, does the ISR synchronization matrix answer your PIR and targeting requirements?
- Are all organic and supporting collection assets considered in the ISR plan? Was the ISR plan developed in relation to the overall ISR architecture? Have

sufficient resources been dedicated to the ISR plan?

- Does the IPB identify the risks during infiltration of ISR assets? Are ISR assets teamed to improve their chances of success and minimize the changes of casualties? Are adequate fires planned to support ISR operations?

- Did the S4 and/or headquarters and headquarters company (HHC) commander plan casualty evacuation and allocate resources to support the reconstitution of ISR assets? Did the signals officer plan adequate communications support for ISR operations?

- Did the staff use a five-paragraph FRAGO based on an ISR tasking matrix to capture all of the integrated staff planning?

- Did the staff develop the counterreconnaissance plan and is its emphasis on identifying threat reconnaissance COAs?

- Did you assign the right assets required to execute your ISR?

- Did you assign the right assets required to execute your counterreconnaissance effort?

D-6. Make the S2 and S3 brief you and the staff on how they will track ISR execution? Train your staff to track the battle, using the DST and the synchronization matrix. The S2 and S3 must use the ISR plan and ISR synchronization matrix (at brigade) to track and retask assets in order to answer your PIR.

D-7. In order to track and retask ISR operations, ask the following:

- Is the S2 using the event and situation templates to analyze the information and perform predictive analysis?

- Are the S2 and S3 tracking the status of ISR assets in a timely manner and cross-cueing ISR assets and teaming them to minimize the chances of casualties?

- Is ISR reporting confirming the initial assumptions about the threat COAs (or the environment)? If not, is the staff using a “mini-wargame” to reevaluate initial assumptions, reinitiate an abbreviated IPB and MDMP, and quickly change the operation?

Appendix E
Foreign Language Support

INTRODUCTION

E-1. You need linguists for full spectrum operations especially when the focus is on stability operations and support operations. You need a good linguist support plan to select qualified linguists for each requirement. The growing focus on multinational operations increases the competition for limited linguist resources vital for mission success. Consider the lowest possible foreign language qualification needed for each mission, taking into account the limitations of the Defense Language Proficiency Test (DLPT) for Army linguists.

LINGUISTIC SUPPORT CATEGORIES

E-2. Foreign language support to US Armed Forces engaged in stability operations and support operations falls into one of four categories:

- **INTELLIGENCE AND INFORMATION COLLECTION.** TRADITIONAL SIGINT AND HUMINT DISCIPLINES, AS WELL AS FOREIGN LANGUAGE SUPPORT TO FORCE PROTECTION AND EXPLOITATION OF OPEN-SOURCE INFORMATION.
- **CIVIL/MILITARY OPERATIONS**. MILITARY INTERACTION WITH THE CIVILIAN POPULATION FOR GOVERNMENT LIAISON, LEGAL AGREEMENTS, MEDICAL SUPPORT AND OPERATIONS, LAW ENFORCEMENT, ENGINEERING PROJECTS, PUBLIC SAFETY, SECURITY AND POPULATION CONTROL, CA, AND PSYOP.
- **LOGISTICS.** SUSTAINMENT OR TRANSPORTATION FUNCTIONS. FOR LOGISTICAL CONTRACTING, PORT, RAILHEAD, AIRHEAD, OR TRANS-SHIPMENT OPERATIONS AND CONVOY OPERATIONS**.**
- **MULTINATIONAL MILITARY OPERATIONS AND LIAISON.** COORDINATION WITH ALLIED PARTNERS, COALITION PARTNERS, AND PREVIOUSLY UNAFFILIATED NATIONS.

DETERMINING LINGUIST REQUIREMENTS

E-3. The staff uses METT-TC, organization or echelon of command, and the environment to—

- Determine the number of linguists for a particular mission.
- Allocate linguists by one linguist team per echelon of command, one linguist per piece of equipment, or one linguist team per location where the function is to be performed.

- Conduct mission analysis and identify specified or implied tasks requiring foreign language support.

E-4. Task organization and scheme of maneuver are then applied to determine the number of linguists needed for an operation. The staff must analyze each operation to determine the language requirements. While interpretation for a peace negotiation requires not only outstanding linguistic capability but also cultural acumen, the translation of routine documents with the aid of a dictionary requires a much different skill set. Poor identification of language requirements can tie up the best linguists in a less effective role, creating linguist shortfalls in other areas.

E-5. The relative importance of each of the four linguist support categories is mission dependent. For example, during a noncombatant evacuation operation (NEO) civil or military coordination would probably not be as critical as collecting intelligence and information. The situation is reversed for a humanitarian assistance mission in which civil or military operations have a significant impact on mission success. Identifying these dynamics helps the commander and staff prioritize linguist requirements.

E-6. Determining stability operation and support operation linguist requirements can be difficult because each operation is unique. Commanders and staff with a basic knowledge of organic Army linguistic assets, foreign language resource alternatives, and MI skills can successfully utilize linguists in support of their military operations.

PLANNING AND MANAGING LINGUIST SUPPORT

E-7. Commanders who conduct stability operations and support operations must include linguist requirements as part of their MDMP. Decide what foreign languages are needed, what types of foreign language requirements are needed for each assignment, and what would be the best source of linguist assets. If the mission includes intelligence and information collection, you must decide on which MI collection skill is needed.

E-8. You should consider linguist requirements for every contingency plan and OPLAN assigned to your command. Linguist requirements should be considered in at least the first nine steps of mission analysis (see FM 5-0 and FM 6-0 (FM 101-5)). Additionally, you must decide on security clearance requirements early in the mission; also, it is helpful to initiate linguist researching and command relationships before actual operations.

PRIMARY STAFF RESPONSIBILITIES

E-9. Primary staff at each echelon has responsibilities for evaluating requirements and managing linguist support. The responsibilities include but are not limited to the following:

- Assistant Chief of Staff, G1 (S1), Personnel will—
  - — Identify linguist requirements needed to support G1/S1functions in all contingency areas.
  - — Manage linguist staffing and linguist replacement management.
  - — Identify foreign language skill identifiers for all assigned, attached, or OPCON Army linguists.

- Identify all Army foreign language skilled soldiers not identified in the Standard Installation Division Personnel Section (SIDPERS).
- Ensure language skills are added to SIDPERS.
- Deploy and provide administrative support of Department of the Army and Department of Defense civilian linguists.
- Hire, contract for, and provide administrative support of local national linguists.
- Procure Army foreign language support personnel for screening local labor resources.

- Assistant Chief of Staff, G2 (S2), Intelligence will—
  - Identify linguist requirements needed to support G2/S2 functions in all contingency areas.
  - Determine, during the initial IPB, all foreign languages (spoken and written) and dialects needed for mission accomplishment.
  - Collect, process, produce, and disseminate information derived from linguist sources.
  - Provide intelligence training for MI linguists employed in the AO.
  - Coordinate for security investigations, as necessary, for local hire linguists.
  - Provide support to CI screening of contracted linguists and the local national labor force.

- Assistant Chief of Staff, G3 (S3), Operations will—
  - Identify linguist requirements needed to support G3/S3 functions in all contingency areas.
  - Consolidate unit linguistic requirements and establish priorities.
  - Develop linguist deployment and employment plans.
  - Develop plans to train linguists and to use linguists for training the force in AO foreign language survival skills.
  - Assign, attach, and detach linguists and linguist teams.
  - Integrate additional or replacement linguists through operational channels.
  - Recommend modernization and development of linguist systems and methods.
  - Coordinate mobilization and demobilization of RC linguist support.
  - Plan linguist usage for deception operations.
  - Plan linguist support to movement of enemy prisoner of war (EPW), detainees, and refugees.
  - Coordinate evaluation of linguist support by all staff elements.

- Assistant Chief of Staff G4 (S4), Logistics will—
  - Identify linguist requirements needed to support G4/S4 functions in all contingency areas.
  - Provide logistical, supply, maintenance, and transportation support to attached linguists.

- Assistant Chief of Staff G5 (S5), Civil-Military Operations will—
  - Assist the G1 in the contracting of local hire linguists.
  - Identify foreign language requirements for NEO and other civil and military operations.

- Assistant Chief of Staff G6 (S6), Signal will—
  - Manage radio frequencies assignments to supporting SIGINT linguist elements.
  - Support linguist operations with internal document reproduction, distribution, and message services.
  - Integrate automation management systems of linguist units.

E-10. In addition, each staff section has to determine the linguist support required to meet its operational missions. Staff requirements for linguist support include but are not limited to the following:

- Assistant Chief of Staff, G1 (S1), Personnel will—
  - Coordinate with local authorities on matters of civilian hire, finance, and recordkeeping.
  - Contract local hire personnel.
  - Coordinate local morale support and community activities.
  - Coordinate with local authorities for postal operations.
  - Support administration, counseling, personal affairs, and leave for local national and third-country national personnel.
  - Coordinate local medical support.
  - Liaison with coalition counterparts.

- Assistant Chief of Staff, G2 (S2), Intelligence will—
  - Evaluate and use local maps and terrain products in operations.
  - Process, for MI purposes, material taken from EPWs or civilian internees.
  - At lower echelons, conduct tactical questioning of refugees, detainees, and EPWs.
  - Assess local open-source information for intelligence value.
  - Ensure intelligence coordination and liaison with coalition and HN counterparts.

- Assistant Chief of Staff, G3 (S3), Operations will—
  - Ensure operational coordination and liaison with coalition and HN counterparts.
  - Translate OPORDs and OPLANs for use by coalition counterparts.

- Assistant Chief of Staff G4 (S4), Logistics will—
  - Procure local supply, maintenance, transportation, and services.
  - Coordinate logistics at air and seaports of debarkation.
  - Provide logistic support to local population.
  - Coordinate foreign language support to help contract for water, food service, bath and laundry if necessary.
  - Contract with local governments, agencies, and individuals for sites and storage.

- Assistant Chief of Staff G5 (S5), Civil-Military Operations will—
  - Assist the G1 in the contracting of local hire personnel.
  - Determine civilian impact on military operations.
  - Minimize civilian interference with combat operations.
  - Inform civilians of curfews, movement restrictions, and relocations.
  - Provide assistance to liaison with HN and multinational agencies, dignitaries, and authorities.
  - Promote positive community programs to win over support.
  - Determine if combined operations PSYOP efforts are mutually planned and synchronized.
  - Support interpretation to assist resolution of civilian claims against the US government.
  - Solicit linguistic and cultural knowledge support to protect culturally significant sites.
  - Use linguistic and cultural support to identify cultural and religious customs.

- Assistant Chief of Staff G6 (S6), Signal will—
  - Coordinate suitable commercial information systems and services.
  - Coordinate with multinational forces on command frequency lists.
  - Coordinate signal support interfaces with HN and multinational forces.

USE OF CONTRACT COMPANIES TO HANDLE LINGUISTS AND LINGUIST SUPPORT

E-11. Contract linguists can be used to backfill shortfalls in military linguist resources. Contracting is usually managed at or above the brigade level, and funding is requested through channels.

E-12. Contract linguists are supervised by the gaining military organizations. The G3 (S3) usually has responsibility. The contract linguists are controlled by the vendor who resolves performance and discipline issues.

SPECIAL STAFF OFFICERS RESPONSIBILITIES

E-13. If no special staff officer is assigned the duties below, the corresponding coordinating staff officer should assume those responsibilities. Linguist requirements for special staff officers include but are not limited to the following:

- Liaison Officer:
  - Should speak the required foreign language; if not, a translator or interpreter is necessary for all aspects of his duties.
  - Request interpreters to assist when representing the commander in combined or multinational operations.
  - Translate orders, maps, traces, overlays, and documents into coalition foreign languages.
- Civilian Personnel Officer:
  - Recruit, interview for suitability, and hire civilian local labor force if required.
  - Host country negotiations on labor agreements.
- Dental Surgeon:
  - Administer dental care to support humanitarian mission requirements.
  - Rehabilitate, construct, and gain usage of existing dental facilities as required.
- Finance Officer:
  - Coordinate exchange of US funds into needed local currencies.
  - Provide non-US and US pay functions to foreign national, HN, and civilian internees, and EPWs.
- Surgeon:
  - Support medical humanitarian assistance and disaster relief operations.
  - Provide medical care of EPWs and civilians within the command's AO.
  - Coordinate medical laboratory access in AO.
  - Determine the nature of local health threats to the force through populace interviews.
  - Determine the identity of local or captured medical supplies.

- Veterinary Officer:
  - Determine source and suitability of local foods.
  - Assist the local population with veterinary service needs.

- Chemical Officer:
  - Identify threat force chemical weapons and equipment.
  - Communicate NBC risks to supported populations.

- Engineer Coordinator:
  - Procure proper local materials to support engineering mission.
  - Communicate engineering project requirements to contracted local work force.
  - Communicate engineering project impact on local landowners and other affected parties. Determine, in coordination with G2 (S2), suitability of local topographic maps and terrain products.
  - Assess environmental concerns of HN and local populations in combined operations.

- Provost Marshal:
  - Support dislocated and civilian straggler control activities.
  - Support internment and resettlement operations.
  - Communicate weapons bounty programs and payments to the local population.
  - Support counter-drug and customs activities.
  - Help foreign civil authorities maintain control when authorized.
  - Conduct liaison with local law enforcement authorities.

- PSYOP Officer:
  - Produce approved PSYOP propaganda and counter-propaganda media.
  - Evaluate PSYOP impact on target audience.

- Safety Officer:
  - Provide safety training to local labor force.
  - Communicate warnings of dangerous military operations and other hazards to local populace.

- Transportation Officer:
  - Coordinate commercial and local transportation needs.
  - Coordinate movement scheduling and routes with multinational forces and HN.

PERSONAL STAFF OFFICER RESPONSIBILITIES

E-14. Personal staff officers are under the immediate control of and have direct access to the commander. Most personal staff officers also perform special staff officer duties, working with a coordinating staff officer. These assignments are on a case-by-case basis, depending on the commander's guidance and the nature of the mission, and are very common in stability operations and support operations. Linguist requirements for special staff officers include but are not limited to the following:

- Chaplain:
  - Provide moral and spiritual leadership to the populace.
  - Coordinate religious support with coalition and multinational partners.

— Determine the impact of indigenous religious group faith and practices on military operations.
— Provide religious support to the community to include hospital patients, EPWs, refugees, and civilian detainees.
— Conduct liaison with indigenous religious leaders in close coordination with the G5.

- Public Affairs Office (PAO):

— Act as commander's spokesman for all communication with external media.
— Assess the accuracy of foreign media interpretation of PAO releases.

— Assess and recommend news, entertainment, and other information (assisting G5) for contracted services foreign nationals.

- Staff Judge Advocate:

— Translate foreign legal codes, Status of Forces Agreements (SOFAs), and international laws.
— Determine local environmental laws and treaties through translation services.
— Assess the treatment of EPW and civilian internees.
— Translate documents to support G4 in local contracts.

IDENTIFYING SOURCES OF LINGUISTS

E-15. Sources of linguist support include AC, non-MI Army linguists, RC, other Service linguists, US government civilian employees, US contract linguists, allied and coalition linguists, and local national contract linguists. It is vital to know the advantages and disadvantages of each type of linguist and to carefully match the available linguists to the operation.

ACTIVE COMPONENT

E-16. AC MI language dependent MOSs include MOS 97E (HUMINT Collector), 98G (Voice Intercept Operator), and their related warrant officer fields. Some soldiers in MOS 96B (All-Source Intelligence Analyst), MOS 97B (CI Agent), and MOS 98C (SIGINT Analyst) and their related warrant officer fields are trained in foreign languages.

E-17. There are many advantages to utilizing soldiers in the MOSs mentioned above. They are already trained in the military system, are not subject to deployment restrictions (a limiting factor with civilian linguists), have a security clearance and, as US personnel, support the command's interests.

E-18. The major disadvantage to using these individuals for general foreign language support is that in doing so, they are removed from their primary MI functions. They should be used only in linguistic duties that include intelligence potential. For example, an interrogator (97E) provides linguist support to a CA team as a method to provide access to the local population to determine their attitudes toward US Forces.

NON-MI ARMY LINGUISTS

E-19. Non-MI Army linguists include some enlisted and warrant officers in Career Management Field (CMF) 18 (Special Forces), CMF 37 (PSYOP), CMF 180A (Special Forces), and commissioned officers with a branch code 18 (Special

Forces) and functional areas 39 (PSYOP and CA) and 48 (Foreign Area Officer). Since the standards vary by field, pay attention to the recorded language proficiency and test date of these individuals.

E-20. The Army also includes numerous soldiers who have proficiency in a foreign language but whose jobs do not require foreign language proficiency. They may have trained in a foreign language or may have acquired proficiency through their heritage. They have the advantage of being trained soldiers and are therefore readily deployable to all areas of the battlefield.

These soldiers may have the specific vocabulary and military skill knowledge for certain linguist support missions. For example, a supply sergeant who speaks the local language would be an invaluable asset to the G4.

E-21. The disadvantages are that they already have another job and units are reluctant to give up personnel, especially those in key positions, and their capabilities are difficult to assess. Since they are not required to take the DLPT, it is often difficult for the G1 (S1) to identify them as a linguist, or for a non-linguist to judge the level of their foreign language capability.

RESERVE COMPONENT

E-22. RC trained MI linguists include the MOSs listed above in the AC. RC MI linguists have the same set of advantages and disadvantages as listed above for AC MI linguists.

E-23. The RC also includes MI linguists in MOS 97L (Translator/Interpreter). The 97L's are specifically trained to be a translator and interpreter and have the advantages listed above. An added advantage is that, since their sole job is translation and interpretation, they do not have to be removed from another job in order to be used as linguists. The major disadvantage is that they might not have additional skills that give them dual functionality.

OTHER SERVICE LINGUISTS

E-24. Other service linguists have the advantage of deployability, loyalty, and clearance, but must often learn the Army system and specific Army vocabulary. They are also difficult to obtain, as their parent service is probably also short of trained linguists. Other Service linguists, however, will be valuable in joint operation centers and joint activities. When serving the JTF headquarters, Army commanders and staffs must be aware of the linguists in the other services in order to plan for their participation and optimize their employment.

US GOVERNMENT CIVILIAN EMPLOYEES

E-25. Civilians who have knowledge of a foreign language and are already employees of the US government in some capacity have the advantage of being in the system. They are difficult to obtain as they are already filling required positions and are usually not available for translator/interpreter use. They also are not as readily deployable as service members.

Civilians may have the advantage of extensive knowledge of the AO and extensive foreign language capability.

US CONTRACT LINGUISTS

E-26. US civilians can be contracted to provide linguist support. They have an advantage over local national hires in that their loyalty to the US is more readily evaluated and they can be more readily granted the necessary security clearance.

There may be severe limitations on their deployment and use and they must be carefully screened for foreign language ability. In many cases their use of the foreign language may be old fashioned or full of US idioms depending on their length of time in the US. If recent émigrés, their use in the country of their origin could be dangerous to them, or their loyalty may reside with the country of origin at odds with US interests.

ALLIED AND COALITION LINGUISTS

E-27. Allied and coalition linguists may be unfamiliar with the US system, and their loyalty is difficult to ascertain. MI linguists who speak the partner's language can be useful in determining reliability and loyalty of allied or coalition linguists.

LOCAL NATIONAL CONTRACT LINGUISTS

E-28. Local national hires will provide the bulk of your linguist support. They are usually cheaper to hire than US civilians and will know the local dialect and idioms. They can be selected for their expertise in particular areas or subject matter. A potential problem with local national hires is their ability to speak English, necessitating a screening interview or test to determine their ability to communicate in English.

E-29. For security reasons, CI personnel must carefully select and screen local nationals initially and periodically throughout their employment. Their loyalty can never be assumed. They may be affected by local prejudices and can be assumed to place their own interests above those of the US.

Appendix F

Stability Operations, Support Operations, and Intelligence Preparation Of The Battlefield

F-1. IPB analyzes the possibilities and limitations imposed by the AO and the threat's capabilities. It depicts the threat's possible COAs, and the probabilities of each COA occurring.

F-2. To make the IPB process relevant to stability operations and support operations, the S2 must go back to the basics: discern the intent of each step of the IPB process and interpret some doctrinal terms loosely. In this way your S2 can prevent trying to force a threat into a mold, which makes threat COAs and activities easier to express with familiar IPB products.

F-3. "Threat" describes the various challenges US forces can expect in stability operations and support operations. "Enemy" is too narrow a term for some of the challenges stability operations and support operations will encounter. Refugees, nongovernmental organizations, disaster victims, disease and environmental dangers, and many other challenges encountered during the types of operations brigades face today do not fit the definition of enemy, but they do pose a challenge to successfully accomplishing your mission.

F-4. To avoid overlooking serious challenges to mission success, we offer this definition of "threat" paraphrased from the Australian Army's definition: "**Threat** is any actor, agent, or environmental factor which endangers the commander's ability to accomplish his mission."

IPB MODIFICATIONS FOR STABILITY OPERATIONS AND SUPPORT OPERATIONS

STEP 1: DEFINE THE BATTLEFIELD ENVIRONMENT

F-5. Stability operations and support operations battlefield environments are not contiguous. For example, upon examining the AO assigned by a higher headquarters to an infantry battalion conducting a counterinsurgency operation, the S2 may be concerned about materiel and moral support for the insurgents coming from a refugee community. Although that community and its assets may have no direct ground connection to the battalion AO, activities in this physically separate region may impact insurgent activities and capabilities inside the battalion's AO. In this instance, you might recommend to the commander an AOI that does not include large areas between the AOI and the AO.

F-6. Stability operations and support operations IPB products need a greater level of detail. An excellent example is demographic analysis. In this stage of the IPB process, the S2 and analysts have to make an initial evaluation of what factors make a given population segment important to your mission and how to communicate this to you and your staffs.

F-7. Examine existing databases and collect intelligence needed to continue the IPB process. The significant difference is that many of those databases will be from open sources and cannot be tapped through normal intelligence channels. Often answers to basic questions of culture, history, and the perceptions they produce can be found by doing a little research using the nearest library or quality book store, in academic journals, and by going online and performing searches by topic, region, and country.

F-8. The intelligence community faces a challenge to produce timely, relevant, and updated reports on regions and issues of sporadic military interest. The academic community, travel industry, and international commercial activities study international regions daily. Their reports and assessments of local sentiments, current cultural taboos, and receptiveness to strangers, for example, are widely published and updated frequently. Rather than await an eventual response to an RFI on these basic intelligence issues, these nontraditional sources give you the information now.

STEP 2: DESCRIBE THE BATTLEFIELD'S EFFECTS

F-9. Revise your thinking for a new battlefield. As with the term "enemy," stability operations and support operations are often not conducted on anything resembling a battlefield. The environment may be lethal, and is usually challenging, but often does not look like a battlefield. Determine how the environment impacts everyone relevant to your operation. In recent years, we have relearned lessons of how civilians on the battlefield can add to the friction of battle and some attempts have been made to account for them. Primarily, these efforts take the form of plans to get refugees and others out of the way of the fighting, both to remove them from possible harm and to reduce the impact on our operations.

F-10. In a stability and support environment, the number and importance of population groups that could have important effects on the commander's mission expands. Classifying them all as civilians on the battlefield is not adequate. Even attempting to classify them as friendly, hostile, or neutral is only a start. For example, neutral refugees seeking relief supplies could spell disaster for an NEO if they flood helicopter LZs. With no hostile intent, they could make air extraction impossible as they head to the sound of rotors—a sound often associated with delivery of relief supplies. Clans or factions that express pro-US sentiments could violently attack relief workers if they assist their clan's perceived enemies. US forces could then become drawn into a larger, standing conflict as they attempt to defend the relief workers.

F-11. In this environment, your staff must do more than list and categorize groups. They must assess the goals and motivations of the groups, their leadership (or lack thereof), their beliefs, and their power bases. From all of these possibly important factors for further analysis, S2s must narrow the list to those with a direct effect on the commander's mission and his ability to accomplish it. The limited time, soldiers, and equipment available to S2s require focusing on the most important issues for detailed analysis.

STEP 3: EVALUATE THE THREAT

F-12. Evaluating the threat was once the easiest part of the IPB process; today, this step is more difficult. The threats are often not regular armies with well-defined doctrine and OB. Even during Operation DESERT STORM, against a threat the intelligence community thought it understood well, the threat did not fight as their doctrine said they would. In the final analysis, threats do the same thing US forces do—they use the means at their disposal to achieve their desired endstate. Cultural factors and economic and training restraints impact operations. Commander personalities also play an important

role. In the end, however, forces apply assets available to achieve what they want to accomplish and your S2 must take all of this into account. Conducting this step of IPB relies on the assessment of the threat's objective, and subsequent threat tactics are based on details of the specific operational environment in consideration.

F-13. Brigades and battalions depend on tactics descriptions, representative vignettes of threat activities, and modified templates packaged as threat models from higher headquarters. By applying basic operational principles to these skeletal products, S2s can modify threat models and assess preferred methods of operation for a given threat peculiar to your operation. By refining all of these, the staff produces a threat picture, which then can be turned into doctrinal templates and sketches. The important difference between these end products and what S2s received in the past is the amount of increased analysis required to turn the information into something useful for your planning and decisionmaking.

STEP 4: DETERMINE THREAT COAs

F-14. The S2 will begin by defining the likely threat objectives and developing threat COAs, bearing in mind that all threat COAs must be considered. The S2 will use the same procedures and tools he uses in conventional IPB (situaton templates, event templates, and event matrixes) to support his threat COA analysis.

F-15. The situation templates will graphically depict the threat's expected disposition should the threat adopt a particular COA. To construct a situation template, the S2 overlays the doctrinal template produced in step 3 on the environmental templates (to include the MCOO) developed in step 2. The threat is then adjusted on the doctrinal template to allow for the effects of the environment. Due to the potential complexity of a stability and support environment, some situation templates may be more suited to present in a matrix format.

F-16. The S2 will use event templates as guides for intelligence collection and ISR planning. These templates will depict where and when to collect the threat information. Some of the NAIs on the event template indicate the COA the threat will adopt. Consider the following when determining threat COAs relative to stability operations and support operations:

- A wider range of actions available to the threat.
- Historical, demographic, and cultural information is of importance in developing possible actions.
- The full set of unique COAs available to the threat.
- Objectives and COAs over a longer period of time.
- The threat will quickly incorporate lessons learned.
- Long-term political objectives; what the threat is willing to commit to at various stages.
- Imagery at a scale of 1:10,000 to 1:25,000 to accurately display detailed characteristics of the terrain.

URBAN OPERATIONS CONSIDERATIONS

F-17. Urban operations are a perfect example of a unique environment. Intelligence collection within the urban operations can be a complex and time-consuming process. Normally, your S2 must quickly focus on the key elements of the environment. The use of an abbreviated analytical process has the advantage of bringing environmental details into the IPB process. It also lays the groundwork for a more detailed analysis later as your operation matures.

F-18. Urban operations have an increased number and potential combination of variables. For example, an infantry battalion operating in a city's industrial park may not only encounter the threat during seasonal rains but also encounter flooding as well. Flooded buildings may in turn be full of damaged storage tanks that leak hazardous waste materials into the water. The battalion could suffer more casualties from the hazardous waste than from direct combat. In the confines of the urban environment there may be literally nowhere for the unit to go, and the situation will have to be addressed by a combination of combat, engineer, and chemical units.

F-19. Because of the diversity in the urban environment, your S2 may have difficulty identifying a starting point. The framework in Figure F-1 is a way for your S2 to start. It is a tool designed to facilitate an urban operation assessment and subsequently support your MDMP. The framework is structured around eleven steps, which may also be considered layers of the whole assessment. Your staff must address the first layer before reaching the second layer, and the third layer, and so on.

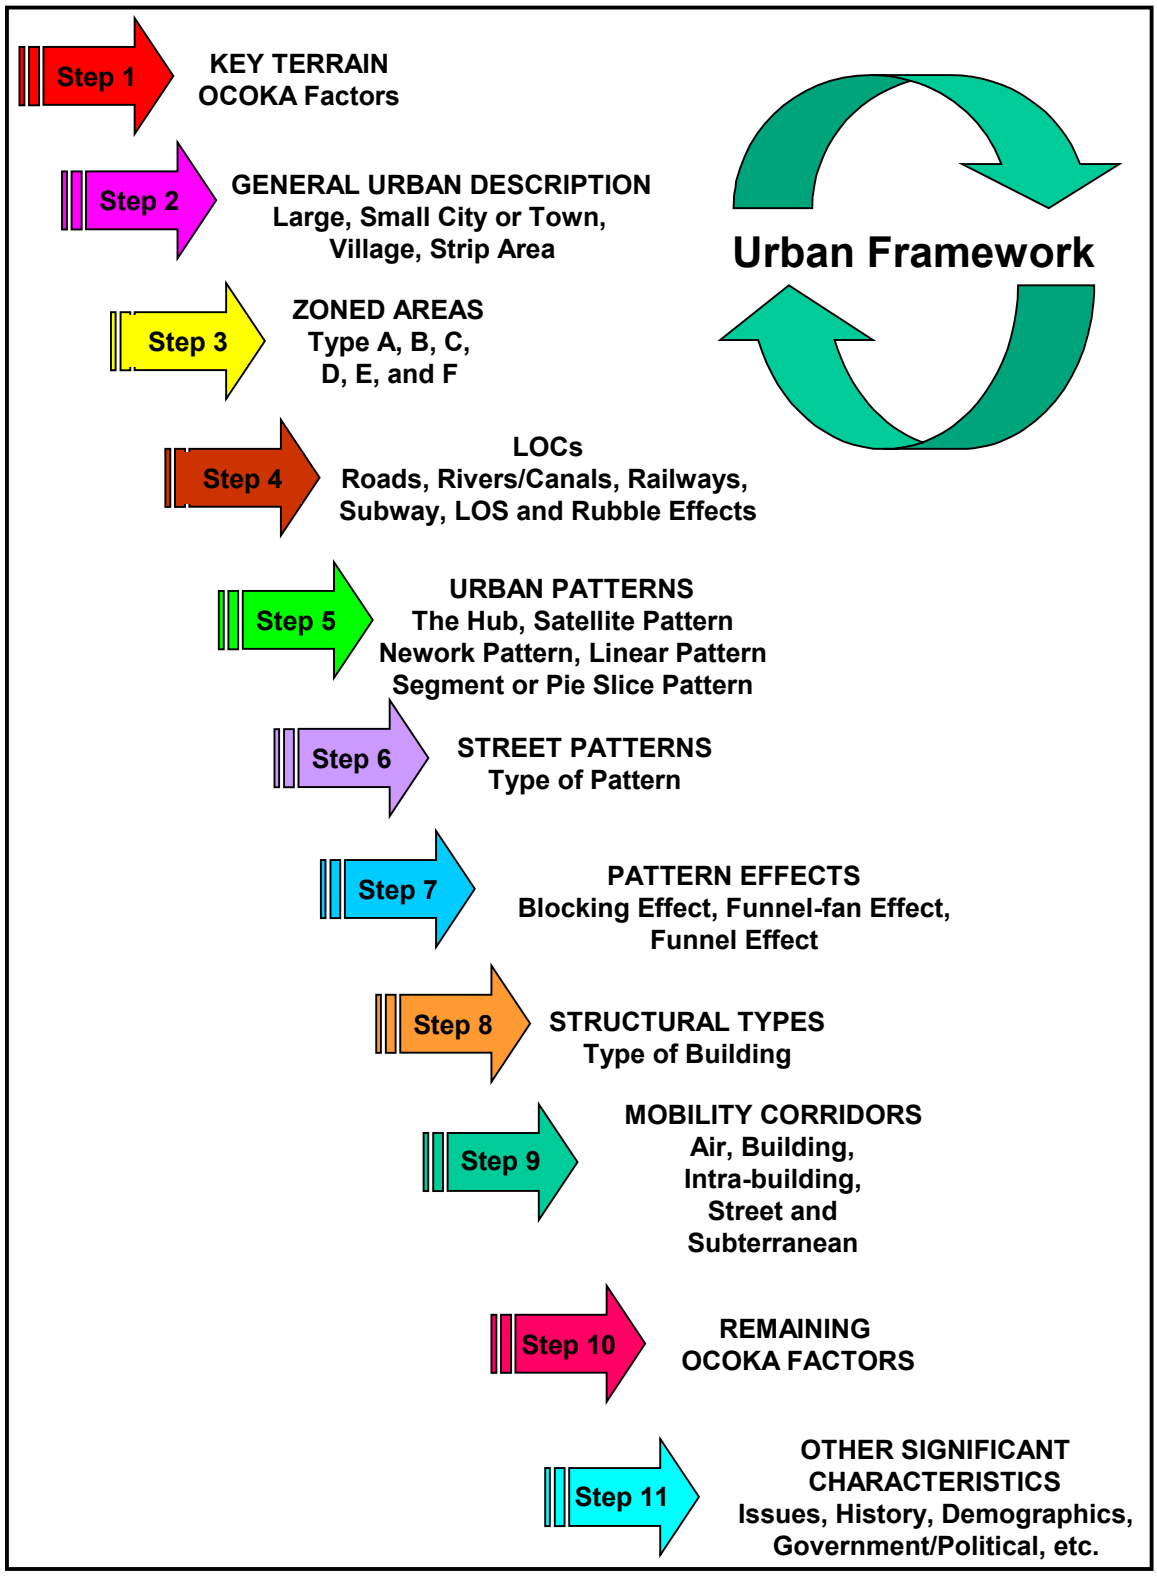

Figure F-1. Urban Operations

Military History Office
US Army Intelligence and Security Command
Fort Belvoir, Virginia

In a ceremony held in May 1969 at Arlington Hall Station, Virginia, the noncommissioned officers of the US Army Security Agency dedicated a memorial in memory of their fallen comrades from three conflicts: Korea, Vietnam, and Dominican Republic. The statue is carved from white Italian marble and depicts a soldier in full battle dress with field radio. Today, the ASA Memorial stands at Headquarters, US Army Intelligence and Security Command, Fort Belvoir, Virginia.

FOREWORD

The first unit to be deployed to South Vietnam belonged to the United States Army Security Agency (ASA) as did the first to be decorated. The first acknowledged casualty of the war was an ASA soldier. All of these milestones are reminders that from the beginning Vietnam was very much an intelligence war. The challenge for US advisors and later commanders in the field was to locate an elusive enemy in a hostile environment. Communications intelligence quickly emerged as the ground forces' primary source of targeting the enemy and for planning operations; it also aided in obtaining other valuable sources of information, such as captured documents and interrogated prisoners of war—all by-products of successful combat operations. Because Vietnam was the first air-mobile war, timeliness of information became as critical as accuracy, where minutes spelled the difference between success and failure. Here again, ASA direct support elements served as invaluable conduits through which communications intelligence flowed to the combat commanders on a real-time basis.

The motto of the Military Intelligence Corps is "Always Out Front." It was precisely because ASA was out front that signals intelligence enjoyed the success it did in Vietnam. Army Security Agency personnel deployed to Vietnam four years in advance of major ground combat elements. This allowed ASA the time to develop a new technique (airborne radio direction-finding) to pinpoint a concealed enemy, to assemble the necessary background data, and to gain the experience required to support US forces in the field. If there is an over-arching lesson learned through the years, it is that military intelligence needs to be continually engaged in order to be successful. One only has to contrast the absence of intelligence in the early phase of the Korean War with the constant flow of information awaiting combat elements upon their arrival in Vietnam.

Although security restrictions prohibit the telling of the intelligence story in full, hopefully, the picture history format will provide a window into an important aspect of the Vietnam War that here-to-fore has not been publicized. Its purpose is to outline the scope and type of support furnished by the Army Security Agency and to provide testimonial evidence of ASA's overall success as well as to note various shortcomings. The history is also the story of individual sacrifice and professionalism on the part of ASA soldiers that will continue to foster *esprit de corps* among future generations of military intelligence specialists.

KEITH B. ALEXANDER
Major General, USA
Commanding US Army Intelligence and Security Agency
Fort Belvoir, Virginia
23 January 2003

PREFACE

Early in his career, Colonel James P. Brown headed up a small history team sent by the Army Security Agency to Vietnam to document its role in the war. Reflecting back, COL Brown recalled a comment made by one of his subordinates: "After working for weeks, night and day to finalize, assemble all the photographs, and make the requisite number of copies of the 509th Radio Research Group historical report, Lieutenant Hunt surveyed the two desks piled high with all the volumes and with a sigh mumbled, 'God, I hope someday someone reads all that stuff!' Indeed!" This history represents a small down payment on the efforts by ASA historical officers in the field and the historians back at Arlington Hall Station to document the signals intelligence story. Once the US Army Center of Military History has completed its official history of Vietnam, it is hoped that declassification will have advanced to the stage that Army intelligence can supplement the work with a more detailed operational narrative.

The history is limited in scope and does not attempt to tell the story of the larger cryptologic effort of the war. It draws only upon Army records and those readily available to the INSCOM History Office. The final product is the result of the contributions of many individuals. Colonel William H. Marvin, Chief of Staff, and Mr. Daniel Scarfo, Chief, Strategic Management and Information Office, provided overall supervision to the project. As in every endeavor undertaken by the History Office, it could not have been possible without the advice and assistance furnished by Dr. John P. Finnegan, Historian, the editorial support of Mrs. Karen E. Kovach, and the detailed review of the manuscript by Mr. Thomas Hauser, Staff Historian. The final product was enhanced by the comments of Ms. Romana Danysh, Organizational History Branch, Center of Military History, and by various ASA veterans.

Photographic support for this volume was provided by Mr. Robert J. Bills and graphic support by Ms. Robin Crawford, both of the Office, Assistant Chief of Staff, G6. Unless otherwise noted, all photos are from the INSCOM collection. Credit for design of this publication belongs to Ms. Maureen Nugent, Office of Typography and Design, US Government Printing Office.

A special word of thanks is owed Mr. James D. Currie, Jr., INSCOM Publishing Management Officer, for his ongoing liaison and quality control throughout the production process. Also to Mr. Mark Bertram for the loan of his unit insignia collection and Ms. Laura Siedlarczyk, who coordinated the volume at Department of Defense. As always, the staff of the US Army Cryptologic Records Center was helpful and patient during the research phase. Simply put, the book would not have been possible without the efforts of numerous people both present and past. However, any mistakes, errors, and omissions are solely the responsibility of the author.

JAMES L. GILBERT
US Army Intelligence and Security Command

Arlington Hall Station served as headquarters of ASA's worldwide organization. Formerly an exclusive women's college, the Hall was home to the Army's code-breaking activities during World War II.

THE EARLY YEARS 1961 1964

"It has been my feeling in years past [prior to Vietnam] that we did not know too much about ASA. . . . If we did know much about it, maybe we felt they were working for authorities outside the Army, albeit important work."

LTG CREIGHTON W. ABRAMS, VICE CHIEF OF STAFF, US ARMY

In the closing days of World War II, US Army leaders began to turn their attention to planning for what would follow in the aftermath. High on their agenda was maintaining access to the Army's most important source of strategic intelligence—information derived from the intercept and deciphering of enemy communications. On 15 September 1945, the War Department established the Army Security Agency (ASA) with headquarters at historic Arlington Hall Station, Virginia. Building upon the legacy of its predecessor, the Signal Security Agency, ASA possessed a sweeping charter to conduct communications intelligence (COMINT) operations as well as to provide the Army with communications security (COMSEC). For the first time, all of the Army's signals intelligence (SIGINT) resources fell under one command. Organizationally, ASA was unique. It was literally an army within the Army. Due to its vertical chain of command, the agency replicated in miniature all the functions of the larger Army, ranging from personnel recruitment and training to research and development. ASA directed a worldwide organization consisting of theater headquarters in the Far East and in Europe and a series of fixed sites, or field stations. that encircled the globe and served as its collection arm.

Over time, ASA underwent a number of important mission changes. In 1949, the Joint Chiefs of Staff established the Armed Forces Security Agency, forerunner of the National Security Agency. In turn, the Army, Navy, and Air Force cryptologic agencies were forced to relinquish control of the signals intelligence system to the new Department of Defense organization. This realignment caused ASA to reexamine a previously neglected portion of its mission—COMINT and COMSEC support to the Army in wartime. The outbreak of the Korean War and subsequent buildup of US forces in Europe further reinforced the need for ASA to field tactical support units on a large scale. Soon groups and battalions became a fixture within the agency's force structure, and from 1950 to 1956, the number of such units grew from zero to nine. Other mission shifts included ASA assuming responsibility in 1955 for the Army's electronic intelligence (ELINT) and electronic warfare (EW) programs. However, both ELINT (intercept of noncommunications signals) and EW (denying the enemy use of his communications through jamming or deception) would largely remain in the background as ASA's primary focus continued to be communications intelligence.

In 1960, on the eve of US intervention into Vietnam, ASA was better prepared and better equipped than at any time to go to war. Although ASA's primary focus remained on manning its worldwide chain of field stations, the agency possessed the necessary doctrine for supporting combat troops, an R&D and materiel development capability geared to deploy new systems, and an efficient personnel system for recruiting, training, and sustaining a highly qualified force.

From its inception, ASA was cloaked in an aura of secrecy. An early recruiting poster proclaimed, "...by the very nature of its work, this agency remains little known." The problem was that ASA also remained little known to the larger Army. Vietnam would test ASA's ability to educate a new generation of combat commanders as to the value of its products and to overcome the obstacle that classification restrictions placed on the sharing of time-sensitive information. And as the Army moved towards air-mobile warfare, minutes could spell the difference between success and failure.

South Vietnamese crowds line the street to greet then Vice President Johnson, whose visit to Saigon in May 1961 would precede ASA troop arrivals by only a few days.
(Library of Congress)

President Eisenhower and President-elect Kennedy both supported assistance to South Vietnam, but it was the latter who stepped up the deployment of military advisors. (National Archives)

"Vigilant Always"

MOTTO OF THE ARMY SECURITY AGENCY

Involvement in Vietnam

At the end of World War II, Vietnam was locked in a struggle between the aspiration of Vietnamese nationalists and the desire of the French to reassert political and economic control over its former colony. Following a failed attempt at a negotiated settlement, guerrilla warfare broke out. Soon the Viet Minh (League for the Independence of Vietnam) controlled large sections of the countryside while French forces ruled most of the cities. The fall of neighboring China to the Communists in 1949 and the subsequent flow of assistance from the Communist Bloc to the Viet Minh escalated the war from a local conflict to one having international implications. Various Communist states recognized the Democratic Republic of Vietnam as the legitimate government while the United States and Great Britain accepted the new "State of Vietnam" supported by the French.

The 1954 defeat of its forces at Dien Bien Phu, coupled with the costs of fighting a protracted war, finally ended France's involvement in Vietnam. The departure of the French created a vacuum into which the US poured an increasing amount of supplies to South Vietnam and assumed responsibility for training its army. Later that year, a Peace Conference convened in Geneva, Switzerland. Here delegates from the Soviet Union, Great Britain, France, and the United States proceeded to divide Vietnam into North and South, separated by a demilitarized zone along the 17th Parallel.

One of the first foreign policy issues facing newly elected President John F. Kennedy in 1961 was how to counter the escalating pressures by the North Vietnamese backed guerrillas undermining the Republic of Vietnam. In response to calls for assistance by President Ngo Dinh Diem and US officials in Saigon, the Kennedy administration took steps to strengthen South Vietnam's ability to win the political, military, economic, and psychological war against Communist-backed insurgency. Among the types of aid being sought by the South Vietnamese was help for their fledgling communications intelligence effort. The Vietnamese had established a small Technical Study Center in Saigon and Dan Nang for the purpose of monitoring the guerrillas' communications. To encourage Vietnamese direct support to its Army, the US provided 30 SP–600 Hammerlund radio receivers along with several AN/PRD–1 direction finders.

In February 1961, LTG Lionel C. McGarr, Chief, Military Assistance Advisory Group, Vietnam (MAAG–V) raised the stakes for COMINT assistance by asking for direct US involvement. Subsequently, MG John M. Willems, Assistant Chief of Staff for Intelligence (ACSI) at Department of the Army (DA), floated a proposal to provide training to the South Vietnamese and at the same time establish US intercept operations in country. On 20 March 1961, the Department of State informed Headquarters, Department of the Army, that it was politically feasible for the US military to conduct a small COMINT effort in South Vietnam. Based on this positive feedback, the ACSI alerted MG William M. Breckinridge, Chief, ASA, to begin planning for deployment of a unit to Southeast Asia. At the same time, reports were arriving in Washington, DC, that the South Vietnamese COMINT element was beginning to enjoy success. These glowing evaluations would later prove erroneous. However, for the moment, they were greeted by the ASA leadership as indicators that the command would have no problem in fielding an intercept unit of its own.

On the eve of Vietnam, ASA's main focus was support of its worldwide chain of field stations.

Request for Assistance

The Army Security Agency's ability to quickly respond to DA's tasking to deploy a mobile intercept unit to South Vietnam demonstrated the strengths of its vertical command structure. The agency was able to draw upon expertise from its theater headquarters, USASA Pacific, for insights on the anticipated targets. Based on this input, Mr. Jimmie Garrett, a member of the Operations staff back at Arlington Hall, labored late into the night putting the finishing touches on Operations Plan (OPLAN) 7–61 (nicknamed WHITEBIRCH) and OPLAN 8–61 (SABER-TOOTH) that listed the equipment and personnel skills required. WHITEBIRCH established a 78-man ASA operational element to target local Communist guerrillas, and SABERTOOTH fielded a 15-man team to train South Vietnamese COMINT specialists supporting the Army, Republic of Vietnam (ARVN) at division and below. When the National Security Council met on 29 April 1961, President Kennedy formally approved the deployment of ASA personnel. Because HQ USASA controlled its own personnel assignments and training, the agency was able to quickly identify the individuals needed for WHITEBIRCH/SABERTOOTH and within 3 days had assembled them at its Training Center and School located at Fort Devens, Massachusetts. At the same time, ASA logisticians lined up the equipment to be shipped; any piece not already in the inventory was taken from a unit lacking an immediate requirement for it. This shuffling of

"The greatest contribution Vietnam is making—right or wrong is beside the point—is that it is developing an ability in the United States to fight a limited war, to go to war without the necessity of arousing the public ire."

ROBERT S. MCNAMARA, SECRETARY OF DEFENSE

personnel and assets to accomplish mission priorities was an art form that ASA had perfected over the years.

As it awaited further orders, the ASA contingent organized itself into the 400th USASA Operations Unit (Provisional) with a cover designation as the 3d Radio Research Unit (RRU). (Throughout the Vietnam Conflict, ASA would designate all of its units as "Radio Research" to shield its presence.) As part of this low visibility status, the first ASA personnel were required to carry US passports, wear civilian clothes, and if asked, indicate that they were military advisors attached to MAAG–V. A local post exchange remained open late one night so that the 3d RRU soldiers could select civies. However, because there was so little variety to choose from, it became the standing joke that the ASA personnel might just as well have been issued uniforms since they were all wearing clothes of a similar style and color.

The first members of ASA to arrive in Vietnam were COL Robert T. Walker, Chief of USASA–PAC, and LTC Robert W. Williams, designated Commander, 3d RRU. The two officers were there to make final arrangements for ASA's pending deployment and to identify possible operational sites. On 9 May in response to a query from the White House, the Army indicated that its ASA element was poised for departure. Three days later, Republic of Vietnam officials formally agreed to a cooperative COMINT effort between its armed forces and those of the United States, but with the understanding that shared information would be limited in content and scope. Upon learning of the agreement, COL Walker immediately flashed word back to the 3d RRU that all systems were "Go."

A cartoon from ASA's publication, The Hallmark, captures the thoughts of many a new recruit to the agency.

Dressed in civilian clothes and carrying weapons, soldiers of the 3d RRU manned the remote direction-finding site at Ha Tien.

On The Ground

On 13 May 1961, 92 personnel of the 3d RRU landed at Tan Son Nhut Air Force Base, located just west of Saigon proper. Here they were greeted by COL Walker and LTC Williams. Throughout the next week, C–124s and C–119s continued to bring equipment contributed by ASA units worldwide. (The 3d RRU's entry marked the first time that an entire Army unit had deployed to South Vietnam; previously only individual advisors had been assigned.) The headquarters and processing elements of the 3d RRU immediately found a home in an empty warehouse near the airfield. Personnel were billeted at the Majestic Hotel in Saigon, but the need to economize soon led to a search for new quarters. Enlisted men eventually occupied six floors of a new building located at 39 Hai Ba Trung, while the officers settled into four small bungalows located in a nearby residential area.

On 15 May at 1015 hours, operations were up and running. Inside shelters parked alongside the Tan Son Nhut airstrip, ASA soldiers tuned their receivers in search of manual Morse signals. A month later, at the encouragement of the ARVN Chief Signal Officer, the 3d RRU moved its vans to the nearby Vietnamese Joint General Staff Compound (Trai Tran Hung Dao), which was located in Saigon proper and also served as the headquarters of South Vietnam's own intercept effort. By having US COMINT operations close-at-hand, the South Vietnamese were suspected of wanting to

"If injured or killed in combat, report as training accident in the Philippines."

STAMPED ON MEDICAL RECORDS OF 3d RRU PERSONNEL

extract more concessions in terms of equipment and information sharing. In the coming months, considerable finesse and diplomacy would be demanded of US officials in deflecting requests from their hosts for added support and increased access.

By 28 May, site surveys for establishing the WHITEBIRCH direction-finding net were completed. The net would stretch along the coastline, running from Ha Tien in the southwest to Cap Saint Jacques east of Saigon and finally to Nha Trang in central Vietnam. Within a month, all of the sites had become operational. At the more isolated Ha Tien site, ARVN soldiers provided security, and ASA operators were instructed to carry weapons at all times and not to travel at night.

The SABERTOOTH School occupied a building at the Joint General Staff Compound and used equipment and instructional material donated by the 3d RRU. In July, ASA advisors began week-long classes to familiarize ARVN SIGINT specialists with various pieces of equipment, but delays in logistical support pushed the formal opening of the school back to early September. Students in the first class completed some 528 hours of instruction, covering such subjects as manual Morse intercept, direction-finding, communications, and maintenance.

No sooner had the 3d RRU settled in country, than efforts were underway to increase its size. At the beginning, only 17 hours of daily coverage were necessary because the Viet Cong ceased operations between 1600 and 2300 hours, but the emerging need for around-the-clock monitoring soon required the Chief, USASAPAC to come up with an additional 52 spaces. At the same time, the National Security Agency looked unfavorably upon ASA's growing commitment to the ground war in South Vietnam, expressing concern that ASA was robbing resources from its other missions within the Pacific theater. No one could have envisioned that within 6 years ASA's in-country strength would be nearly 6,000 personnel.

The Direction-Finding Problem

Dating as far back as World War I, the US Army had utilized direction-finders (DF) to locate enemy transmitters and, in turn, enemy forces. Upon acquiring a signal, direction-finding (DF) stations within a DF net would simultaneously take bearings on the transmission. The point where three or more lines crossed would result in a "fix." Unlike earlier conflicts, the task of finding an elusive enemy would take on an even greater sense of urgency in Vietnam.

ASA arrived in Vietnam fully expecting that its direction-finding mission would be accomplished. (ASA's optimism was due in part to erroneous reports it had received of early success by the South Vietnamese.) Plans called for a medium-range direction-finding (MRDF) net to be established at semi-permanent sites. The net would pass general targeting locations to mobile direction-finding teams using AN/PRD–1s. Operating from locations 5–15 miles away from an enemy transmitter, the mobile teams could then produce the necessary refined fixes. Once an enemy unit was sufficiently pinpointed, South Vietnamese forces could then engage it.

Located entirely within the targeted area, the WHITEBIRCH Net was initially thought to represent the ideal situation because of the closeness of substations to their targets. However, the insurgents waging mobile warfare in mountainous regions and possessing limited resources utilized hand-generated, low-powered radios for means of communications. Instead of attempting to broadcast by direct or ground waves that couldn't travel beyond 5 to 15 miles, enemy communicators employed horizontally radiating antennas in the high-frequency band. By this means, the signals were bounced off the ionosphere to receiving stations. DF operators could normally calculate bearings from sky waves. However, in Vietnam, targets located 15 to 150 miles away produced sky waves with unusually steep angles (greater

A PRD–1 mounted on a ¼-ton vehicle.

"The principle of airborne direction-finding appears to have possibilities for generally improving DF effectiveness on the Viet Cong problem. Recommend that equipment be assembled and concept tested in CONUS...."

LTC WILLIAM J. COCHRANE, JR., CDR, 3d RRU

than 45 degrees) for the DF site to intercept. Under these conditions, accurate bearings were hard to come by, and there was little wisdom in launching a tactical operation against the Viet Cong at an ill-defined location. The WHITEBIRCH net faced other challenges such as the effects of humidity upon the AN/TRD–4A direction finders and the lack of transportation to isolated sites where security was a growing concern. ASA operators at Ha Tien were soon subjected to small-arms fire, leading to the substation's relocation to Bien Hoa.

By the fall of 1961, the 3d RRU's new commander, LTC William J. Cochrane, was turning to Arlington Hall Station for answers to his direction-finding problems. Warrant Officer George Miller served as the point of contact for the 3d RRU and began correspondence with Mr. Herbert S. Hovey, Jr., an electrical engineer in the Office of the Assistant Chief of Staff, Developments at HQ USASA. Eventually, a four-pronged approach to the problem emerged: investigate the possibility of an airborne system, improve the PRD–1, replace the TRD–4As, and develop a small man-pack direction finder for future Special Forces operations. To even consider airborne direction-finding at the time indicated a certain amount of desperation on the part of ASA leaders.

ASA's First Casualty

When the idea of airborne radio direction-finding (ARDF) first surfaced, Mr. Herbert Hovey immediately contacted Mr. Harold H. Jaffe and Mr. John Woodworth from the US Army Electronics Command (ECOM) laboratories located at Fort Monmouth, New Jersey. The three had collaborated in the past on similar projects. The first item on the ASA/ECOM team's agenda was a fact-finding trip to Vietnam. Here, they tried to acquire first-hand knowledge of the direction-finding problem and the local signal environment. Among those they talked with was 25-year old SP4 James T. Davis, who was serving as an advisor to one of the ARVN PRD–1 teams. Davis, a native of Livingston, Tennessee, had come to Vietnam as a member of the original 3d RRU contingent. Reflecting the optimism of the times, Specialist Davis wrote home to his family that, "I feel a little proud about this deal, too. I just hope that our little bit will help to ease things in this part of the world." He also communicated the growing danger of his assignment, "We became a little more involved in this conflict yesterday... It looks like the bad guys have gotten the word to start giving us hell. It breaks the daily routine even though it could become a bit dangerous."

SP4 James T. Davis "... the first American to fall in defense of our freedom in Vietnam."

PRESIDENT LYNDON B. JOHNSON

As tests on the new ARDF system proceeded at Fort Monmouth, the 3d RRU renewed its efforts to make direction-finding successful by utilizing resources on hand. To increase coverage, the 3d RRU began integrating ARVN stations into the WHITEBIRCH net. In addition to the static MRDF net, the 3d RRU also continued to field mobile, short-range direction-finding (SRDF) teams, using PRD–1s. However, establishing an SRDF net meant that ASA personnel were often forced to operate near the enemy. Normally, a network of vehicles consisting of two jeeps and a ¾-ton truck would deploy on a SRDF mission that might last up to a week. Evidence later emerged that the Viet Cong were fully aware of the mission of these DF-teams, and in fact, had taken steps to target them.

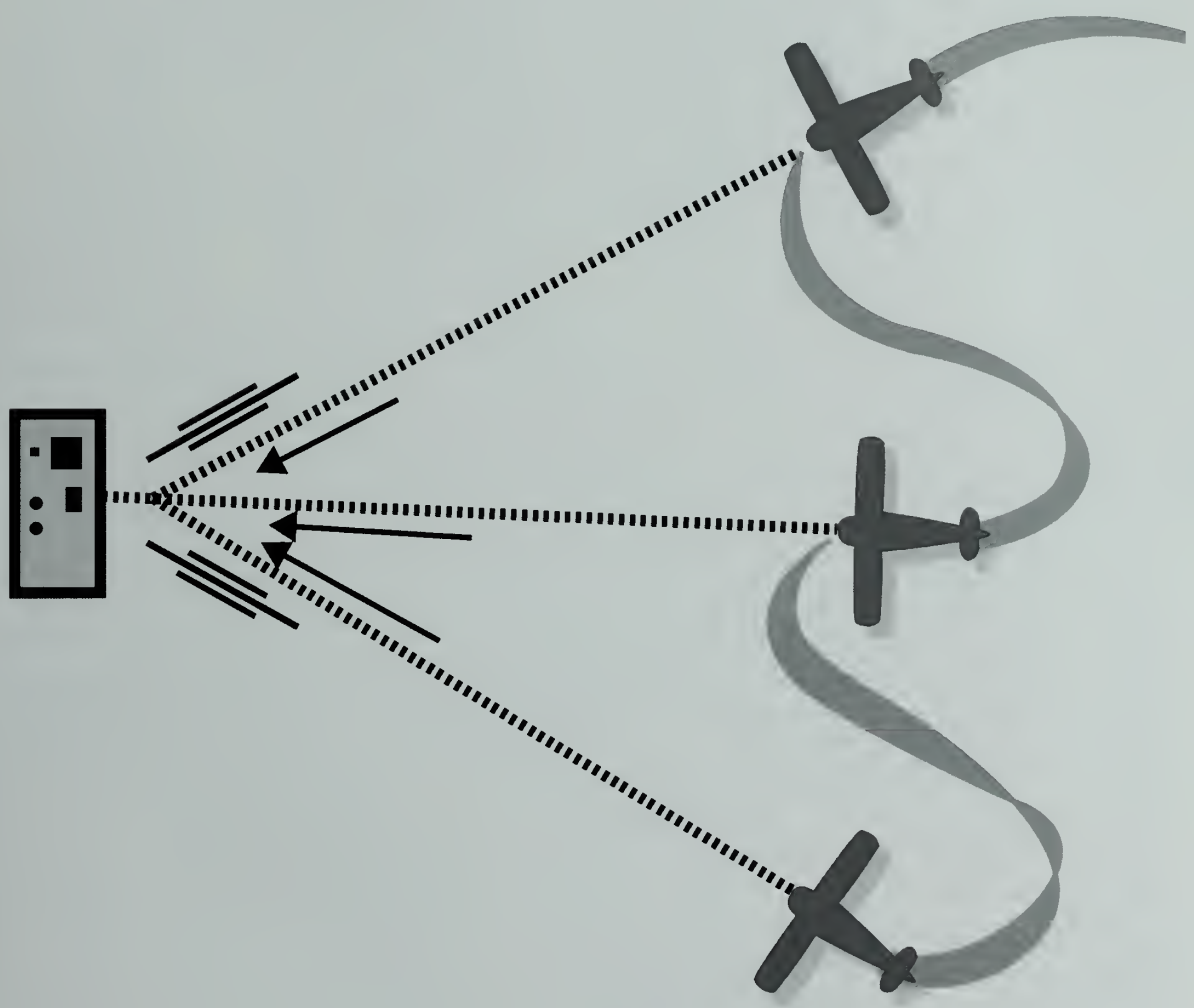
At noon on 22 December 1961, Specialist Davis and his PRD–1 team had just taken a bearing approximately 20 kilometers west of Saigon. The ¾-ton truck carrying Davis and ten ARVN soldiers proceeded northwest on Provincial Highway 10 and was 800 meters west of Cau Xang, not far from the remnants of an old French garrison and a nearby canal, when an electrically controlled land mine suddenly exploded underneath the vehicle's tailgate. The truck then spun out of control, coming to rest in the right ditch. Emerging from their concealed positions, a band of approximately 20 Viet Cong opened fire on the dazed and wounded soldiers. Managing to escape from the truck, Davis returned fire with his M–1 rifle before being fatally struck. Within minutes the ambush was over, and Davis and nine members of his team lay dead. Besides stripping the soldiers of their weapons, the Viet Cong also removed the radio to add to their eclectic collection of US/French/Chinese communications gear.

Because wartime conditions did not exist at the time, Army Regulations prohibited awarding Davis the Purple Heart. But on 10 January 1962, Davis' fellow ASA soldiers dedicated the 3d RRU's facility at Tan Son Nhut Air Base as "Davis Station" to serve as a memorial to their fallen comrade. Of all the tributes given, none, however, were more fitting than the words of Davis' father, "It is a tragedy... to lose a son, but is also an honor to know that a son was a good soldier."

Specialist Four James T. Davis was killed while on an advisory mission with a South Vietnamese PRD–1 team.

The 3d RRU area at Ton Son Nhut AFB in Saigon was named in honor of Specialist Davis.

Inside the U–6, there was barely room for the intercept operator and equipment.



"Because in a way it [airborne radio direction finding] is the radar of Vietnam...."

MR. HERBERT S. HOVEY, JR., ENGINEER, HQ USASA

Airborne Radio Direction-Finding

The challenge for the ASA/ECOM engineers was to create an airborne system that could discriminate between direct and sky waves. Although the answer on how to decouple the antenna from the metal skin of the aircraft was sophisticated, the hardware portion of the problem was easy to solve. The biggest obstacle proved to be selection of the right type of aircraft. When early tests using a UH–19 "Chickasaw"helicopter failed because of vibration problems, the engineers turned to the U–6A, a small, fixed-wing aircraft nicknamed the "Beaver." The U–6s were numerous in Vietnam, which meant that maintenance support was readily available. The aircraft also provided the pilot good ground visibility and could transport a crew of three plus a small load of equipment.

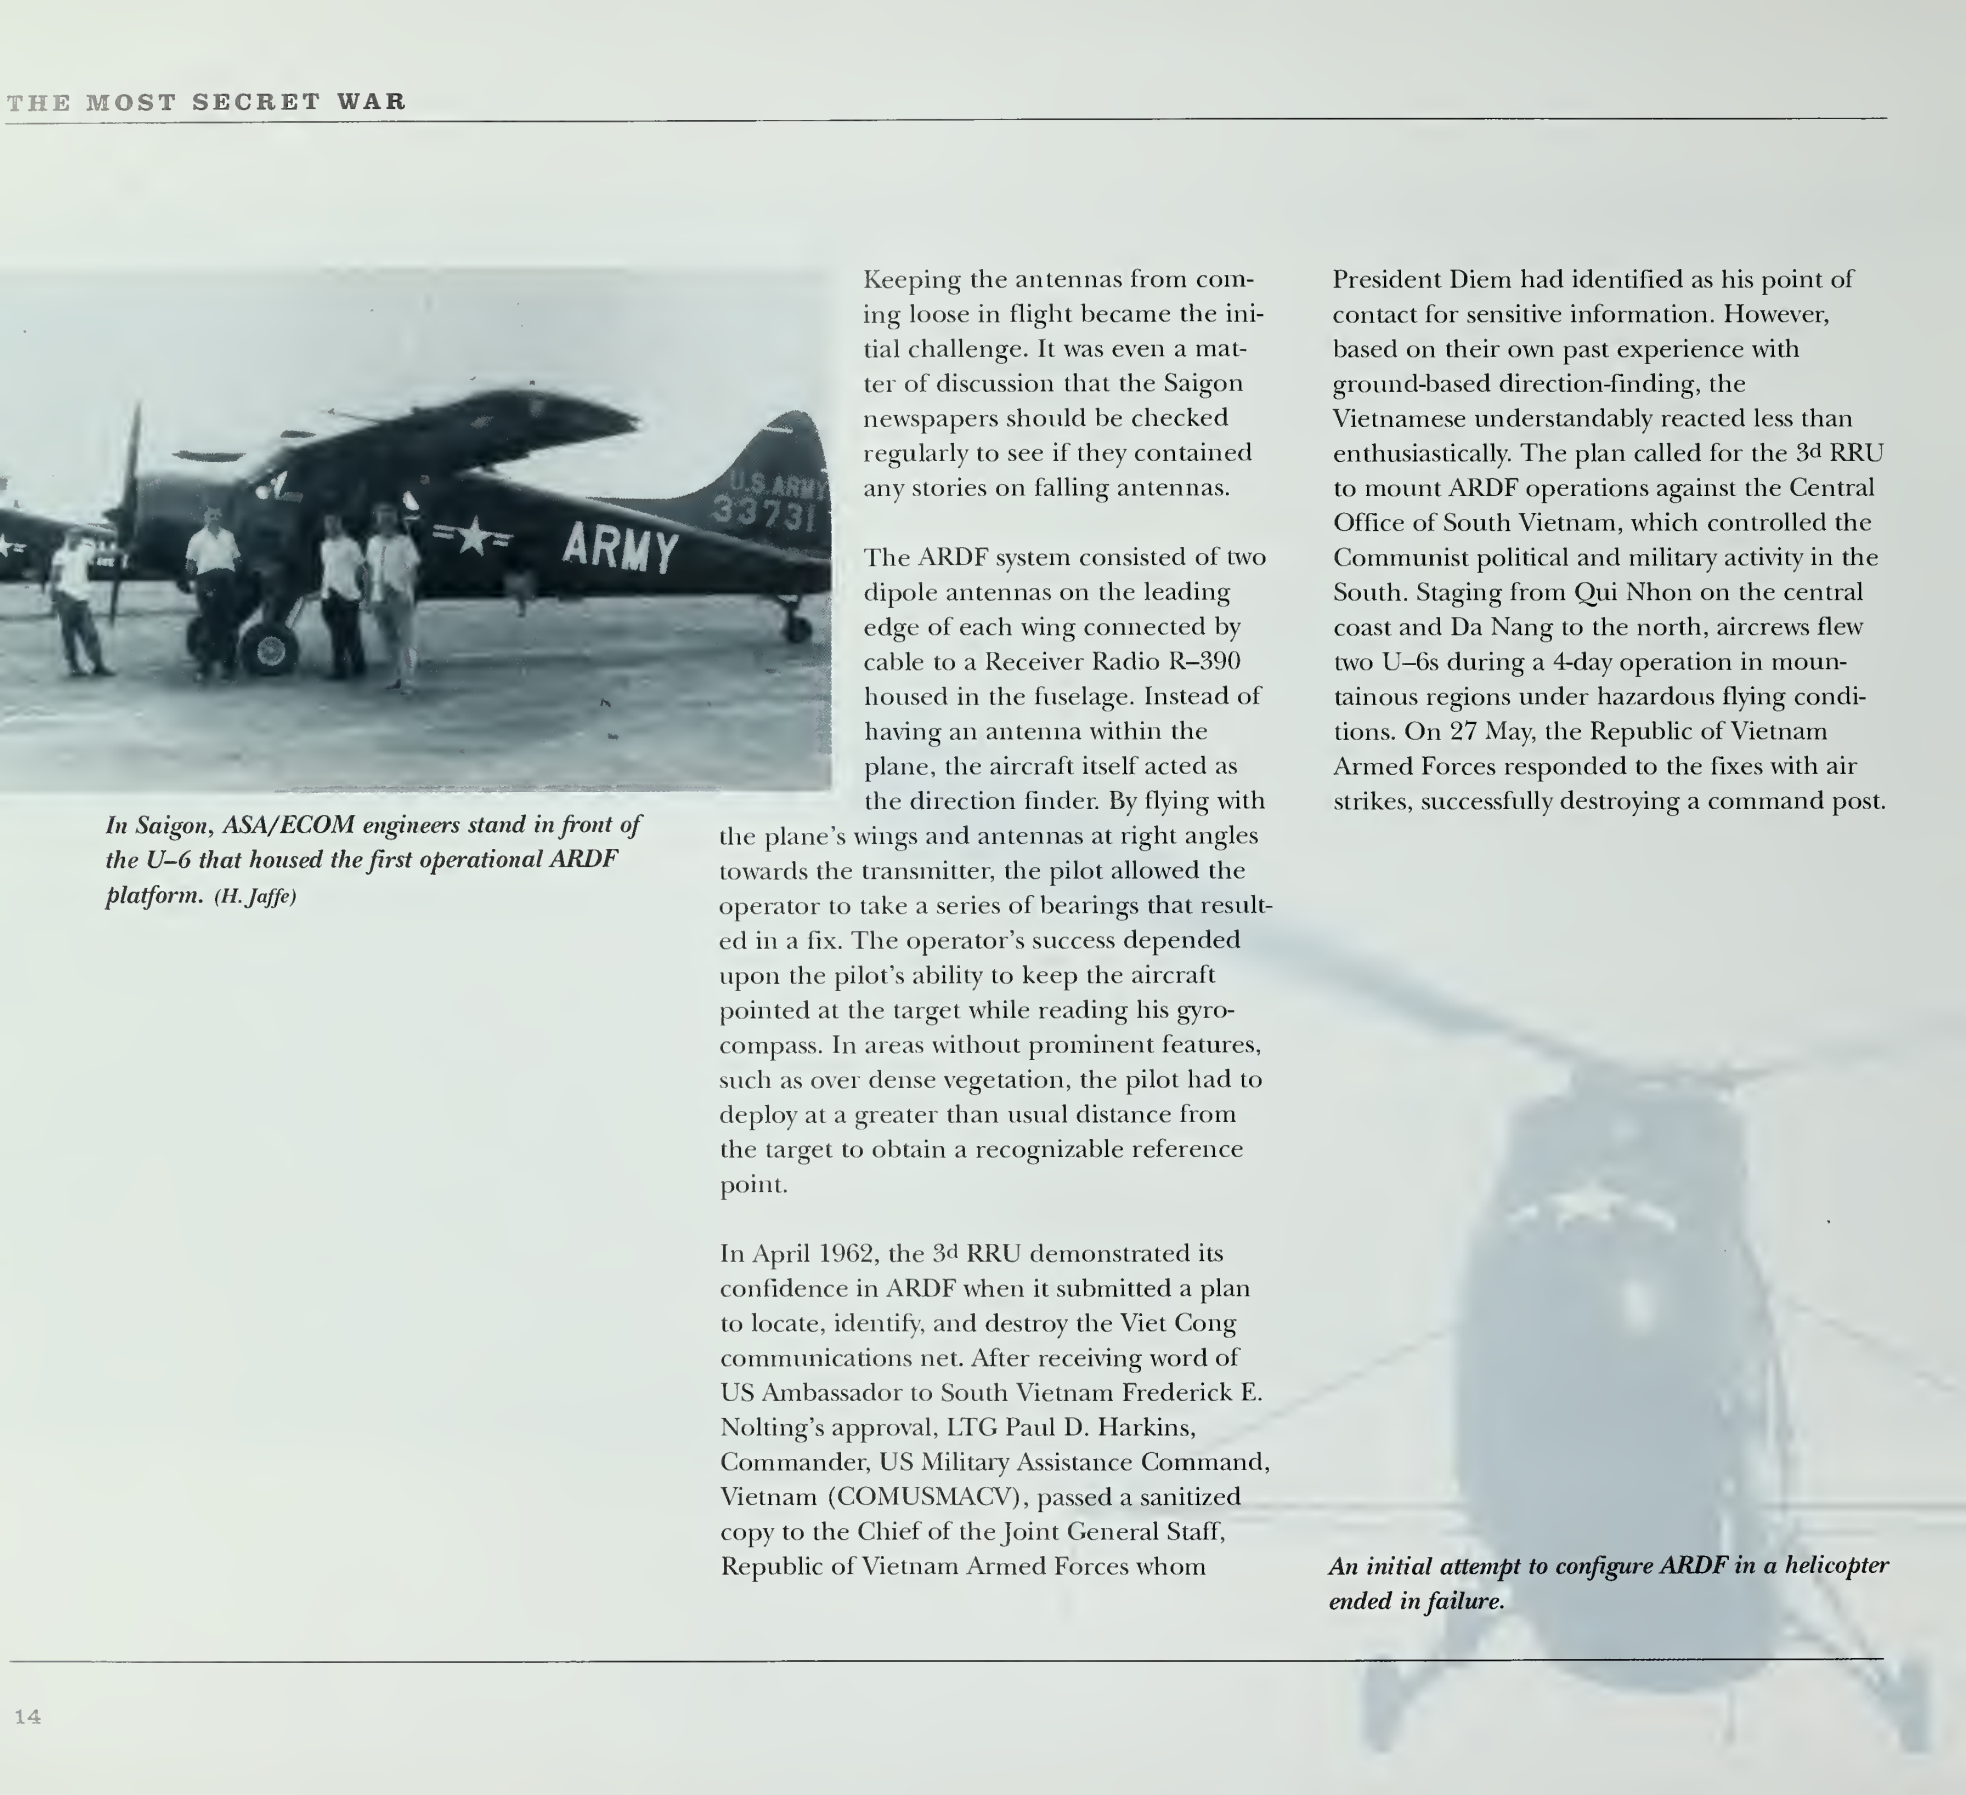
Carrying the airborne radio direction finding (ARDF) equipment in their luggage, the ASA/ECOM team, minus Woodworth, who ironically disliked flying, boarded a commercial flight for Vietnam in early March 1962. Meanwhile, the 3d RRU secured three U–6 aircraft from MAAG–V along with the services of two pilots, CPT William F. Simpson and CPT Donald C. Schessler, neither of whom had prior experience working with communications intelligence. Upon arriving in Saigon, the ASA/ECOM engineers immediately set about installing the DF equipment on the Beavers.

In Saigon, ASA/ECOM engineers stand in front of the U–6 that housed the first operational ARDF platform. (H. Jaffe)

Keeping the antennas from coming loose in flight became the initial challenge. It was even a matter of discussion that the Saigon newspapers should be checked regularly to see if they contained any stories on falling antennas.

The ARDF system consisted of two dipole antennas on the leading edge of each wing connected by cable to a Receiver Radio R–390 housed in the fuselage. Instead of having an antenna within the plane, the aircraft itself acted as the direction finder. By flying with the plane's wings and antennas at right angles towards the transmitter, the pilot allowed the operator to take a series of bearings that resulted in a fix. The operator's success depended upon the pilot's ability to keep the aircraft pointed at the target while reading his gyrocompass. In areas without prominent features, such as over dense vegetation, the pilot had to deploy at a greater than usual distance from the target to obtain a recognizable reference point.

In April 1962, the 3d RRU demonstrated its confidence in ARDF when it submitted a plan to locate, identify, and destroy the Viet Cong communications net. After receiving word of US Ambassador to South Vietnam Frederick E. Nolting's approval, LTG Paul D. Harkins, Commander, US Military Assistance Command, Vietnam (COMUSMACV), passed a sanitized copy to the Chief of the Joint General Staff, Republic of Vietnam Armed Forces whom President Diem had identified as his point of contact for sensitive information. However, based on their own past experience with ground-based direction-finding, the Vietnamese understandably reacted less than enthusiastically. The plan called for the 3d RRU to mount ARDF operations against the Central Office of South Vietnam, which controlled the Communist political and military activity in the South. Staging from Qui Nhon on the central coast and Da Nang to the north, aircrews flew two U–6s during a 4-day operation in mountainous regions under hazardous flying conditions. On 27 May, the Republic of Vietnam Armed Forces responded to the fixes with air strikes, successfully destroying a command post.



An initial attempt to configure ARDF in a helicopter ended in failure.

The 3d RRU had its own communications center in Saigon.

Success At Last

A year after its arrival in Vietnam, the 3d RRU was beginning to make the impact it had originally envisioned. Much of the success could be attributed to ARDF, which eliminated many of the problems previously associated with ground operations. The ARDF operator and equipment could get close enough to the target transmitter with reasonable safety. One aircraft moved fast enough to cover a vast area and did not require a network of direction finders. ARDF also offered quicker response to the tactical commander's requirements in a fluid situation. However, it was ARDF's ability to precisely target the enemy that made the difference in driving other forms of intelligence gathering, such as reconnaissance, and that led to follow-up by artillery, air strike, and ground operations. Finally, ARDF gave the ARVN, and later the US forces, the advantage of surprise, essential during airmobile and rapid entry operations. (It should be noted, however, that in these early years, the ARVN still did not take full advantage of the new source of intelligence.) For its contributions as the ground war escalated, the 3d RRU was presented the Meritorious Unit Commendation in February 1963—the first unit to be so decorated in Vietnam.

The speed with which the first ARDF platforms were deployed to the field could be attributed to their being assembled "in-house" from available resources. Because the original system was relatively simple and the hardware already in existence, ASA required no large outlay of

"One of the biggest historical disadvantages to any counter-insurgency program has been the inability to locate guerrilla concentrations. The direction-finding activities of the 3d Radio Research Unit have provided this headquarters with a vital intelligence advantage previously unavailable to any US or friendly tactical force."

LTG PAUL D. HARKINS, COMUSMACV

The twin-engine U–8 equipped with navigational gear gave the 3d RRU an ARDF platform with greater versatility.

research and development funding from Department of the Army. Consequently, ARDF progressed as rapidly as new platforms were required. During 1963, ASA added two U–8 "Seminoles" to its ARDF fleet. Although the U–8's airframe kept the platform from producing as accurate fixes as the U–6, the Seminole would quickly emerge as the workhorse in the Army's ARDF fleet. The twin-engine aircraft gave the 3d RRU an "all-weather" capability for the first time, and the extra cargo space allowed for installation of navigational gear, eliminating dependence upon visual sightings of landmarks. The aircraft also covered more target areas faster and could be flown at higher altitudes—important in mountainous regions. The bottom line was that the U–8 offered greater versatility and thus greater productivity.

Tan Son Nhut Airfield served as home base for the 3d RRU's aircraft and as headquarters for the 3d RRU's Aviation Branch, which was responsible for managing the growing ARDF mission. On a temporary basis, ASA pilots also flew missions from other airfields. In early 1963, the 3d RRU created a second permanent base for air operations at Phu Bai, 10 miles south of the ancient capital of Hué and approximately 450 miles north of Saigon. ARDF operations at Phu Bai were initially limited to the dry season that lasted from April to October.

At the same time the Army's ARDF program was getting off the ground, the Air Force was laying out long-range plans of its own. However, leadership at the Department of Defense expressed serious reservations regarding the Air Force's proposal until their concerns were alleviated following discussions with ASA engineers. Still, it would take time before the Air Force could deploy a viable system. In the interim, ARDF remained an Army story.

The SABERTOOTH School in Saigon was used for training ARVN signals intelligence personnel.

"These huts probably withstood the weather many years before they were sent in there with the AN/TRD–4, and now they are just rotting. At three of the sites the ARVN and the site advisors erected a bamboo hut right over the other hut."

CWO3 FRED NEWELL, JR., SIT OFFICER, 3d RRU

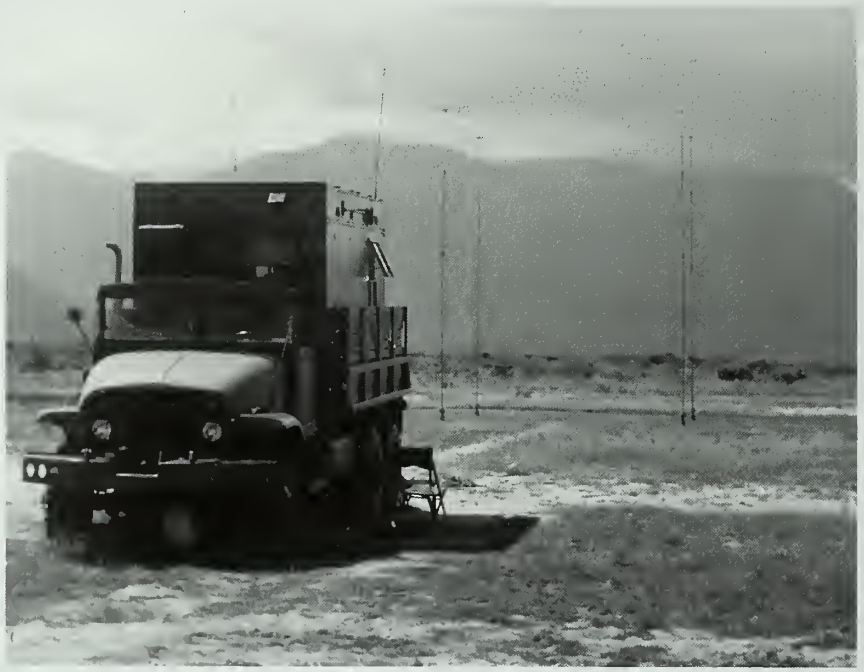
Training The ARVN

The 3d RRU's mission of running a cryptologic school for their South Vietnamese counterparts was short-lived. After its opening in September 1961, the SABERTOOTH School completed only two cycles of instruction in basic SIGINT skills. Approximately 70 students graduated from the course plus another 75 from instruction in equipment familiarization, before difficulty in identifying personnel for security clearances caused classes to be suspended for 8 months. During the wait, the 3d

RRU proceeded to transfer its training equipment to the ARVN, and by April 1963, the South Vietnamese assumed complete responsibility for the training center. Assisted by a handful of 3d RRU advisors, ARVN instructors conducted classes only whenever sufficient numbers of cleared students were available. In late 1964, an advanced course in intercept and direction-finding was offered for the first time, but the results proved disappointing. Almost half of the operators failed to copy Morse code at the minimal rate of 25 words a minute.

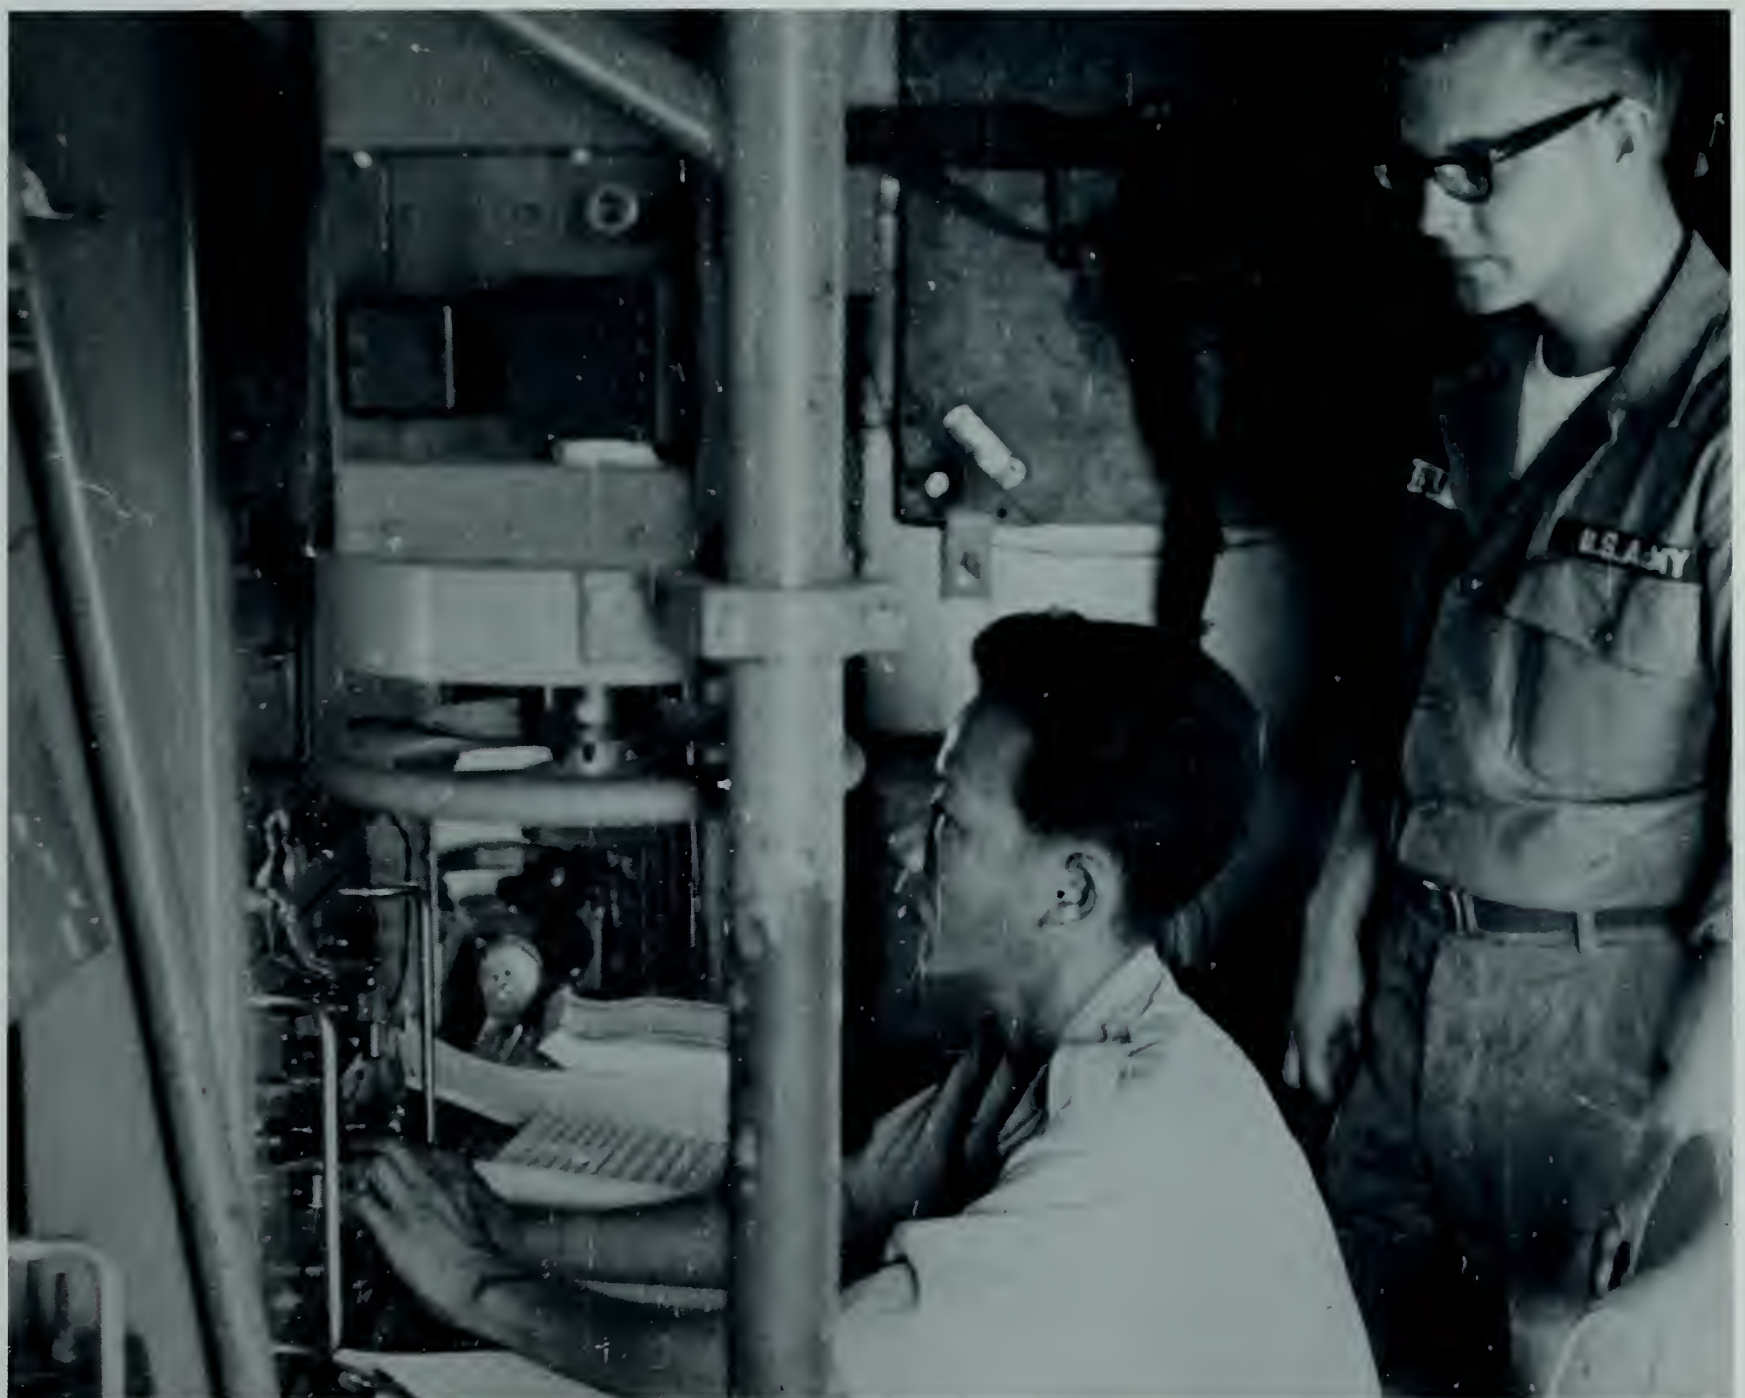
The WHITEBIRCH MRDF net furnished an early opportunity for joint operations. ASA believed that by adding four ARVN outstations, the accuracy of the net could be improved. At each of these new substations, the 3d RRU provided supervision and, for the first time, shared use of its TRD–4A direction finders. By June 1962, 3d RRU personnel were down to manning only two of the WHITEBIRCH outstations. Consequently, ASA could now devote more of its resources to ARDF and the establishment of a second independent MRDF net with a much longer baseline.

In September 1962, Unit 15, the ARVN COMINT element, expressed interest in jointly participating in the 3d RRU's ARDF program. This set off a debate between US officials in Saigon and Washington over how much technical information should be exchanged. In light of recent improvements in Viet Cong communications security procedures, many feared that shared secrets were being leaked to the enemy. Rebuffed, the South Vietnamese



simply began a program of its own. This led US officials to reverse their early stance and to agree to fund four platforms. However, over time, the South Vietnamese would fail to emerge as an important player in ARDF.

Although Unit 15 had tripled in size from 1960 to 1962, it continued to suffer from a lack of direction and support from senior ARVN officers. One of the major reasons was that Unit 15 had to compete with the larger ARVN Signal Corps for qualified individuals. Both fell under the control of the Office of the J6, Joint General Staff (JGS), but the J6 regarded Unit 15 as an unwanted step-child and was reluctant to transfer personnel with the necessary technical skills to the COMINT side. When the Office of the J7 was established in March 1963, it assumed total command and control of COMINT, but it failed to bring about an immediate solution to the personnel problem. Still the 3d RRU welcomed this attempt on the part of the South Vietnamese as a step in the right direction and seized upon the opportunity to further encourage Unit 15 by helping to develop a new internal table of organization and equipment. As part of its assistance package, ASA transferred 15 trucks with S–144 shelters, 20 tape recorders, and 21 PRD–1 direction finders. However, what was lacking was any acknowledgement by the South Vietnamese of their need for technical improvement. The culture, the political system, the lack of leadership, and absence of personal skills all worked against success. The fact that there was a steady stream of US advisors rotating in and out also didn't help to bring the message home.



A member of the 3d RRU looks over the shoulder of an ARVN direction-finding specialist, symbolic of ASA's advisory role in the war.

Communications Security

Even before the arrival of the 3d RRU, a handful of Army Security Agency personnel were already in Vietnam engaged in fulfilling the command's other major mission—communications security. In 1959, questions were raised as to the state of security of military communications being used by American advisors. These concerns eventually led MG Charles J. Timmes, Chief, MAAG–V, to request assistance from ASA. In late 1960, a six-man team of the 104th USASA Detachment was sent TDY to Vietnam to monitor military circuits. The team quickly discovered that for all practical purposes the United States/Republic of Vietnam military radio nets were operating without adequate COMSEC. Their report disclosed that some US military advisors had failed to use one-time

Specialists of the 7th RRU based out of Saigon monitor MACV communications for security violations.

encryption pads even once during their entire tour. As a result, COL Walker, Chief, USASAPAC, ordered the issuance of crypto equipment to MAAG–V elements, recommended procedural changes in the transmission of messages, and established control over call-sign and frequency assignments.

Nine months after its arrival in country, the 3d RRU received authorization to establish its own COMSEC mission and proceeded to allot five soldiers to the task. The 3d RRU's effort was elevated a month later when a COMSEC team of the 104th Detachment on TDY departed Vietnam leaving behind most of its monitoring equipment. To cover the communications of the widely dispersed US military advisers, the 3d RRU's new COMSEC Section created mobile teams. The first of these two-man teams was tasked with monitoring the MAAG–V Advisory Team 1 at Da Nang. Besides supporting US advisors, COMSEC personnel also trained the ARVN in the use of cryptographic materiel furnished by the United States. Over the next year, the 3d RRU COMSEC element continued to expand, eventually reaching 18 personnel.

On 1 March 1963, the 101st USASA Security Detachment (known initially within country as

the 7th RRU) was organized, ushering in the second phase of ASA COMSEC operations in Southeast Asia. Subordinated to the 3d RRU, the 30-man unit assumed the mission of the former COMSEC Section and subdivided itself into headquarters, security monitoring, and control/analysis elements. The 7th RRU was physically located at the Joint General Staff Compound next to the building housing the 3d RRU's COMINT operations. The creation of the 7th RRU greatly expanded the use of mobile teams to cover MACV elements located throughout South Vietnam. Although there were on-going problems in scheduling either air travel or armed convoys between sites, the 7th RRU was still able to field 10 COMSEC teams by the end of 1963.

By late 1964, it was apparent that the 7th RRU had nearly exceeded its capabilities; the unit's personnel were logging long hours in trying to meet their heavy monitoring schedule. To help alleviate the workload, 16 more soldiers were assigned and another 14 placed on TDY from the nearby 104th USASA Security Detachment. Within months, the ASA COMSEC effort in Vietnam had doubled in size, and the 7th RRU was gradually acquiring the manpower and equipment needed to cope with its ever-expanding mission.

Special Forces

ASA's fielding of special operations units in the early 1960's paralleled the Army's increased reliance on Special Forces to fight counterinsurgency war. By 1962, ASA had organized Special Operations Detachments (SOD) to support each of the Army's four Special Forces Groups. Later that same year, Department of the Army outlined the type of role ASA would play in special warfare operations. The SODs could provide COMINT and COMSEC to US Special Forces and help train indigenous personnel of friendly countries. However, shared COMINT could not normally exceed the classification level of "SECRET" and under no circumstances would training of foreign personnel be conducted at a higher level.

Actual fielding of special operations detachments proved difficult. Details on what specific type of support the SOD should provide and what exact form that support should take still

ASA had its own organic detachments trained to support the Army's Special Forces.

ASA Special Forces experimented with a variety of manpack intercept and direction-finding equipment.

"Much of our information came from the 400th SOD, a Special Forces unit flown in to run test missions for us to determine how close they could get to the border in order to find better intercept sites."

SFC ROBERT J. SMISEK, OPERATIONS SECTION, 3d RRU

had to be ironed out. While creating the SODs, ASA attempted to integrate a number of missions within a small detachment by cross training personnel, by reducing layers of command, and by attaching the unit to its parent organization for logistical purposes. In several instances, ASA drew upon lessons-learned of the 3d RRU, such as emphasizing the use of manual Morse operators (frequently referred to as "ditty-boppers") who possessed language skills. However, upgrading language proficiency did not prove easy, and interpreting and applying security regulations remained major obstacles. Finally, there was an absence of lightweight equipment for mobile operations. While awaiting development of new systems, ASA turned to purchasing off-the-shelf receivers, but even here the procurement process faced protracted bureaucratic delays.

Special Forces were among the first advisors that the US deployed to Vietnam. However, it took some time before ASA could allay the concerns on the part of national authorities regarding possible compromise of secrets while conducting special operations in Vietnam. In the end it was agreed that ASA Special Forces personnel would not carry technical material with them other than what they had developed during the operation itself. Before distributing any intelligence, the SOD would be responsible for sanitizing it for references to any specific COMINT source and would forward copies of all released information to the local Special Security Office (SSO) in Saigon and to the 3d RRU. (The SSO system, which was totally independent of ASA, oversaw the handling and distribution of compartmented information throughout the SIGINT community.)

In February 1964, the 400th USASA SOD deployed a team for a 120-day field test in Vietnam. By the time they were ready to redeploy, the team had confirmed that the Viet Cong were using voice communications and recommended that the ARVN's Unit 15 should follow up. (The exercise also pointed out a paucity of fluent linguists within the SOD.) For the next 2 years, personnel of the 400th shuttled back and forth to Vietnam on one-of-a-kind assignments. These missions provided an opportunity to test direct support to tactical forces and represented an important milestone in shaping ASA's future assistance to Special Forces. Besides operational support, 400th teams also advised ASA planners at the new Phu Bai site on defensive measures and tactics and helped train the station's personnel in the use of weapons.

ASA's Special Forces initially lacked portable equipment and were required to buy systems off-the-shelf.

Detachment J

In January 1962, the 3d RRU received authorization for 21 officers, 4 warrant officers, and 356 enlisted men. A major reason for the increase in manning was the establishment of the Mobile Detachment at Da Nang, near one of the existing South Vietnamese intercept sites. The detachment consisted of an M–292 mobile van that possessed both manual Morse intercept positions and a direction-finding capability—all targeted against selected Viet Cong in the northern provinces and North Vietnamese ground and naval communications. Although collection results at Da Nang represented a real improvement from the past, growing concern over North Vietnam's support of the Viet Cong led to planning for a site even closer to the northern border.

In April 1962 the 3d RRU dispatched a team of three intercept operators to Phu Bai, 10 miles south of Hué, to determine how well targets could be heard. Upon receipt of positive readings, ASA decided to relocate its Mobile Detachment. Although the new site lay 450 miles north of its parent unit, the detachment was near the Phu Bai airstrip and adjacent to Highway 1, allowing the station easy access to logistical, security, communications, and technical support, but more importantly, the area provided excellent reception of the desired signals. However, high winds and sand storms delayed construction, and much of the equipment such as the M–292 vans, which could not readily negotiate the mountainous stretch of road leading from Da Nang, had to be flown

The 3d RRU Mobile Detachment was initially located at Da Nang.

"The channel marker for the Phu Bai direction-finding site was 'Juliet' or 'J.'"

MSG HAROLD E. CASTLE, 3d RRU

Located near Phu Bai, Detachment J was targeted against the Northern provinces and served as a window into North Vietnam.

in. It would take nearly 9 months before the site was ready for occupancy. Upon relocation to Phu Bai in January 1963, the Mobile Detachment became known as Detachment J.

In early 1964, a study of North Vietnamese communications acknowledged a need for expanded coverage. In response, ASA outlined plans for a major field station to be constructed at Phu Bai, designed to accommodate nearly a thousand personnel and a hundred operational positions. However, changes had already begun that would transform the US military presence in Vietnam and reshape ASA's support role. As these historic events began to unfold, Phu Bai found itself at center stage.

Phu Bai also served as home to a detachment of the US Marine's First Composite Radio Company, which was based out of Hawaii. Phu Bai offered the Marines a forward area for COMINT training under the auspices of the 3d RRU. Among the targets of interest to the US Marines were those of the North Vietnamese navy and their reactions to US patrols in the Gulf of Tonkin. (The purpose of these so-called Desoto patrols was to assert freedom of navigation in international waters and to collect photographic and hydrographic information.) On 2 August 1964, Marine operators at Phu Bai accurately foretold of a pending attack by the North Vietnamese on the US destroyer *Maddox*. If such attacks occurred again, the White House warned North Vietnam that there would be consequences. New SIGINT warnings by Phu Bai telling of apparent North Vietnamese plans for more naval attacks and the subsequent response of the destroyers *Maddox* and *Turner Joy* to unknown and unseen enemy vessels on the night of 4 August provided sufficient justification for President Johnson to ask Congress to endorse an expanded role for the American military in South Vietnam by passing the Gulf of Tonkin Resolution.

Enlisted quarters at 39 Hai Ba Trung in Saigon.

Members of the 3d RRU render honors to the flag-draped coffins bearing their fellow soldiers, killed by a Viet Cong detonated bomb in February 1964.

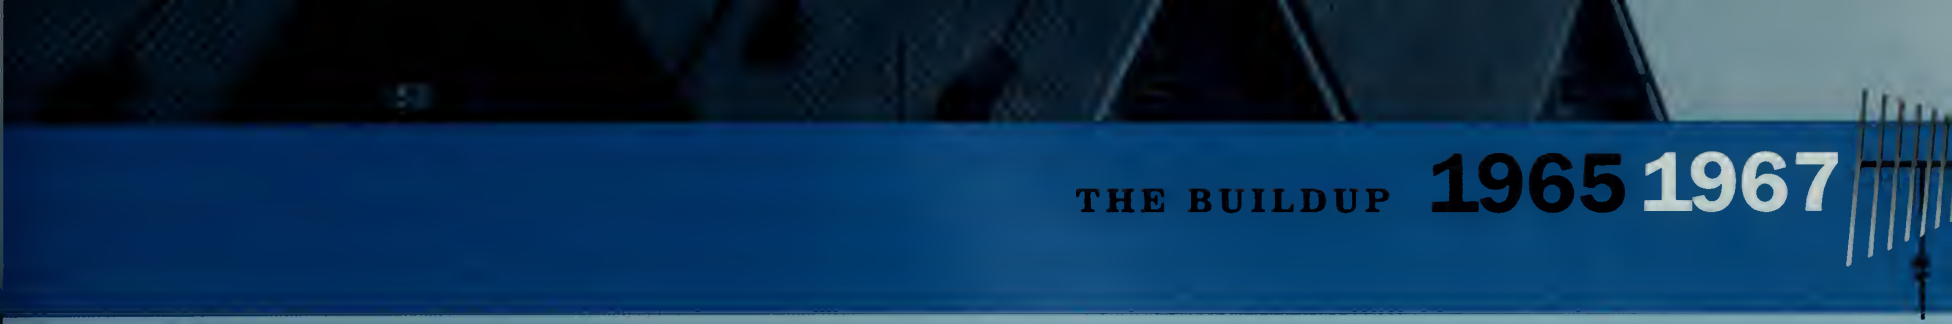
An ASA analyst operating in the field near Pleiku.

Eventually, 3d RRU soldiers found housing in a compound near Tan Son Nhut Air Base. (Note the memorial constructed to honor ASA fallen in foreground.)

"The very best soldiers, or let me say the most highly intelligent, were in ASA. . . . ASA acquired quite a lot of people who weren't particularly interested in avoiding the draft but wanted to do their duty by their country so they volunteered for Agency work. . . ."

COL JOHN J. MCFADDEN, CDR 509th RR GP

The 198th Infantry Brigade arrived in country in December 1966. In time, ASA would have 27 units in direct support of combat forces. (National Archives)



THE BUILDUP 1965 1967

"We were the first detachment of this type to be sent over there and we were the first to be committed. We ran into more bumps and grinds than those that followed."

SSG RICHARD W. HURLBAT, 404th RR DET

The year 1965 opened with the Republic of Vietnam reeling from a series of military setbacks and a deepening political crisis. At Binh Gia, the Viet Cong launched a division-sized attack against the ARVN, and for the first time, the North Vietnamese Army sent its troops into battle near Dak To in the Central Highlands north of Kontum. Terrorist attacks had also stepped up, and among their targets were installations having a strong US presence. It was becoming evident to American policymakers that the existing level of US aid was insufficient to prevent South Vietnam from collapsing. In light of these developments, General William C. Westmoreland, Commander, US Military Assistance Command Vietnam (COMUSMACV) recommended to his superiors that US Army and Marine ground forces, together with supporting air and naval forces, be sent to South Vietnam and adjacent waters.

The Army Security Agency had two battalions available for deployment: the 303d ASA Battalion (Corps) at Fort Wolters, Texas, and the 313th ASA Battalion (Corps) at Fort Bragg, North Carolina. (Their total strength stood at 1,927, an 80 percent fill, due in part to the number of individual soldiers already in Southeast Asia.) The 303d ASA Battalion provided COMINT, COMSEC, and EW support to the III US Army Corps and its major subordinate commands during field exercises and contingencies. The 313th ASA Battalion performed a similar role for the XVIII Airborne Corps. (For example, in April 1965, the battalion deployed its Company A in support of the 82d Abn Division during the US intervention in the Dominican Republic.) The only other tactical asset stationed in CONUS was the 403d ASA Special Operations Detachment, also at Fort Bragg. The 44-man detachment was attached to the 3d Special Forces Group (Airborne) and served as a "training center" for ASA personnel assigned to other SODs overseas.

The present authorized ASA force structure was insufficient to support all divisions and independent brigades. This left ASA planners with the substantial task of standing up additional types of direct support units (DSU) and reorganizing existing ones to function in the Vietnam target environment. On 3 May, ASA activated the 404th ASA Detachment (Airborne Brigade) in support of the 173d Abn Brigade, the first of the ground combat elements selected for deployment. Personnel and equipment used in forming the 48-man detachment came from Company B, 313th ASA Battalion, stationed at Fort Campbell, Kentucky. On 9 June, the 404th ASA Detachment (temporarily designated Det 1, 3d RRU) arrived in Vietnam and was reunited with the 173d Abn Brigade at Bien Hoa. They would prove to be only the tip of the proverbial iceberg.

The 404th Detachment's compound lay near the Bien Hoa Air Base, 3 km southwest of the city and was composed of tents with wooden floors. Utilizing PRD–1s to provide fixes and conducting manual Morse intercept, teams from the detachment accompanied brigade forces on operations in the field. They also passed on targeting information received from ARDF aircraft and performed low-level voice intercept ("low-level" referred to the echelon of communications being targeted). Because only a handful of its members were jump qualified, the 404th was unable to support the 173d Abn Brigade in what would fortunately turn out to be the lone American parachute assault of the war.

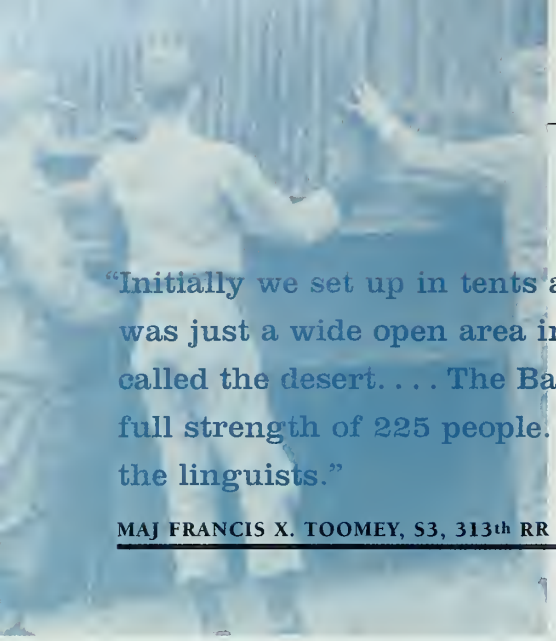
In March 1966, members of the 313th ASA Battalion at Fort Bragg, North Carolina, begin loading equipment—destination Vietnam.

Newly arrived ASA units faced more than the enemy. Weather also posed challenges to equipment and operations as shown here at the 407th RR Detachment compound.

Field Force, Vietnam

The deployment of combat divisions signaled the launching of a new strategy by GEN William C. Westmoreland, COMUSMACV, to defeat the enemy in a ground war. On 11 July 1965, the first elements of the 1st Inf Division arrived. The 1st Brigade, 101st Abn Division followed on 29 July, and the 1st Cav Division closed on An Khe in September. Each of the newly arriving divisions was given its own ASA direct support company, and the 1st Brigade, 101st Abn Division was assigned a detachment. The deployment of US combat units led to the creation of a provisional field force headquarters in the II Corps Tactical Zone (CTZ) on 1 August. As a stopgap measure aimed at providing liaison to the new field force, ASA activated a 29-man element, the 407th ASA Detachment at Nha Trang.

By 1966, the growing numbers of combat units and the launching of major ground operations necessitated greater command and control. In March, I Field Force, Vietnam (FFV) was established at Nha Trang and given operational control over US forces in the II CTZ. At the same time, the II FFV was organized at Bien Hoa in the III CTZ. These field forces were essentially corps-level organizations that also had responsibility for assisting and advising the South Vietnamese. Furthermore, the term "field force" avoided any confusion with the existing South Vietnamese corps tactical zones. Finally, the field force structure offered great flexibility in adding and subtracting combat elements as needed.

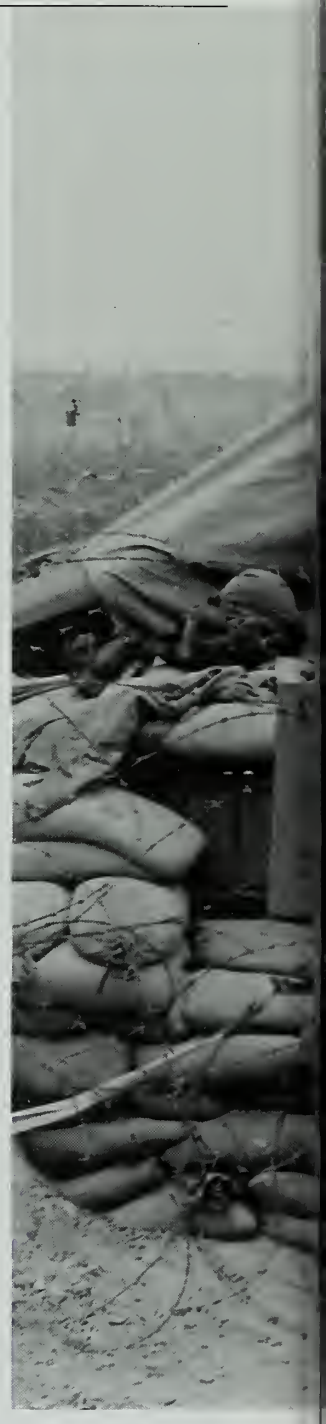


"Initially we set up in tents at Camp McDermott in Nha Trang and this was just a wide open area in the middle of a somewhat large open field, called the desert. . . . The Battalion Headquarters Company deployed at full strength of 225 people. The only thing that we were short of was the linguists."

MAJ FRANCIS X. TOOMEY, S3, 313th RR BN

In the March-April time period, the 303d and 313th ASA Battalions arrived in Vietnam to support the newly established field forces. The 313th ASA Battalion was collocated with the I FFV at Nha Trang, and the 303d ASA Battalion with the II FFV at Bien Hoa. While under the operational control of their respective field forces, the battalions were subordinated for administrative purposes to the 3d RRU, which remained the principal ASA headquarters in country. In turn, both battalions commanded direct support units that were allotted on the basis of one ASA company per division and one detachment per independent brigade or armored cavalry regiment. Eventually, each of the battalions also had an operations company assigned to it. These processing companies served as collection managers for the DSUs and played a key role in tasking airborne platforms and in issuing special and summary reports on SIGINT activity within their respective corps tactical zones.

Prior to the buildup of US forces, NSA had resisted any proposal that included deploying ASA tactical support elements to Southeast Asia. Rather, NSA believed fixed intercept sites such as Phu Bai and Saigon to be sufficient. However, the whole debate became moot when ASA direct support units began entering Vietnam as part of the Army's approved force structure. Experience would soon prove a need existed for both the mobile direct support units and fixed stations. The next debate would be over who exactly commanded the COMINT assets. The Army Security Agency's principal unit in country, initially the 3d RRU, maintained administrative control (personnel and logistical support) over all units; and doctrinally, direct support units were under the operational control of their respective tactical command. However, for the first time, fixed sites, such as Phu Bai, were within the war zone, and soon there would be aviation companies. Because these units were in support of theater-wide missions, COMUSMACV eventually took control.



Direct support units, such as Detachment A, 358th RR Company, operated near their parent tactical command.

Direct Support Units

The precedent of having units conducting COMINT/COMSEC in direct support of tactical elements dated back to World War II. During the Korean War, ASA took the practice a step further by adding groups and battalions to the force structure. In both conflicts, there were numerous examples where direct COMINT/COMSEC elements made a significant contribution to success on the battlefield. On the other hand, in World War II, the radio intelligence companies were overshadowed by the code-breaking effort at theater level that was guiding operational planning. During the Korean War, it was a matter of being too little, too late. The first direct support units did not arrive in Korea until late 1950, and another 6 months would pass before the war became stalemated to the point that they could begin making a real contribution.

In Vietnam, ASA's initial challenge would be to tailor each DSU to the tactical element being supported and to the existing signal environment of Southeast Asia. For example, ASA doctrine had not previously allotted DSUs to airborne brigades. This meant that detachments had to be carved out of existing units and given an entirely new organizational structure. ASA planners configured the new detachments at the lowest possible manning level, resulting in a 48-man unit structured to provide maximum mission support, but dependent upon

A soldier of the 265th RR Company copies traffic from inside a bunker. One survey showed that the direct support units were responsible for approximately 90 percent of the COMINT products received by the local commander. Almost all the rest would come from corps-level cryptologic resources.

"... I cannot overstate our case for the Direct Support Unit. COMINT from the DSUs is by far our most important source of intelligence. If DSU support were not available, the timeliness of this most perishable product would either be lost or degraded to a point where it might be useless."

LTG STANLEY R. LARSEN, CG, I FFV

the host command for logistics. Each of the airborne detachments possessed three positions for manual Morse, one devoted to voice intercept, and one for COMSEC monitoring.

The next challenge was to construct a DSU for an airmobile division. In CONUS, Company C, 313th ASA Battalion (10th RRU) had been in support of an infantry division. However, when selected for assignment to the 1st Cav Division (Airmobile), the company's authorized strength was cut almost in half and its operations subdivided into two parts. First, the company established a centralized manual Morse intercept and analytical effort that utilized R–392 receivers removed from ¼-ton vehicles, modified, and remounted on locally fabricated tables at the An Khe base camp. These operational positions were used to indirectly support the division as part of the larger on-going COMINT effort within the CTZ. The second half of the 10th RRU's operations consisted of three voice-intercept teams ready for immediate deployment with troops in the field. For battalion-size or larger operations, a mobile manual Morse position could be tapped to target enemy communications that couldn't be copied from An Khe. It soon became evident, however, that the 114-man company was simply too light. This eventually led to adding additional resources.

Company B, 313th ASA Battalion (11th RRU) exemplified the most common type of DSU, in support of an infantry division. The company originally consisted of a headquarters element with subordinate platoons designated for COMSEC, communications, and collection/jamming, but prior to deployment the unit was stripped of its EW, ELINT, and VHF intercept capacity, all of which had been designed for a European scenario. The revamped 168-man company supported battalion or larger size operations by receiving, processing, and recording ARDF results; conducting voice intercept; and manning three manual Morse intercept positions. The 11th RRU was also tasked with providing COMSEC assistance to the 1st Inf Division.

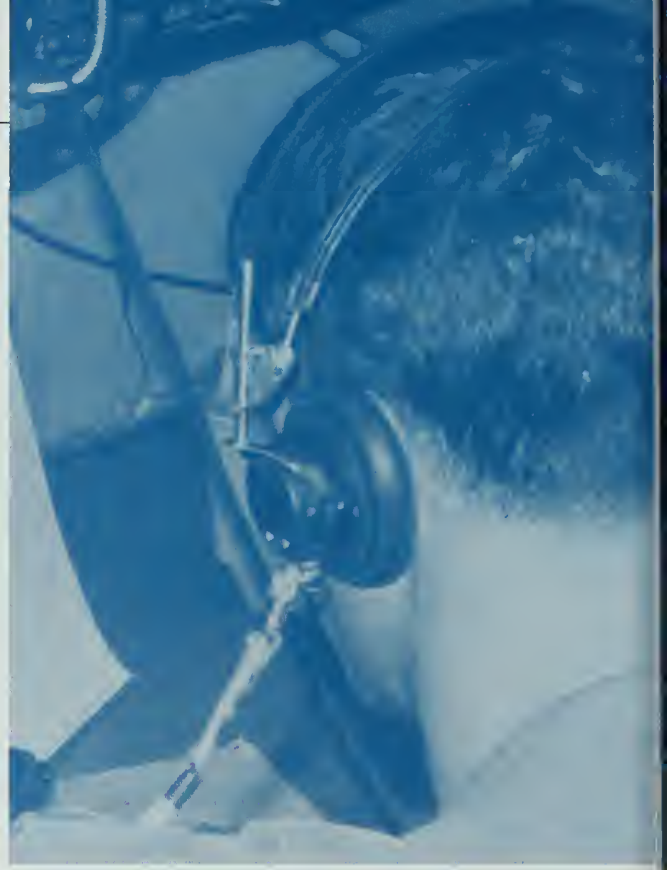
With weapons in hand, a 3d RRU crew prepares to board a U–6 "Beaver" aircraft at Tan Son Nhut Air Base on an early ARDF mission. (H. Jaffe)

Operation Starlight

The deployment of US combat forces led to new demands for ARDF support. During early 1965, seven additional U–8s were sent to Vietnam under Project SEVEN ROSES. This was followed by CHECK MATE, a procurement package for 17 more aircraft (7 U–6s and 10 U–8s). As US troops entered the ground phase of the war, ASA had a total of 30 aircraft on hand. To manage these new resources, the 3d RRU formed aviation detachments in each of the four corps tactical zones. An ARDF mission began with the J2, MACV sending a tasking message to either the operations officer at the 3d RRU in Saigon or to his counterpart at the 8th RRU (formerly Detachment J) at Phu Bai. They then would assemble the necessary technical background data needed by the operators and deploy the aircraft to satisfy the requirement. Upon completing their missions, the aviation detachments reported the ARDF fixes back to the 3d RRU or 8th RRU, where the information was sanitized and forwarded for tactical exploitation.

> **"The intelligence produced by your units was a clinching factor in the decision to launch this operation. Subsequent events confirmed the accuracy and timeliness of the intelligence produced by your units. . . . "**
>
> **LTG LEWIS WALT, CDR, III MARINE AMPHIBIOUS FORCE**

On 18 August 1965, US Marines launched the first large-scale American operation of the war on the basis of intelligence provided by the 3d RRU and 8th RRU. The combined air-sea-land attack entrapped a large portion of the 1st VC Regiment on a peninsula near Chu Lai, a hundred kilometers southeast of Da Nang. Although the Marines encountered heavy resistance and suffered losses of their own from an enemy who sought concealment in caves and tunnels and then attacked from behind,



STARLIGHT was considered a major success in the opening round of the expanded ground war. More than 600 of the enemy lay dead, and the American press treated the operation as a major victory. The operation was also notable because of the successful application of close tactical ARDF support. Staging from Phu Bai, 3d RRU platforms provided continuous fixes on the terminals of the 1st VC Regiment and its subordinate battalions. The information was then passed through the 8th RRU to the 3d Marine Division. These fixes reflected enemy locations and movements that permitted the Marines to make adjustments by bringing continued pressure to bear on the Viet Cong forces.

The success of Operation STARLIGHT led the Joint Chiefs of Staff to approve a third procurement package for 41 additional aircraft (Project WINE BOTTLE). The operation also greatly influenced COMUSMACV's decision in January 1966 to give priority to ARDF resources being used in a close tactical support role. ASA support units could in the future directly tip-off ARDF platforms that would then relay back fixes and target information. By using one-time pads to secure their communications, aircrews cut the delivery time from up to 24 hours down to approximately 3 hours. Soon Direct Support Units were receiving 85 percent of their fixes before the aircraft had landed. In October 1966, permission was granted for use of a different type of one-time pads that permitted transmission of information at the SECRET level. Despite these improvements, the one-time pads were still not considered user friendly and failed to allow for sufficient clarification.

As the use of ARDF in a direct support mode continued to evolve, there was still a demand for general search missions. In such instances, ARDF aircraft were used to help develop potential targets within a specific geographical area. Information regarding enemy transmitters was reported back to the direct support unit for follow up by ground collectors.

ARDF Coordination Center

In keeping with his decision to utilize ARDF for close tactical support, General Westmoreland indicated that a requirement existed for "150 U–6/U–8 ARDF aircraft or equivalent systems." The escalating demand for ARDF had a number of far-reaching consequences. For the first time, the US Air Force became a major player in ARDF in Vietnam. The Army and Air Force agreed among themselves that a need existed for both direct and general support types of ARDF platforms and that the Army should contribute 57 U–6/U–8s and the Air Force an equal number of C–47s. However, control of ARDF soon became a major concern. Were ARDF platforms cryptologic assets or were

"Everybody wanted those resources [ARDF aircraft] responsive to them, under their control. However, they were too valuable an asset to diffuse in that manner. I believed that we could get the best effect by concentrating or massing them, with Special Intelligence support in priority operational areas."

MG JOSEPH A. MCCHRISTIAN, J2 MACV

ARDF Coordination Center

Major General Joseph A. McChristian, J2 MACV, established a jointly-manned ARDF Coordination Center to task both Army and Air Force platforms.

they tactical systems? MG Charles J. Denholm, CG, USASA, urged GEN Creighton W. Abrams, Jr., Vice Chief of Staff, US Army, to support the position that ARDF was a "special platform" that could not be divorced from the total SIGINT system. However, the Joint Chiefs of Staff issued guidance that real-time responsiveness was the ultimate goal and that operational control of ARDF resources should be assigned to the overall military commander, in this case, COMUSMACV.

In the past, the scarcity of ARDF resources had been a mitigating factor against committing them to small-scale tactical situations. When MG Joseph A. McChristian became J2, MACV, he further tightened control of ARDF and also acted to end the tug-of-war between the Army and the Air Force as to who should be in the driver's seat when it came to tasking and coordinating ARDF missions. In June 1966, he established a jointly-manned ARDF Coordination Center (ACC) in Saigon. Although the Army (3d RRU) and Air Force (6994th Security Squadron) each retained control of its aircraft, the new center assumed responsibility for translating requirements from combat commanders into taskings once they were approved by the J2, MACV. Furthermore, the ACC monitored, evaluated, and reported the results of all ARDF missions.

At the working level, there was good rapport and cooperation between ASA and the USAF Security Service. Each made a unique contribution to the common goal of supporting the warfighter. Because the PHILLIS ANN platform did not require maneuvering to take a bearing and the size of the C–47 permitted a greater number of collection positions on board, the Air Force systems were much more productive than those of the Army. Initially, however, fixes taken by the Army platforms proved to be more accurate. Thus the ARDF Coordination Center tended to assign direct support missions, particularly those of a high priority, to the Army side of the shop and gave the Air Force responsibility for general search. It was the old question of quality versus quantity. Both were important. While Air Force platforms made rapid progress in the area of accuracy, ASA justified its mission by pointing out that its total cost (aircraft, fuel, maintenance, mission gear, personnel) per fix remained a fraction of that of its sister service.

"I have found the ASA soldier more resilient and...is better equipped to roll with the punches. Age and schooling are certainly factors in this. . . . We don't have major problems. If we do, the man losses his clearance and is transferred out. . . . "

MAJ DAVID J. WOEHR, CHAPLAIN, 509th RR GP

Main gate of the 509th RR Group at Davis Station. The group controlled widely dispersed ASA elements from the Delta to the DMZ. (A bandaged tiger cub served as the symbol of the 509th RR Group.)

The 509th Radio Research Group

In mid-1965, ASA's command and control in Vietnam was relatively simple. A total of 1,487 personnel were distributed among three units: the 3d RRU (606), the 7th RRU (54), and the 8th RRU (827). (The 3d RRU continued to serve as the command element.) But the next 9 months brought the arrival of direct support units and with them new challenges. Given no increase in personnel authorization or realignment of responsibilities, the commander of the 3d RRU had to now divide his attention between fulfilling his own operational mission and making sure that DSUs were meeting the needs of their combat commanders in the field. To resolve the command and control issue, ASA discontinued the 3d RRU on 1 June 1966 and redistributed its mission and resources among four new organizations. Headquarters, 509th Radio Research Group which assumed administrative control of ASA assets in Vietnam; a new Radio Research Communications Unit, Vietnam (RRCUV) that served as ASA's in-country communications center; and the 175th RR Company which took over the 3d RRU's collection and processing missions.

The fourth and final unit created was the 224th Avn Battalion (Radio Research). Activated on 1 June 1966, the battalion and its four subordinate aviation companies replaced the 3d RRU Aviation Branch and its four detachments. The 138th Avn Company (RR) was located at Da Nang; 144th Avn Company (RR) at Nha Trang;

146th Avn Company (RR) at Tan Son Nhut, Saigon; and the 156th Avn Company (RR) at Can Tho. In addition, the 144th Avn Company had platoons at An Khe and the Holloway Army Airfield at Pleiku, and the 138th Aviation Company had an element at Phu Bai.

By September 1966, the 509th RR Group had settled into a command structure that would remain virtually unaltered for the next 5 years. The group had under its direct control three battalions and a field station: the 303d and the 313th RR Battalions, which supported the field forces; the 224th Avn Battalion; and the 8th RRU (soon to be redesignated the 8th RR Field Station). In addition, the 509th commanded three smaller elements that performed countrywide missions. The 101st RR Company (formerly the 7th RRU) directed the 509th RR Group's COMSEC effort, and the RRCUV fulfilled ASA's unique communications requirements. The third and final unit, the 403d RR Special Operations Detachment, would soon arrive in country to provide direct support to the 5th Special Forces Group.

Aside from a small Processing, Analysis, and Reporting Branch, the 509th RR Group acted primarily as an administrative headquarters to provide overall supervision and support to the 20 to 30 ASA units that were further broken down into detachments and teams located at remote sites and fire support bases. At any given time more than a hundred such elements could be scattered throughout South Vietnam. Besides organizational fragmentation, there was the problem of continuous fluctuation as some DSU's moved from one corps tactical zone to another. Compounding all of this was the challenge of distance that separated the various elements from one another and the 509th Group. For instance, teams of the 407th RR Detachment operating along the DMZ were more than 500 miles away from Saigon.

The 403d RR SOD

In June 1966, the fragmented intelligence-gathering activities of the Special Forces in Vietnam took a significant step forward. Up to then, the Special Forces had made do by using internal resources to conduct intelligence-gathering at a basic level. The restructuring of intelligence within the Special Forces began with the arrival of a 110-man contingent equipped to provide counterintelligence, interrogation, and analytical assistance. The other half of the intelligence picture was completed in September when 51 soldiers of the 403d RR SOD deployed from Fort Bragg to conduct signals intelligence.

From the beginning, the 403d RR SOD faced the formidable task of supporting a Special Forces group whose assigned strength would eventually reach 3,500 personnel scattered among 85 different locations. Given its limited resources, the 403d RR SOD attempted to direct COMINT support to the lowest tactical level possible while maintaining maximum mobility and flexibility. By providing support

"Instead of waging guerrilla warfare against conventional forces in enemy territory, the US Special Forces troops were to find themselves attempting to thwart guerrilla insurgency in 'friendly' territory."

COL FRANCIS J. KELLY, AUTHOR *US ARMY SPECIAL FORCES, 1961–71*

Like other direct support units, the 403d RR SOD was initially committed to establishing short range direction-finding nets.

on a mission-by-mission basis and by emphasizing analytical and reporting assistance, the unit would play a much larger role than indicated by its size. (The 403d RR SOD also gained some added resources by abandoning its COMSEC mission.)

Throughout its stay in Vietnam, the 403d RR SOD's Headquarters/Control Team was collocated with the 5th Special Forces headquarters at Nha Trang. Here, the special operations detachment performed limited analysis and integrated COMINT into the Special Forces' operational planning. The 403d RR SOD also exercised administrative control over its subordinate teams, but depended totally on the 5th Special Forces for all non-ASA logistics and transportation—an arrangement that proved highly satisfactory. Troop billeting conditions ranged from simple wooden structures to immense underground concrete bunkers, leaving most ASA teams situated only a short distance from their operational positions. Despite the remoteness of many of these locations, ASA believed that adequate security measures were in place to safeguard its sensitive mission from enemy attacks.

During its first year in Vietnam, the 403d RR SOD focused upon targets in the northern II CTZ area. From Kontum, which served as a major Special Forces base, the 403d RR SOD manned manual Morse intercept and ARDF tip-off positions, deployed direction-finding/voice intercept teams, ran the local DF net, and performed second and third echelon maintenance. When tasked, the Kontum element could also deploy a small intercept team in support of mobile operations. Normally, low-level voice intercept teams consisted of two or three linguists, but the 403d arrived with only one soldier proficient in Vietnamese. To help new linguists recognize commonly used words and phrases, the detachment obtained voice tapes from the 330th RR Company. The benefit was immediate. On a number of occasions when high-priority support for strike forces was required, the 403d obtained linguists on loan from nearby ASA units. For some time, the Special Forces had hired local villagers since their proven loyalty was often greater to their US employers than to the Saigon government. Following suit, the 403d began utilizing indigenous personnel who proved particularly adept at understanding local Viet Cong transmissions and regularly predicted impending enemy attacks, locations of their units, and on occasion, operational plans.

The intercept vans parked in a row represented the consolidation of resources at the 175th RR Company, CMA for the III CTZ.

"The CMA is the focal point of COMINT operations in the battalion. Allocation of all cases was controlled by the CMA, who had complete authority on allocation of cases to all intercept units throughout the battalion."

LTC NORMAN J. CAMPBELL, CDR, 303d RR BN

Collection Management Authorities

When the 3d RRU was discontinued in June 1966, its operational mission was transferred to the newly organized 175th RR Company. With only 275 authorized spaces, the company was a third the size of the 8th RRU. National authorities proposed that the resources of the 175th RR Company be expanded, but in a counter proposal, ASA successfully argued for the deployment of the 330th RR Company, a processing support unit with a manning level of 350 spaces. This would save having to build up the existing facilities in Saigon and Phu Bai, and by basing the 330th RR Company at Pleiku, it would fill a gap in coverage of targets. Strategically locating each of the three processing elements in a different tactical zone also solved the problem of how to effectively manage the growing number of cryptologic resources in Vietnam. Initially, the 330th RR Company was named Collection Management Authority (CMA) for the II Corps Tactical Zone, and the 175th RR Company as CMA for the III Corps Tactical Zone. The 8th RRU would eventually serve as CMA for the northern tier of provinces, and a fourth and final CMA (335th RR Company) was created in the Delta region (IV CTZ).

On paper, the processing companies were to have been used solely in support of the direct support units. However, from the beginning, they shed all pretense of being mobile and assumed the role of fixed sites. Acting as mini field stations in a war zone, the CMA's were responsive to the theater commander General William C. Westmoreland. In contrast to the direct support units, the CMAs performed in-depth processing. They also directed intercept coverage and responded to special consumer

needs, such as performing area analysis. The CMAs issued a series of intelligence and after-action reports and provided technical "feedback" to the DSUs located within their corps tactical zone. In addition, analytical personnel from the CMAs often conducted on-site visits to the DSUs to provide technical assistance. With their own designated communications, the CMAs also served as a switchboard for information being exchanged up and down the SIGINT chain of command.

The CMAs were the glue that allowed ASA to successfully fulfill its mission in Vietnam. By effectively managing the SIGINT resources, the CMAs ensured that the larger interests of the field forces, MACV, and the cryptologic community were satisfied. By exercising targeting authority and providing technical support, they also enhanced the value of the DSUs' support to the tactical commander. Divisions and brigades quickly came to the realization that they could not effectively task their DSUs. A 1967 survey found that only two DSUs were actually utilizing more than 30 percent of their intercept positions in a direct support mode. The remaining units were being tasked by the CMAs. This intercept was fed into the larger SIGINT system that could then indirectly benefit the commander in the field. The Collection Management Authorities also played a critical role in deploying ARDF platforms. In coordination with the ARDF Coordination Center, they helped validate targets, select the type of aircraft needed for a mission, and determine time-over-target.

"COMSEC in Vietnam, among US forces, is terrible, absolutely deplorable—horrible—it practically doesn't exist. . . . Pilots gave coordinates, flight times, targets under attack, mentioned locations of supported Allied units in the clear. . . . Most of the Army divisions were little better."

MAJ EDWIN M. MORRISON, SECURITY OFFICER, G2, I FFV

The Transmission Security Problem

Transmission security had been a problem within US forces since the advent of the telephone and radio. Vietnam was no exception. The biggest obstacle that communications security had to overcome was human nature. Too few communicators actually believed that "Charlie" was listening—although it was common knowledge that the enemy possessed captured US radios. Captured enemy documents indicated that South Vietnamese communications were an important source of information, and prisoners of war revealed that the Viet Cong and NVA forces were regularly eavesdropping. In one instance, an interrogated prisoner reported seeing a group of 8 Chinese on several different occasions carrying radios. When he queried his platoon leader as to their purpose, he was told that they were "Chinese comrades who have come to help us, they speak Vietnamese, English, and Cambodian, and they listen to the radios they carry to let us know what the Americans and Vietnamese troops plan to do."

The advent of rapid moving airmobile warfare only compounded the problem of transmission security. Many commanders in the field reasoned that even if the enemy were listening, they simply could not react quickly enough to take advantage of the situation. One of the division commanders put it this way: "With regard to COMSEC, I had to choose between communicating freely in voice to enable rapid deployment and reaction or losing timeliness of tactical communications and movement through applying full COMSEC measures. I took the risk of COMSEC weaknesses in voice communications to develop the most rapid possible reactions…with our mobility, the enemy could not keep up with the speed of our tactical action and reaction…." This tension between the need for security and the need for timely communications would remain as long as US combat forces were engaged in Vietnam.

Many communicators falsely reasoned that the mobile nature of the war negated the need for COMSEC. (National Archives)

Captured documents and interrogation of prisoners revealed that the enemy was listening.

Transmission security also faced the challenge of convincing communicators that their "homemade" codes lacked security. (The origin of some of these codes could be traced back to the American Expeditionary Forces in World War I.) On one occasion, COMSEC personnel from the 303d RR Battalion demonstrated the inherent weakness of an unauthorized point-of-origin code being used by the long-range reconnaissance patrols of the 9th Inf Division. (Point-of-origin codes were used to relay locations by referencing a position from points left or right and up or down, usually in increments of 1,000 meters.) In a briefing to the division commander, a COMSEC specialist from the 303d illustrated that the improvised code being used by one of his patrols could be broken in less than 4 minutes.

During Operation SILVER BAYONET, the 1st Cav Division and ARVN forces launched a pursuit operation against two regiments of the North Vietnamese 325th Division. While the operation was in process, the 101st RR Company monitored the 1st Cav Division's communications. The study revealed a high rate of disclosures of communications frequencies, operational plans, and intelligence information. The end result was a decision by the Joint Chiefs of Staff to ship all available voice encryption devices to Vietnam to help stem the tide of COMSEC violations.

"We were monitoring . . . a transportation battalion. . . . The conversation included the time they would leave, how many people they needed, where they were going, and the fact that the troops would conduct a sweep of the area on the way back to Camp Enari. Any analyst could figure what time the B–52 raid would take place."

CPT CONRAD P. SKANTZ, LEADER, 2d PLT, 101st RR CO

A COMSEC specialist from the 303d RR Battalion monitors US communications for security violations. The direct support units brought their own COMSEC assets.

A Failed Solution

The arrival of ASA's direct support units greatly expanded the number of available COMSEC resources. Each of the two battalions was authorized 2 officers and 26 enlisted personnel and up to four positions for COMSEC monitoring purposes. In addition to supporting the field force headquarters, the battalions also oversaw the COMSEC activities of their subordinate companies and detachments. Each company was allotted 19 personnel and from two to five COMSEC positions. However, detachments could contribute only four soldiers and one position to security. All DSU's were responsible for preparing a COMSEC plan for their commander's approval, and most often, it was the emphasis of the commander that spelled the difference between a successful COMSEC program and failure.

Throughout the war, the 101st RR Company (formerly the 7th RRU) remained the principal proponent of Army COMSEC within Vietnam. The company interfaced with J2, MACV, on security policy matters and exercised technical control over ASA's COMSEC mission. From Saigon, the 101st RR Company directed cells based at Da Nang, Pleiku, Long Binh, and Can Tho. These teams were responsible for

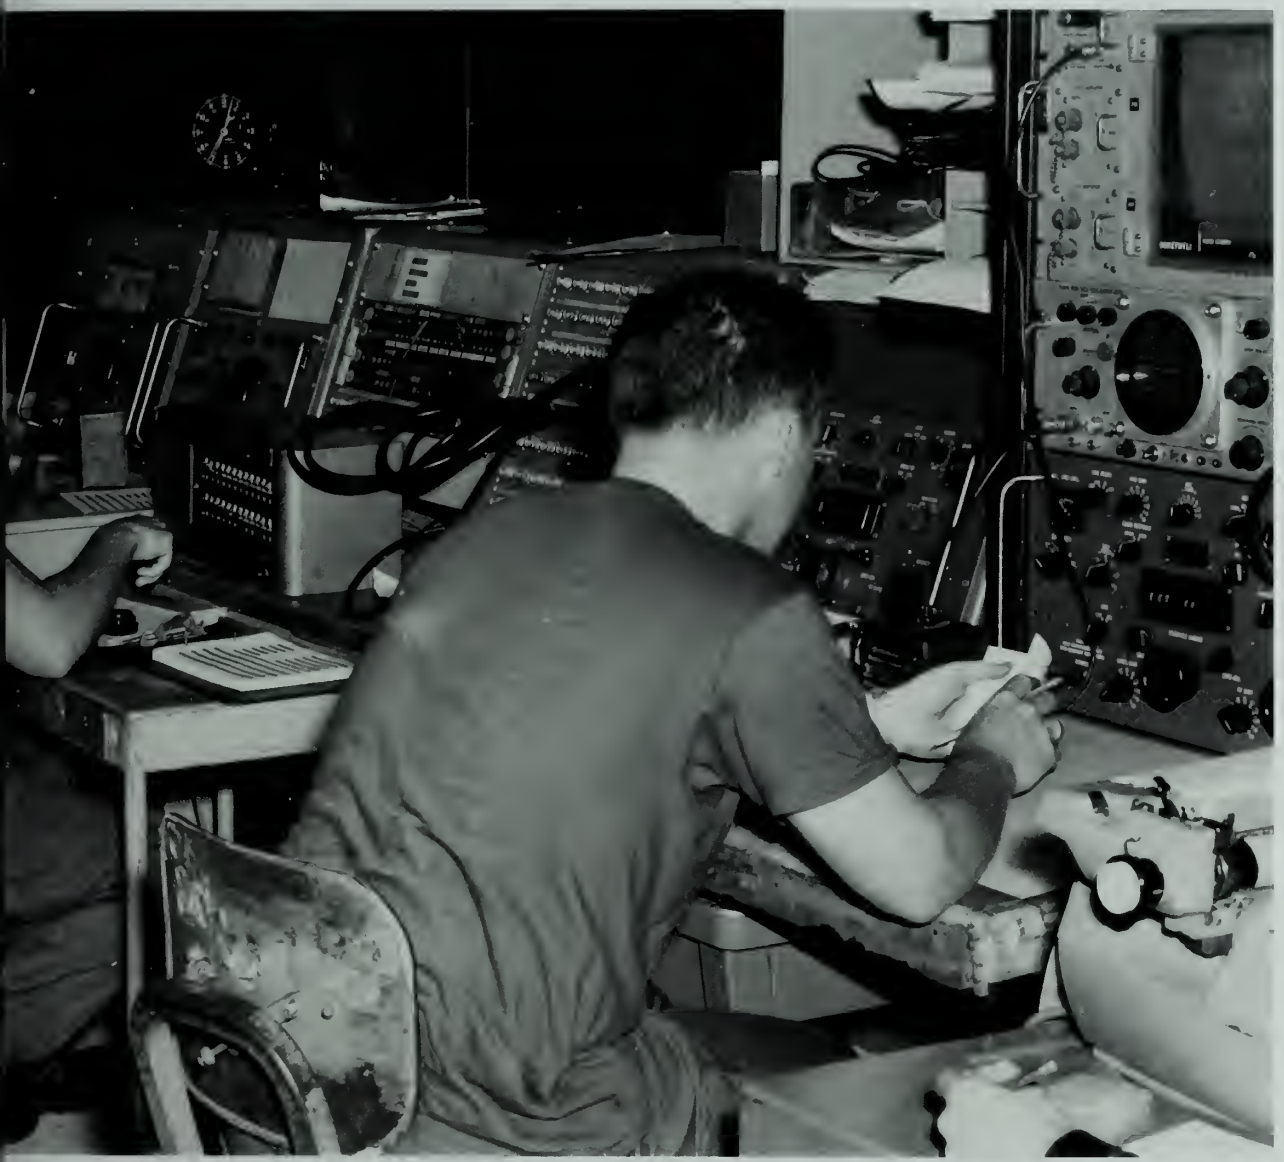
monitoring and analyzing MACV communications as well as conducting training in security procedures. They also briefed South Vietnamese forces in the use of cryptosystems on loan to them by the United States.

ASA elements were capable of monitoring only 6 percent of the Army's communications in Vietnam. Furthermore, approximately two-thirds of the effort was targeted against one source—the radiotelephone. This meant that only a relatively small percentage of actual communications violations could be identified. By focusing on procedures, monitors often failed to address the larger issue of exactly how much intelligence could be gained by enemy analysts from all communications sources, both classified and unclassified. Although COMSEC monitoring did not solve the security problem, it did lead to rethinking the issue. In 1966, evidence arose that the enemy was receiving warnings of pending B–52 strikes and that friendly communications might be the weak link. To confirm these suspicions, the 509th RR Group committed a large portion of its COMSEC resources to studying the problem. The findings concluded that it was possible for the enemy to obtain advance notice, determine the general location of a raid, and once the operation was underway, identify a specific target. During one of the monitored calls, the parties even acknowledged that the information being discussed was classified, but continued to converse anyway.

COMSEC personnel also played a limited role in electronic warfare that included deception operations. Imitative communication deception (actual intrusion into an enemy's communications network) was never attempted in Vietnam, but from time-to-time, manipulative communication deception was employed with mixed results. Manipulative deception was the use of one's own communications to deceive the enemy. Already involved in monitoring and performing analysis of friendly communications, COMSEC specialists were tasked with providing technical assistance to deception operations. However, actual cases of electronic deception were few in number and restricted to small-scale operations.

"The fact that the RFP positions continued to operate at all was simply due to good coordination between personnel at the various stations. If somebody had something the other guy didn't have, he'd loan it to him or give it to him. This, of course, didn't always work because everybody ran out from time to time."

CWO–3 RICHARD W. FOOTE, SIT SECTION, 509th RR GP



A member of the 175th RR Company mans a radio fingerprinting position on the right.

Fingerprints and Landlines

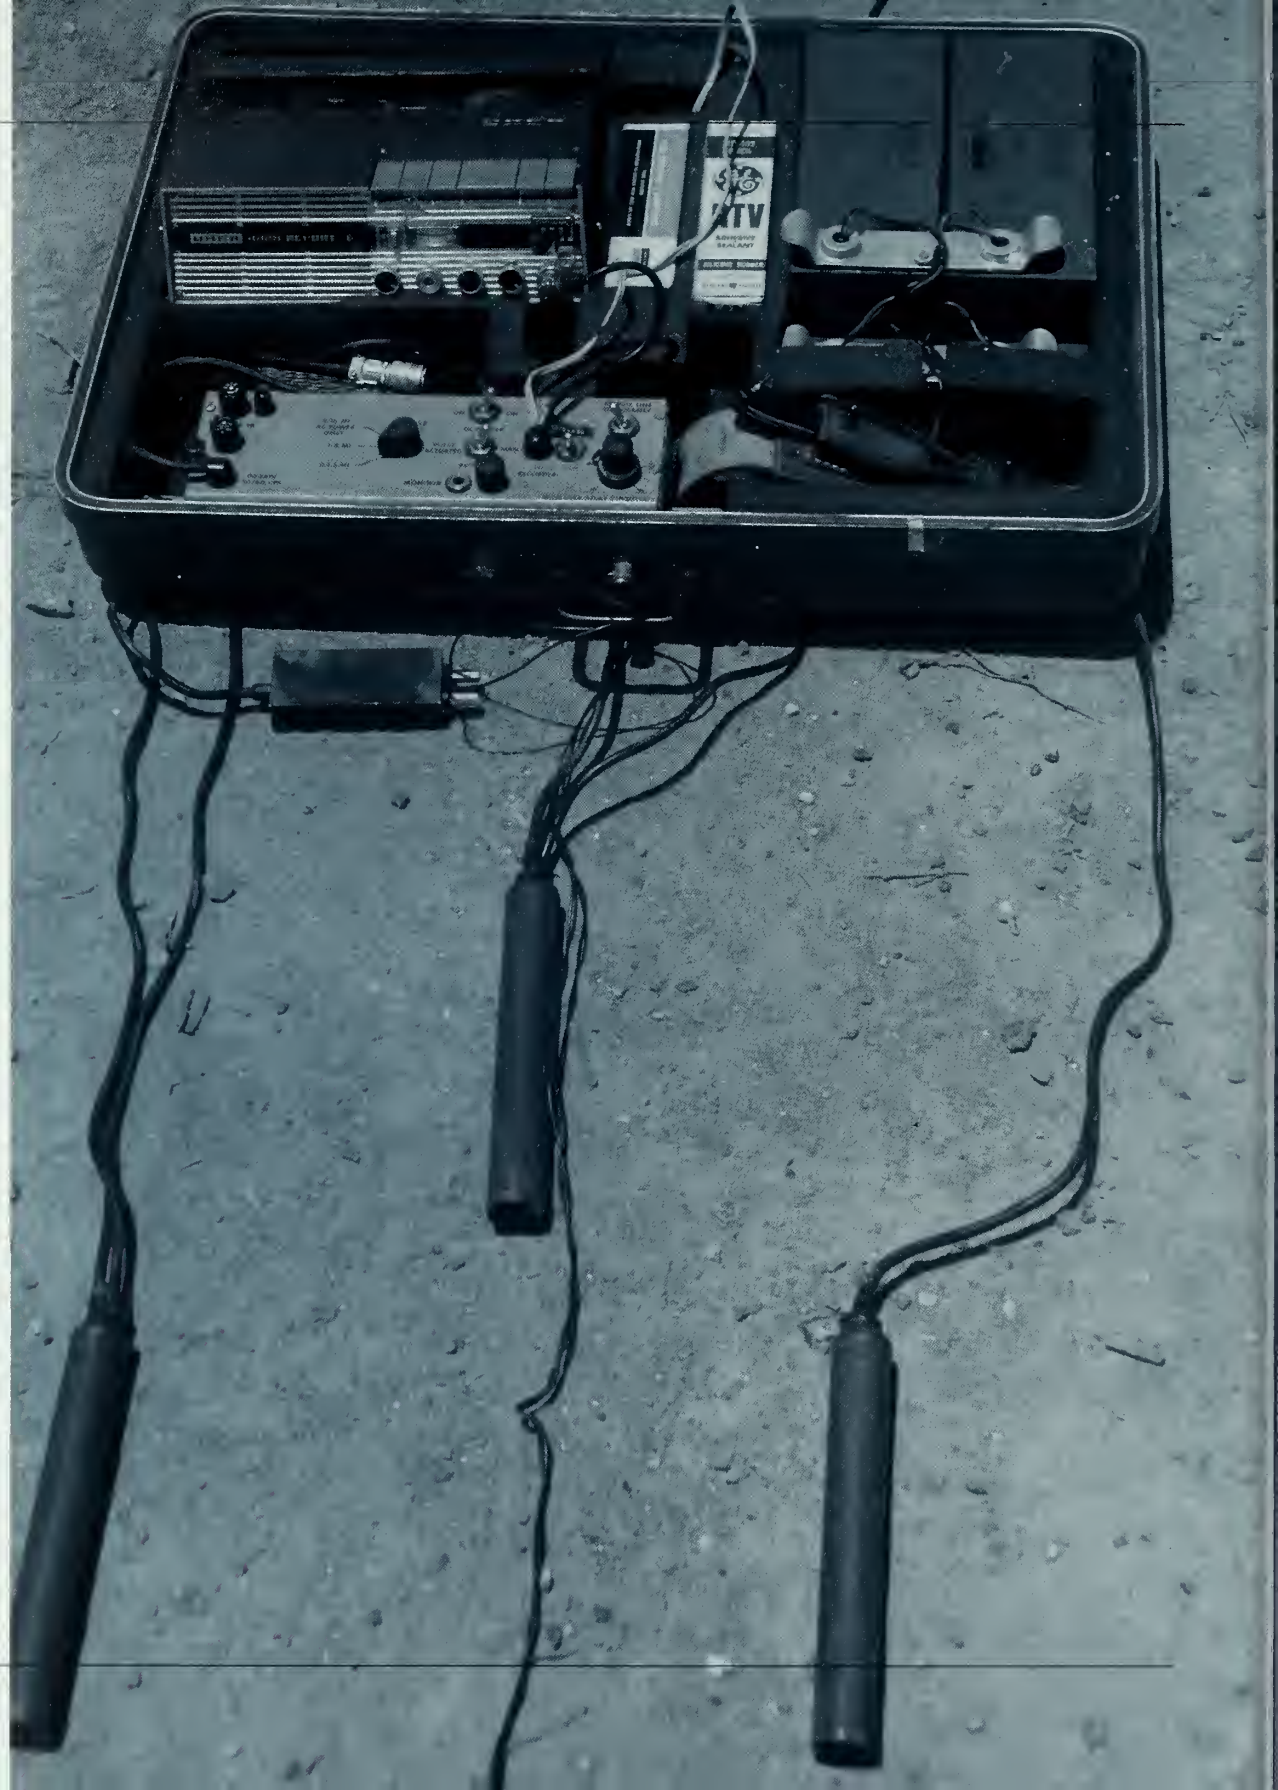
While in Vietnam, ASA found itself engaged in a number of minor projects that consumed a disproportionate amount of its energies. One of the diversions was radio fingerprinting (RFP). First used in World War II, radio fingerprinting involved recording of characteristics (such as power and frequency variations) of an intercepted signal in order to identify a specific radio transmitter. An oscilloscope converted a signal into a visual format that could then be captured on film. To make this happen, the intercepted signals had to be of sufficient strength. Furthermore, an experienced operator was needed to interpret the results. What many did not fully grasp was that radio fingerprinting was never meant to stand alone, but rather to be used in conjunction with other identification tools. RFP was far from an exacting methodology, and in Vietnam, it would face added challenges.

In 1962, less than a year after arriving in Vietnam, ASA decided to deploy an AFSAV–37 radio fingerprinter to its Saigon intercept site. Twelve months later, a second piece of equipment arrived at Phu Bai. Together, these systems covered targets in the Delta and the northern provinces, but had significant problems identifying low-powered transmitters being used by the enemy in central Vietnam. More than 10 years old, the AFSAV–37 began to quickly show its age. A hostile environment of

dust, humidity, and heat was taking its toll on the sensitive equipment, and atmospheric interference and the presence of weak signals further reduced RFP's effectiveness. Mounting repair problems soon convinced ASA that a new generation of equipment was a necessity.

Landline intercept was another mission that demanded an expenditure of a disproportionate amount of energies and resources on the part of ASA. The targeting of landlines dated to the Civil War, when both the North and South frequently tapped telegraph lines for the purpose of intelligence gathering. During World War I, opponents monitored radiotelephone lines that ran among the intricate trench systems that bordered "no-man's-land." However, the lack of a stable front in World War II furnished the US Army with few opportunities. In the summer of 1951, the Korean War, like World War I, had become stalemated along the 38th Parallel, leading ASA to revive the technology. For example, a landline-monitoring site was established on "Heartbreak Ridge."

Given this historical background, ASA naturally began searching for possible targets in Vietnam. In March 1966, a small team made up of personnel from the 3d RRU and the 400th ASA SOD explored the feasibility of ground return intercept at several widely dispersed locations. The equipment consisted of two UHER–4000 battery powered tape recorders,



One of a number of landline kits sent to Vietnam in an attempt to provide smaller, more user-friendly equipment.

battery powered special-purpose amplifiers, and 3-foot brass ground stakes. Although no Viet Cong telephone conversations were recorded, the team did bring back a number of important lessons learned. It was impossible to deploy such a system under the cover of darkness, and any future operations would have to be conducted in remote areas. At the same time, ASA operations personnel expressed serious reservations as to whether or not information gained from such intercept would ever outweigh the risks of exposing installation teams to enemy attack.

Mobile DF

In 1965, short-range direction-finding (SRDF) received renewed emphasis with the arrival of ASA's direct support units, all of which possessed PRD–1s. At the height of the war, the DSUs had some 36 PRD–1 teams organized into local direction-finding nets. Each substation searched for a signal or was tipped off by the control station. After locating a signal, the PRD–1 operator took a bearing, recorded it on the azimuth scale disk, and then passed the information to net control by using radio and one-time pads for security. Control then plotted all the bearings and retransmitted the "cuts" (two intersecting bearings) or fixes to its immediate headquarters where an "SRDF Spot Report' was released electronically to all DSUs within the respective corps tactical zone.

Many of the same problems that had handicapped SRDF in the early days in Vietnam continued to plague the effort. Weighing over 50 pounds, the PRD–1 was far from portable. This led to attempts to make the system more mobile. Under Operation MASHER/ WHITEWING in early 1966, PRD–1 teams were airlifted from place to place in a "leap-frog" fashion, hoping to pinpoint the target. Later, there was even an attempt to operate SRDF teams from inside helicopters. In the end, however, these efforts demonstrated more ingenuity than they did long-term solutions. Tactical commanders could not expend the personnel needed to protect SRDF teams so they were often relegated to firebases. This often led to the base line (distance between the extreme outstations) being longer than the desired 6 to 10 km. Keeping the SRDF teams in the rear also altered their mission. Instead of serving as a target acquisition tool, they supplemented other systems, such as PPS–4 personnel detectors, in providing force protection. Furthermore, the signal environment that existed around firebases often proved a hindrance to the SRDF mission. These outposts

Given adequate protection, PRD–1 operators, such as this one from the 303d RR Battalion, could target enemy transmitters.

"To begin with I had to instruct them on how to operate this DF. We used 05H's as the operators on DF and they would look at the equipment and say 'what's this.' We would have to tell them that is a DF set."

SP5 DUANE M. GAGNON, DET 1, 16th RRU

had more than their share of radiating and reflecting materiel such as antennas, concertina wire, vehicles, and shell casings.

The constant movement of the PRD–1s between sites was a leading cause of equipment outage, and the lack of air transportation only exacerbated the problem. In one instance, members of the 403d RR SOD were forced to rely upon elephants for transport. The age of the equipment placed added strain on a logistical system that could not maintain an adequate supply of parts, such as vacuum tubes. This led to cannibalization of existing PRD–1s, further reducing the number on hand. However, the lack of qualified operators was the final nail in the coffin. On the basis of its early experience with SRDF in Vietnam, ASA eventually relegated most of their PRD–1s to supporting intercept operations. In the process, school-trained, direction-finding specialists (05D) were replaced by manual Morse operators (05H) who possessed only on-the-job training and lacked the essential skills.

DANCERS and Small Steps

The only joint training conducted at the SABERTOOTH facility between 1965 and 1967 was a class on conversational English, taught in hope of promoting increased communications and leading to better understanding between the ARVN and US SIGINT personnel. By 1966, the 509th RR Group had given up on jointly manning the WHITEBIRCH DF net with the South Vietnamese, having failed to convince Unit 15 (COMINT) personnel of the necessity to perform such elementary tasks as preventative maintenance, continuously manning their positions, and responding to all DF flashes. The situation deteriorated to the point that if a US advisor was not present, ARVN operators would literally walk away from their DF positions, consequently no credence could be placed in line bearings being received from an ARVN outstation. However, ASA leadership would be unsuccessful in its efforts to extricate the command from having any future involvement with the WHITEBIRCH net.

Although the Vietnamese failed to achieve the necessary proficiency in direction-finding, they did contribute in other ways. The lack of qualified linguists led US cryptologists to turn to the use of native Vietnamese—Project DANCER. In 1964, the 3d RRU received permission for the first time to use locals, but it was not until June 1965 that equipment was actually in place for the program to be implemented. ARVN

"There is a definite need for more DANCER personnel. Because they are native they do a better and more rapid job than our people. Their transcriptions of...low-level voice were consistently superior."

CWO–4 WILLIAM R. MACDONALD, 175th RR CO

South Vietnamese linguists or DANCERS would become invaluable assets for ASA's voice intercept mission.

DANCERS were to be assigned to ASA elements, and civilian DANCERS employed at the South Vietnamese SIGINT center in Saigon. ASA would provide the ARVN linguists with tapes of plain text Vietnamese voice intercept for transcription along with the necessary technical data such as call signs, with which to accomplish their tasks. However, the project proceeded at a much slower pace than originally envisioned. During the first 3 months of 1966, DANCERS processed some 923 tapes of voice intercept, but only 11 were identified as being enemy communications. By 1967, DANCERS numbered 22, of which 12 were at the 8th RR Field Station. Many of the early DANCERS lacked basic grammar skills and suffered from low morale because they experienced feelings of isolation and discrimination at the hands of their US hosts.

Since its inception in 1961, the South Vietnamese COMSEC organization, the 1st Radio Control Company (known as Unit 16), lagged behind its sister communications intelligence organization (Unit 15). In October 1965, Unit 16 restructured itself into a headquarters element and four mobile platoons; one for each of the corps tactical zones, thus mirroring the 101st RR Company. Although for the first time the unit possessed all the equipment necessary to monitor the Republic of Vietnam Armed Forces communications, serious shortcomings persisted. Many of the South Vietnamese COMSEC personnel still did not know what actually even constituted a transmission violation. Few had adequate typing skills, and if they did, they didn't have access to typewriters, leaving copying to be done by hand. And even if a security violation was identified, the finding lost all relevance after making its way through a cumbersome reporting system. To make matters worse, ARVN units viewed Unit 16 as a sort of a "communications police" because officers committing violations received fines, while enlisted personnel could be reduced in rank, all of which did not encourage cooperation.

A soldier from Unit 16 monitors ARVN communications fo security violations.

"As a division commander, SI was the one kind of intelligence that would actually and always cause me to move elements or maneuver units based on it. Anytime a significant movement of an enemy regiment in the operational area was reported, I made corresponding immediate movements, based on such intelligence."

MG WILLIAM E. DEPUY, CG, 1st INF DIV

ASA personnel entered and exited Vietnam through either the 509th in Saigon or the 8th Field Station at Phu Bai. (Pictured is the processing center at the Saint-George Hotel in Saigon.)

Manual Morse intercept positions dominated ASA's effort in Vietnam. (The manual Morse bay of the 328th RR Company.)

A low-level voice intercept team in the field.

The Headquarters Building of the 224th Avn Battalion is shown in the left foreground; the 509th RR Group's headquarters is across the street with overhang.

In the aftermath of the enemy's Tet 68 offensive, support for US involvement in Vietnam waned, eventually leading to the exit of US forces from Vietnam. (National Archives)

NEW BATTLES 1968 1970

"I recall COL Faulk, my G2, in talking to me about it afterwards said that this group asked him, 'What were major intelligence failures?' He told them that he didn't really know what the intelligence failures were, but he simply hoped that next time he would have as much intelligence. . . . "

LTG FREDERICK C. WEYLAND, CG, II FFV

Beginning the night of 30 January 1968 and into the next morning, a combined force of approximately 84,000 Viet Cong and North Vietnamese troops launched a coordinated attack country-wide during the traditional holiday period surrounding the lunar new year—Tet. Besides the capital of Saigon, the enemy mounted over 100 assaults against provincial capitals, autonomous cities, and district capitals. Although the Allies defeated the enemy in the field, Tet 68 proved to be the watershed event of the war. It led to the disenchantment of the Nation's decision-makers, US news media, and eventually the American people themselves. Support for the war would soon begin to wane, ultimately leading to the withdrawal of US forces.

The intelligence failure of Tet 68 resulted from J2, MACV's underestimating the enemy's strength in South Vietnam and miscalculating how the war was progressing. The rate of infiltration down the Ho Chi Minh Trail was a key factor in determining the order of battle. MACV had come to rely on SIGINT as the basis for its analysis of the flow of men and materiel, but only after the information was confirmed by interrogations of prisoners, debriefings of defectors, and exploitation of captured documents. This took time, creating an information gap. Still COMINT was able to provide ample warning of the Tet buildup. On 30 December 1967, pattern analysis found enemy forces to be generally well away from populated centers with some along South Vietnam's border. (In pattern analysis, dots on a chart were used to represent fixed enemy radio terminals or other information indicators of unit locations. Over time, these began to suggest possible courses of action.) By 15 January, a movement to the more populated areas was underway, "like iron filings being attracted to a magnet," and on the eve of the attack, analysis showed the enemy encircling the major population centers. Based on this information, Allied forces were placed on full alert for the night of 30 January. What COMINT did not show was the scope, fury, and nature of the attack. Two prime targets, Saigon and the city of Hué, were heretofore untouched by the war. The possibility of a rocket attack was not unthinkable, but the prospects of a ground assault were believed slim. When the enemy employed messengers and maneuvered on prearranged plans, COMINT was blind. It could not reveal what the enemy did not choose to transmit.

ASA units were not immune from the fighting. On 31 January, several companies of VC, backed by mortars, launched an all-out assault on the Vietnamese Joint General Staff Compound housing the 509th RR Group's operations. Enemy soldiers penetrated the compound's defensive perimeters and came within 100 meters of the WHITEBIRCH Building before being killed or turned back. Landline cables belonging to the RR Communications Unit at Tan Son Nhut were severed, delaying the dissemination of SIGINT products. On 18 February, rocket fire hit Tan Son Nhut Air Base, wounding some 25 ASA soldiers. At Phu Bai, a rocket attack destroyed a portion of the trailer complex and damaged several buildings and antennas belonging to the field station.

One of the great stories that emerged from Tet was the awarding of the Legion of Merit to Edward W. Minnock, Jr., a 19-year-old private whose intercept team was isolated near Tuy Hoa City. After analyzing the in-coming intercept, Minnock formulated a plan to thwart an enemy attack against the city and sold the local combat commander on a successful counter-offensive maneuver.

The Army outfitted a Navy P2–V "Neptune" aircraft as an electronic warfare platform (CRAZY CAT/CEFLIEN LION).

"Then he [General Westmoreland] asked a question. 'Well, what do you think about jamming the enemy up in Khe Sanh, if we have to?' I told him from the way I looked at the enemy's communications. . . that when they were on the offense, they had very little need for communications, per se."

COL WILLIAM T. RILEY, JR. CDR, 509th RR GROUP

A ¾-ton mounted MLQ–24 jammer. Like the rest of ASA's electronic warfare resources in Vietnam, it remained silent.

Electronic Warfare

ASA was responsible for the Army's EW mission. However, a judgement call was made early in the war that intelligence derived from COMINT far outweighed any possible short-term benefits of denying the enemy his ability to communicate. Apart from a handful of isolated exceptions, this policy was never altered. One such exception occurred in late 1965 when the 5th Special Forces Group reported that the enemy planned to broadcast a message in the area of Pleiku with the intent of inciting local Montegnard tribesmen serving with the Civilian Irregular Defense Group. After obtaining clearance from the US Embassy, GEN Westmoreland, COMUSMACV, directed the 3d RRU to jam the broadcast. By simultaneously using transmitters located at Nha Trang and Pleiku, ASA jammers successfully overrode the foreign voice signal.

That same year, the US Pacific Command sponsored an electronic warfare conference to outline a strategy to disrupt the communications of low-level Viet Cong targets. One of the recommendations was for the Army to deploy an EW platform. The Joint Chiefs of Staff approved, assigning ASA the responsibility for fielding Project CRAZY CAT (later renamed CEFLIEN LION). However, no existing Army aircraft could sustain the weight and size of the AN/MLQ–29 countermeasure systems being proposed, causing ASA to turn to the Navy's RP–2E "Neptune." In continuous operation

since 1945, the Neptune was used for maritime patrol missions and had even set a non-refueling long distance record of 11,000 miles. Its ability to stay aloft for 14 hours at a time made it particularly attractive for use as an EW platform. Because the aircraft was the only one of its kind within the Army's inventory, the five CEFLIEN LION platforms required specially trained pilots and a unique logistical support system.

The 1st RR Company (Avn) was activated for the sole purpose of performing the CEFLIEN LION mission, but when the company arrived in Vietnam in June 1967, it immediately ran into strong opposition. The most vociferous objection to jamming came from the J6, MACV, who feared the enemy would retaliate by launching attacks against US communications sites or that jamming would "slop-over" and disrupt friendly comms. Members of the cryptologic community also expressed concerns that jamming would jeopardize the exploitation of enemy targets. Only the strong interest shown by GEN Westmoreland, COMUSMACV, kept the project alive.

The closest the CEFLIEN LION platforms ever came to deploying in an electronic warfare mode was during the Battle of Khe Sanh. In early 1968, NVA/VC forces attempted to wrestle the northern province of Quang Tri from the control of the Allies. As the intensity of the battle increased, GEN Westmoreland called together several advisors to discuss the possibility of jamming the communications of enemy forward observers. However, those who had argued against such a course of action in the past prevailed once again. In 1968, the 509th RR Group needlessly updated its inventory of ground based jammers by adding four AN/MLQ–29 sets. Like the systems they replaced, the MLQ–29s sat in storage where they continued to gather dust along with their operational plans.

Airborne Collection

The Army's first attempt at airborne intercept in Vietnam was short-lived. In January 1966 ASA deployed an SSQV–6 system housed within a "Caribou" CV–2B: a twin-engine, medium tactical transport aircraft capable of carrying as many as 32 passengers. Besides its lift capacity, ASA engineers were attracted to the aircraft's ability to cruise for over 5 hours at a speed of 135 knots. Nicknamed PATHFINDER, the platform had space for 4 HF/VHF intercept and search positions plus a HF direction-finding capability. The project was terminated early when an agreement was reached between the Army and the Air Force that all medium-size transport aircraft, including the CV–2B, be transferred to the latter. Although PATHFINDER failed to demonstrate that it was the final answer, airborne collection did show enough promise to merit further exploration.

The next attempt involved a U–1A "Otter," a single-engine, light tactical-transport aircraft that could carry up to two crew members and 2,000 pounds of cargo. The first of the platforms, nicknamed CAFÉ GIRL, arrived in Vietnam in March 1967. CAFÉ GIRL utilized the standard dipole-antenna configuration and the AN/ARD–15 direction finder, but also came equipped with manual Morse search. The next two U–1As, nicknamed LAFFING OTTER, represented an upgraded CAFÉ GIRL and were primarily employed in a collection mode with an auxiliary ARDF capacity. On 12 February 1969, hostile fire downed a LAFFING OTTER approximately 1.5 miles inside Cambodia. US rescue attempts were aborted when a firefight broke out between the crew of the Otter and nearby enemy forces. Following their capture, the crew.was fortunately turned over to Cambodian authorities. When US officials finally had the opportunity to debrief the released ASA soldiers, they were relieved to learn that all documents and equipment had been destroyed and that security had not been compromised.

The U–1As provided ASA with its first successful airborne collection platform in Vietnam.

Aboard a LAFFING OTTER, an ASA operator turns the dials to begin copying.

"During my recent visit to South Vietnam I observed and was told by our senior commanders that COMINT, primarily airborne direction finding and airborne intercept, is providing 80 to 85 percent of the intelligence used in planning and operations against the Communist Forces in South Vietnam . . . "

FINN J. LARSEN, DEPUTY DIRECTOR, DOD (DDRE)

In April 1968, MACV directed ASA to deploy its five CEFLIEN LION platforms in a collection mode. Designed for communications jamming, the CEFLIEN LION system also had the capability to gather COMINT in both the VHF and HF range. (One had to collect signals before one could target them for jamming.) Operational plans were drafted to use the platforms against the ongoing infiltration of enemy personnel, supplies, and equipment into South Vietnam. In its new role, CEFLIEN LION would emerge as the Army's most prolific airborne collector. For all intents and purposes, CEFLIEN LION was an extension of the 8th RR Field Station at Phu Bai. After receiving daily briefs on pending B–52 strikes in the area of operations, the crew of the P–2E aircraft would take off at 0400 hours from Cam Ranh Bay and head north along the coast before turning west in the vicinity of Phu Bai/Hué. Following the DMZ, the plane completed a long arching orbit. Whatever information operators could transcribe was immediately passed to the 8th RR Field Station for processing and distribution to consumers. Five to eight hours later, the aircraft landed at Da Nang for refueling. Here, soldiers from the 8th waited to courier the day's intercept back to Phu Bai. The crew then departed for home by retracing their earlier flight pattern south along the coastline to Cam Ranh Bay.

Housed in a UH–1D helicopter, the LEFT BANK system operated in direct support of the local commander.

LEFT BANK/ LAFFING EAGLE

LEFT BANK was unique among ASA's airborne systems. First of all, it was housed in a UH–1D helicopter, not a fixed-wing aircraft. More importantly, LEFT BANK represented a joint effort between ASA units that packaged the systems and the supported divisions that furnished the choppers. In the summer of 1967, the 1st Cav Division provided three "Hueys" along with pilots, while its direct support unit, the 371st RR Company, contributed operators and systems. (The 4th Inf Division and the 374th RR Company worked out a similar arrangement.) LEFT BANK was also one of a kind in that it came under the direct operational control and tasking of the division commander. Initially designed as a complete direct support package in the HF spectrum, LEFT BANK contained an AN/ARQ–27 direction-finding system, an RO–278 radio fingerprinting position (RFP), and a voice recorder. One operator reported losing the RFP film out the chopper's open door and having to hang upside down on the helicopter's skids to retrieve the classified material resting on the top of the jungle canopy. Within 2 years of becoming operational, the finger printer was eliminated altogether because of erroneous readings caused by excessive vibrations. Its removal actually enhanced the platform's overall effectiveness by simplifying operations and allowing the intercept position to be used solely in support of direction-finding.

"... the LEFT BANK went out, obtained a target, and then became a small command center in the sky directing the attack. In fact, the Cav became so reliant on this technique that when the LEFT BANK was no longer available their effectiveness was severely hampered."

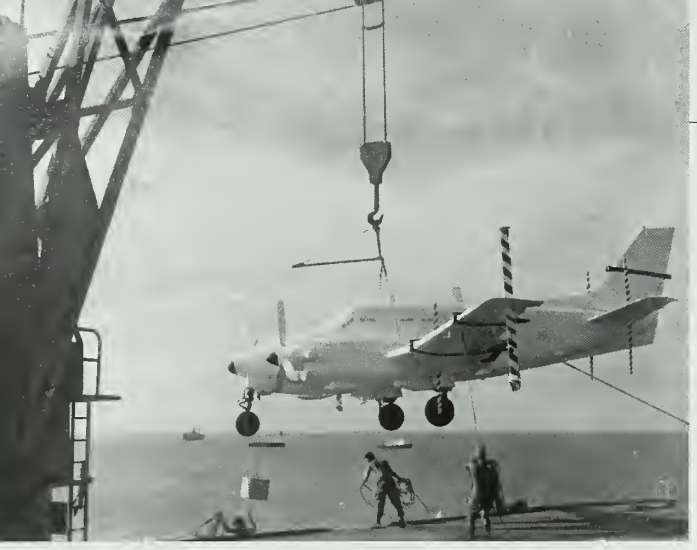
LTC DONALD E. GRANT, CDR 303d RR BN

What allowed LEFT BANK to achieve its full potential was the development of a concept of operations that integrated the platform with the firepower and mobility of airborne warfare. After a LEFT BANK pilot called in a fix, an observation chopper worked the area at tree level for evidence of movement, trail use, or bunkers. If personnel were spotted, a gunship rolled in, and troops possibly inserted. In 1969, two platforms of the 4th Inf Division flew some 315 missions (1,215 hours); the average radius of the 438 fixes was even smaller than that of fixed wing platforms. In the month of January alone, LEFTBANK was responsible for six B–52 strikes, firing of 1,200 rounds of artillery, and insertion of troops that accounted for 300 of the enemy being killed. However, LEFT BANK missions experienced their share of risks. ASA suffered the loss of two crews when enemy fire downed their helicopters.

In December 1968, ASA deployed the first of its 16 U–21D "Ute" aircraft. The LAFFING EAGLE platforms were designed to perform both direction-finding and airborne collection, but delays in the development of the AN/ARD–23 (V–Scan) DF system forced the platform to be employed initially for VHF voice and HF manual Morse intercept. The LAFFING EAGLE possessed the capability to record low-level voice intercept on tape which could then be passed rapidly by courier to the local collection management authority or by secure voice to a direct support unit. The aircraft could also pass on targeting data to nearby ARDF platforms.

LAFFING EAGLE gave ASA its most efficient collection platform. The U–21D was a smaller, newer, less complex, and mechanically superior aircraft to the CEFLIEN LION P–2E. (The U–21 also demonstrated greater flexibility because CEFLIEN LION had to deploy close to its logistical base.) LAFFING EAGLE was credited with intercepting elements of the NVA 1st Division and their plans for an attack on 22 February—the launch date of the 69 Tet Offensive. LAFFING EAGLE was also the first airborne system to successfully target the low-powered voice transmitters employed by the Viet Cong in the southern delta and hill country.

The radio fingerprinting and voice positions were eventually eliminated from the LEFTBANK platform in favor of improved ARDF.



The arrival of the U–21D LAFFING EAGLE platforms in late 1968 represented an important milestone for ASA in its development of airborne collection and direction-finding.

"Previously we had to land after flying all the way back to Saigon and then send the data over the wire. It was passed through channels to Bien Hoa Base and they had to get it out to the tactical commander. In the new system, using COMUS pads, we could pass the information directly to the ASA direct support unit with the 173d."

SFC MICHAEL R. CUMM, NCOIC PROCESSING SECTION, 3d RRU

Manpower/Navigation/ Communications

Pilots played an important role in intelligence collection. The quality of an ARDF fix depended upon accurately determining the position of the aircraft. Before each mission, pilots received a pre-brief in which they were given the location where the target was last fixed along with other operational details. It was important that they overfly the proper area at the correct time. ARDF training for pilots was originally conducted at the USASA Training Center and School, Fort Devens, Massachusetts, until eventually being transferred to Fort Huachuca, Arizona, to take advantage of better weather conditions and improved on-site maintenance. During the war's peak years, ASA graduated approximately 170 pilots annually from the course.

Initially, visual contact with ground features proved adequate, but cloud cover, darkness, and the lack of distinguishable landmarks precluded total dependence on this method. In 1964, U–8 platforms began to arrive equipped with Doppler navigational radar. Eventually, the Canadian Marconi Doppler (AS/ASN–64) became standard equipment on U–8s, the P–2Es (CEFLIEN LION), and the U–1As (LAFFING OTTER). The Doppler not only turned the aircraft into an all-weather system, but made it possible for the platform to be flown at a higher altitude, thus extending its intercept range. The Doppler also reduced the time a pilot spent continuously following the aircraft's position on a map. But adoption of the Doppler had its drawbacks: the copilot was required to systematically update the system; Doppler errors voided as many as a third of the intercepts; and breakdown of the radar proved to be the number one cause of aborted missions.

Besides navigation, ARDF became increasingly dependent upon the need for secure communications. When an enemy transmitter was on the air for only a few minutes, rapid communications was more than a luxury; it was essential. The ultimate solution lay in the introduction of voice encryption equipment—the TSEC/KY–28 in late 1966. With encrypted voice, delivery time to a supported commander dropped from hours down to as little as 6 minutes. At the same time, overall mission productivity rose because secured voice allowed for clarification of the downloaded information.

Despite these improvements, communication problems remained. Mountainous regions could prohibit tip-off procedures altogether, and the airwaves also became increasingly congested. Ground-to-ground communications, ground-to-air tip-offs, and air-to-ground reporting often occurred on the same frequency, making it difficult to sort out the tip-offs. Within the III CTZ alone, ARDF platforms could simultaneously receive tip-offs from as many as 16 different intercept sites because ground flash stations often could not hear each other's transmissions. Pilots frequently reacted to the incessant verbiage by turning their sets off until they could again stand to put up with the chatter. To help alleviate the problem, the ARDF Coordination Center eventually assigned priorities to different types of traffic and in 1969 resorted to allotting separate flash and reporting frequencies.

Using captured radios, the VC/NVA regularly tried to jam Allies' communications and to enter their nets.

An Unofficial War

From time to time ASA operators engaged in unofficial electronic warfare. To keep a target communicating, individual operators would sometimes temporarily jam an enemy's signal. This caused the targeted transmitter to try and communicate again. In one instance an ASA team working off the USS Benewah, on the Mekong River, obtained permission to undertake sustained jamming. By keeping the enemy broadcasting, the intelligence specialists successfully followed the movements of the headquarters communications element back and forth across the Mekong River until all of its members were either captured or killed by waiting Navy river patrol boats.

If the US Army was reluctant to use EW as a weapon, the enemy was not. To conduct jamming, the only thing the enemy needed to possess was compatible equipment such as

"The only time we let him communicate was when one of our ARDF birds was in the air. . . . We would get an ARDF fix and thirty seconds later here comes gunships. . . . So when he tried to get across [the Mekong], all the patrol boats up river and all the patrol boats down river converged. We got . . . all their radio operators except for one which was killed. . . . "

SFC JAMES W. WOOD, JR. LIAISON TO IV CORPS

Aboard the USS Benewah, an ASA team practiced limited electronic warfare against enemy units operating along the Mekong River.

captured radios and to be in close proximity to the intended target. Enemy operators employed whistling, keying, scratching the mike, or playing Armed Forces Vietnam Network radio programs. One captured document listed the following simple guidelines for VC operators: "When jamming, play with dials, whistle, make noise or simulate sounds if possible, but do not talk."

The enemy also engaged in communications deception by entering Allied communications nets and broadcasting messages in hope that the subterfuge would not be detected. The NVA/VC was known to have successfully used American, Australian, and Spanish accents for the purposes of deception. One US unit reported six such intrusions within a week's time. Typically, the enemy intruders tried to redirect artillery fire and medical evacuations or to order Allied forces to withdraw or to cease fire.

On 6 January 1968, ABC News cameras captured for its nightly broadcast a case of enemy intrusion. Elements of the 9th Inf Division and the 2d Brigade, 25th Inf Division, were engaged in a firefight with VC/NVA forces within 10 miles of the Cambodian border when an intruder, identifying himself as Australian, entered one of the command nets. He urgently requested artillery fire to be shifted as rounds were impacting in his area. In a display of poor COMSEC, US personnel made no attempt to authenticate and continued to converse with the unidentified station. Eventually, the would-be deceiver withdrew from the net once he sensed that the other side had grown suspicious.

The best protection against the enemy's electronic warfare and signals intelligence was simply good COMSEC—the use of proper radio procedures and exercise of discipline within the communications net. Against jamming, a radio operator could employ such countermeasures as relocating his reception site so as to lessen the effect of the incoming jamming signal, ceasing broadcasting altogether, or changing frequencies. Attempting to broadcast on a different frequency was to be used only as a last resort since a jammer could easily find the new signal.

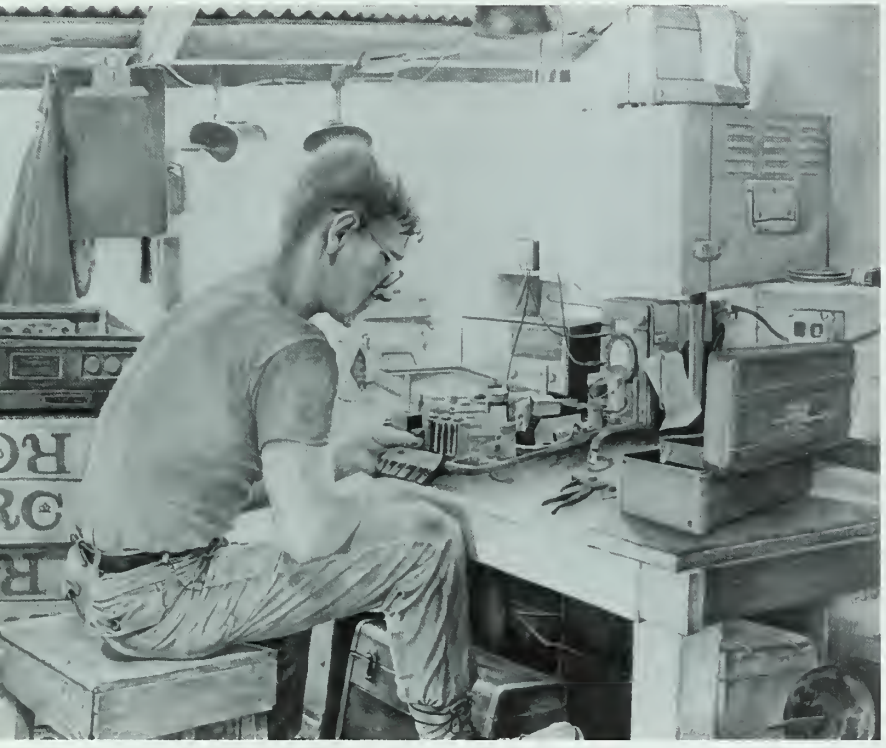
SHORT SKIRT/CAFÉ BLEW

In 1966, a new radio-fingerprinting (RFP) system, Project SHORT SKIRT (later renamed LAFAIRE KNEE), was deployed as replacement equipment at each of the CMAs: the 8th RR Field Station, the 175th RR Company, and the 330th RR Company. The RO–278 worked on the principal of recording an analog picture of the targeted signal on light-sensitive paper. Operators could then develop the image by simply exposing the paper to low intensity ultraviolet light, such as a florescent lamp. The use of paper eliminated the need for chemicals in film processing and permitted multiple copies to be forwarded to different RFP libraries. Despite the advantages of convenience and ease of operation, the RO–278 presented its share of challenges. Unwanted characteristics showed up in the recordings that were eventually traced to improper grounding of

"The value in the radio-fingerprinting system is that it is self-contained within one station. . . . without taking the time that is required for MRDF shots throughout the country to locate entities that have disappeared for a time."

CPT JAY M. WALDMAN, OP OFF, 335th RR COMPANY

the equipment. The quality of the light-sensitive paper was poor and reached the 50-percent degradation point within an hour of having been developed. But the greatest challenge to RFP remained one of management. How to utilize a handful of RFP positions against an unlimited number of targets? Sometimes the collection management authorities placed emphasis on quality of shots; other times the emphasis was on quantity. Maintenance of RFP libraries was also a major concern. One library might contain as many as 10,000 individual shots that required constant screening.



When it came to PRD–1s, good maintenance was critical as shown in this piece of combat art.
(Charcoal by SP4 Wayne A. Salge, member of the 509th RR Group)

Short-range direction-finding remained in Vietnam much longer than the ASA leadership had anticipated. Commanders in the field were reluctant to turn loose assets that they owned and believed were helping to pinpoint enemy troops in their local area of operation. However, cuts and fixes on targets that could not be verified through analysis were of questionable value and could even lead to serious consequences. For example, one commander used SRDF teams as flank protection during combat operations. Another deployed the PRD–1s in defense of his base camp, thereby committing more troops to combat actions. Some of the blame could be attributed to the direct support units themselves who too often lacked a clear understanding as to how to correctly utilize the equipment.

One of the earliest attempts at improving SRDF was an effort to field a manpack, hand-held system to be used by the 403d RR SOD. However, field tests by the detachment revealed major shortcomings in each of the systems, such as the lack of a built-in compass in the RTCV–7A radio receiver that possessed an AT–249 homing antenna. The next piece of equipment to be tested was the PE–484 system, which demonstrated sufficient accuracy, but proved inadequate for the task at hand. It lacked the necessary ruggedness, possessed only limited range, and proved difficult to repair.

In 1968, ASA made a last-ditch attempt to field a system that would solve the SRDF problem once and for all. CAFÉ BLEW was a new mobile direction-finding system designed to provide line bearings on HF and VHF signals, to differentiate between sky and ground waves, and to allow for antennas to be remoted up to 700 feet away. However, test results in Vietnam quickly revealed that CAFÉ BLEW fell far short of expectations. Consequently, in March 1969, MG Denholm, CG USASA, directed the removal of CAFÉ BLEW equipment and ordered, that in the future, PRD–1s no longer be used in a direct support mode. SRDF's.legacy in Vietnam would be that its failure had led to the development of ARDF.

Engaged in long-range reconnaissance patrol, MAC–SOG soldiers and their South Vietnamese counterparts were regular practitioners of landline intercept. (A. Berg)

Circus Act

The 509th RR Group served as a coordination center for landline intercept activities in Vietnam. Under Project CIRCUS ACT, the group assumed responsibility for processing and reporting information gained from intercept, conducting training, and whenever security was not a consideration, engaging in the actual setup. Priority was given to training reconnaissance elements such as Special Forces, long-range patrols, Navy SEALS, and

Marine amphibious assault groups, but any tactical unit could request assistance. Compromise of COMINT was not believed to be a problem as long as non-indoctrinated personnel were the only ones performing the line tap.

The Military Assistance Command-Studies and Observation Group (MAC–SOG) was a joint service, unconventional warfare task force engaged in long-range reconnaissance patrols throughout the region. Because MAC–SOG personnel operated in remote areas, it was believed they would be ideal candidates to intercept landline circuits. In October 1966, a MAC–SOG team successfully spliced an enemy landline and attached a monitor, but the operation failed to yield any meaningful intelligence. However, the never-ending demand to expand the intelligence base in Vietnam would continue to drive future experimentation with landline intercept.

Specifically designed for use in Vietnam, the VITACK XR4–100 kit system could be deployed in different modes, including parallel induction and wire splicing. Furthermore, the equipment could be left buried for 7 to 10 days for landlines located in remote areas. The drawback was it resembled a two-piece luggage set and weighed 54 pounds. The 403d RR SOD first tested the VITACK XR4–100 in 1968. During the initial phase of the operation, the US/ARVN team was discovered, and a firefight ensued. Several of the team members were wounded and an enemy soldier killed. It was obvious that what was needed was lighter, less cumbersome equipment and a method for conducting a pre-test to determine if a line was actually active. The 403d RR SODs next tested the XR4–100A, a replacement system, half the size of the original equipment. On the first three attempts, the team had to withdraw under fire even before reaching its target.

"The majority of all wire sightings reported has been in Northern I Corps Tactical Zone which is the area under XXIV Corps control. . . ."

MAJ DAVID B. MULLAN, USAF, NSA PROJECT OFFICER

During its fourth deployment, while in the process of locating the wire, the team was observed and engaged by an enemy platoon. Two members of the team were killed, a 403d RR SOD soldier wounded, and the equipment wound up being destroyed in place to keep it from falling into enemy hands.

For a number of years, Special Forces had attempted to sample landlines with home-made inductive monitoring devices, no larger than a package of cigarettes. Although no documented evidence existed to prove any of these efforts actually bore fruit, the idea of an effective, hand-held device remained popular. In December 1968, NSA engineers finally gave the Special Forces what they had been asking for—the XR–114A, a system weighing 5 pounds that was voice activated and capable of recording up to 2 hours. A year later ASA deployed the XR4–100D surveillance system, which offered even broader applications. This newest piece of equipment came with radio relay and remote command activation capabilities. But despite these technical advances, the J2 MACV's command emphasis, and the 509th Group's attempts to reenergize CIRCUS ACT, success continued to elude the landline program.

Advice and Assistance

Each of the direct support units possessed internal resources to perform COMSEC monitoring, but it was becoming increasingly evident that monitoring by itself was an ineffective means of preventing transmission security violations. During Project COVERALL, the 101st RR Company tried to revitalize the program by monitoring only similar units at the same time so as to present a more accurate transmission security picture, but the time lapse before a follow-up session could be accomplished negated any benefit. (The 101st RR Company alone had responsibility for 142 units.)

By the mid-Sixties, a change in the direction of COMSEC was emanating from the National Security Agency and was slowly working its way throughout the rest of the cryptologic community. The new approach emphasized advice and assistance. The assumption was that if people knew what to do, they would do it. Communicators already recognized the need for safe-guarding information; they just had to be informed of the nature of the threat, given reasonable means to effect security, and shown how. More importantly, the fear associated with the policeman role of COMSEC monitoring did not prevent violations; it actually hindered good security practices.

The security poster at the 328th RR Company was a reminder that ASA could and did monitor all types of communications.

"The efforts of the COMSEC Advice and Assistance Team caused more improvement within these two divisions in a few weeks than the many previous months of communications monitoring. . . ."

US ARMY, VIETNAM MESSAGE, DATED AUGUST 1968

The National Security Agency at Fort George G. Meade, Maryland, was the primary proponent of the new emphasis on advice and assistance. (National Security Agency)

However, advice and assistance was not just a top-down drill. Initiatives also came from below. In February 1968, a team of COMSEC officers from the 303d RR Battalion traveled around the III CTZ to determine the security awareness among US units in the aftermath of the 68 Tet Offensive. They concluded a need existed for a COMSEC Advice and Assistance Team (CAAT) to present classes, to implement security measures, and to work with local COMSEC specialists to improve their skills. Elsewhere, the 313th RR Battalion kicked off Project CORRECT (COMSEC Role Recast) throughout the II CTZ. A letter of introduction from the Chief of Staff, I FFV, preceded an assistance visit by CORRECT team members. Once on the ground, they conducted COMSEC awareness classes, followed 3-4 weeks later by a monitoring team that evaluated a unit's progress.

The road leading from an emphasis on monitoring to focusing on education was not always a smooth one. COMSEC personnel often shifted back to monitoring and analysis because that was what a local commander desired most. Other commanders wanted COMSEC resources assigned on a permanent basis, not just showing up periodically. Some in the COMSEC business believed that even advice and assistance did not go far enough. Operations security, where all types of threats were evaluated, was what was really called for. But perhaps the greatest hindrance to change was the shortage of COMSEC specialists skilled as educators. COMSEC personnel had to know the tactical environment, local communications networks, and the organization of the supported command. By the time a COMSEC specialist acquired the know-how, his tour of duty was up. It would take longer than the US Army's stay in Vietnam for the COMSEC advice and assistance program to become a reality.

"In general, I've seen no great development in COMSEC status since World War II. Although there have been improvements in COMSEC equipment, there is a practical limit to the amount of COMSEC equipment that we need or which can be carried by the combat soldier. In Vietnam, the use of even the KY–38 was not practicable for manpack on the soldier in active combat."

MG JOHN R. DEANE, JR., CG, 173d ABN BDE

Secure Voice

Captured documents revealed that enemy COMINT personnel concentrated on exploiting unauthorized codes and plain text. There was no evidence the enemy ever successfully attacked approved enciphered systems and methods. That is not to say the enemy might not have had success when communicators employed improper procedures, such as when plain text was mixed within an encoded message. In 1968, the 101st RR Company conducted a survey that revealed tactical battalions were employing unauthorized codes 90 percent of the time when passing locations of friendly units over radiotelephone nets. COMSEC specialists even speculated that transmissions in the clear were preferable over "homemade" codes. At least the sender would not be lulled into a false sense of security.

Early in the war, one-time crypto pads where each page was destroyed as it was used were in wide use, but the sheer numbers required proved a significant burden. In 1967, the KAC codes were widely distributed for use at the lower echelons. However, the vocabulary of the General Purpose Codes (KAC–P and KAC–Q) was not always adequate for all types of units. To correct this deficiency, codes were designed upon request for units with special vocabulary. (For instance, artillery units used the KAC–184.) The reception of these specialty codes was generally favorable. In the words of one artillery officer, "It is the first decent code I have seen produced for artillery. Most of the time we get a modified infantry code that doesn't fit our needs."

However, talk persisted among Army communicators that the KAC codes were not convenient. For instance, having to use pencil and paper at night, in the rain, or under actual combat conditions was considered prohibitive, but upon investigation these criticisms proved largely without merit or highly exaggerated. Pilots complained that the vibration of their helicopters made the KAC hard to read. Because this had never been an issue elsewhere, one COMSEC officer commented tongue-in-cheek that "the air currents found in Vietnam must be significantly different." COMSEC personnel were also quick to point out that the often chosen alternatives to the KAC—unauthorized, home-made codes used to encrypt and decrypt coordinates—did not actually save any time. To address the perceived shortcomings of the KAC, COMSEC authorities next issued a wheel code, the CIRCE, which was considered more user-friendly.

Since the Army had become dependent upon voice communications, secure voice equipment was seen as the ultimate answer to transmission security. In 1964, production of the Nestor series of enciphered voice communications (KY–8 vehicular mounted, KY–28 aircraft, and KY–38 manpack) was begun, but over a year passed before the KY–8/38 reached Vietnam in sufficient numbers, and even then few existed below battalion level. The Nestor equipment was sensitive to humidity and heat, and aircraft carrying KY–28s required frequent refitting. However, most of the problems involved the KY–38 because of its weight and bulkiness. The initial solution was to divide the communications gear, connected by a cable between two soldiers. During combat, the weakness of such an arrangement was obvious.

Touchdown

Prior to the deployment of US Forces to South Vietnam, the enemy had concentrated his intercept activities on Vietnamese Air Force and Government communications. However, in 1965 there was a decided shift in priorities. The VC/NVA communications intelligence effort began an intensive training program to produce the requisite number of English linguists to exploit US communications. Through interrogation reports and captured enemy documents, it was known that the VC/NVA was primarily targeting plain language and brevity coded voice communications. It was also commonly known that the enemy was exploiting low-level codes, both authorized and unauthorized. What was not known was exactly how successful they had been. This would change with the capture of an enemy COMINT unit.

On 20 December 1969, in response to a fix provided by a US Air Force ARDF platform, elements of the 1st Inf Division captured a VC/NVA radio intercept unit 3 km north of Ben Luc, in the III CTZ, near the division's base camp at Lai Khe. A South Vietnamese scout noticed a whip radio antenna affixed to a tree limb with a wire leading down into a "spider hole." Having been discovered, an enemy soldier threw out a hand grenade and was quickly killed. However, his comrades were talked into surrendering. Follow-up interrogations revealed the element to be the Technical Reconnaissance Unit A–3, a radio intercept cell of the Military Intelligence Section, Military Affairs Branch, Sub-Region 1. Individual members included the unit commander, one voice (Vietnamese) intercept operator, two voice (English) intercept operators, five manual Morse intercept operators, two manual Morse analysts, and one female nurse. Their dead companion had served as the team's senior analyst.

TAREX (target exploitation) personnel from the 509th RR Group were assigned the task of processing the captured documents and equipment. The TAREX effort was a small one. It consisted of a group of highly skilled human intelligence specialists who had already served a tour with ASA in Vietnam and who were proficient in the Vietnamese language and familiar with the target environment. Based out of Saigon, TAREX teams regularly performed liaison with Allied tactical units and the joint intelligence exploitation centers in search of information or captured materiel that might assist ASA in its mission.

The two captured AN/PRC–25 receivers were evidence that the enemy intercept cell possessed the capability of intercepting US tactical units. The R–139 Chinese manufactured receiver could also target radios in the AN/GRC series, and even the homemade

"This work is really rather startling; the attention to detail, complete accuracy, and thorough professionalism is amazing. These guys are reading our mail and everyone will be informed that they are."

GEN CREIGHTON W. ABRAMS, COMUSMACV

Wires leading out of a spider hole led to the capture of an NVA communications intelligence team.

receivers were compatible with some US communications gear. The enemy unit also possessed seven Sony radios and one Panasonic receiver with which it could exploit virtually all nonsecure communications emanating from US/ARVN tactical units. Captured documents revealed listings of frequency and call-sign allocations by unit, still others gave extensive instructions on proper intercept techniques, and one even told how to break point-of-origin codes. In the 4–5 weeks prior to its capture, the team had intercepted over 2,000 US unencrypted transmissions and had screened them for possible indicators. Couriers then carried the material to a division-level headquarters located approximately a mile away. Here, further evaluation was made of the traffic, and the results sent by radio or courier to nearby tactical elements.

The capture of an enemy SIGINT unit verified what COMSEC specialists already knew—the enemy was listening.

The 175th RR Company's processing and reporting section concentrated on getting out intelligence products.

"Compartmentalization detracted most from maximum USASA mission accomplishment. . . special clearances which, in turn, contributed to the problem of getting the intelligence to the user—the tactical commander at the lower echelons—was a definite disadvantage toward maximum mission accomplishment."

COL WILLIAM E. BURR, II, G2, XXIV CORPS

Processing Information

ASA believed that if there was a deficiency in its support to the tactical commander, it lay in the area of analysis. The overall value of the product provided the commander was believed to be good, but could use improvement. In 1967, the 509th RR Group leadership proposed that a 265-man processing company be created. Its purpose would be to coordinate, manage, and analyze results countrywide and not be restricted to a specific corps tactical zone. In-depth, interpretive analysis and reporting could be performed without jeopardizing the near-real-time mission of the direct support units. Owing to its close proximity to MACV, the processing company could also help fuse collateral and SIGINT information, something that was not being done by the collection management authorities.

Believing the existing system to be more than adequate, NSA initially resisted the proposal. However, in the aftermath of the 68 Tet Offensive, the J2, MACV, directed that the 509th RR Group organize a 30-man Processing, Analysis, and Reporting (PAR) Branch. One of its first assignments was to study unidentified radio terminals appearing on established networks. In the coming months, personnel TDY from units in theater further augmented the branch, but the branch never realized the vision that ASA had originally planned.

For SIGINT information to be useful to combat commanders, it had to be timely, but "timely" meant different things to different people. Some commanders accepted a reasonable delay between the time information was intercepted and when it was in their hands. Others felt that any delay was unacceptable. In response, ASA

introduced the Tactical Report (TACREP). The TACREP was in addition to Spot Reports, Electrograms, and Summary Reports and was designed to pass sensitive information directly to military commanders on a real-time basis. One survey in 1967 revealed that 81 percent of TACREPs was reaching the supported commanders via its direct support unit within 30 minutes of intercept.

Although established guidelines existed for the dissemination of SIGINT, the implementation of those procedures varied widely from unit to unit. In most instances, the process depended upon the relationship between the DSU commander and the G2, the working style of the Special Security Officer (SSO), and the past exposure of the combat commander to SIGINT. (Established in World War II, the Special Security system was responsible for handling special intelligence and came under the control of the theater commander, in this case COMUSMACV.) For example, one DSU commander reported an excellent relationship between himself, the local SSO, and the G2. Priority information was delivered directly to the G2 or his staff. In contrast, an SSO at another headquarters insisted on reviewing all information, thereby creating a delay in the reporting process. Dissemination was also hindered by the lack of personnel cleared for special intelligence (SI). Over time, combat divisions requested and received approval for indoctrination of three-times the original allotment, but the number of personnel seldom exceeded 25. Even then, commanders at battalion level were never cleared, requiring information to be sanitized, a process that again cost valuable time. The substitution of the term "usually reliable source" for SIGINT was normally a sufficient indicator for a commander to take action, but if he had not experienced past successes, there might be some hesitation. Battalion commanders also sometimes did not respond simply because of human nature. Sanitized SIGINT was simply not as "exciting" as the real thing.

Expanding Support

Lacking many of the capabilities of a company-size direct support unit, the 403d RR SOD required close coordination with a major processing element. The 330th RR Company at Pleiku served as the collection management authority for the II CTZ, the 403d's primary area of operations. Consequently the detachment found it invaluable to place a small team of analysts with the 330th to assist in transcribing and processing intercepted traffic. By this means, the 403d also received much needed technical aids (such as frequencies, call signs, and last known location of enemy units) along with guidance in assigning target priorities. To provide similar support to its ARDF tip off and low-level voice intercept teams being deployed outside of the II CTZ, the 403d RR SOD ended up installing analysts at the other three collection management authorities. (However, the bulk of the 403d RR SOD analysts remained collocated with the 330th RR Company.) In 1969, the 403d RR SOD upgraded its analytical efforts by establishing briefing and correlation teams with the Special Forces command and control elements within each of the CTZs. Their purpose was to meld COMINT into the overall intelligence picture for the Special Forces.

Analysts from the 403d RR SOD continuously monitored all ARDF fixes received by the CMAs for indications of enemy buildup or movement that could possibly endanger Special Forces camps or operations. The results were sanitized and issued in the form of Special Agent Reports (SPAR) as part of general intelligence reporting, but if a specific detachment faced an immediate threat, analysts would pass the information directly to the unit involved. Prior to deployment of Special Forces elements, the 403d briefing teams prepared current intelligence studies and an order of battle on NVA/VC units active in the area of operations. These studies included ARDF locations of all identified and unidentified terminals over the previous 60–90 day period.

Communications were particularly important to the 403d RR SOD. The lack of secure comms impacted the timeliness in which information was inputted, analysis made, and intelligence distributed. The 403d took advantage of circuits belonging to the various CMAs to communicate between the detachment's headquarters and its analytical elements. In the field, elements located at Special Forces bases used one-time pads until 1967 when they received KY–8 crypto systems. Low-level voice intercept and ARDF tip-off teams deployed with Strike Forces were also

Operations hut occupied by a forward deployed team from the 403d RR SOD.

"... ASA personnel of the 403d SOD remained at the base camp and made direct contact with the aircraft [LAFFING EAGLES] and passed fixes immediately to the camp commander. As a result, we absolutely flattened the enemy, drove his forces out of the area, and declared the battle of Bu Prang an ARVN victory. ..."

1LT JARVIS E. WILLIAMS, LIAISON OFFICER, G2 SECTION, HQ, I FFV

outfitted with the bulky KY–38 man-pack version. Altogether, these improvements in secure communications greatly aided passing of information to airborne platforms and providing fixes to the local commanders.

While the 403d RR SOD's soldiers were trained intelligence specialists, they also served as members of the Special Forces and, as such, were often subjected to many of the same dangers. Over a 2-year period, the 403d RR SOD suffered some 22 wounded and 1 killed as a result of providing close support. For instance, 403d RR SOD soldiers were part of a 12-man Special Forces team located at Duc Lap, a remote camp situated 3 miles from the Cambodian border near an infiltration route. In August 1968, the enemy launched 3 days and 2 nights of unrelenting mortar and rocket fire coupled with human-wave attacks against the outpost. ASA soldiers fought alongside other members of the team as they defended the base and helped lead local Montagnards in counterattacks.

The Cambodian Incursion

Perhaps no single operation better illustrated the full extent of ASA's support during the Vietnam War than the incursion of Allied troops into Cambodia in the spring of 1970. Prior to the conception of the campaign, ASA units had assembled a wealth of technical data on VC/NVA entities in the border area. This proved essential to the campaign's success. On 28 April, officers from the 371st RR Company accompanied MG Elvy B. Roberts, Commander, 1st Cav Division, his G2, and the SSO to brief LTG Michael S. Davison and staff at HQ, II FFV. A density plot of ARDF fixes accumulated by ASA elements over the previous 6-month period served to orient the axis of the Allied advance into the "Fish Hook" area and helped to identify sites for possible fire support bases and landing zones.

The 175th RR Company, CMA for the III CTZ, supplied translations, tasked ARDF/collection efforts, identified fixes, monitored the DSUs, and issued reports to higher headquarters. The processing company also deployed three RATRACE teams to assist DSUs in analysis of their intercept, and a TAREX team traveling with combat elements was able to exploit captured documents. Using both U–8 and U–21 aircraft, the 146th Avn Company alone flew 222 direction-finding sorties and 156 collection missions in support of the campaign.

Despite lack of advance notification, LTC James Freeze, Commander, 303d RR Battalion was able to quickly formulate an effective plan to shape ASA's support on the ground.

"As COSVN retreated we could watch . . . the transmitters moved along with the DF fixes. On a daily basis we could tell people that COSVN had moved so many miles up Highway 7. Unfortunately, they managed to stay just outside of US penetration into Cambodia."

CW3 CHARLES R. BYARS, SIT OFFICER, 509th RR GP

Because the enemy possessed low-powered transmitters, a decision was made to emphasize voice intercept. On 4 May 1970, personnel of the 409th RR Detachment became the first DSU to enter Cambodia. Attached to the 11th Armd Cav Regiment, the detachment logged 158 km over a 54-day period. Its low-level voice intercept (LLVI) effort contributed 2,133 minutes of enemy traffic and exploited 108 messages. The 371st RR Company also engaged in LLVI, and its LEFT BANK platform was credited with locating the enemy's logistics center popularly known as "The City." When ARVN soldiers secured the area, they discovered 182 storage bunkers containing supplies and weapons. The 372d RR Company supplied targeting data to the 25th ARVN Division crossing into the "Parrot's Beak" area in search of other enemy logistical bases. Under Operation SKYSPOT, the company also used air-to-ground communications to receive fixes and then quickly passed them on to tactical aircraft.

In the II CTZ, the 374th and 330th RR Companies supported the 4th Inf Division engaged in joint operations against NVA tactical and rear service elements. To the south, the Delta Military Assistance Command launched a combined land and naval operation to secure the Mekong River from the Vietnam border and to evacuate Vietnamese nationals from Cambodia. Besides passing information on the changing enemy situation, the 335th RR Company also briefly ran an LLVI/ARDF tip-off operation off the USS Benewah, command ship for naval operations.

A LEFT BANK platform located "The City," a large cache of enemy supplies and weapons.

Members of the 409th RR Detachment pause aboard an M–113 armored personnel carrier during the 1970 Cambodian Incursion.

TRAI BAC

The 8th RR Field Station, nicknamed "Trai Bac Station" or "Station of the North," possessed some of the finest facilities in Vietnam, consisting largely of permanent structures, a prefabricated operations building, and air conditioned trailers for troop billets and mess. The field station's security posture was equally impressive. An intensive defense perimeter, including 2600 meters of personnel and communication trenches, 30-foot-high steel watch towers, 12-inch cement reinforced star bunkers, concertina and barbed wire fences, and 54,000 M–14 antipersonnel mines all surrounding the compound. Although there was no fear of direct attack, the facility did receive occasional rocket fire. Of greater concern was enemy activity interrupting truck convoys bringing supplies.

Beginning in 1967, the 8th RR Field Station began focusing on the network that carried personnel and cargo on a 1,000–mile journey down the "Ho Chi Minh Trail" to the battlefields of South Vietnam. The North Vietnamese travelled in battalion size groups, as organic table of organization units, or in smaller-sized elements of specialized personnel and were conveyed by train, truck, and barge as well as on foot to their destinations. Cargo, which was stockpiled at various sites, entered the system and was transported via similar means. Observers believed that the system was capable of handling a minimum of 200,000 personnel annually and 2,200 tons of supplies each month.

The arrival of ASA direct support units during the spring of 1968 significantly expanded the field station's mission. The recent Tet Offensive and the deteriorating tactical situation in the Northern provinces led to the shifting of the 1st Cav Division; the 1st and 2d Brigades, 101st Abn Division; and the 3d Brigade, 82d Abn Division into the I CTZ. The 371st RR Company, the 265th RR Company, and the 405th RR Detachment accompanied the divisions. By fall, the 371st RR Company, 405th RR Detachment, and their parent organizations had redeployed to the III CTZ and were replaced by the 407th RR Detachment in support of the 1st Brigade, 5th Inf Division.

The 8th RR Field Station maintained an operational site on Hill 180.

". . . I would say at least three times a week, General Abrams would come over to the field station at Phu Bai. . . . He and a field station Chief Warrant Officer by the name of Holder would literally talk the entire situation through. General Abrams would at times turn around to the J3 and say, 'Let's lift a force over in such and such an area, and have the 1st Air Cav throw a blocking action. . . .' "

COL WILLIAM T. RILEY, JR., CDR, 509th RR GP

South Vietnamese civilians assisted in bolstering the defenses of Phu Bai which was a well guarded installation but suffered rocket attacks from time to time.

In its new tactical support role, the 8th RR Field Station found itself having to provide technical and analytical assistance to the assigned direct support units. However, the field station lacked the staff necessary to serve as a "provisional battalion" and was without the type of logistical system needed to support the needs of the DSUs. One of the early problems was the discovery that some DSU personnel could not function in their new area of operations because of the different target environment. As they received on-the-job training at the field station, the 8th was forced to substitute its own personnel in the field.

Throughout its history, the 8th RR Field Station made a significant contribution at theater level. For example, its intercept of enemy weather reports supported the Seventh Fleet's strike and reconnaissance missions. The field station's around-the-clock reporting provided the carrier task group commanders with timely information on which to base their aircraft go/no-go launch decisions. To keep pace with its ever-expanding missions, Phu Bai undertook a series of major construction projects. In the end, the 8th RR Field Station would not only become ASA's largest unit in Vietnam, but its largest operational element worldwide.

Sharing the Mission

In 1968, a significant amount of VC/NVA voice intercept was being collected. To meet the increased workload, ASA made greater use of South Vietnamese transcribers, DANCERS, who were almost 3 times more efficient than US linguists. By 1970, 76 DANCERS were scattered among US cryptologic units, almost half of them assigned to the 8th RR Field Station. In August, DANCERS even began to fly collection missions with the 138th Avn Company. DANCERS-in-the-sky (DITS), as they were called, could copy live 90 percent of all voice traffic intercepted, thus eliminating the need for transcription and allowing for timelier reporting. DANCERS were also used at remote collection sites and as members of the RATRACE teams deployed by the various CMAs to provide direct support units with analytical and transcription assistance.

In 1970, the 509th RR Group undertook a study of the South Vietnamese SIGINT effort (Unit 15) to determine what further assistance could be provided. High on the agenda was evaluating the ARVN's medium range direction-finding net. The study disclosed serious deficiencies, including the fact that some Unit 15 operators were readjusting bearings to fit preconceptions. This further confirmed ASA's long held belief that the South Vietnamese should get out of the MRDF business altogether and focus mainly on voice intercept. But in the end, the 509th RR Group was forced to continue to assist the South Vietnamese's direction-finding program, eventually turning over state-of-the-art AN/TRD–23 direction finders.

Unit 15 had repeatedly tried to get its ARDF effort off the ground. Utilizing U–6 aircraft, the South Vietnamese began flying missions in the III and IV Corps areas. Although given only targets that they demonstrated the ability to copy,

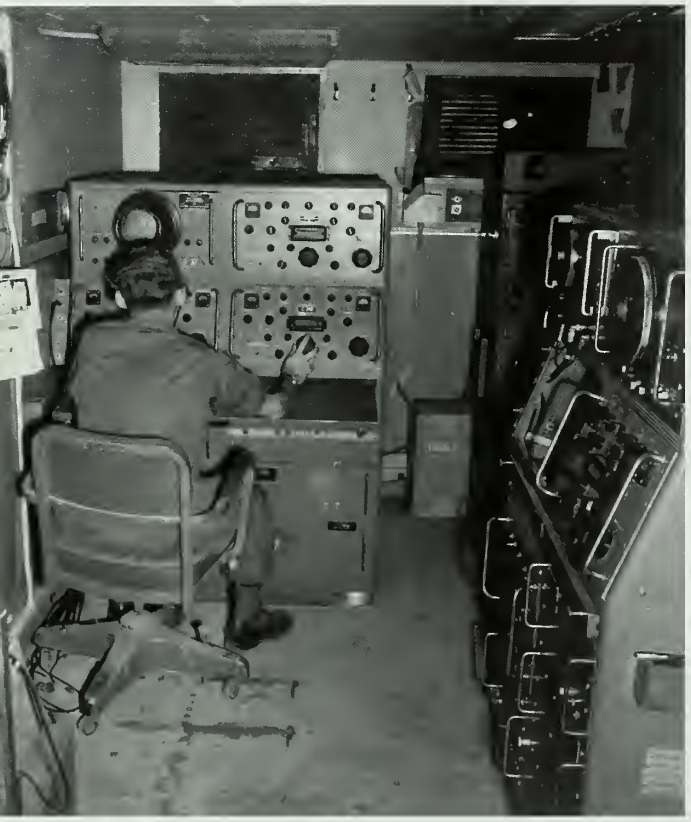
"I hope people understand, it is going to take time to establish an ARVN SIGINT Data Base. It takes months, even years, to build an intelligence base. Just because someone puts up an antenna doesn't mean he's going to start producing intelligence."

MAJ DAVID A. BELL, ADVISOR, 21st DIVISION

A South Vietnamese linguist stands atop a remote intercept site at An Duong Wong. From here, the 265th RR Company conducted voice and manual Morse intercept.

the South Vietnamese ARDF program still continued to founder. A 1970 study by the 509th RR Group placed much of the blame for poor results on ineffective equipment. ARVN pilots and operators were judged to be competent and highly motivated, but the R–390 receivers, magnetic compasses, and direction gyros were showing signs of age. Even the maps were too small and outdated. Subsequently, 509th RR Group furnished the South Vietnamese with additional training in ARDF procedures and put into place a new reporting system. Six months later, the US Air Force began transferring aircraft to the South Vietnamese who, in the meantime, had created a separate organization, Unit 17, for the specific purpose of carrying out its revitalized ARDF mission.

The South Vietnamese COMSEC effort (Unit 16) was characterized by its lack of trained personnel, inability to perform telephone monitoring because of political considerations, tardiness in receiving authorized equipment, and absence of qualified US advisors, but over time, Unit 16 began to demonstrate signs of progress. By 1971, it possessed for the first time the COMSEC resources needed to monitor, on a sampling basis, all networks within the Vietnamese Armed Forces and to conduct semi-annual crypto inspections of all military and non-military agencies. But in the end, it was a simple matter of being too little and too late.



An operator mans the AN/TRD–23 Direction-finder inside a shelter.

"... General McCown when we got onto the ship (USS Benewah) took me down into the operations center and introduced me to all the colonels, couple of generals and the remaining staff. . . . He said, 'Gentlemen I want your attention, this is Sergeant Wood and he will be coming down every once in a while with some information for you and whatever he tells you is fact.' "

VIETNAMIZATION 1971 1973

"In theory, the centralized field station concept would allow mission accomplishment with reduced resources. In our case, however, the benefits of the concept were not realized because our assets were spread over 53 percent of the land mass of Vietnam."

LTC DAVID A. WISYANSKI, CDR, 330th RR FS

Following a meeting with South Vietnamese President Thieu on 8 June 1969, President Richard M. Nixon announced the initial withdrawal of 24,000 American troops from South Vietnam. The redeployment signaled the beginning of a process to extract the United States from the war and to turn the fighting back to the South Vietnamese. The reduction in US tactical operations and the withdrawal of combat elements would lead to corresponding changes in the size and scope of the SIGINT mission in Vietnam. Representatives from the cryptologic community met in Saigon in early December 1970 to map out exactly how and where the cuts would be made. A plan emerged to consolidate at a handful of locations, thus allowing the 509th RR Group to take its manpower reductions among support rather than operational personnel. This could be accomplished by replacing the direct support battalions with field stations, inactivating the 144th Avn Company, and reorganizing the 101st RR Company. Plans called for selected manual Morse positions to be remoted, and systems whose value was deemed marginal eliminated altogether.

Over the next 9 months, ten DSUs were either redeployed or inactivated, among them the Headquarters and Headquarters Companies of the 303d and 313th RR Battalions and the 403d RR SOD. In September 1971, two new field stations were organized from the existing Collection Management Authorities. The 175th RR Company was redesignated the 175th RR Field Station at Bien Hoa. The 330th RR Company was inactivated and the 330th RR Field Station organized in its place at Nha Trang. Like the 8th at Phu Bai, the two new field stations would exercise control of targeting and the residual direct support units in their area of operations. At the same time, ASA inactivated the 335th RR Company as the local collection management authority for the IV CTZ. In its place, a new smaller-sized company was organized and given an advisory mission in support of the local South Vietnamese COMINT Center. Other changes involved the drawdown of the 144th Avn Company and redistribution of its aircraft and mission to the 3d Platoon, 146th Avn Company. The 101st RR Company's strength was reduced by 50 percent to 113 spaces, its supervisory role transferred to the 509th RR Group, and its COMSEC specialists were formed into support platoons that were assigned to the various field stations.

During the initial reduction phase, marginal systems were first on the cutting block. Radio fingerprinting had fallen into disuse, making it an easy candidate for removal. The WHITEBIRCH direction-finding net was also discontinued, and its targets assumed by other nets and ARDF. At best, WHITEBIRCH had served to maintain continuity on targets of a relatively low priority. However, other missions were not as easily eliminated; chief among them was manual Morse, the backbone of ASA's intercept effort in Vietnam. June 1970 found the 509th RR Group devoting 199 of its 271 positions to manual Morse. A year later, the number of manual Morse positions was cut almost in half, and the impact was immediately felt by consumers at all echelons.

Members of the 1st ASTD, the ARVN equivalent of an ASA direct support unit.

Vietnamese students learning to transcribe manual Morse code using both pencil and typewriter.

DARRS and CARRS

As they assumed more responsibility for conducting the war, the South Vietnamese began to reorganize their COMINT effort to more closely mirror the US system, but on a much smaller scale. For example, the South Vietnamese created ARVN Special Technical Detachments (ASTDs), each consisting of 4 officers and 56 enlisted personnel. They provided direct support to combat divisions and passed information up the South Vietnamese cryptologic chain of command. On 1 July 1969, the first two of the ASTDs became a reality: one in support of the 1st ARVN Division at Hué, and the other assigned to the 2d ARVN Division at Quang Ngai. Under the terms of the Vietnamese Improvement and Modernization (VIM) program, the 509th RR Group assisted all 10 of the ASTDs by providing mission equipment and logistical support and by instructing the South Vietnamese on how to perform their own maintenance. ASA also made an NCO available to each of the ASTDs for advice and assistance. All the while, ASA representatives continued to take every opportunity to press the ASTDs to focus upon voice intercept and even offered on-the-job training by temporarily assigning Vietnamese to the 509th RR Group's own low-level voice intercept teams.

"For a long time we had a shortage of hard intelligence such as *Chieu Hois* and POWs. This was back in July through October of last year before the 9th DARRS existed. . . . The 9th DARRS has given us the ability to make estimates and allow the commander to make decisions."

MAJ NOEL J. DOYLE, JR., G2 ADVISOR, TEAM 60

Under Project SCREWDRIVER, ASA soldiers regularly visited South Vietnamese elements to pass on maintenance tips and to ensure that they were receiving a reliable source of expendable supplies, especially for their ARDF program. These types of advice and assistance visits proved an excellent means to monitor overall operational progress. ASA collection management authorities also created a sponsorship effort at each of the ARVN fixed stations. Nicknamed Project LEVER, the program revolved around periodic visits and recommendations concerning procedures and techniques.

Although responsibility for the fighting shifted to the South Vietnamese, requirements by US authorities for COMINT support remained as critical as ever. Under Project AXE, the concept of Division Advisors Radio Research Support (DARRS) Detachments was first tested in the field in January 1970 when a DARRS team successfully deployed in support of the Senior Advisor, 1st ARVN Division and the 1st ASTD. This led MACV to approve DARRS detachments for all the ASTDs. The primary function of the DARRS was to pass COMINT to senior US personnel advising the ARVN divisions and to provide a sanitized version for the ARVN commanders. In addition, DARRS personnel served as advisors to the ARVN Special Technical Detachments. The impact of the DARRS was immediately evident and was given credit for making the ASTDs operationally functional.

In July 1971, the 509th RR Group assisted in establishing the Center Advisory Radio Research Support (CARRS) detachments at each of the four South Vietnamese field stations/centers: Can Tho, Pleiku, Saigon, and Da Nang. The CARRS's primary mission was to improve the SIGINT centers' management of operations, communications, and maintenance support.

Housed in a U–21, the LEFT JAB platform was targeted against transmitters near the DMZ. An antenna was contained in the radome mounted under the plane's belly and extended upon takeoff.

"Special intelligence has been a key factor in tactical success—we'd be quite blind without it. Although one cannot rely on special intelligence alone, it provides the essential skeleton against which other source material can be associated to form a quite accurate framework of enemy disposition and in some cases, enemy intentions...."

MG GEORGE I. FORSYTHE, CG, 1st CAV DIV

New Platforms

Throughout the war, COMINT/ARDF was the most important source of timely, accurate intelligence and served as the commanders' principal eye in finding an elusive enemy. By May 1968, the 224th Avn Battalion was contributing nearly 4,000 fixes a month to the ground war. Consumers often utilized ARDF as a warning mechanism of pending enemy activity. This was particularly important in protecting fire support bases and isolated outposts. Normal countermeasures included air strikes, artillery fire, and even the launching of offensive operations. On one occasion, ARDF fixed an enemy terminal several kilometers in front of an advancing

convoy. The rapid relay of the warning allowed the commander to halt the convoy in time and insert armored personnel carriers and tanks. The ambush was thwarted and heavy casualties were inflicted on the enemy.

ARDF often influenced the intelligence-gathering process. A member of the G2 staff, Delta Regional Assistance Command, made the following observation: "Often an ARDF fix will cause us to look for the collateral; a ground sweep will be made and a prisoner captured and interrogated...." On the flip side, ARDF proved most effective when merged with other forms of information such as airborne personnel detectors, infrared, side-looking airborne radar, long-range reconnaissance patrols, aerial photography, enemy documents, prisoner-of-war interrogation, and area studies.

In February 1968, MACV established a requirement for an airborne VHF intercept and direction-finding platform to cover the DMZ area. The initial attempt to field a system in a U–1A (SORE THUMB) was a failure, and a second try in an OV–1C (HOMING PIGEON) ended with mixed results. But after a lengthy delay, three LEFT JAB platforms were finally fielded in December 1970 and assigned to the 138th Avn Company at Phu Bai. At the heart of the system was a spinning spaced loop antenna mounted in a radome under the belly of a U–21 aircraft. Originally designed for ground-based systems, the antenna could be extended after takeoff.

The installation of the AN/ARD–23 V-Scan on the LAFFING EAGLE platforms in October 1970 represented a major milestone in Army ARDF. The V-Scan system was the most advanced HF ARDF platform in the ASA's inventory and placed the Army technologically on more equal footing with the Air Force. Advantages over previous systems included increased speed in recording fixes, ability to cover larger areas, and a more accurate navigational system. It was not long before the LAFFING EAGLE was being used exclusively in its ARDF role as other platforms began to stand down.

On 4 March 1971, the 224th Avn Battalion received word that a LEFT JAB aircraft was missing in action. The fate of the craft and its 5-member crew was later confirmed by a report of the North Vietnamese News Agency, which claimed that a surface-to-air missile had downed a US plane just inside North Vietnam. But the shoot-down did not deter future flights near the DMZ. In fact, during the enemy's 1972 Spring Offensive, airborne COMINT collection efforts in the area took on even greater significance. Although credited with only a small portion of the total manual Morse intercepts, LEFT JAB still made a significant contribution during the campaign's critical phase.

Wideband operators at the 175th RR Field Station helped to make up for the loss of manual Morse resources.

"On Hill 950 with Project EXPLORER the Chief of the Studies and Observations Group . . . was adamant about putting anything up there that would draw attention to the hill. He remarked that the 5 Americans and 38 . . . mercenaries on the hill were there at the grace of the VC. . . . He did not object to a new antenna, but a shelter would have drawn too much attention."

CWO–4 WILLIAM R. MACDONALD, 175th RR CO

Computer systems, such as this at the 8th RR Field Station, were increasingly in use during Vietnam.

New Technologies

Over 50 percent of ARDF fixes remained unidentified. In response to this problem, the USASA Materiel Support Command at Vint Hill Farms Station, Virginia, fabricated the first Wideband position, known as MUSTARD, and shipped it to the 330th RR Company, where it became operational in April 1967. Wideband collection recorded segments of the radio frequency spectrum for selective playback. Although the system demonstrated promise, tapes of the recovered intercept had to be sent back to Vint Hill Farms Station, Virginia, for processing. The 2-week turn around time kept Wideband from having any real impact upon the immediate tactical situation. However, by September 1968, the two Wideband positions were beginning to make some headway, accounting for between 10–20 percent of the fixes being identified each month. This led to the introduction of additional systems with increased collection capability at each of the Collection Management Authorities. When the 509th RR Group finally departed Vietnam, Wideband positions would be among the last positions manned.

During Vietnam, computers began to make their debut on the battlefield. One of the earliest systems was designed to improve target acquisition. Field tested at the 8th RR Field Station in May 1969, the new system did not replace the manual Morse operator, but it did provide him with a new tool to automate

certain functions that had previously been done by hand, such as, tuning to selected frequencies.

Until 1970, airborne platforms provided the only significant intercept of enemy VHF communications along the Laotian border. To augment airborne collection, a hearability test was conducted on Hill 950 located in western Quan Tri Province, 110 km northwest of the 8th RR Field Station. Manned by a contingent of Special Forces and Montagnard Tribesmen, the mountain overlooked the rugged wilderness that served as a haven for elements of the North Vietnamese Army. The quality of intercept obtained by these tests proved at least equal if not superior to any being copied from airborne platforms.

In June 1970, the first remote system (EXPLORER), controlled by operators at the 8th RR Field Station, was put into operation. Despite its successful beginnings at producing real-time intelligence, EXPLORER faced a number of logistical problems. The most significant was providing adequate supplies of gasoline to power the system. To draw as little attention as possible, ASA soldiers buried all of the equipment minus the antennas, and to cut down on noise, used generators specifically designed for "whisper" quietness. Then there were the normal environmental factors of heat, dust, humidity and their affect upon the equipment. To top it off, the rainy season frequently interrupted refueling and maintenance runs.

By March 1971, four more remote positions had been added on Hill 950. (A month later, EXPLORER II was established at Golf 5 (Hill 1005) and the intercept relayed to the 330th RR Company at Pleiku for processing and reporting.) Unfortunately, EXPLORER operations at Hill 950 ended abruptly on 4 June 1971 when the outpost came under intense enemy mortar and rocket fire, lasting most of the day. At 2100 hours orders were given to destroy the equipment with thermite grenades and to evacuate the site.

Success at a High Price

It wasn't until the latter stages of the war that the landline effort could point to an example of real success. In February 1970, a Ranger team from the 1st Brigade, 5th Inf Division, was inserted by chopper to exploit an enemy landline located in the vicinity of the DMZ. Making the remainder of the way on foot, they found a lead-in wire running parallel to a small, well-used trail that ran through dense undergrowth. Here, they buried the kit's lead wires along with the control box and batteries and then fastened a whip antenna on the backside of a tree away from the path. Total time to install the XR4–100D was 38 minutes. A second trip was made to replace the antenna because of an interference problem. During the 2 weeks the Con Thien operation was active, 15 translations were made and nine tactical reports forwarded, successfully alerting friendly forces against pending attacks. The intercept also revealed the enemy's reaction to Allied artillery fire. In total, almost 255 hours of North Vietnamese plain text voice were intercepted until the output ended abruptly. A third Ranger team was sent to investigate, but came under small arms fire. This led to the decision to destroy the intercept equipment by targeting the site with rounds of artillery and by dropping some twenty-four bombs as the final *coup de grace.*

The success at Con Thien served as a catalyst for further attempts. During the Cambodian Incursion in 1970, one landline intercept successfully warned US forces of a pending attack by a battalion-size force and a 75mm recoilless rifle company. In another instance, the 138th Avn Company (RR) participated in an airborne test for intercepting relayed signals. However, for the most part, landline operations continued to court disaster. On 23 April 1971, Company L, 75th Infantry (Ranger) attempted to tap into communications lines believed to be serving the Ho Chi Minh Trail, but were met with stiff resistance by the enemy. Two choppers were shot down, killing 11 soldiers and wounding 22 others. Later it was discovered that the operation had been doomed from the start because the recording unit's batteries had been accidentally reversed.

"Analysis of the tape indicated that the intercept was . . . entirely concerned with roads and routes which are probably part of the Ho Chi Minh trail. . . . This cut was too brief to be of significant intelligence value."

MAJ ALBERT B. YOUNG, COLLECTION OIC, 509th RR GP

One of the major problems faced by wiretap teams was that the VC/NVA units would daily send runners along the lines to check them. Two ASA engineers working at Vint Hill Farms Station came up with the LEFT TWIST system where a transmitter in the form of a pole was dropped from a helicopter. Actual results in the field in 1971 proved mixed, and future trials were cut short when the course of the war began to change. The drawdown of US combat forces led to fewer deployment opportunities for landline intercept and eventually brought an end to the mission altogether. Time had finally run out on ASA's landline mission. However, lingering questions remained as to why lessons learned as far back as 1966 were continually ignored. The technological advances in the CIRCUS ACT program were achieved at a high cost given the numbers of casualties suffered by the installation teams and the limited amount of usable intelligence extracted.

The departure of US troops ended all opportunities to exploit enemy landlines. (National Archives)

Free Fall

What began as a steep glide in the level of ASA's commitment to Southeast Asia had turned into a virtual free fall by late 1971. The 509th RR Group was ordered to cut its remaining 4,000 spaces in half. Missions were eliminated, the last of the DSUs was inactivated, two of the field stations were discontinued, and the 224th Avn Battalion was in the process of being reduced to a company. Plans called for only the 509th RR Group headquarters, the 8th RR Field Station, the 175th RR Field Station, and the 146th Avn Company to remain.

In November, the 335th RR Company began to systematically shift its manual Morse effort to the South Vietnamese collection site at Can Tho. The company would be the first among ASA's units to undergo such a transfer. The 335th RR Company personnel were responsible for training the ARVN specialists in analysis, reporting, and maintenance procedures. Eventually, the 175th RR Field Station took over as the CMA for the Delta Region when the 335th finally ceased operations in 1972.

The departure of US forces also changed the manner in which ASA did business. The need for COMSEC support was greatly reduced, leading to the phase out of the 101st RR Company and its discontinuance altogether on 1 April 1972. The drawdown also meant TAREX personnel could no longer depend upon US combat units for captured equipment and documents. In the future, all TAREX collection teams would be based out of Saigon, and liaison with the South Vietnamese stepped up. As US

Manual Morse positions, such as these at the 175th RR Field Station, were the heart and soul of ASA's effort in Vietnam. Their decline signaled that ASA's role in the war was coming to an end.

"Plans for our evacuation were jovially passed around, trying to convince each other that it would never actually come to that. Then, at the stroke of 5:00 p.m., the sky caved in, and within the next 30 minutes more than 500 shells of assorted sizes impacted and detonated. . . . At 5:30 p.m., when the heavy barrage was lifted, we resumed destroying all that was not an absolute necessity."

MSG G. DUANE WHITMAN, 407th RR DET

The loss of direct support units such as elements of the 407th RR Detachment at Con Thien near the DMZ significantly impacted ASA's ability to satisfy all of its consumers.

units departed, the Army's logistical system also began to shut down, creating a shortage of signal parts in the supply pipeline and significantly impacting upon ASA's operations.

During January 1972, the 1st RR Company flew two of its five Neptune aircraft to Japan for turn-in. Despite having only half of its aircraft available, the company maintained production at 90 percent of previous levels until the company was inactivated on 30 April. (The 1st RR Company also sent one of its remaining aircraft to Fort Rucker, Alabama, for permanent display at the Army Aviation Museum.) Meanwhile, flight crews of the 156th Avn Company were also touching down for the last time in preparation for turn-in of the U–6's and transferring the unit's colors to Fort Bliss, Texas. During the 156th Company's 6 years of existence, its aviators flew over 16,000 support missions and logged some 7 million miles.

Nowhere did the drawdown have a greater impact than in the area of manual Morse collection. By 30 June 1972, ASA had 60 intercept positions remaining, compared with 199 two years earlier. On top of this, the 509th RR Group was facing a critical shortage in intercept operators. Realigning working schedules and shifting mission taskings offered some temporary relief; the lack of personnel also justified the retention of the five remaining Wideband collection systems.

Changing Course

Conventional intelligence sources, along with COMINT support from ASA direct support elements, had slowly dried up with the departure of US combat divisions. In January 1972, SIGINT began to reflect large-scale movement of equipment and supplies southward into the DMZ, Tri-border, and Panhandle areas, indicating preparations for a major offensive that threatened the phased withdrawal of US forces. Twelve North Vietnamese combat divisions representing approximately 100,000 personnel were located within or adjacent to South Vietnam. In the light of these developments, MACV indicated that it could not tolerate further loss of SIGINT coverage in Military Region (MR) II and the southern portion of MR I. To compensate for the pending closure of the 330th RR Field Station, a last-minute replacement detachment was stood up at Da Nang and placed under the control of the 8th RR Field Station. Meanwhile, responsibility for targets in the southern MR II was transferred to the 175th RR Field Station. Once these improvised arrangements were in place, the 330th RR Field Station proceeded to stand down on 1 September 1972.

Planning called for paring the 224th Avn Battalion's organization down to one company, the 146th Avn Company, and reducing the number of aircraft from 36 to 10 U–21s. On 10 June, COMUSMACV intervened and reversed the order, citing the following rationale: "MACV ARDF resources…represent our most effective means of finding and fixing the enemy…." The drawdown was not only put on hold, but the allotment of manpower spaces was actually doubled to 540. To complicate matters, when the 224th Avn Battalion received notification that the current level of ARDF support must be maintained, it was entering the final phase of inactivation. Only 5 percent of the Headquarters and Headquarters Company's personnel remained. The 138th Avn Company had flown 11 of its U–8s to Vung Tau for shipment back to the States, and the remaining aircraft were at Long Thanh North Army Airfield to wait processing.

"We're in a dynamic situation. Decisions on units being drawn down, forces being economized, and selection of the key installations to stay open are being made. To do this safely you must have knowledge of the enemy, his plans and intentions. Special intelligence provides this. It's invaluable."

MG CHARLES M. GETTYS, CHIEF OF STAFF, USARV

The ASA leadership: (left) BG Herbert E. Wolff, CG USASAPAC, and (center) MG Charles Denholm, CG USASA, arrive at Phu Bai International Airport to discuss drawdown plans with ASA commanders in country.

For the next 3 to 4 weeks, the 224th Avn Battalion scrambled to retrieve planes and equipment. The stock of replacement parts had dropped so low that the battalion was forced to cannibalize nine of the returned aircraft. For the sake of efficiency, a decision was made to place all 27 U–8s with the 146th Avn Company at Long Thanh North and to assign all U–21s to the 138th Avn Company at Phu Bai. This would allow each type of aircraft to be in close proximity to support facilities handling its particular type of navigational equipment. Despite having released a third of its aviators, the 224th Avn Battalion was able to draw upon TDY crews to take up the slack. Within 10 days, the 224th Avn Battalion had the first U–8 back in the air, and by another week and a half, the number of missions had risen to 133 a week.

A member of the 8th RR Field Station's security force surveys the horizon.

Shifting Sites

Throughout the spring and summer of 1972, ASA units in Vietnam faced a growing security problem. Increased enemy activity coupled with the departure of nearby US combat elements left ASA sites vulnerable to attack. During the last 9 months in country, each one of the 509th RR Group's remaining units would be forced to relocate at least once. On 13 August, the COMUSMACV ordered the removal of US forces at Long Thanh North. Thanks to outstanding lift support from the US Air Force, the 224th Avn Battalion completed its transition to Saigon in less than 6 days. Simultaneously, the 146th Avn Company was moved from Long Thanh North to Can Tho while still completing 50 percent of its missions.

The 175th RR Field Station and the 8th RR Field Station remained as collection management authorities, and each were subdivided into collection management and reporting sections. Targeting continued to be responsive to field commanders' Essential Elements of Information and Special Intelligence Collection Requirements. On 30 September, the 175th RR Field Station relocated from Bien Hoa to Davis Station in Saigon and began conducting operations out of the former WHITEBIRCH facility within the Joint General Staff Compound. The building had become available when the 509th RR Group, no longer requiring the large work area, moved to the communications center adjacent to Davis Station.

"During the current NVA offensive, ARDF has been the single most important intelligence collection program providing early warning of impending enemy action. . . . I consider ARDF coverage especially of the northern Military Regions to be critical as long as US interests are involved in the Republic of Vietnam."

GEN FREDERICK C. WEYAND, COMUSMACV

The 8th RR Field Station and the 138th Avn Company were the last of the ASA units to change locations. Beginning in March, the physical security posture at Phu Bai became a subject of growing concern, leading to manning the perimeter and placing reaction teams on 24-hour alert. All personnel were assigned defense responsibilities that required a vast amount of time, equipment, and funds devoted solely to defense. Faced with an increased number of rocket attacks that left several dead and others wounded, the field station moved quickly to divest itself of its remaining missions. The end came in November when the residual elements of the field station and the 138th Avn Company were evacuated to Da Nang.

By the close of 1972, ASA personnel in Vietnam were manning only a handful of positions. The shifting of ground-intercept responsibilities to the South Vietnamese had progressed slowly but steadily. All the while concerns continued to be voiced as to whether or not the South Vietnamese had either the manpower or skills required to do the job. As a final stop-gap measure, ASA personnel worked alongside South Vietnamese SIGINT specialists in Saigon and Da Nang. By so doing, they helped to ensure that a steady supply of intelligence reached US authorities.

Cease Fire

In October 1972, USARV issued an operations plan that directed all remaining US forces to depart Vietnam within 60 days of a cease-fire. By early January, ASA had turned over all ground-based intercept to the ARVN with the exception of its Wideband positions located at the South Vietnamese COMINT site in Saigon. The departure of the 7th Air Force from Tan Son Nhut forced the 509th RR Group to move its personnel to the annex adjacent to MACV Headquarters for billeting and messing purposes.

Between 0620 and 0800 hours on 28 January 1973, the 509th RR Group's staff assembled atop the Newport Hotel to welcome in the cease fire by watching the enemy's rocket attack on Tan Son Nhut Air Base. The next day a contingent of VC/NVA soldiers arrived to occupy the former Davis Station compound as members of the four-power joint military commission. No sooner had the delegation settled in and guards been posted at the installation's gates than antennas began to appear. To the ASA personnel observing the proceedings, the prospects of the new occupants conducting communications intelligence at 509th RR Group's former headquarters seemed an ironic but fitting conclusion to the war in the ether.

During the cease-fire, the 509th RR Group analysts continued to serve as advisors at the South Vietnamese SIGINT centers, but VC/NVA units tended to remain in place and began to make greater use of landlines. All the while, ASA crews flew collection missions that, despite the truce, continued to be subjected to antiaircraft fire. On 16 February 1973, a crew of the 138th Avn Company completed the Army's final ARDF mission in the vicinity of Pleiku. The end came less than a month later on 7 March 1973, when the 509th RR Group was discontinued and the handful of its remaining soldiers boarded the last plane for home, bringing ASA's 12-year tour of service to a close.

When ASA left Vietnam, it took with it a number of lessons learned. (Although in reality, many of these issues were for higher echelons to solve.) The need for greater fusion of communications and collateral intelligence was recognized as well as better coordination of the entire US intelligence effort. ASA had felt frustrated by the limited numbers of consumers cleared for SIGINT and of the restraints imposed by the SSO system, a system it did not control. There was also acknowledgement that in mobile warfare, intelligence could never be too timely. Some within the ASA leadership believed that the agency had not taken personnel assignments seriously enough and had often placed junior or inexperience officers in key operational or leadership positions, particularly at the DSU level. On the other hand, despite the hostile intelligence environment, ASA had succeeded in providing the commander on the ground with a level of support previously unknown in the annals of Army cryptology. (Vietnam was the reverse of World War II where SIGINT had achieved great success at theater level but proved to be of only marginal value in the direct support mode.) ASA had been first into Vietnam and among the last to leave. Its systems had operated in the air and in close support of ground forces from the Delta to the DMZ and all points in between. ASA left Vietnam with the satisfaction of having been the primary source of timely, usable intelligence during the course of the war. A staff officer assigned to J2, MACV, perhaps summed it up best, "The COMINT effort gained great 'kudos' from tactical commanders and G2s. . . . There was never anything like it before and possibly there may never be again!"

The 509th RR Group receives the Republic of Vietnam's Cross of Gallantry with Palm. While in Vietnam, ASA units were awarded more than 120 US decorations and 60 foreign citations.

101st US ARMY SECURITY AGENCY SECURITY DETACHMENT

Organized: 1 March 1963
Cover Designation: 7th Radio Research Unit
Assigned Command: 82d US Army Security Agency Special Operations Unit
Supported Command: MACV and USARV
Location: Saigon
Reassigned Command: 509th US Army Security Agency on 1 June 1966
Cover Redesignation: 101st Radio Research Company on 10 September 1966
Redesignation: USASA Security Company, Saigon on 15 December 1967
Relocation: Long Binh on 30 March 1970
Relocation: Saigon on 16 March 1971
Discontinued: 1 April 1972
Vietnam Campaigns: 1–17
Vietnam Decorations: 4 MUCs and 1 RVN CGP

175th US ARMY SECURITY AGENCY COMPANY

Organized: 1 June 1966
Cover Designation: 175th Radio Research Company
Assigned Command: 303d Army Security Agency Battalion
Supported Command: MACV and FFV–II
Location: Saigon
Relocation: Bien Hoa on 3 July 1967
Redesignation: US Army Security Agency Operations Company, Bien Hoa on 15 December 1967*
Supported Command: MACV and TRAC as of 30 April 1971
Redesignation: US Army Security Agency Field Station, Bien Hoa on 30 September 1971**
Cover Redesignation: 175th Radio Research Field Station
Reassigned Command: US Army Security Agency Group, Saigon on 30 September 1971
Relocation: Saigon on 29 September 1972
Discontinued: 26 February 1973
Vietnam Campaigns: 3–17
Vietnam Decorations: 5 MUCs, 1 RVN CGP, and 1 RVN CA

*The original redesignation order read US Army Security Operations Company, Saigon
**The Radio Research Field Station, Bien Hoa (Provisional) was in existence from 1 May 1971 to 30 September 1971.

400th US ARMY SECURITY AGENCY UNIT (PROVISIONAL)

Organized: 23 May 1961
Cover Designation: 3d Radio Research Unit
Assigned Command: US Army Security Agency Pacific
Supported Command: MAAG–V
Location: Saigon
Discontinued: 20 September 1961*

*Mission and personnel transferred to the 82d USASA Special Operations Unit.

509th US ARMY SECURITY AGENCY GROUP

Organized: 1 June 1966
Cover Designation: 509th Radio Research Group
Supported Command: MACV and USARV
Assigned Command: USASA Pacific
Location: Saigon
Redesignation: US Army Security Group, Vietnam on 15 December 1967
Discontinued: 7 March 1973
Vietnam Campaigns: 3–17
Vietnam Decorations: 3 MUCs and 2 RVN CGP

US ARMY SECURITY AGENCY FIELD STATION, PLEIKU*

Organized: 30 September 1971**
Cover Designation: 330th Radio Research Field Station
Assigned Command: US Army Security Agency Group, Vietnam
Supported Command: MACV and SRAC
Location: Nha Trang
Discontinued: 1 September 1972
Vietnam Campaigns: 15–17
Vietnam Decorations: None

*The planned relocation to Pleiku never took place.

**USASA Field Station, Pkeiku (Provisional) in existence from 1 May to 30 September 1971.

US ARMY SECURITY AGENCY COMPANY, CAN THO

Organized: 5 April 1971*
Cover Designation: 335th Radio Research Company
Assigned Command: US Army Security Agency Group, Vietnam
Supported Command: Delta Regional Assistance Command
Location: Can Tho
Discontinued: 30 June 1972
Vietnam Campaigns: 14–17
Vietnam Decorations: None

* Residual mission of the inactivated 335th ASA Company.

US ARMY SECURITY AGENCY COMMUNICATIONS UNIT, VIETNAM

Organized: 1 June 1966
Cover Designation: 18th Radio Research Unit
Assigned Command: 509th US Army Security Agency Group
Supported Command: 509th US Army Security Agency Group
Location: Saigon
Cover Redesignation: Radio Research Communications Unit, Vietnam on 2 September 1966
Discontinued: 31 January 1973
Vietnam Campaigns: 3–17
Vietnam Decorations: 3 MUCs and 1 RVN CGP

Appendix C

Key ASA Personnel

US Army Security Agency

MG William M. Breckinridge	1 Apr 60–31 May 62
BG Orman G. Charles	1 Jun 62–30 Jun 62
MG William H. Craig	1 Jul 62–7 Sep 65
BG Dayton W. Eddy	8 Sep 65–14 Sep 65
MG Charles Denholm	15 Sep 65–4 Feb 73

US Army Security Agency, Pacific

COL Robert T. Walker	15 May 60–16 Jun 61
COL George A. Godding	16 Jun 61–23 May 64
COL Robert P. Brust	30 Jul 64–21 Jan 67
COL Edgar F. Hoffman	21 Jan 67–19 Oct 67
BG George A. Godding	20 Oct 67–24 Jun 69
COL Arthur W. Hackwood	25 Jun 69–25 Aug 70
BG Herbert E. Wolff	26 Aug 70–16 Nov 72

3d Radio Research Unit

LTC Robert W. Williams	23 May 61–10 Aug 61
LTC William J. Cochrane	11 Aug 61–8 Jul 63
LTC Thomas S. Owen	9 Jul 63–7 Dec 64
COL William M. Hamilton	8 Dec 64–27 Nov 65
COL Clayton C. Swears	28 Nov 65–1 Jun 66

509th Radio Research Group

COL Clayton C. Swears	1 Jun 66—17 Nov 66
COL John J. McFadden	17 Nov 66–18 Oct 67
COL William T. Riley	18 Oct 67–19 Sep 68
COL Allen J. Mauderly	20 Sep 68–5 Apr 69
COL Richard A. Grodin	6 Apr 69–21 Sep 69
COL William W. Higgins	21 Sep 69–18 Aug 70
COL Jack P. Lansford	18 Aug 70–6 Aug 71
COL George R. Hamer	6 Aug 71–1 Aug 72
COL Marion E. White	2 Aug 72–7 Mar 73

224th Aviation Battalion (Radio Research)

MAJ John D. Rieser	1 Jun 66–31 Jul 66
MAJ Donn E. Taylor	Aug 66—Aug 66
LTC Richard A. Rusk	Aug 66–Aug 67
LTC George W. Cadmus	Aug 67–4 Aug 68
LTC Jimmie King	5 Aug 68–24 Jul 69
LTC John P. Brown	25 Jul 69–12 Jul 70
LTC Robert Swanson	12 Jul 70–22 Jun 71
LTC David Richards	22 Jun 71–1 Jun 72
MAJ Gerald E. Lethcoe, Jr.	1 Jun 72–20 Nov 72
MAJ Charles S. Simerly	21 Nov 72–5 Dec 72
LTC James M. Henderson, Jr.	5 Dec 72–3 Mar 73

303d Radio Research Battalion

LTC John J. Masters	8 Jul 64–13 Apr 67
LTC Norman J. Campbell	29 Apr 67–12 Apr 68
LTC Robert W. Price	13 Apr 68–16 Nov 68
LTC William O. Roscher	16 Nov 68–30 Jun 69
LTC James E. Freeze	1 Jul 69–4 Jun 70
LTC Claude E. Vannoy	5 Jul 70–7 Jan 71
LTC Donald E. Grant	8 Jan 71–15 Jun 71

313th Radio Research Battalion

LTC Russell B. Jones, Jr.	15 Jan 65–15 Aug 66
LTC Charles B. Ablett	15 Aug 66–21 Dec 66
LTC Stanley G. Kozlowski	21 Dec 66–26 Jun 67
LTC Richard L. Jones	26 Jun 67–4 Feb 68
LTC George E. Strickland	5 Feb 68–4 Aug 68
LTC James F. Morris, Jr.	5 Aug 68–21 Jun 69
LTC Andrew E. Little	21 Jun 69–5 Dec 69
LTC Joseph J. Muhlherr	6 Dec 69–6 Aug 70
LTC David A. Wisyanski	6 Aug 70–15 Jun 71

8th Radio Research Field Station

MAJ George T. Shearin	1 Nov 64–25 Feb 65
COL Joseph Goldenberg	25 Feb 65–Feb 66
COL Richard A. McMahon	13 Feb 66–Feb 67
COL George F. Garrant	9 Feb 67–19 Jan 68
COL Allen J. Mauderly	20 Jan 68–5 Mar 68
LTC Robert F. Von Dach	6 Mar 68–7 Feb 69
LTC Kenneth F. Coykendall	8 Feb 69–17 Sep 69
LTC Forrest G. Fultz	18 Sep 69–8 Dec 69
LTC Gerald M. Dirkx	9 Dec 69–18 May 70
MAJ Joseph F. Short	18 May 70–18 Jun 70
LTC Eugene S. Sanford	18 Jun 70–8 Sep 70
LTC Nathaniel Alderman, Jr.	9 Sep 70–25 Aug 71
COL Louis W. Powers	25 Aug 71–16 Aug 72
COL Stanley G. Kozlowski	17 Aug 72–31 Oct 72
MAJ Kenneth G. Neiman	1 Nov 72–26 Feb 73

330th Radio Research Field Station

LTC David A. Wisyanski	15 Jun 71–18 Jul 71
LTC Horace S. Kelley	19 Jul 71–22 Jun 72
MAJ Robert J. Adams	23 Jun 72–30 Jul 72

175th Radio Research Field Station

LTC Donald E. Grant	Jun 71–Dec 71
LTC Thomas J. Flynn	Dec 71–Sep 72
MAJ Charles G. Burke	Oct 72–Feb 73

Appendix E
Airborne Systems

Beaver (U–6A)	Mar 62–Mar 72	HF DF
Seminole (U–8D/8F)	Jan 63–Feb 73	HF DF
PATHFINDER Caribou (CV–2B)	Jan 66–Apr 67	HF/VHF DF/Collection[1]
HAPPY NIGHTS/CAFÉ GIRL Otter (U–1A)	Mar 67–Jan 71	HF DF/Collection[2]
CRAZY CAT/CEFLIEN LION Neptune (P–2E)	Jun 67–Apr 72	HF/VHF ECM/Collection[3]
LEFT BANK Huey (UH–1D/1H)	Aug 67–Jun 72	HF DF RFP/Collection[4]
LAFFING OTTER Otter (U–1A)	Dec 67–Jan 71	HF DF/Collection
HOMING PIGEON Mohawk (OV–1C)	Jun 68–Sep 69	VHF DF
LAFFING EAGLE Ute (U–21D)	Dec 68–Feb 73	HF/VHF DF/Collection[5]
LEFT JAB Ute (U–21A)	Dec 70–Feb 73	VHF DF/Collection

[1] Used only in HF

[2] Configured as a LAFFING OTTER by 1970

[3] Used only in collection capacity

[4] RFP/Collection positions removed in 1970

[5] Not used in HF DF until Oct 70 and never in VHF

Appendix F
Chronology

29 Apr 61	Presidential decision approves ASA COMINT effort in South Vietnam.
13 May 61	3d RRU arrives at Ton Son Nhut AFB—the first Army unit to be deployed.
15 May 61	WHITEBIRCH Phase of operations begins with manual Morse coverage.
27 Jun 61	3d RRU intercept vans move to ARVN compound, Trai Tran Hung Dao.
29 Jun 61	WHITEBIRCH DF Net becomes fully operational.
Aug 61	Mobile AN/PRD–1 DF teams are deployed.
4 Sep 61	3d RRU personnel conduct SABERTOOTH class for ARVN SIGINT specialists.
22 Dec 61	SP4 James T. Davis is killed in ambush while advising ARVN DF team.
Jan 62	3d RRU conducts joint mission with ARVN counterpart.
27 Jan 62	3d RRU personnel complete their first COMSEC monitoring mission.
Mar 62	First ARDF platform (U–6) arrives in Vietnam.
Apr 62	3d RRU moves to new quarters at Ton Son Nhut AFB, named in memory of SP4 James T. Davis.
27 May 62	ARDF results in a major tactical success.
28 Jun 62	3d RRU occupies Phu Bai as a DF site.
Jan 63	A U–8 aircraft equipped with ARDF capability becomes operational. The twin–engine aircraft gives the 3d RRU an all-weather capability.
1 Mar 63	Newly organized 7th RRU assumes responsibility for COMSEC mission.

14 May 63	3d RRU awarded Meritorious Unit Commendation, the first unit to be so honored in Vietnam.
4 Aug 64	Phu Bai warns of imminent danger in Gulf of Tonkin.
1 Nov 64	Det J, 3d RRU at Phu Bai is replaced by a field station (8th RRU).
9 Jun 65	First Direct Support Unit (the 404th ASA Det) arrives in country.
Jun 65	Vietnamese born linguists, DANCERS, are used by the 3d RRU as transcribers.
Aug 65	ASA units prove a key factor in the first large-scale battle involving US forces (Operation STARLIGHT). ARDF deploys in a direct support mode during battle.
Jan 66	The Nestor series of secure voice equipment is introduced in the field.
Mar–Apr 66	303d and 313th ASA Battalions arrive to support Field Forces.
1 Jun 66	3d RRU is replaced by the 509th RR Group. The 224th Avn Battalion is activated to assume responsibility for airborne mission.
1 Jul 66	ARDF Coordination Center is created to manage Air Force/Army ARDF missions.
27 Sep 66	403d RR SOD arrives to support the 5th Special Forces Group.
Oct 66	330th RR Co is named Collection Management Authority for II CTZ and the 175th RR Co for III CTZ.
Oct 66	ARDF indicates the presence of 325th NVA Division within South Vietnam.
17 Apr 67	Project MUSTARD (Wideband intercept) is inaugurated at the 330th RR Co.
29 Jun 67	CEFLIEN LION (EW) platforms arrive.
Jul 67	LEFTBANK heliborne DF platform becomes operational.
Jan 68	Direct Support Units received authority to issue their own tactical reports (TACREP) which allowed for passing of perishable information in a sanitized format.
23 Feb 68	8th RR Field Station at Phu Bai assumes control of Direct Support Units for the first time.
29 Mar 68	CEFLIEN LION platforms flown by 1st RR Co begins airborne collection.
May 68	Initial steps taken by COMSEC specialists to move away from monitoring and to begin to emphasize advice and assistance role.
15 Jun 68	Processing and Analysis Section is established at the 509th RR Group to look at country-wide analytical problems.
28 Jan 69	LAFFING EAGLE U–21 aircraft arrives and becomes operational.
13 Apr 69	Deployment of the experimental Tactical Automated Data Processing System signals the increased use of computers in the field.
1 Jul 69	ARVN Special Technical Detachments are organized.
15 Oct 69	SSG Donna P. Baldwin becomes first WAC to be assigned to the 509th RR Group.
20 Dec 69	Project TOUCHDOWN exploits capture of an NVA COMINT Intercept Team.
24 Dec 69	335th RR Company moves to Can Tho and assumes responsibility as the CMA to the Delta.
Feb 70	RATRACE Team deploys to Ben Luc to provide analytical and transcription assistance.
3 May 70	During the Cambodian Incursion, LEFT BANK platform produces information leading to the discovery of "The City," a large logistics center.

4 May 70	First ASA unit (the 409th RR Detachment) enters Cambodia to perform low-level voice intercept.
10 Jun 70	Project EXPLORER becomes operational on Hill 950.
31 Jul 70	The Division Advisors Radio Research Support (DARRS) Detachments are established.
Oct 70	Installation of the ARD–23 V–Scan on the LAFFING EAGLE platforms represents major upgrade in Army ARDF.
13 Nov 70	The Vietnamization Improvement and Modernization Plan is formally implemented to begin shifting the fighting responsibilities to the ARVN.
8 Jan 71	LEFT JAB airborne platform becomes operational.
Apr 71	303d and 313th RR Battalions redeploy to CONUS.
1 May 71	Field stations are organized at Bien Hoa and Nha Trang.
Jul 71	Center Advisory Radio Research Support (CARRS) Detachments are established at the South Vietnamese SIGINT centers.
30 Mar 72	Two members of the 8th RR Field Station killed by incoming rockets. Their deaths brought the total ASA soldiers killed in action to 34.
1 Apr 72	101st RR Company is discontinued, effectively ending the 509th RR Group's COMSEC mission.
30 Jun 72	328th RR Company and the 405th RR Detachment represents the last of the Direct Support Units to be either inactivated or redeployed.
Feb 73	8th and 175th, the last of the field stations, are discontinued.
16 Feb 73	A U–21 LEFT JAB crew flies last ARDF mission for the Army.
7 Mar 73	509th RR Group is discontinued, ending ASA's 12-year presence in South Vietnam.

VHF	very high frequency
WAC	Women's Army Corps

Appendix H

Unit Insignia

Because of security considerations, ASA personnel in Vietnam were not allowed to wear the agency's official shoulder sleeve insignia or its distinctive unit insignia. However, personnel from each of the battalions were authorized and did wear their own unit crests. At the same time, there were many unofficial "beer can" insignia, so called because of the aluminum metal used by local Vietnamese vendors to manufacture them. What follows are representative of the various official and unofficial (unless otherwise noted) insignia carried by various ASA units from time-to-time.

224th Avn Battalion
(authorized)

303d ASA Battalion
(authorized)

313th ASA Battalion
(authorized)

1st RR Company

3d RR Unit

3d RR Unit
(Davis Station)

Det J, 3d RRU

8th RR Field Station

101st RR Company

"It is always easy for the people to see the performance of an infantry battalion or brigade in fighting and winning the battle. The performance of a support unit is not so obvious, and yet in your case [303d RR Battalion that supported the II FFV], you have probably contributed to the winning of more battles than any maneuver element in the country."

Foreword

Intelligence has been defined as the art of "knowing one's enemies," and military intelligence is as old as war itself. However, the development of an intelligence organization within the United States Army is comparatively recent. The Army did not acquire a permanent peacetime intelligence organization until 1885, and the oldest of today's military intelligence units can trace its lineage only back to the eve of World War II. The Army did not formally recognize intelligence as a distinct professional discipline until 1962, when it finally created the Army Intelligence and Security Branch, the predecessor of today's Military Intelligence Branch. The Military Intelligence Corps, which incorporated all military intelligence personnel and units into a single large regiment, did not come into existence until 1987.

Although the intelligence organization within the U.S. Army was slow to develop, it has become increasingly important both as a combat multiplier in war and as a source of information for the nation's decision makers in peace. As the nation and its Army move into an information age, military intelligence will assume an even greater significance.

To tell the military intelligence story in as much detail as security regulations currently in force allow, the U.S. Army Center of Military History has worked in collaboration with the U.S. Army Intelligence and Security Command (INSCOM) to produce this volume of the Army Lineage Series. It is intended both to bring a relatively unknown part of the Army heritage to the attention of the general public and to foster unit esprit de corps among the thousands of military intelligence specialists now serving in the ranks of America's Army.

The Authors

John Patrick Finnegan graduated magna cum laude from Boston College in 1957 with an A.B. in English Literature. After a period of civilian employment with the National Security Agency and military service in the U.S. Army Counter Intelligence Corps, he went on to receive a Ph.D. in Twentieth Century American History from the University of Wisconsin–Madison. Before accepting his present position as historian with the U.S. Army Intelligence and Security Command, Dr. Finnegan taught at several American universities and at the University of Ibadan, Nigeria, and worked as a military historian at the U.S. Army Center of Military History. He is the author of *Against the Specter of a Dragon: The Campaign for American Military Preparedness, 1914–1917*, *Military Intelligence: A Picture History*, and *The Military Intelligence Story: A Photo History*, as well as coeditor of *U.S. Army Signals Intelligence in World War II: A Documentary History*.

Romana Danysh graduated from Barnard College in 1962 and received her M.A. degree in history from Stanford University in 1963. Since 1964 she has served as a historian at the U.S. Army Center of Military History. Ms. Danysh is coauthor of *Infantry, Part I: Regular Army*, a volume in the Army Lineage Series.

Preface

This book attempts to present an organizational history of Military Intelligence in the United States Army from its beginnings to the present. It makes no pretense at discussing the operational aspects of intelligence in detail, partially due to the continuing need to safeguard intelligence sources and methods. Furthermore, the book focuses its attention on the Army and necessarily slights the complex interrelationships between Army intelligence and other organizations in the intelligence community. Finally, although the book includes the lineages and heraldic items of military intelligence brigades, groups, and battalions organized under tables of organization and equipment (TOEs), it does not cover the numerous intelligence units, past and present, organized for one-of-a-kind missions under tables of distribution and allowances (TDAs).

Preparation of this volume has been a collaborative effort between the U.S. Army Center of Military History (CMH) and the U.S. Army Intelligence and Security Command (INSCOM). John Patrick Finnegan, Military History Office, INSCOM, wrote the narrative text. Romana Danysh, Organizational History Branch, CMH, compiled the lineages.

Both authors owe large debts to numerous individuals. The idea of preparing an organizational history was conceived by James L. Gilbert, INSCOM Command Historian; Janice E. McKenney, Chief of the Organizational History Branch, CMH, was instrumental in bringing about its publication as part of the Army Lineage Series. The introductory text owes much to those who took the time and trouble to compose unit histories, as well as to the former historians of the U.S. Army Intelligence Center, the U.S. Army Security Agency, the U.S. Army Intelligence Command, and the Office of the Assistant Chief of Staff for Intelligence. Lt. Col. Marc Powe's thesis on the evolution of the Military Intelligence Division from 1885 to 1917 served as a basic building block for the monograph, as did Col. Bruce Bidwell's unpublished eight-volume manuscript on the development of military intelligence from the founding of the republic to 1953. The unpublished thirty-volume history of the Counter Intelligence Corps which Maj. Ann Bray and others prepared in the late 1950s also contained a

wealth of information. Finally, preparation of the narrative would have been impossible without the research assistance provided by the library and archival staffs of the National Archives and Records Administration, the U.S. Army Military History Institute, the Library of Congress, the National Security Agency, the U.S. Army Cryptologic Records Center, the Pentagon Library, and the Center of Military History.

Special thanks are due to the individuals who served on the panel that reviewed and commented on the first draft of the narrative. These include Brig. Gen. James L. Collins, U.S. Army (Retired), former Chief of Military History; Romana Danysh, Morris J. MacGregor, Jr., Janice E. McKenney, and John B. Wilson of CMH; Dianne Putney of the U.S. Air Force History Office; and Col. James W. Dunn, U.S. Army (Retired), of the Corps of Engineers History Office. Others who provided a valuable critique include David F. Trask and Robert K. Wright, Jr., of CMH; Dean Allen of the Defense Intelligence Agency History Office; Bruce Saunders, formerly with the History Office, U.S. Army Intelligence Center and School; and Henry Schorreck, formerly with the National Security Agency's History Office. Jeffrey J. Clarke, the Army's present Chief Historian, devoted considerable time and energy to polishing the final version of the manuscript. Over the years, a succession of INSCOM commanders have encouraged the project of compiling an organizational history, while former INSCOM Chief of Staff Malcolm L. Hollingsworth provided steady support.

In addition to the narrative history, this volume features lineages and heraldic data for 108 military intelligence units—13 brigades, 10 groups, and 85 battalions. They comprise all active and inactive Regular Army and Army Reserve TOE units as well as all federally recognized Army National Guard TOE units as of 30 June 1996. We did not include smaller units, such as companies and detachments, because they are not authorized their own heraldic items. However, former separate companies and detachments perpetuated by brigades, groups, or battalions are covered in the relevant lineages. No TDA units of any size are included because, in accordance with longstanding Army policy, lineage and honors are determined for TOE units only.

The Organizational History Branch of CMH is responsible for determining and publishing the official lineage and honors of Army units. The lineages in this volume are the result of research done by many past and present members of the branch, including John Finnegan. Romana Danysh prepared all the lineages for publication and updated them to reflect significant organizational changes, campaign participation credit, and unit decorations through 30 June 1996.

Each lineage is adapted from the unit's official Lineage and Honors Certificate, which outlines the history of the unit in a highly stylized format and constitutes its birth certificate, its deed to organizational properties, and verification of its service record. Although we have compressed the lineage and honors data in this book to save space, the information is the same as that on the certificates, which accounts for the technical language used. The glossary at the

end of the volume will assist readers unfamiliar with lineage terms. The parenthetical entries after each unit decoration refer to the general orders announcing the awards.

Descriptions of coats of arms, shoulder sleeve insignia, and distinctive unit insignia approved for the units appear with the lineages. These descriptions as well as the color illustrations and the brief account of heraldic items were furnished by The Institute of Heraldry (TIOH). The authors are particularly grateful to Gerald T. Luchino, Thomas B. Proffitt, Nuala Barry, and James M. Hammond for their expert assistance in providing the heraldic material for this book. We also want to express our very special thanks to the late Ronald E. Dudley, an alumnus of both TIOH and CMH, who volunteered to type the heraldic data in the appropriate format for publication. In some instances, the text relating to the heraldic items is not as comprehensive as in the original letters of approval, amendment, or redesignation sent to the units. Minor changes have been made to meet the need for brevity.

Although previous volumes in the Army Lineage Series had individual unit bibliographies, the scarcity of open-source literature on military intelligence units made such an approach impracticable. Very few histories of intelligence units have been published, and historical reports submitted by intelligence organizations generally have been classified. The files of the INSCOM History Office contain information on selected units and installations. Some intelligence histories are also included in the large unit history collection maintained by the U.S. Army Military History Institute at Carlisle Barracks, Pennsylvania. In addition, the *Military Intelligence Professional Bulletin*, a quarterly publication of the U.S. Army Intelligence Center and Fort Huachuca, regularly features thumbnail sketches of various military intelligence units.

Photographic support for this volume was provided by T. Gardner, Sr., and Robert J. Bills, contractors working for the Assistant Chief of Staff, G–6, INSCOM. At CMH, John W. Elsberg, Arthur S. Hardyman, Catherine A. Heerin, Diane M. Donovan, the late Rae Panella, Joycelyn M. Canery, and John Birmingham all participated in the various aspects of producing the book.

As indicated, the efforts of a great many people contributed to the production of this volume of the Army Lineage Series. However, any mistakes, errors, or omissions are solely the responsibility of the authors.

MILITARY INTELLIGENCE

Introduction

Military Intelligence—the collection of information by commanders on the enemy and the battlefield environment they must confront—has existed since the beginnings of armies and of wars. However, the emergence of professional Military Intelligence organizations and the definition of the functions they most appropriately performed are comparatively recent developments. Until the nineteenth century, Military Intelligence was practiced only in wartime; methods of collection were rudimentary; and the conduct of Military Intelligence was considered a function of command, one which any professional officer could perform. Furthermore, commanders tended to be skeptical about the reliability of the information they received from spies, scouts, and their own troops. In his monumental treatise *On War*, Clausewitz commented only that "many intelligence reports in war are contradictory, even more are false, and most are uncertain."[1]

The powers of continental Europe developed military staff organizations during the nineteenth century and provided a peacetime institutional locus for Military Intelligence organization. Staffs developed an intelligence element that collected maps and military statistics and dispatched attaches. Ultimately, these developments were replicated in the United States, although not without some delay. The U.S. Army was small, it had no general staff, and there were no pressing military threats to drive intelligence collection. And although George Washington had been a masterful practitioner of intelligence while serving as commander in chief of the Continental Army, this aspect of his experience has never become part of the national heritage. A small Division of Military Information was finally set up within the Adjutant General's Office twenty years after the American Civil War had ended. A few years later the Army dispatched its first military attaches abroad to provide general information on worldwide military affairs. When the Army at last gained a General Staff in 1903, the Military Information Division was transformed into the General Staff's Second Section.

---

[1] Karl Von Clausewitz, *On War*, ed. and trans. Michael Howard and Peter Paret (Princeton: Princeton University Press, 1976), p. 117.

At the time, the Army's fledgling General Staff was groping to define its own appropriate mission, and these beginnings were never fully developed. A subsequent reorganization effectively eliminated the intelligence function of the staff, and it took America's entry into World War I to reverse the situation. To fight a land campaign on the continent of Europe, the Army was compelled to remodel itself along continental lines. An intelligence division was re-created within the War Department General Staff, and staffs that included intelligence officers were introduced at all units down to the level of battalion. Military Intelligence expanded to become a "shield" as well as a "sword," as the Army became heavily involved in counterintelligence.

In the field, technology helped to rationalize intelligence collection at the tactical and operational levels. Under combat conditions, intelligence gathering was accomplished not only by Military Intelligence specialists but also by the line troops themselves. As S. L. A. Marshall later stated, "Infantry . . . is the antenna of the mechanism of combat intelligence."[2] Increasingly, these sources were augmented by what were later called "special information services" that engaged in various types of technical collection activities.[3] World War I exposed the Army to a dazzling new array of technological enhancements to the collection process: aerial photography and reconnaissance, radio intercept, and optical and acoustical sensors used to detect aircraft and artillery. One secondary effect was that much of the Army's practical intelligence work was carried out by nonintelligence personnel: the intercept personnel of the Signal Corps; technicians manning artillery targeting devices; topographic specialists in the Corps of Engineers; and aviators. This situation in turn tended to block or delay the further centralization of the intelligence function.

In the long years of peace following the Armistice, Army Intelligence continued to search for an appropriate place within an Army the size of which had again been greatly reduced. A basic problem of Army Intelligence remained conceptual: defining what an intelligence organization should do. Army Intelligence offices, in fact, continued to be regarded as clearing houses for all manner of information functions unrelated to intelligence. During the interwar years, for example, intelligence staffs managed the Army's public affairs programs; later they were tasked with conducting psychological warfare and writing the Army's history. It took a surprisingly long time—until the end of World War II—for Army Intelligence to shake off such extraneous functions and concentrate on its primary task, "knowing one's enemies."[4] At the War Department level, the Army's intelligence organization tended to act more as a reference library than as

[4] This useful definition is taken from the title of Ernest May's *Knowing One's Enemies: Intelligence Assessments Before the Two World Wars* (Princeton: Princeton University Press, 1986).

a positive directing force. Not until May 1945 did the War Department's Military Intelligence Division (MID) acquire an organization to establish intelligence priorities and requirements, missions that finally allowed it to put into practice all components of the modern intelligence cycle: determining requirements, collecting the appropriate information, processing the acquired data into finished intelligence, and disseminating the results, a circular process that often generates a new set of requirements, initiating the cycle again.[5]

Military Intelligence also labored under other handicaps in the years between the wars. Under garrison conditions, unit intelligence officers found themselves with little to do. Battlefield collection mechanisms seemed to have little utility in peace. The Military Intelligence Division maintained a small counterintelligence element and for a time funded a small cryptanalytic unit; but the latter function subsequently passed over to the Signal Corps. Military attaches continued to report, but their purpose was somewhat anomalous—government parsimony and expensive representational demands made it impossible for officers without private incomes to serve in overseas posts, and their function seemed more political and social than military.

These factors, along with the perceived absence of any real threat in times of peace, effectively marginalized intelligence work within the Army. Intelligence seemed unrelated to the real life of the Army, and intelligence assignments were viewed as curiosities at best. General of the Army Dwight D. Eisenhower later commented, "I think that officers of ability in all our services shied away from the intelligence branch in the fear that they would be forming dimples in their knees by holding teacups in Buenos Aires or Timbuctoo."[6] At the same time, if intelligence was peripheral, the Army still assumed that any officer could fulfill its functions.[7]

In World War II these attitudes began to change. Military and political leaders alike recognized that intelligence was crucial to military success. To meet its information needs, the Army was forced to create a large intelligence structure, manned largely by draftees and officers commissioned into the Reserves. Acting through its wartime operating arm, the Military Intelligence Service, the Military Intelligence Division instituted formal training for intelligence personnel in a diversity of disciplines. By the end of the war, various types of intelligence teams and counterintelligence detachments were supporting the intelligence

6 Dwight D. Eisenhower, "Command in War," lecture presented to the National War College, Washington, D.C., 30 Oct 50.

7 The author of one of the earliest books on Military Intelligence in the U.S. Army stated, "If things are not going right between G–2 and G–3 . . . then a switching of the duties of these is recommended. If the G–2 is not competent to be a G–3, he is not competent to be a G–2 and should be retired from the General Staff." Walter Campbell Sweeney, *Military Intelligence: A New Weapon in War* (New York: Frederick A. Stokes Co., 1924), p. 135.

staffs of all tactical units in the field. Meanwhile, the Signal Corps conducted its own intelligence and security war, entering the field of radar, which was at once a collection technology, a new intelligence target, and a subject of possible countermeasures. More important, the Signal Corps provided cryptologic support to the War Department through its Signal Security Agency and furnished theater commanders with tactical signals intelligence units. The growing importance of communications intelligence ultimately resulted in the transfer of responsibility for the function from the Signal Corps to Military Intelligence. The Army emerged from World War II with an intelligence structure that in some ways prefigured that of the present. Most of the lineages of today's intelligence units trace back to the second World War. However, this structure was departmentally oriented, fragmented, and less than fully articulated. Following the postwar reorganization of the Army in 1946, the Military Intelligence Division again emerged as the dominant institution in the whole architecture, providing overall direction, producing intelligence, and engaging in a diversity of operational activities. As part of its mandate, the Division commanded a vertically organized signals intelligence and security apparatus, the Army Security Agency (ASA), and an administratively centralized counterintelligence element, the Counter Intelligence Corps (CIC). Both ASA and CIC were organized into sizable units. However, the Army's other intelligence disciplines—human intelligence and imagery intelligence—continued to be essentially orphans, their personnel grouped into small teams supporting tactical commanders and their training base neglected. Electronic warfare remained the province of the Signal Corps. The system continued to be manned by a mix of detailed Regular Army officers and reserve officer specialists who chose to remain in uniform when the war came to an end.

During the next forty years, these arrangements were reshaped by several diverse influences. The Cold War, advances in technology, and imperatives of bureaucracy were perhaps the most significant. To meet evolving challenges, the structure of Army Intelligence was repeatedly reorganized. Military Intelligence was professionalized, its disciplines integrated, and the scope of its operations enhanced. As a result, Military Intelligence became a branch in the U.S. Army, and Military Intelligence professionals were affiliated with the Army's regimental system through the creation of the Military Intelligence Corps. Intelligence staff sections, present at all Army levels, were supplemented by specialized intelligence units up to brigade level. This book attempts to trace the long and complicated organizational history that characterized this evolution.

1

The Beginnings

In 1885 the Division of Military Information was established as part of the Military Reservations Division, Miscellaneous Branch, of the Adjutant General's Office. This step gave the U.S. Army a permanent intelligence organization for the first time in a century.

The long delay in giving recognition to the importance of Military Intelligence stemmed from various factors. One of these was the marginal position that the Army itself occupied in American society. The American tradition was one of liberty, democracy, and commercialism; except in time of war the country tended to neglect all the Army's needs. The professional Army was there to perform constabulary work against scattered Indian tribes in the vastness of the American West, to man coast defenses against the implausible threat of a foreign attack, and to serve as a continuing nucleus of professional expertise. Should a real threat to the Republic appear, citizens would rally to the flag, as they had in all of America's past wars, and some kind of mechanism for collecting intelligence would eventually be improvised to meet the crisis.

Another factor retarding the development of a permanent intelligence organization until 1885 was the general backwardness of the Army. On the European Continent, armies had been forced to create systematic staff organizations dealing with both operations and intelligence since the beginning of the nineteenth century. The Prussian Great General Staff provided the model for all of Europe's armies. In the United States, with its distrust of militarism, the idea of such a super army headquarters was repellent. Collecting intelligence and laying out detailed war plans were not in the American tradition. The U.S. Army's central staff consisted mainly of bureaus dealing with questions of administration and supply, and these reported directly to the secretary of war, not to the commanding general of the Army.

Without any organizational support, each U.S. commander served as his own intelligence officer, and the intelligence function was limited to simple reconnaissance in time of war or during an Indian campaign. In the field, units set up security patrols in tactical arrangements described in a now-

quaint vocabulary of pickets, vedettes, and Cossack posts.[1] During major deployments, such as those which took place in the Civil War, cavalry served its traditional function as the eyes of the Army.

Army topographic engineers and other officers trained under the U.S. Military Academy's engineer-oriented curriculum also made important contributions to intelligence, continuing an Army tradition that dated back to the explorations of Lewis and Clark. In 1814 the War Department created a unit of topographic engineers to help with the military effort against Great Britain. From 1818 on, the Army maintained a topographic bureau and from 1838 to 1863 a separate Corps of Topographic Engineers. West Point–trained engineers helped lead Maj. Gen. Winfield Scott's army to the conquest of Mexico City in 1847.[2] Reconnaissance efforts carried out by troops were often supplemented by civilian auxiliaries. Indian and civilian scouts brought their special expertise to bear on the frontier. During the Mexican War, General Scott had even employed a group of locally hired Mexican bandits and deserters, the "Mexican Spy Company," to gather specific tactical intelligence.

Limiting Military Intelligence to tactical collection had led to numerous disasters in the past. In the War of 1812 American troops had crossed the Canadian border without maps in an abortive invasion attempt that ended in a fiasco. A generation later, the Army's quartermaster general found himself with no idea whether or not wagons could be used to support the advance of Maj. Gen. Zachary Taylor's forces into Mexico. In a classic breach of security, the Army then sent a courier to Taylor carrying unenciphered secret orders that stripped the general of most of his regulars. The orders were captured on the way, and Taylor's lack of reconnaissance allowed his depleted forces to be taken by surprise at Buena Vista. Buena Vista turned out to be an American victory only due to the fighting prowess of Taylor's volunteer troops. With luck on its side, the Republic managed to muddle through the Mexican War just as it had through the War of 1812. In both cases, the ultimate triumph of largely improvised forces encouraged a casual approach toward Military Intelligence, an attitude that fit well with the longstanding American tradition of subordinating military concerns to other, more immediate interests.

The nature and scope of the Civil War provided unusual opportunities for intelligence collection.[3] Because the North and South were physically proximate

[2] The services of the topographical engineers are documented in William H. Goetzman, *Army Exploration in the American West, 1803–1863* (Lincoln: University of Nebraska Press, 1979); Guy C. Swan III et al., "Scott's Engineers," *Military Review* (March 1983): 61–68, deals with reconnaissance in the Mexican War.

[3] An excellent treatment of Civil War intelligence can be found in Peter Maslowski, "Military Intelligence Sources During the American Civil War," in *The Intelligence Revolution: An Historical Perspective; Proceedings of the Thirteenth Military History Symposium, United States Air Force Academy*, ed. Walter T. Hitchcock (Washington, D.C.: Office of Air Force History, 1991), pp. 39–70.

and loyalties were desperately intermixed, both sides made extensive use of spies as well as the military information cheerfully turned over by an uncensored press. In the field the rival armies often used civilian guides, willingly or unwillingly recruited from the population. This was an American adaptation of Napoleon's succinctly brutal advice on intelligence collection: "You order the major to put a peasant at your disposal, arrest his wife as a hostage, have a soldier dress himself as the man's farm hand. This system always succeeds."[4] Cavalry once again proved its indispensability. For the first part of the war, lack of an effective cavalry organization left the Union armies blinded in the presence of their enemies. During the Gettysburg campaign, however, the situation was reversed. Maj. Gen. J. E. B. Stuart's decision to raid rather than scout led directly to the Confederates' accepting battle on unfavorable terms.

Increased use of technology also contributed to innovations in the intelligence and security arena during the Civil War. The Union Army used both free and tethered balloons to watch over enemy dispositions in the early stages of the conflict. Manned by civilian aeronauts, the balloons were successively assigned to the Corps of Topographic Engineers, the Quartermaster Corps, and the Corps of Engineers.[5] The Army Signal Corps, first set up in 1863, also came to play an intelligence role. Signal Corps communications troops posted on high ground often provided valuable field intelligence.[6] However, their messages, transmitted by "wig-wagged" signal flags, could be intercepted. Similarly, the increased use of the telegraph by each side created opportunities both for communications intercept and communications deception. This quickly led to the employment of rudimentary field codes and ciphers in tactical situations.

Most commanders on both sides continued to serve as their own intelligence officers. Confederate Lt. Gen. Thomas "Stonewall" Jackson directly supervised the mapping of the Shenandoah Valley.[7] Another Confederate corps commander, Lt. Gen. James A. Longstreet, personally debriefed the spy who provided the first indications that the Union Army was on the move to Gettysburg.

[4] Martin Van Creveld, *Command in War* (Cambridge: Harvard University Press, 1985), p. 67.

[5] Army balloon activities in the Civil War and later periods are covered in Tom D. Crouch, *The Eagle Aloft: Two Centuries of the Balloon in America* (Washington, D.C.: Smithsonian Institute Press, 1983). The Confederates were able to field only one balloon during the course of the conflict, but its performance impressed at least one rebel officer. "My experience with this gave me a high idea of the possible efficiency of balloons in active campaigns. Especially did we find, too, that the balloons of the enemy forced upon us constant troublesome precautions in efforts to conceal our marches." General E. P. Alexander, *Military Memoirs of a Confederate* (Bloomington: Indiana University Press, 1962), pp. 172–73.

[6] The Union Signal Corps operated both "stations of observation" and "stations of communication." J. Willard Brown, *The Signal Corps, U.S.A. in the War of the Rebellion* (New York: Arno Press, 1974), p. 125. The Confederate Signal Corps was even more involved in intelligence work. See William A. Tidwell et al., *Come Retribution: The Confederate Secret Service and the Assassination of Lincoln* (Jackson: University Press of Mississippi, 1988), pp. 80–104.

[7] This is documented in *Make Me a Map of the Valley: The Civil War Journal of Stonewall Jackson's Topographer*, ed. Archie P. McDonald (Dallas: Southern Methodist University Press, 1973).

However, there were some attempts to designate intelligence officers and to establish rudimentary intelligence organizations. During the opening days of the Bull Run campaign, Maj. Gen. Pierre Beauregard's assistant adjutant general was able to provide the Confederate Army with early warning of incipient Union moves through a well-connected spy network he ran in Washington, D.C. Shortly afterward, Maj. Gen. George McClellan, the newly appointed head of the Union Armies, employed private detective Alan Pinkerton as his intelligence chief. However, Pinkerton's untutored and exaggerated evaluation of Confederate strength virtually paralyzed Union operations for a time.[8] But amateurishness in the field of intelligence at this point was not confined to civilians: after Pinkerton's return to private life, McClellan's cavalry chief, Maj. Gen. Alfred Pleasanton, provided equally misleading information regarding the enemy's numbers.[9]

Union forces did not acquire a professional intelligence officer until the spring of 1863, when Maj. Gen. Joseph Hooker, commander of the Army of the Potomac, directed Col. George V. Sharpe of the 120th New York Volunteer Infantry to set up a bureau of information. Sharpe, a lawyer and diplomat in civilian life, devised an effective system making use of civilian scouts, behind-the-lines agents, and interrogation reports from deserters and prisoners of war to build up an accurate picture of Confederate order of battle and intentions. By the end of the war, Sharpe was a brevet brigadier general and assistant provost marshal assigned to Headquarters, Armies of the United States.[10]

Counterintelligence organizations also made an appearance. In one of their few successes, Pinkerton and his operatives rolled up the Rosa Greenhow spy network that had funneled information to the Confederates from the nation's capital. At the beginning of 1862 the War Department took over the rather elaborate nationwide counterintelligence organization built up by Secretary of State William Henry Seward and placed it under Lafayette Baker, a civilian who subsequently operated a "secret service" of detectives that engaged in both positive collection and counterintelligence. In addition, Baker supervised investigations of graft and fraud and still found time to organize his own cavalry regiment, thus acquiring

---

8 To the end, Pinkerton was convinced he was right. See his autobiographical work, *The Spy of the Rebellion: Being a True History of the Spy System of the United States Army During the Late Rebellion* (New York: G. W. Carleton and Co., 1883), p. 588. The best evaluation of his performance is in Edwin C. Fishel, "Pinkerton and McClellan: Who Deceived Whom?" *Civil War History* 24 (June 1988): 115–42.

9 Stephen V. Sears discusses the "singular ineptitude" of Pleasanton as an intelligence officer in *George B. McClellan: The Young Napoleon* (New York: Ticknor and Fields, 1988), p. 274. Pleasanton continued to serve as cavalry chief of the Army of the Potomac even after McClellan stepped down. His reports continued to be "remarkably unreliable." Russell F. Weigley, *History of the United States Army, Enlarged Edition* (Bloomington: Indiana University Press, 1984), p. 242.

10 Maslowski, "Intelligence Sources," p. 40. It should be noted that Sharpe's organization was known as a "bureau of information," not an intelligence office. In nineteenth-century usage, the word "intelligence" equated with today's "news." The Army Intelligence Office, which the Confederates established in 1862, was headed by a chaplain with the mission to inform the families of wounded Southern soldiers about their care and disposition.

the rank of colonel. As a result of his work in tracking down Lincoln's assassins, Baker also ended his Civil War service as a brevet brigadier general.[11]

After the Civil War, older habits reasserted themselves. The vast armies were hastily demobilized, and the wartime arrangements for gathering intelligence discontinued. Sharpe returned to civilian life; Baker was fired by President Andrew Johnson, who disagreed both with his methods and, more to the point, his suspicions that unregenerate Confederates were regaining power and influence under the Johnson administration. Once Reconstruction had ended, the Army was scaled back to a force of some 25,000 men, thinly scattered over the empty spaces of the American West. Once again, each commander served as his own intelligence officer. Under typical conditions of Indian warfare, cavalry regiments were broken up into penny-packets and employed as standing garrisons or mobile strike forces. In the West, commanders relied on Indian scouts and civilians like Buffalo Bill Cody to fulfill their intelligence needs. Indians had been used in this role since the beginning of the Republic, and Congress had authorized a permanent Corps of Indian Scouts in 1866. Although the legislation provided for a force of 1,000 scouts, budgetary factors allowed no more than 300 scouts to be employed at any one time.[12]

Despite its occasional wartime accomplishments, Army Intelligence had been a matter of improvisation. There had been no institutional structure to give it historical continuity. Expertise gained in wartime had quickly dissipated. However, by the 1880s the tide began to turn. American society itself was rapidly changing from a loosely knit aggregation of agriculturalists into an industrial unit of large corporations bound together in a national market. This in turn led to a new emphasis on professional expertise.[13] At the same time, similar developments were taking place in the major nations overseas, which began to exhibit a renewed interest in imperial expansion, a fact of some concern to the United States. The U.S. preoccupation with the Civil War had already encouraged French intervention in Mexico. As the steamship and the international cable continued to draw the world closer together, the actions of foreign powers impinged on the American popular consciousness in a way that had not been the case in the past.

Slowly, America's military institutions began to respond to these pressures for greater professionalization and greater access to information concerning events abroad. In 1881 the Army created a professional school at Fort Leavenworth, Kansas, to give advanced instruction to infantry and cavalry officers. In 1882 the U.S. Navy set up the Office of Naval Intelligence with the primary mission of observing and reporting on new developments in maritime technology overseas.

13 This interpretation owes much to Robert G. Wiebe.

The establishment of the Division of Military Information by the Army in 1885 was thus part of a larger pattern of historical developments.

Military Intelligence in Place

The Army's Intelligence organization underwent a steady evolution between 1885 and the beginning of the war with Spain. Initially, the Division of Military Information appears to have been seen as simply a passive repository for information on military-related developments at home and abroad. Its domestic responsibilities led to its location in the Military Reservations Division of the Adjutant General's Office. Initial collection requirements were disarmingly simple. The adjutant general requested that the Army's geographical departments and technical services "whenever practicable, make report on anything which it may be desirable for the Government to know in case of sudden war." Just what sort of information this was, however, was "almost impossible to specify in detail . . . but this can well be left to the intelligence and discretion of the officers."[14]

In 1889 the division took a first step toward taking on a more positive role when the Army dispatched military attaches to the capitals of the five major European powers: Great Britain, France, Germany, Russia, and Austria-Hungary. Since the attaches were charged with performing intelligence-gathering tasks in addition to diplomatic representational duties, they provided the division with its own professional collection arm. About the same time, the division became a separate body, directly subordinate to the adjutant general, and access to its files was restricted to the commanding general of the Army and the bureau chiefs.[15]

Although the introduction of attaches improved the Army's foreign intelligence capabilities, it also resulted in the Army's first intelligence scandal. In 1892 Capt. Henry T. Borup, the American attache posted to France, was expelled from the country for attempting to purchase the plans for the fortifications of Toulon from a disgruntled employee of the French Ministry of Marine. This event caused some consternation, especially to Jefferson Coolidge, the American minister to France. Coolidge pointed out that Borup's action had been "perfectly useless"; not only was America at peace with France, but the small American navy could not attack Toulon.[16] However, the captain's behavior, while indiscreet, was not totally irrational; the United States had recently embarked on a program to upgrade its own coastal defenses, and Borup, an

ordnance officer, presumably believed that any information gleaned from abroad would be helpful. At any rate, this minor embarrassment did not interfere with the growth of the attache system. By 1894 five additional attache posts had been set up at other European capitals, Japan, and Mexico.

Meanwhile, the functions of the Military Information Division expanded further. In 1892 the secretary of war reorganized the division, assigning it a wide spectrum of duties that nearly transformed it into a combined operational and intelligence staff. The division was tasked to collect information on both the United States and foreign countries, to direct the attache system, and to disseminate intelligence products and maps to the Army. In addition, it was to monitor the militia mobilization base, prepare instructions to the militia inspectors, and formulate mobilization plans. As if all of this were not enough, the division was also directed to "have charge of a museum . . . for the care and preservation of military relics."[17]

By 1893 the Military Information Division was large enough to be organized into four branches. The Progress in Military Arts Branch collected scientific and technical intelligence from the various attaches. The Northern Frontier Branch focused on the Canadian border: Great Britain was still thought of as a possible, though not probable, enemy, and Army officers were encouraged to take "hunting and fishing" leaves to reconnoiter and map certain areas of Canada. The Spanish-American Branch monitored developments in the troubled Caribbean, where Cuban revolutionaries were already plotting insurrection against Spain. Finally, the Militia and Volunteer Branch kept track of the various state National Guard organizations and performed whatever rudimentary mobilization planning was possible in peacetime.

As a result, when the war with Spain began in April 1898, the Army for once entered upon a conflict with at least a semblance of intelligence preparation. Eleven officers were on duty with the Military Information Division at the State, War, and Navy Building in Washington; 6 additional attaches went to join the 10 already abroad, and another 40 officers provided status reports on the nation's militia.[18] The Military Information Division had already collected a good deal of intelligence on conditions in Cuba and soon collected more using Army officers on undercover assignments in Cuba and Puerto Rico. The clandestine collection mission of Lt. Albert Rowan in Cuba was later both popularized and distorted in Elbert Hubbard's famous story, "A Message to Garcia."[19]

18 Marc B. Powe, *The Emergence of the War Department Intelligence Agency, 1885-1918* (Manhattan, Kans.: MA/AH Publishing, 1974), p. 29. The head of the Military Information Division at the time was Col. Arthur S. Wagner, author of *The Service of Security and Information* and the leading expert on intelligence in the Army.

19 For the true story, see Rowan's own account in *Military Intelligence: Its Heroes and Legends*, comp. Diane Hamm (Arlington, Va.: U.S. Army Intelligence and Security Command, 1987), pp. 1–19.

Unfortunately, the war would reveal much about the weaknesses of both the Army and its Military Intelligence organization. The 25,000-man Regular Army was increased in strength, but concomitantly 140,000 militiamen and volunteers were placed under arms, creating intolerable strains on the country's mobilization capacities. The dispatch of the main Spanish fleet to Santiago, Cuba, first discovered by a Signal Corps wiretap of the Spanish cable, led to the hasty deployment of elements of the Army's newly organized V Corps to that island. This expeditionary force was pulled together amid conditions of chaos and then committed to action under a slothful commander of dubious tactical skills. Eventual victory in Cuba owed much to the valor of regular and volunteer troops, but little to planning or to the effective use of intelligence, since the expedition's commander had refused the War Department's offer to set up a Military Information Division in the field to support the campaign.

Meanwhile, mobilization effectively disrupted the workings of the Military Information Division. The natural desire of officers for field service, coupled with the need to stiffen the volunteer troops with regulars, drained the Military Information Division of its uniformed personnel; only 2 officers and 10 civilian clerks were left on duty in Washington when the war came to a close, and all but 5 attaches had returned from their posts abroad. But during the same period the Army's intelligence needs had grown immensely. Following Dewey's victory at Manila, troops had been committed to the Philippines. An intelligence officer accompanied the expedition, but he labored under severe handicaps because the Military Information Division had never made any study of the Far East. Once a Filipino insurrection against American occupiers broke out, the Army in the Philippines was forced to expand its intelligence activities. In 1899 it set up its own independent counterintelligence center, the Bureau of Insurgent Records. Redesignated a year later as the Bureau of Military Information, this organization was not subordinated to the War Department's Military Information Division until 1902.

The lessons of the war with Spain and the imperatives of maintaining a 100,000-man Army to secure America's new empire led to a complete reorganization of the War Department in 1903. As a result, the Army finally acquired a General Staff organization to carry out administrative, intelligence, and planning functions. Six of the forty-four officers on the new War Department General Staff were assigned to its Second Division, which absorbed the Adjutant General's Military Information Division and was given the exclusive mission of collecting foreign intelligence. The arrangement allowed the Army's military information organization to focus its attention on intelligence rather than on the diversity of operational assignments that the Military Information Division had been given in 1892. In 1904 Great Britain belatedly organized its own Army General Staff, adopting precisely the oppo-

site solution: the British combined intelligence with operations in the same staff element.[20]

Four major duties were assigned to the U.S. General Staff's Second Division: collecting and disseminating information on foreign countries; directing the work of the attache system and managing contacts with foreign military attaches in the United States; supervising mapping; and maintaining a reference collection. However, even under the new arrangements, the military information unit still could not perform certain vital intelligence staff functions. First, it had not been given the responsibility for planning Army Intelligence organization and operations in the field; it simply acted as a central point for intelligence-gathering at the War Department level. Second, the organization had no responsibility for security or counterintelligence within the Army. Moreover, the division's small staff was hard pressed to cope with its existing functions, and the War Department General Staff could not give the subject the attention it deemed necessary. Nevertheless, at least some officers had come to realize that the criterion for staffing the new organization should have been the size of the world rather than the size of the Army.

Military Intelligence in the Twentieth Century

The first decade of the twentieth century furnished Army Intelligence with new challenges. Formerly, intelligence officers had concerned themselves with procuring information on the neighboring states in the Western Hemisphere and collecting, on a more or less academic basis, technical intelligence on military developments in Europe. The acquisition of the Philippines had forced the Army to develop a counterintelligence capability in that area. The Army soon realized that the Philippine involvement, together with a growing American commercial and military presence in China, had a wider intelligence impact. America was now a Far Eastern power. This meant that the Army now had to evaluate the military threat of the expanding Japanese Empire. Prejudice against Asian immigrants on the West Coast, which repeatedly jeopardized American-Japanese relations, only reinforced this need. Military observers thus went abroad to supplement attache coverage of the Russo-Japanese War of 1904–1905. In 1907 the Army began to assign officers to Japan for language training and shortly thereafter to China for the same purpose.

Paradoxically, as the Army's need for intelligence increased, the Army's capacity to meet it declined. Between 1903 and America's entry into World War I, the Army's new General Staff strove to find an identity and a suitable role. The Army's intelligence organization was caught up in this bureaucratic maneuvering with unfortunate results. In 1907 the incumbent adjutant general, the autocratic Maj.

[20] Thomas G. Fergusson, *British Military Intelligence, 1870–1914: The Development of a Modern Intelligence Organization* (Frederick, Md.: University Publications of America, 1984), p. 202.

Gen. Frederick Ainsworth, restricted the authority of the Second Division to communicate directly with the attaches overseas, insisting that certain categories of correspondence pass through his office. Then, in 1908 the Third Division of the General Staff, which dealt with contingency and operational planning and was a principal consumer of the Second Division's products, relocated to Washington Barracks (now Fort McNair). Unfortunately, its new and spacious quarters were some miles away from the Second Division's offices in downtown Washington, D.C. This soon caused coordination problems, since the Third Division had only one automobile at its disposal. To satisfy the Third Division's information requirements, the Second Division was in turn moved from its own centrally located offices and banished to Washington Barracks. Incumbent Chief of Staff Maj. Gen. J. Franklin Bell then decided that it was impracticable to have two separate General Staff elements in the same place and directed that the two divisions be merged. The Army's intelligence staff element thereby lost its separate identity.[21]

The result of this reorganization was an unqualified disaster for the intelligence function at the General Staff level. Intelligence was now assigned to the Military Information Committee, all of whose members were preoccupied with numerous other duties. Intelligence was no longer produced for the Army as a whole, but for the War College Division (as the Third Division was later redesignated), and soon it ceased to be produced at all. A few years later, the chief of the War College Division had to confess that because of the press of business, "the collecting, digesting, and filing of military information of foreign countries . . . appears never to have been carried on continuously," and that "the work of attaches is without proper supervision and guidance, and therefore, to a large extent, the value of their work is lost."[22]

The outbreak of revolution in Mexico in 1911 did little to end this situation, although two War College Division captains were eventually detailed to monitor developments and compile what information about the country was available.[23] Still, when American forces landed at Vera Cruz in 1914 they were essentially without intelligence support. Sent down to investigate the situation, Capt. Douglas MacArthur reported back to his superior that "the Intelligence

[21] Maj. Gen. Ralph Van Deman, who headed War Department Military Intelligence for most of World War I, commented that "had there been sufficient automobile transportation it is possible that the disastrous incident . . . would not have occurred." *The Final Memoranda: Major General Ralph Van Deman, U.S.A. Ret., 1865–1952: Father of Military Intelligence*, ed. Ralph J. Weber (Wilmington: Scholarly Resources, 1988), p. 15.

[22] Memo, Brig Gen M. M. Macomb for Chief of Staff, 13 Jul 14, sub: Employment of a Monograph Clerk, Record Group (RG) 165, ser. 5, National Archives and Records Administration (NARA), Washington, D.C. A contemporary observer attributed the eclipse of the intelligence function to a personnel shortage. "The reduction of the General Staff by 12 officers in 1912 had made it impossible for an Intelligence division of any strength to be maintained." Maj Gen Dennis E. Nolan, Memoirs, ch. 4, p. 4, Dennis Nolan Ms, U.S. Army Military History Institute, Carlisle Barracks, Pa.

[23] Ltr, Brig Gen M. M. Macomb to Brig Gen Tasker H. Bliss, 26 Oct 14, Tasker Bliss Ms., Library of Congress (LC), Washington, D.C.

Office established by the Brigade was practically useless for my purpose. There seems to be no logical conception of just what information is needed and as a result its efforts consist largely in accumulating wild and exaggerated reports from a lot of scared and lying American refugees."[24]

The outbreak of general war in Europe also failed to revive the Army's intelligence program, even though the United States was soon on the verge of breaking diplomatic relations with Imperial Germany over the sinking of the *Lusitania*. Although the attache system was now extensive—historian Alfred Vagts has pointed out that only Imperial Russia had as many military attaches as the United States—and although additional military observers were sent to Europe to watch the fighting there, the mechanism for analyzing the reports submitted from overseas was lacking.[25] After 1915 the Military Information Committee was used simply as a bookkeeping device. Congressional appropriations listed the committee as a budget line item, but its membership comprised all War College Division officers engaged in "current General Staff work" as opposed to war plans.[26]

The state of intelligence work in the Army was demonstrated graphically when the War Department was called upon to produce a preparedness plan for Army reorganization in 1915. Preparation of the threat estimate justifying the plan was assigned to Capt. Dennis E. Nolan of the War College Division, who assembled his data from three open source references: a 1914 almanac of the world's armies, a shipping register from the same year, and the Army's own Field Service Regulations. In the interest of simplicity, Nolan decided to ignore the fact that the outbreak of World War I had rendered the information contained in these documents obsolete and changed the whole strategic situation. But by using this material creatively, Nolan demonstrated that Germany, to use only one of his examples, could deploy a force of 435,000 men and 91,457 animals in the United States within 15.8 days of the start of hostilities. Although this estimate served to justify the War Department's plans for a greatly expanded Army, it ignored so many other factors as to pass beyond the bounds of reality.[27]

Although Army Intelligence was collapsing at the center in the period just before American entry into World War I, there were other, more positive developments taking place in the field. These were mostly brought about by Signal Corps initiatives in the areas of communications intelligence, aerial reconnaissance, and communications security. A growing Signal Corps involvement in the

[25] Vagts, *The Military Attache*, p. 34.

[26] *The Final Memoranda*, p. 147.

[27] However, the Epitome of Military Policy produced by the War Department General Staff in 1915 concluded that "the accomplishment of the plan outlined above for the invading force instead of being a noteworthy military achievement would be a commonplace military operation ridiculously easy of accomplishment." John P. Finnegan, *Against the Specter of a Dragon: The Campaign for American Military Preparedness, 1914–1917* (Westport, Conn.: Greenwood Press, 1974), p. 50.

intelligence arena came about by a circuitous route. The Signal Corps had used balloons for meteorological purposes when it had the mission of operating the U.S. Weather Bureau. After the Signal Corps turned over all but the military aspects of the weather function to the Department of Agriculture in 1890, it redirected its aeronautical expertise toward the development of a manned observation balloon. A Signal Corps balloon, the *Santiago*, took part in the fighting in Cuba, where it served chiefly to draw enemy fire. Undeterred, the Signal Corps persevered in this line of development and continued to experiment with the possibilities of aerial observation from a variety of platforms.[28] In the early years of the twentieth century, it made trials of traditional tethered observation balloons, a small powered dirigible, and the new airplane invented by the Wright brothers. In 1909 the Army purchased its first aircraft and by 1915 had a whole squadron.

Similarly, the Signal Corps pioneered the development of wireless for military uses. In 1914 it acquired three "radio tractors," actually White Company motortrucks equipped with radio sets. Although this equipment was procured for communications work, it could easily be adapted to intelligence purposes. Finally, in the field of security, Capt. Parker Hitt became the first Army officer to undertake research in the exotic field of codes and ciphers. In 1916 Hitt produced the first work on cryptology ever published in the United States.[29]

About the same time, other signs of renewed interest in Army Intelligence began to emerge. In March 1916 Maj. Ralph Van Deman, an infantry officer on detail to the War College Division, submitted to his superiors two multipage memorandums on the subject. Van Deman had served with the former Military Information Division both in Washington and in the Philippines, performed undercover work in China, and held an intelligence position on his previous General Staff assignment from 1907 to 1910. Upon returning to Washington, he expressed his dismay at the extent to which the General Staff had allowed its intelligence function to lapse. Van Deman pointed out that information was no longer "collected—it just comes in. . . . But even such information as does come in, is not studied and checked. . . . As far as any benefit to the Government is concerned, the mass of this information might just as well be in Timbuctoo. It will remain in the Record Section unavailable to the end of time."[30] What the Army needed, Van Deman felt, was a separate division of the General Staff to deal exclusively with military information.[31] Although this report had no immediate effect, in April the acting chief of staff

of the Army ordered intelligence officers to be posted in the Army's four continental United States and two overseas geographic departments. In addition to supporting their own commanders, these officers would report back to the Military Intelligence Committee. Even before this step had been taken, the Army found it had new requirements for intelligence.

In March 1916 the forces of Mexican bandit leader Pancho Villa raided Columbus, New Mexico, inflicting loss on troopers of the 13th Cavalry and causing civilian casualties. In response, the Wilson administration ordered Brig. Gen. John J. Pershing to lead a punitive expedition into Mexico to hunt down Villa's guerrilla band. Subsequently Pershing's forces deployed the widest range of intelligence assets which the Army had yet managed to field.

During the American foray into Mexico, traditional collection mechanisms were augmented by newly emerging technologies. Pershing's intelligence officer, Maj. James A. Ryan, organized a highly effective "service of information" that gave Pershing a good knowledge of northern Mexico. Ryan made use of local informants, supplemented by the Army's own reconnaissance capabilities. These were extensive. A large part of the force consisted of horse cavalry, and for the last time in its history the Army fielded a force of twenty Apache Indian scouts. In addition, the Punitive Expedition was accompanied by the aircraft of the Army's 1st Aero Squadron, commanded by Maj. Benjamin Foulois, the first Army officer to learn to fly. The squadron attempted aerial reconnaissance and even brought along an aerial camera, although little came of these efforts. The planes were too underpowered to fly over the mountain ranges of Mexico and all eight initially assigned to the expedition crashed within two months.[32]

Finally, motor vehicles appeared in an intelligence role for the first time in the Army's history. Pershing's expedition was not only supported logistically by trucks, but also used a few for intelligence collection. Although rugged Mexican terrain and the limitations of the early motor vehicle meant that ground reconnaissance still depended on horse cavalry, the "radio tractors" of the Signal Corps deployed with Pershing's forces monitored Mexican government communications as Mexican authorities became increasingly alarmed at the American probe, which soon extended 500 miles into their sovereign territory. Although the Punitive Expedition was a limited success—Villa's troops were engaged and scattered, but the leader himself escaped, and war with Mexico almost ensued—it was a milestone in the Army's use of multisource intelligence.

On 1 February 1917, the Mexican problem was suddenly eclipsed by the German decision to wage unrestricted warfare against all vessels carrying supplies to the Allied Powers. In addition to threatening America's capacity to export, this act defied the principles of neutral rights, which the Wilson admin-

istration had upheld since the beginning of World War I. As the United States teetered on the brink of war, all War College students were relieved of their normal duties and instructed to familiarize themselves with attache reports relating to the war in Europe. At the same time, Secretary of War Newton Baker recommended that each state appoint a National Guard officer to receive intelligence training.[33] However, when Congress finally declared war against Germany on 6 April 1917, the U.S. Army still had no intelligence organization. The Army essentially was moving blindly into the greatest foreign conflict in its history.

2

World War I

The United States entered World War I almost completely unprepared: the National Defense Act which Congress had passed in 1916 had provided the basis of a mobilization plan, not an actual army. In early 1917 the country had only 210,000 men under arms, a third of them National Guardsmen who had been called up the previous summer to serve on the Mexican border. The Army had no permanent tactical organization above the level of the regiment and lacked adequate quantities of artillery, machine guns, tanks, modern aircraft, and even gas masks. Its General Staff organization was not designed to cope with the logistical and operational problems presented by a major conflict, and at the direction of the Wilson administration it had made no war plans. The Army had no intelligence organization.

Within seventeen months, however, the country had transformed itself into a fighting machine. With the help of the draft, the United States raised an Army of 4 million men; half of this great force was transported to France, where it provided the decisive margin that led to victory over Imperial Germany and its allies. American industry was also mobilized for war, but not soon enough, forcing Britain and France to supply the American Expeditionary Forces (AEF) in France with almost all required tanks, planes, and artillery. The General Staff was repeatedly restructured and finally became an effective instrument of control. And under the pressures of war, the Army was forced to develop new intelligence capabilities.

The development of Army Intelligence in World War I proceeded along two parallel but more or less separate tracks. At the War Department level, intelligence work was revived; by the end of the war, Military Intelligence had become a full-fledged staff element as one of four operating divisions of the General Staff. Concurrently, General John J. Pershing, commander of the AEF, built up his own field intelligence organization, structured along rather different lines to meet tactical needs. Pershing's ideas on Army reorganization and on the need for an intelligence apparatus were adopted by the War Department in organizing troop units and ultimately provided the basis for reorganization of the General Staff itself.

Van Deman and Military Intelligence

At the War Department level, the individual most responsible for rebuilding an intelligence apparatus was Maj. Ralph Van Deman, the General Staff officer who had lobbied vigorously but unproductively in the years before the war to re-create the Army's capabilities in this area. In 1917, with the United States at war, Van Deman tried again. He submitted a formal recommendation to Maj. Gen. Hugh Scott, the Army's chief of staff, urging the War Department to establish a Military Intelligence Division. This initiative was strongly supported by Van Deman's immediate superior, Brig. Gen. Joseph Kuhn, chief of the War College Division.[1] Unfortunately, the chief of staff was not receptive. Scott was an old-time cavalryman with an encyclopedic knowledge of Indian sign languages and a deep interest in packsaddles, but his former commander in chief, President William Howard Taft, had described his intellectual abilities as "wood to the middle of his head." By 1917 he was demonstrating a disconcerting tendency to fall asleep at Cabinet meetings.[2] Scott simply believed that the Army had no need for an intelligence organization: since America was now fighting a war as an ally of Great Britain and France, the United States could acquire whatever intelligence it needed from them.

Undeterred, Van Deman decided to adopt different tactics, employing what British military analyst Basil Liddell Hart would later describe in another context as the "indirect approach."[3] Using such diverse contacts as a lady novelist and the police chief of Washington, D.C., as intermediaries, Van Deman discreetly lobbied Secretary of War Newton D. Baker. Baker proved to be more receptive to the major's ideas, and on 3 May 1917, the War College Division replaced its moribund Military Information Committee with the Military Information Section headed by Van Deman.[4] Although far from an ideal organizational setup, with Military Intelligence subordinated to what was essentially a planning organization, it was at least a beginning.

The Military Intelligence Section began modestly, with Van Deman, two other officers (one retired), and two civilian clerks. Initially, its office space was confined to a balcony overlooking the War College Division's library. At first it had no data files, since the information collected by the old Military Information Division had been merged into the War College Division's general files and remained there, effectively lost. Its responsibilities, however, were considerable. In addition to supervising the existing Army attache system and

[4] In his memoirs, Van Deman highlights his own role in bringing about the rebirth of Army Intelligence. *The Final Memoranda*, pp. 21–23. Marc Powe finds substantial continuities between the old Military Information Division and Van Deman's organization. *The Emergence of the War Department Intelligence Agency*, pp. 77–81, 102–03.

developing policies and plans for Army Intelligence activities, Van Deman's organization was charged with "the supervision and control of such system of military espionage and counterespionage as shall be established . . . during the continuance of the present war."[5] The section was thus not only to serve as a staff element but was also to perform operating functions.

In the beginning, Van Deman's organization depended heavily on the British and the French, who supplied it with watch lists of suspected enemy sympathizers and basic organizational concepts. From the British, Van Deman borrowed the fundamental division of intelligence into "positive" and "negative." Positive intelligence consisted of collecting information from the enemy; negative intelligence consisted of denying the enemy intelligence about one's own forces. An important part of negative intelligence was "counterespionage," another new word in the Army's growing intelligence vocabulary, this one borrowed from the French.

Doctrine and data could be borrowed from abroad, but personnel could not. Because of the demand for regular officers in combat assignments, no more than six regulars were available for intelligence duties at the General Staff during the whole war. To obtain additional competent personnel for his own organization, Van Deman used an informal "old boys" network that recommended civilians for direct commissions, a practice not uncommon in the World War I Army. Initially, many of these men were commissioned in the Signal Corps, since there were unused officer billets in the Aviation Section of that branch. Later, intelligence officers were hastily commissioned in whatever Army branch could afford to give up a few of its slots.

The buildup of the Military Intelligence element of the War Department General Staff took place at the same time that hundreds of additional intelligence officers had to be found for the Army's divisions and subordinate units. In July 1917 Pershing and the War Department agreed that intelligence staffs had to be provided to units down to the battalion level. Logically, this was an area in which the General Staff's intelligence organization should have had an interest. However, the Military Intelligence Section was too small to supervise the procurement and training of intelligence personnel for the field army. Instead, this was accomplished through normal Army channels. The process began in July 1917, when the adjutant general directed departmental commanders to select 160 specially qualified men from the newly established officer training camps for intelligence assignments. The ideal individual, the adjutant general advised, was a "young college instructor" with language ability.[6] The Signal Corps trained intercept operators and photo interpreters, and the Corps of Engineers trained topographic personnel. The Military Intelligence Section did process

applications for the Corps of Interpreters, a new Army organization of officers and noncommissioned officers set up in July 1917 to handle the Army's language functions. Later, it procured enlisted counterintelligence specialists.

Intelligence Operations

The General Staff's former Second Division had confined its efforts to gathering positive intelligence, employing the Army's military attache system to collect scientific, technical, and geographic data from abroad. Although the Military Intelligence Section was responsible for the lapsed functions of the older organization, it got off to a curiously slow start in collecting foreign intelligence. Until the end of 1917, only one officer was assigned to the task, and the principal target was Mexico. However, as his organization enlarged Van Deman was able to direct greater resources to this area. In doing so, Military Intelligence gained a broader definition. In addition to accumulating data on the military situation abroad, the Army began to collect information on economic, social, political, and even psychological factors worldwide. World War I was a global conflict fought between entire industrialized societies, where victory depended on more than military factors; the fighting armies were only the cutting edges of much larger swords. The War Department's Military Intelligence staff element thus became the functional equivalent of today's Central Intelligence Agency.

However, the War Department's efforts at collecting foreign intelligence were somewhat overshadowed by the fact that the AEF's general headquarters (GHQ) in France was 3,000 miles nearer the enemy and in a much better position to gather information on the European theater. Pershing had already established his own intelligence staff element, and this functioned almost autonomously. The great distances between the two separate organizations discouraged collaboration, as did Pershing's belief that he was responsible for the conduct of the war and that the only function of the War Department was to furnish him with the troops and supplies he needed.

Because of this, Van Deman directed much of his attention to the new field of negative intelligence, or counterintelligence.[7] This was an area in which the Army had little previous experience. Although the Army had conducted counterintelligence work during the Philippine insurrection, not since the Civil War had it contended with the problems of espionage, sabotage, or subversion in the continental United States. However, when the United States joined the war against Germany in 1917, it appeared that the country confronted a substantial threat from within. The America that entered World War I was still a nation of

[7] It should be noted that Van Deman's first intelligence assignment, in the Philippines, had been as a counterintelligence officer fighting insurrectos. There, he had "synthesized reports, analyzed captured documents, and provided pictures and descriptions of known revolutionaries." Brian McAllister Lynn, *The U.S. Army and Counterinsurgency in the Philippine War, 1899–1902* (Charlotte: University of North Carolina Press, 1989), p. 155.

immigrants, many newly arrived. German Americans were particularly suspect, but the War Department was also concerned about the loyalties of Irish Americans, Scandinavian Americans, and African Americans. In addition to the problems that might be posed by unassimilated ethnics, there was a substantial antiwar movement. Finally, opinion-makers at the outbreak of war had exaggerated ideas about the scope and power of the German espionage and sabotage organization within the country.

In 1917 the United States seemed almost defenseless against these perceived enemies from within. The Treasury Department had a Secret Service, but it was confined by law to narrowly circumscribed duties. The Department of Justice maintained the Bureau of Investigation, but the bureau's duties before the outbreak of war had largely consisted of investigating cases of fraud against the government. A few major cities had organized police "bomb squads" to deal with the anarchist threat of the period. The almost total lack of civilian resources in the field spurred the Army to launch its own major and wide-sweeping counterintelligence program.

In June 1917 Van Deman took his first step, setting up a War Department security force of civilian investigators drawn from the ranks of the New York Police Department's Neutrality and Bomb Squad. Its operations were cloaked in secrecy, with members working from a private office building in Washington, D.C., under the enigmatic designation "Personnel Improvement Bureau." At first intended as a guard force, the unit soon began screening military personnel and applicants for government employment. A month later, the Military Intelligence Section opened its first field office in New York City, also staffed by former New York City policemen. Six additional field offices were subsequently set up in other major cities and embarkation points to provide counterintelligence coverage.

This was only the beginning. The Military Intelligence Section was concerned particularly with the problem of possible subversion within the vast new citizen forces being raised by the draft. The draft act which Congress passed in May 1917 had been designed to tap as much of the national manpower pool as possible. Granting few exemptions, the act impartially swept up American citizens and resident foreign nationals, including citizens of enemy countries. Regarding this heterogeneous force as posing a serious threat to national security, Van Deman believed that the newly forming National Guard and National Army divisions were infested with German agents and sympathizers.[8] In October 1917 he ordered the divisional intelligence officers just assigned to these units to come to Washington, D.C., under tight security. Upon reporting, the officers were instructed to set up a secret surveillance program within their

[8] Intelligence officers professed to fear that "unless we proceed on an extensive and thorough scale, the enemy, with his existing system in the United States, will be stronger than we are right in our own army and we will be helpless." War Department General Staff, War College Division (WCD), MI-3, Provisional Counter Espionage Instructions, WCD 10148-37, INSCOM archives, Fort Belvoir, Va., Feb 1918, p. 3.

divisions. The program was later extended to Regular Army divisions and fixed installations with the assistance of a confidential pamphlet, "Provisional Counter-Espionage Instructions," drawn up by Van Deman's staff.

Van Deman conceived a comprehensive counterespionage program. It envisaged the creation of a clandestine agent network extending throughout the Army down to company level. Nets in each division would be managed by an assistant to the divisional intelligence officer. He would work through a system of anonymous collection managers known only to himself and to their own immediate superiors and subordinates within the apparatus. At the bottom of this secret pyramid, "operatives" placed in every company would submit intelligence reports on their fellow soldiers. At least two operatives, mutually unknown to one another, would be recruited from each company.[9] Reports emanating from this organization would be relayed by the divisional intelligence officer to the Military Intelligence staff in Washington for investigation.

Once this system was in place, it produced a growing stream of incident reports that drove the relentless expansion of the War Department's counterintelligence organization. To supplement the efforts of his overextended force of intelligence officers, Van Deman hired additional civilian detectives, recruited unpaid volunteers, and soon found a fresh source of investigative manpower in the enlisted counterintelligence specialists of a completely new military organization, the Corps of Intelligence Police.

The Corps of Intelligence Police (CIP)

The stimulus for the creation of this corps of enlisted investigators had originally come from the AEF. Soon after his arrival in Europe, Maj. Dennis E. Nolan, Pershing's intelligence officer, had become concerned about the possible security problems faced by American troops fighting on foreign soil. In 1915 Nolan had written alarmingly about the possibilities of German invasion; now his work took on a more concrete form. In early July 1917 he requested that the adjutant general provide him fifty company grade officers proficient in foreign languages. In addition, Nolan asked for "fifty secret service men who have had training in police work [and] speak French fluently."[10] This called for a category of intelligence personnel not previously imagined by anybody in the War Department, but in August the acting chief of staff authorized the creation of a fifty-man Corps of Intelligence Police made up of enlisted soldiers who would serve with the "rank, pay, and allowances" of sergeants of infantry.[11]

---

9 Ibid.

10 History of the Counter Intelligence Corps, vol. 3, p. 3.

11 As was later pointed out, the title of the organization was a little anomalous. "It was a 'Corps' that was not a 'Corps.' It was a 'counterintelligence' organization but called an 'Intelligence' organization and it was called 'Police' when it had no interest in crime, as such, and no police power." History of the Counter Intelligence Corps, vol. 3, p. 114.

Tasked with furnishing the appropriate personnel, Van Deman ran into difficulties. Private detective agencies seemed a likely source at first, but when told of the Army's requirements for French-speaking investigators, the head of the Pinkerton Agency countered, "There ain't no such animal."[12] The War Department was reduced to recruiting the first CIP agents through newspaper advertisements. The first contingent was assembled at Fort Jay in New York Harbor, given a month's training as infantry, outfitted with distinctive green-corded campaign hats, and shipped to France without civilian clothes or any instruction in intelligence work. Once overseas, the group was screened by French authorities, who rejected many as undesirables. Those who passed muster were then bustled off to Le Havre for instruction by veteran Allied counterintelligence officers.[13]

The initial group was not promising, but the need for enlisted counterintelligence specialists remained, and the formation of the CIP had set a precedent. The Military Intelligence Section found it increasingly difficult to staff its headquarters and expanding network of field offices with the existing mix of freshly commissioned reserve officers, civilian volunteers, and hired detectives. Officers were a scarce commodity, and competent civilian investigators were hard to find, especially since the War Department paid them only $4 a day plus expenses. Thus it seemed logical for Van Deman's organization to turn to the enlisted ranks of the Army to solve the personnel problems in the counterintelligence arena. The iron broom of the draft had swept highly qualified people into the ranks of the Army; men experienced in law, teaching, or insurance investigation were especially fit for counterintelligence work. Additionally, the military thought that investigations of Army personnel could be carried out most appropriately by other soldiers. In November the Military Intelligence Section requested that it be allotted 250 CIP agents to assist its counterintelligence program. Many of the civilians previously employed by Van Deman promptly enlisted in the Corps of Intelligence Police, including the twenty-three former policemen in the New York Field Office.

Expansion

The expansion of Van Deman's organization, largely driven by operational responsibilities in the counterintelligence field, in turn forced a growing specialization within the Military Intelligence staff. It was no longer possible for Van Deman and a small group of assistants to deal interchangeably with all aspects of positive and negative intelligence. The whole operation had to be put under a

bureaucratic regimen. Between December 1917 and January 1918, Van Deman divided his organization into functional subsections, all according to the British practice with which he was now familiar. As the organization grew larger and more complex, it achieved a position of greater prominence within the War Department. In February, following a reorganization of the General Staff, the Military Intelligence Section was upgraded in status, becoming a branch of the newly established Executive Division. Since the Executive Division was burdened with diverse responsibilities, the reorganization was less than perfect. As one knowledgeable officer put it, its chief "could not know and would not know what MI was doing . . . when MI papers came up to him, they were like Greek to him."[14] In March the Military Intelligence Branch, overcrowded at the War College, moved to a seven-story apartment building in downtown Washington, D.C., where it was at least in closer proximity to the Army's center of administrative power.

The Military Intelligence Branch initially consisted of eight numbered sections. MI–1, MI–5, MI–6, and MI–7 were responsible for carrying out general support functions in the respective areas of administration, publications, translation, and management of confidential files. Later, MI–7 assumed responsibility for graphics. At first there was only one section, MI–2, exclusively dedicated to collating foreign intelligence, although MI–5 soon received the new mission of coordinating the collection efforts of the attaches. Two other sections were set up to manage aspects of counterintelligence: MI–3, which handled counterespionage in the military services, and MI–4, which dealt with civilian subversion.[15] MI–3 worked closely with over 400 divisional and installation intelligence officers who supervised the clandestine counterespionage system. Other subelements served specialized needs: administering the District of Columbia field office, dealing with the specific counterintelligence problems presented by foreign-born draftees, and overseeing programs that dealt with particularly sensitive Army branches such as the Air Service and the Chemical Corps. Thousands of investigations were conducted, but contrary to early fears, only a relatively small number of troops had to be removed. The draft-raised Army was loyal.

In addition to policing the Army's own ranks, Van Deman was concerned that spies and agitators in the civilian community might also threaten the Army or at least its mobilization base. At the same time that MI–3 was created, MI–4 came into existence to handle counterintelligence in the civilian sector. This section sought to cope with broad and ill-defined threats, initially concerning itself with labor unrest in the West, racial disturbances in the South and Southwest, and foreign disaffection in the polyglot cities of the East. Its operative premise

[15] Bruce W. Bidwell, *History of the Military Intelligence Division, Department of the Army General Staff, 1775–1941* (Frederick, Md.: University Publications of America, 1986), p. 123.

was that "the misbehavior, disloyalty, or indifference of native Americans is as important a material of military intelligence as any other."[16] At one time or another, the organization involved itself in deportation cases, sabotage by organized labor, enemy finance and trade, and counterespionage work abroad.

To carry out its duties, MI–4 had to conduct an active liaison with many other government agencies, especially the Department of Justice, which alone had powers of arrest and prosecution in cases of civilian offenses against the military. MI–4 also relied on two civilian auxiliaries, the Plant Protective Service and the American Protective League. The Plant Protective Service was an organization of undercover civilian operatives originally established by the chief signal officer to protect the country's new aircraft industry. Subsequently it spread to other private plants working under government contract. Almost inevitably, the organization came under the aegis of Military Intelligence.

The American Protective League, larger and less official in character, comprised several vigilante groups originally put together to help the Department of Justice uncover spies. Once in place, it also began to assist local authorities in enforcing the draft act, and its activities brought it into a close working relationship with MI–4. The Army sought to curb the organization's excesses while still making use of its thousands of members: estimates of the league's strength ranged between 60,000 and 200,000, with the organization itself favoring the latter number. Ultimately, top American Protective League leaders were commissioned as officers in MI–4 to enhance military control over the league's activities. Although such paramilitary organizations appear alien to the American tradition, similar organizations existed in Great Britain and France, reflecting the intense and sometimes excessive nationalism of the period.

In addition to his pioneering work in establishing an Army counterintelligence organization, Van Deman also involved Army Intelligence in the exotic world of codes and ciphers. This was an area in which the Army as a whole already had some experience. Ciphers had been used in the Civil War, and the War Department had employed a telegraph code since 1885. More recently, in 1916, the Signal Corps' Capt. Parker Hitt had published a manual on military cryptography. However, it was Van Deman who made cryptology an adjunct of Military Intelligence. One of his first acts after setting up the Military Intelligence Section was to secure a commission for a youngish State Department code clerk, Herbert O. Yardley, so Yardley could head up a Cipher Bureau for Van Deman's organization. Although Hitt and a few other Regular Army officers possessed the necessary expertise in this field, all of them were needed for other duties when war broke out.

The Cipher Bureau, later redesignated MI–8, soon found itself caught up in a multiplicity of projects. Van Deman quickly saw that the Army had no means

---

16 War Department General Staff, Military Intelligence Division, *The Functions of the Military Intelligence Division, General Staff* (Washington, D.C.: Government Printing Office, 1918), p. 18.

of secure communications. The War Department Telegraph Code of 1915 in use for Army administrative communications was a cumbrous work designed to save telegraph costs rather than to provide security, and in any case, it was probable that the Germans already possessed a copy of the code book. Yardley's bureau was hastily directed to devise new enciphering tables for the code that once more made it practical for secret messages. MI–8 then prepared a completely new code that Military Intelligence as well as the rest of the Army could use. Regrettably, this was compromised as soon as it was issued, and a new code could not be prepared before Armistice Day. However, MI–8's own communications system, which made use of the new enciphering tables, remained secure and was used throughout the war as a channel to transmit messages from the secretary of war and the chief of staff to the field.

MI–8 was to have more success in breaking codes than in making them. It soon began to attack agent communications. This led Yardley's unit into the arcane world of secret inks, regarding which the British provided help and advice. It was forced also to learn to read the diverse systems of shorthand employed in the United States and abroad.[17]

MI–8's increasing responsibilities, together with the AEF's anticipated requirements in the area of codes, soon created a demand for trained cryptologic personnel. To meet the need, the Army turned to the only organization in the United States with cryptanalytic expertise. This was Riverbank Laboratories, a private research foundation set up by the eccentric philanthropist George Fabyan in Geneva, Illinois.[18] One of Fabyan's hobbies was attempting to prove that Shakespeare's plays contained hidden cipher messages revealing that the works had actually been written by Sir Francis Bacon. Fabyan was wrong—no such cipher existed—but his obsession had led to the creation of a center for cryptanalysis at Riverbank. This organization trained three classes of Army cryptanalysts in late 1917 and early 1918. The arrangement ended only when MI–8 developed its own training program. Ultimately, two Riverbank instructors accepted Army commissions and went to France as cryptanalysts with the AEF.

The cryptanalytic side of its work soon led MI–8 into other fields. To supplement physical interception of German messages, it established a radio intelligence service using selected Signal Corps personnel. These specialists monitored German diplomatic and agent communications, initially employing a chain of fourteen "radio tractors" strung out along the Mexican border and later using fixed intercept sites in the same locations. The radio intelligence service also had a large fixed station at Houlton, Maine, that monitored transatlantic German diplomatic communications.

The Military Intelligence Division

In April 1918 General Peyton C. March was recalled from France to become the new Army chief of staff. In June he ordered Van Deman, now a colonel, to go to Europe to inspect the intelligence operations of the AEF. Van Deman left behind a functioning Military Intelligence organization that had a strength of 170 officers and hundreds of enlisted agents and civilians and was still growing. The expansion forced the War Department to again move its intelligence headquarters, this time to the Hooe Building in Washington, D.C. However, the full development of the wartime Army Intelligence organization was not yet complete. Military Intelligence reached its final organizational development in World War I as a result of March's experiences with Pershing's AEF.

In August 1918 March restructured the General Staff, in the process raising the intelligence function to the status it enjoyed in France. He established the Military Intelligence Division (MID) as one of the four principal divisions of the War Department General Staff. The new division's enhanced prestige and responsibilities meant that Van Deman's successor, a Field Artillery lieutenant colonel from the AEF with the glorious name of Marlborough Churchill, was advanced to the rank of brigadier general. With these changes Military Intelligence had finally reached the position of institutional equality on the Army Staff that Van Deman had long advocated. In turn, this elevation in status permitted a more elaborate form of organization, with Positive and Negative Branches now controlling the various numbered sections.

One of the motives for the establishment of MID was March's desire to create an organization that could bring Army Intelligence training in the continental United States into line with the needs of the AEF. Military Intelligence had heretofore neglected this area for a number of reasons, including its limited charter, its concentration on counterintelligence activities, and its lack of jurisdiction over training. The perceived deficiencies of training in the United States had previously led Pershing to demand that all commanders and staff officers, including intelligence officers, spend a lengthy period in France prior to the arrival of their divisions. To help rectify this situation, MID recalled an experienced intelligence officer from France to head a new Field Intelligence Section, MI–9, that would provide MID input to the training camps. However, the war ended before the plans devised by the new element could be put into effect.

In the meantime, MID's counterintelligence operations underwent a further expansion. The Negative Branch extended the scope of its operations across the seas in September 1918, taking over supervision of the counterintelligence operations of military attaches. It also created a new section to handle passport control duties previously shared jointly by MI–3 and MI–4. The State Department had primary jurisdiction over foreign travel by American citizens, but MID also wanted to screen all individuals traveling to Europe. Military Intelligence was particularly interested in checking the backgrounds of the large

numbers of welfare workers sent overseas to support the AEF by the Red Cross, the YMCA, the Salvation Army, and other organizations.

The same month, MID also gained control over military censorship within the continental United States, setting up another new section, MI–10, to handle the assignment. Originally, Army censorship had been regarded as an independent function under a chief military censor, partially out of deference to the American tradition of freedom of speech. However, the general Army reorganization of August 1918 had made this an intelligence responsibility. MI–10's activities soon encompassed a wide variety of fields—in addition to censoring military mail and Army photographs, the organization also supervised a system of voluntary press censorship, ran a newspaper clipping bureau, accredited newspaper correspondents, monitored telephone and telegraph lines running into neutral Mexico, assumed direction of the radio intelligence service, and maintained liaison with other government departments. All this demanded a heavy commitment of personnel, and by the end of the war 300 people were on duty with MI–10.

In two areas the Negative Branch ventured completely beyond the normally defined boundaries of intelligence activity. The branch became involved in investigating graft and fraud within the Army and in finding ways to enhance military morale. In both cases, the transfer of these functions to intelligence came by default. Although the quartermaster general was originally assigned to deal with cases of graft and fraud, he had no trained investigative personnel. As a result, MI–13 was organized in August 1918 to assume the mission. The problem of Army morale was added to the MID agenda when Corps of Intelligence Police investigators included instances of low morale in their intelligence reports. Since MID had discovered the problem, it seemed appropriate to some members of the Army Staff that the division find a way to counter it. In this case, however, MID was able to reassign the function to a separate Military Morale Section of the General Staff in November 1918.

The armistice finally ended the headlong and rather undisciplined expansion of MID's activities. By this time, 282 officers, 250 CIP agents, and 1,100 civilians were on its staff. Van Deman's labors had succeeded in building up a massive intelligence organization that doubtless surpassed his wildest expectations. The establishment of MID had restored the intelligence function to the level of the General Staff, where it would remain from then on. However, in the process it had acquired broad ancillary functions the precise boundaries of which had yet to be defined rationally.

The American Expeditionary Forces in France

The American Expeditionary Forces in France built up an intelligence organization parallel, but not completely similar, to MID. When Pershing took command of the AEF, he designated Maj. Dennis E. Nolan as his intelligence officer.

Once in Europe, Pershing decided to adopt the French staff system throughout the AEF. Intelligence became the second section, or "G–2," of Pershing's headquarters staff. Intelligence thus achieved a position of equality with other functional areas in the AEF a year before it would do so at the General Staff level in the continental United States, and Nolan ultimately became a brigadier general.

Pershing arrived in France in June 1917 with a small headquarters and a hastily formed division of infantry. By November 1918 the AEF had grown to a force of twenty-nine combat divisions and had opened its own front against the armies of Imperial Germany. The expansion and elaboration of the Army Intelligence structure ran hand in hand with the growth of the AEF it supported.[19] Initially the AEF heavily depended on help from the British and French in this field as in many others. Intelligence officers assigned to document exploitation and prisoner-of-war interrogation were trained at the British intelligence school at Harrow until August 1918, when the AEF finally opened its own intelligence school at Langres, France. Students at Langres were provided with the unique opportunity to interrogate real prisoners of war as part of their training. From the start, the AEF trained its own photo interpreters and intercept operators.

By the end of the war, G–2 at Pershing's Chaumont headquarters had grown to a full-fledged theater intelligence center, engaging in a span of activities that was even broader than that of the Military Intelligence Division in Washington, since it also supervised deception operations and actively managed a propaganda campaign. In contrast, the work of MID's "psychological" subsection concentrated on coordination and training. The intelligence operations of Pershing's G–2 staff also overlapped and duplicated those of MID, because it produced its own political and economic intelligence as well as dealing in combat intelligence. Pershing considered that as a theater commander, his legitimate intelligence interests extended beyond the immediate Western front to cover developments on the Eastern, Macedonian, and Italian fronts. In Pershing's mind, any overlap with the activities of MID in the continental United States was justified because MID was an ocean away from the main battle and the transatlantic cable system had limited capacities.

The capstone of the intelligence pyramid, the Military Information Division, or G–2–A, produced finished intelligence reports and studies from the mass of information available from the AEF's tactical units and the other divisions of G–2.[20] The division was able to draw upon the full range of intelligence disciplines (human, photographic, and signals) to supply combat intelligence, and it also produced political and economic intelligence, mostly from open sources. The production activities of G–2–A had the result of involving the organization

19 There has never been a scholarly study of intelligence work in the AEF. British Military Intelligence in World War I has been better served. See Michael Occleshaw, *Armour Against Fate: British Military Intelligence in the First World War* (London: Columbus Books, 1990).

20 Reminiscences of the order of battle specialist on Pershing's G–2 staff are contained in Samuel T. Hubbard, *Memoirs of a Staff Officer* (Tuckahoe, N.Y.: Cardinal Associates, Inc., 1959).

in areas outside the field of pure intelligence: by the summer of 1918 G–2–A was also releasing the Army's daily public affairs communique and furnishing the War Department with a daily informational cable.

The base of this intelligence pyramid within the AEF began at the level of the battalion, the smallest unit with an intelligence staff officer, the S–2, and dedicated intelligence collection personnel.[21] In addition to its S–2, each infantry battalion had a reconnaissance element consisting initially of 1 officer and 28 enlisted men, including 15 scouts, 11 observation post personnel, and 2 snipers. At the next level of the command structure was a regimental intelligence officer, with 8 additional observers at his disposal. Brigades were not authorized intelligence officers under the original scheme of organization, but in practice intelligence personnel were frequently detailed to these commands.

At the division level, there was a small intelligence section headed by the divisional G–2, who was assisted by a deputy for combat intelligence, a commissioned interpreter, a topographic officer, and various enlisted personnel. This was the initial level for interrogating prisoners of war and collecting enemy documents. Ground observation at this echelon was supplemented by spotting reports from Army Air Service balloons forwarded through division artillery channels. Under World War I conditions, divisions were responsible for keeping watch over the section of enemy front opposite them for a depth of two miles. In practice, however, the length and breadth of a division's span of interest was often much larger.

Balloons were used primarily for observing artillery fire, but balloon units also provided intelligence, especially under the static conditions of trench warfare that prevailed on the Western front.[22] The main disadvantages of balloons were their vulnerability and their requirement for support personnel. A balloon in combat had an estimated life expectancy of fifteen minutes; although fliers did not wear parachutes in World War I, balloonists did. It took a full company of 178 men to service a single balloon, because it took many hands to deploy a balloon in a breeze and because each company was also responsible for manning six antiaircraft machine guns to defend its fragile aerial asset.

The intelligence officer at corps level used a wider array of resources that allowed him to take responsibility for surveillance of the area between two and five miles beyond the enemy's forward line of troops. In addition to observation posts and balloons, he used aero squadrons equipped for visual and photo-

Nolan, Dictation of March 2, 1935: Echelons of Intelligence from the Front Line Back to G.H.Q., Nolan Ms, U.S. Army Military History Institute; Intelligence Regulations, American Expeditionary Forces, Aug 1918.

22 Balloons could ascend to an altitude of 4,500 feet, allowing observers to watch enemy positions eight miles away. Richard P. Weinert, *A History of Army Aviation, 1950–1962: Phase I: 1950–1954* (Fort Monroe, Va.: U.S. Army Continental Army Command, 1971), p. 2.

graphic reconnaissance and sometimes even flash- and sound-ranging troops who detected and targeted enemy batteries. These were under the command of the corps artillery headquarters but under the staff supervision of G–2. Five of the seven corps that the AEF committed to combat were supported by such troops.[23] The corps also had its own dedicated counterintelligence element consisting of twelve Corps of Intelligence Police sergeants.

The most sophisticated intelligence resources were concentrated in the field armies formed in mid-1918 and at GHQ, Chaumont. Each of the two field armies in the AEF had additional aerial reconnaissance units, including some that could operate at night.[24] A topographic battalion allowed the army-level intelligence staff to draw up large-scale war maps, termed *plans directeurs* in the jargon of the day. Each Army Intelligence staff also contained a radio intelligence section that translated intercepted enemy messages. A larger radio intelligence element at GHQ engaged in cryptanalysis and supplied the subordinate Army sections with the necessary keying material to decode the messages. Intercept was provided by Signal Corps personnel who operated direction-finding and intercept equipment and manned listening posts directed against low-level enemy telephone and ground telegraph communications, a task facilitated by the use of induction coils rather than by direct wiretaps.[25]

Pershing's radio intelligence organization not only monitored enemy ground communications, but also could track the movements of enemy spotter aircraft through their transmissions. Searchlight platoons of the 56th Engineers attached to the AEF's Antiaircraft Service provided early warning of night air attacks. These units were equipped with multihorn and parabolic acoustical detectors that alerted crews to the approach of aircraft before they were in visual range.[26]

At the top of this layered intelligence structure was G–2–A at Chaumont, which processed and analyzed the information sent up from lower levels. Its efforts were supplemented by those of three other, more specialized, divisions of G–2. The "secret service," G–2–B, supervised both undercover collection operations and counterintelligence. Although most of the intelligence obtained by Pershing's headquarters about political and economic develop-

[23] A participant documented this specialized technical activity in Edward A. Trueblood, *Observations of an American Soldier During His Service with the AEF in France in the Flash Ranging Service* (Sacramento, Calif.: News Publishing, 1919).

[24] The AEF experience produced the first clash between ground commanders and airmen over the priority to be given aerial reconnaissance. It would not be the last. Interestingly enough, the recalcitrant aviator was Col. William Mitchell. See Maj Gen Dennis E. Nolan, Dictation 38, p. 17 (1–31–36), Nolan Ms, U.S. Army Military History Institute.

[25] War Department, Office of the Chief Signal Officer, *Final Report of the Radio Intelligence Section, General Staff, General Headquarters, American Expeditionary Forces* (Washington, D.C.: Office of the Chief Signal Officer, 1935). An anecdotal treatment of these activities can be found in E. Alexander Powell, *The Army Behind the Army* (New York: Charles Scribner's Sons, 1919), pp. 16–22.

[26] William Barclay Parson, *The American Engineers in France* (New York: D. Appleton and Co., 1920), pp. 256–61.

ments in Germany came from open sources, G–2–B did set up "information centers" in Switzerland, Denmark, and Holland that ran agent nets behind the enemy lines. The most valuable contribution of clandestine intelligence probably came from the reports of the "trainwatchers" who monitored rail movements of the German army.[27] G–2–B's information centers competed directly with the MID-directed activities of the military attache offices in the same neutral countries and depended heavily on British and French assistance. The British and the French were also called upon for assistance in counterintelligence. However, the development of the Corps of Intelligence Police gave G–2–B an instrument of its own in this field. By Armistice Day some 450 sergeant investigators were on duty with the AEF, not only supporting the rear communications zone, but also providing intelligence coverage to corps and divisions at the fighting front.

Mapping was normally a function of the Corps of Engineers. But under combat conditions in France, it fell under the supervision of the intelligence staff, since battle maps included information about enemy as well as friendly forces. G–2–C, the Topographic, Map Supply, and Sound- and Flash-Ranging Division of G–2, essentially served to coordinate the activities of the 29th Engineers, a bizarrely structured regiment without a headquarters that provided the AEF with both topographic and sound- and flash-ranging personnel. One battalion of the 29th manned the AEF's large map-printing facility at Langres; another supplied topographic troops to the field armies; ranging companies from two additional battalions supported the targeting needs of the field artillery while providing collateral intelligence.

Finally, a fourth division, G–2–D, handled press and censorship matters. Censorship operations were an intelligence function within the AEF from the very beginning. While mail was censored at the unit level, a base censor's office in Paris conducted spot checks of regimental mail, operated a secret-ink laboratory, and censored mail written in foreign languages. Internally, the section was able to translate mail written in forty-nine languages, requesting outside help only for messages written in Chinese or Japanese. One additional function of this office was to censor letters containing information that servicemen did not want their immediate superiors to see. Such correspondence was mailed in specially issued blue envelopes.

Managing press relations was the division's second principal function. This included supervising the accreditation of war correspondents, censoring their dispatches, and making arrangements for their transportation and billeting. In view of practices in later wars, correspondents were held on a fairly tight rein.

---

[27] Bidwell, *History of the Military Intelligence Division*, p. 139. General Nolan felt that no more than 15 percent of his intelligence requirements were filled by secret agents, but felt that reports by the network of trainwatchers tracking German rail movements across the bridges over the Rhine were most useful. Memoirs, ch. 4, p. 9, Dennis Nolan Ms, U.S. Army Military History Institute.

Censorship principles insisted on accuracy; forbade releasing military information useful to the enemy; and prohibited news stories which would "injure morale in our forces here, or at home, or among our Allies" or "embarrass the United States or her Allies in neutral countries."[28] On the other hand, correspondents had free access to the troops, and G–2–D refrained from using them for propaganda.

In addition, G–2–D carried out a wide spectrum of other information-related activities. It was charged with preparing propaganda to undermine German morale—by the fall of 1918 a rain of 3 million propaganda leaflets from G–2–D was blanketing German lines, distributed by plane and balloon and even by rifle grenade and patrol. And while it sought to undercut German morale, the division tried to preserve that of the AEF. The famous troop newspaper, *Stars and Stripes*, was published in Paris under G–2 auspices. Finally, straying even further from any conceivable intelligence functions, the division supervised the Army art program, employing the services of eight soldier-painters, and was tasked with taking photographs for historical purposes and verifying the accuracy of their captions.

Communications Security in the AEF

Communications security within the American Expeditionary Forces in France was primarily a Signal Corps responsibility. Although MI–8 was responsible for preparing the War Department's codes, in France this task was assigned in December 1917 to the Signal Corps' Code Compilation Section, a small group located at the GHQ at Chaumont. This organization found itself confronted by an immense task. The Army entered World War I with few effective arrangements for secure tactical communications. The insecure and cumbersome War Department Telegraph Code was intended for administrative use, not battlefield communications. The Signal Corps' existing cipher disk was a simple celluloid device designed on principles as uncomplicated as those of the toy code-rings that once appeared in cereal boxes. When used with a running key, however, at first it seemed to offer unbreakable security. However, cryptanalysts at Riverbank and at MI–8 quickly discovered that messages encrypted this way could be broken faster than they could be enciphered. The British introduced the U.S. Army to the Playfair cipher, but this too was easy prey for cryptanalysts.

As a result, the AEF decided to devise a completely new system. The first efforts were unsuccessful. The Code Compilation Section produced a one-part trench code and a set of enciphering tables, but these proved to be impracticable for use in combat situations. What was needed was a method of encryption that would place as little burden as possible on communicators operating under

---

[28] *United States Army in the World War*, vol. 13, p. 86.

battlefield conditions.[29] The solution finally adopted was the creation of a set of two-part codes with separate tables for encoding and decoding. In June 1918 the section produced the "Potomac Code," the first in a series of codes named after major American rivers. The "river" codes were issued to the First Army when it became active in August 1918. When the Second Army took the field in October, a separate "lake" series of codes was introduced to meet its needs. These codes, distributed down to regimental level through intelligence channels, carried the main burden of Army traffic, supplemented as necessary by a small number of more specialized codes. To ensure security, individual code books were replaced about every two weeks or upon evidence that they had been compromised.

Regrettably, the sophistication of the AEF's cryptographic systems did not equate with good communications security. The mere fact that codes were available did not mean that they were used. Communicators unfamiliar with codes showed a marked disinclination to employ them, and tactical units evolved various private, unsanctioned codes of their own. Moreover, the AEF relied on the telephone rather than the radio for the bulk of its communications, and officers repeatedly sent plain-language messages on tactical matters over unsecured telephone lines. To eliminate such problems, the AEF's general headquarters issued security guidelines for Army communications and established its own Security Service. Signal Corps personnel assigned to the Security Service monitored radio and telephone communications and reported violations of established procedures to control officers at the radio intelligence sections within the headquarters of the field armies. The G–2 then reported security breaches to commanders, but little could actually be done to punish offenders.[30]

Sideshows

The bulk of American forces committed overseas in World War I went to France. However, it is sometimes forgotten that there were some peripheral ventures. An infantry regiment and support troops were hastily deployed to the Italian front to help shore up the morale of the flagging Italian Army after its disastrous defeat at Caporetto in the fall of 1917. More importantly, two separate American Expeditionary Forces, miniatures of the larger AEF in France, were sent respectively to Murmansk and Siberia in the summer of 1918 as a result of the Bolshevik Revolution, which had forced Russia out of the war and

---

[29] "In view of the fact that code work is frequently done under heavy bombardment and gas or in the critical moments of an advance, it does not seem advisable to add any additional burdens to code operators." [30] James L. Gilbert, "U.S. Army COMSEC in World War I," *Military Intelligence* 14 (January 1988): 19–21.

created conditions of chaos in Eastern Europe. Both expeditions were launched on ill-defined missions and given little background intelligence.

The reinforced regiment ordered to North Russia, originally assigned the limited mission of keeping a large store of war supplies from German hands, became involved in operations against the Bolsheviks as part of a much larger Allied effort and only evolved a G–2 section of its own shortly before the force was withdrawn in early 1919. However, Bolshevik propaganda and war-weariness after the armistice did confront the unit with serious problems of subversion.

A larger force under Maj. Gen. William S. Graves went to Siberia to help rescue former Czechoslovakian prisoners of war from the Bolsheviks and incidentally to keep an eye on the Japanese intervention force sent on a similar mission. Since the initial American contingent deployed from the Philippines and included elements from the Philippine Department's Military Intelligence Division, it incorporated an intelligence section from the beginning. Additional intelligence personnel from the continental United States joined the force later. Unfortunately, intelligence efforts were largely stultified by a conflict between General Graves and his G–2 concerning the nature of the latter's responsibilities. Graves pursued a policy of strict neutrality towards the Bolsheviks and vetoed any attempt to gather intelligence by using the services of the anti-Bolshevik "White" forces.[31]

Conclusion

World War I was the watershed in the evolution of U.S. Army Intelligence. Both in the War Department and in the field intelligence work was revitalized and placed on a footing of organizational equality with other major functions. The Army ventured into new fields of counterintelligence and cryptology and made use of the full spectrum of intelligence sources. Although some of these—such as prisoner of war interrogation, captured document exploitation, and ground reconnaissance—were traditional, the newer disciplines of signals intelligence, aerial photography, and collection through sensing devices were not. At both the War Department and theater levels, the definition of Military Intelligence was enlarged to include the collection of political, economic, and social data. Finally, intelligence activities were expanded to include the allied fields of deception and propaganda.

The professional intelligence field was still, however, in its infancy. Intelligence was still considered essentially a staff-level activity within the Army. No intelligence units as such were fielded, although the Army did deploy a topographic engineer regiment and aerial observation groups to France. A table of

[31] The prominent historical novelist Kenneth Roberts served on the intelligence staff of the Graves Expedition. His recollections of the experience can be found in his autobiography, *I Wanted to Write* (Garden City, N.Y.: Doubleday and Co., Inc., 1949), pp. 98–112. I am indebted to Col. William Strobridge, U.S. Army (Ret.), for calling my attention to this fact.

organization for a field-army radio section—a communications intelligence unit—was drawn up, but never implemented, as Pershing chose to keep his limited intercept assets under direct GHQ control. Moreover, Army Intelligence was not yet considered an official career field. After the war, both Van Deman and Nolan became major generals, but they achieved their stars as tactical commanders, not as intelligence officers. Still, compared with the past, much had been accomplished. For Army Intelligence, World War I represented a great leap forward.

As an Army Intelligence organization was put together from nothing in the space of seventeen hectic months, many mistakes were made. MID largely concentrated its efforts on counterintelligence operations directed at a threat that proved to be largely imaginary.[32] Yet its concern, however misplaced, reflected widespread perception among American leaders. The year before war broke out, even President Wilson's closest confidant, Colonel House, fretted that "there are more German reservists here [in the United States] than I thought."[33] More telling is the criticism that MID spread itself too thinly by venturing into areas like fraud investigation and morale enhancement. Even some of its foreign intelligence efforts could be questioned. MID maintained files on areas as remote from the war effort as the Antarctic islands and on topics as broad as "Christendom."[34] Similarly, G–2 in the AEF became deeply involved in press relations, a precedent which confused the duties of intelligence with those of public information in a way that would have an adverse application for Army Intelligence in the twenty years of peacetime following the armistice.

Nevertheless, the Army had at last established a permanent structure for meeting its intelligence needs. After 1918 the evolution of Army Intelligence would follow a twisted road, but it would never return to the marginal position it had occupied prior to World War I.

---

32 There were also questions as to the efficacy of the whole effort. On the eve of America's entry into World War II, the officer who then headed the Corps of Intelligence Police provided a scathing evaluation of the World War I counterintelligence program. "In the United States the Corps of Intelligence Police was composed of many well-meaning but inexperienced officers, enlisted men, and civilians and their unorganized efforts accomplished practically nothing. It is said the organization in the United States may have caught one spy." History of the Counter Intelligence Corps, vol. 4, p. 122.

Military Intelligence Between Wars

Woodrow Wilson had declared that America entered World War I to make the world safe for democracy. The effort had not succeeded. Four great empires had collapsed in Central and Eastern Europe, creating a revolutionary battleground for many disparate and competing political ideologies. Novelist John Dos Passos later described the year 1919 as a time for "machinegunfire and arson, starvation, lice, cholera, and typhus."[1] The peace process went awry. The victors at Versailles saddled the new republican government of Germany with great territorial losses and reparations payments while allowing it to remain the strongest and most industrialized power on the European Continent. Meanwhile, the growing problems posed by the widening revolution in Russia went unaddressed, and animosities developed rapidly among the victors. Wilson had hoped that the peace settlement, however flawed, would be redeemed by the establishment of a collective security organization, the League of Nations. But his own Senate refused to ratify the measure as America retreated toward isolationism.

Within the United States, there was also unrest as the bonds that had held the nation together during the war began to dissolve. Motivated by wartime idealism, pundits had spoken vaguely of a postwar era of "reconstruction" that would lay the basis for an "industrial democracy" in which the American economic cornucopia would be shared more equitably by all.[2] Instead, the end of the war brought unemployment, inflation, and labor unrest. Alarmed by revolution abroad and radical labor agitators at home, the country was swept by a "Red Scare" leading to thousands of arrests. In the end, a fatigued American people, weary of wartime idealism and stress, voted for Warren G. Harding and a return to "normalcy."

Military Intelligence was intimately involved in these events, both at home and abroad. Twenty MID officers accompanied President Woodrow Wilson and

the American delegation to the Paris Peace Conference. Sixty CIP agents, directed by Van Deman, provided security for the American party, and Maj. Herbert O. Yardley of MI–8 furnished cryptologic support.[3] Meanwhile, Army Intelligence personnel accompanied the new Third Army, the American occupation force that marched into the Rhineland under provisions of the armistice. On the domestic front, Bolshevik agents replaced German spies as the focus for MID's counterintelligence efforts. In the fall of 1919 a naive MID officer warned that "the situation in the United States [was] . . . verging on revolution."[4] However exaggerated the estimate, it accurately reflected the fears of many Americans who found the world changing too fast for America ever to recover her lost innocence.

Military Intelligence at Peace

Normalcy meant a return to a peacetime Army, a process that had begun almost as soon as the fighting ended. The vast conscript armies that had won the war were hastily demobilized, and a new volunteer force enlisted. Subsequently, the National Defense Act of 1920 provided for a Regular Army of 280,000, backed up by Organized Reserves and a 475,000-man National Guard. The command and control of this force would be exercised through nine corps areas in the continental United States and through three overseas departments in Hawaii, the Philippines, and Panama. Under the terms of this legislation, MID retained its place as one of the four principal divisions within the Army Staff. Among its numerous duties were administering the attache system, supervising military drawings and maps, writing regulations for tactical intelligence personnel, performing liaison with other intelligence agencies, approving codes and ciphers, and planning censorship operations. As one of the four assistants to the chief of staff authorized by law, MID's director was given the rank of brigadier general.

Unfortunately for the Army, the economy-minded Congress never provided the necessary appropriations to maintain the authorized force. By 1929 the Regular Army had thus shrunk to a strength of 137,000, with four skeleton combat divisions in the continental United States and three more in the overseas departments. That part of the force assigned to the continental United States was scattered over a multitude of tiny posts inherited from the Indian Wars. The subsequent Great Depression made Congress even more parsimonious, forcing the Army to make do with the large but increasingly obsolescent stockpile of weapons left over from World War I. The Military Intelligence Division was directly affected by these policies, dwindling from a peak strength of 80 officers

[3] Some of the CIP agents in Paris questioned the utility of their assignments. Apart from the men detailed to guard President Wilson, one wrote, they were employed as "a species of bell boys, ladies maids, and hallmen." Gilbert Elliott Ms, p. 7, RG 319, NARA.

[4] Memo, Col C. H. Mason for Brig Gen Marlborough Churchill, 31 Oct 19, sub: Sinister Inertia in Present United States Situation, MID Documents.

and about 160 civilians in 1920 to a cadre of 20 officers and fewer than 50 civilians by 1934, and undergoing repeated internal realignments.[5]

The reorganization of the Army Staff under General John J. Pershing also weakened Military Intelligence. After becoming chief of staff in 1921, Pershing imposed the AEF's wartime model of a five-part General Staff on the Army, directing that separate divisions be established for personnel, intelligence, operations and training, supply, and war plans. However, congressional legislation had provided for only four brigadier generals on the staff, and in the savage competition for general officer slots the intelligence staff often lost. Of the seven directors of the Military Intelligence Division who served between 1922 and 1939, only two were brigadier generals.[6] Military Intelligence thus became a second-class citizen, since its lesser position on the Army Staff was reflected throughout the rest of the Army. Implicitly, U.S. military leaders seem to have accepted the dictum of British Field Marshal Sir Douglas Haig that "intelligence is rather a special kind of work and has a very small place in the army in peacetime."[7]

This trend was reinforced by Pershing's insistence that G–2 undertake public relations duties as it had done in the AEF. Under peacetime conditions, these responsibilities became one of the Military Intelligence Division's principal functions. Intelligence officers at corps level and below also spent much of their time in this secondary area. As a result, intelligence work often became a dumping ground for officers incapable of performing any more demanding activities, and astute officers regarded intelligence assignments as detrimental to their military careers. According to intelligence historian Thomas Troy, "intelligence was neither a profession [n]or a career; at best, it was a one-time activity in an army or navy officer's service. Hence, when closely scrutinized, the intelligence services [were] small, weak stepchildren of their parent organizations."[8]

The weakness and lack of professionalism of Army Intelligence during this period was reinforced by the decline in its capabilities for intelligence collection. The attache system remained MID's principal means for collecting foreign intelligence, irregularly supplemented by arrangements made with American businessmen working abroad. General George Marshall would write later that interwar military intelligence was "little more than what a military attache could

---

[5] From 1920 on, MID strength was affected by the provisions of the National Defense Act of 1920, which limited the number of General Staff officers on duty in Washington, D.C., to 93. This meant that MID would be allotted 14 to 16 General Staff officers. When the law took effect, Brig. Gen. Dennis Nolan, assistant chief of staff, G–2, hoped that 31 more officers could be detailed from the line to keep MID up to what he regarded as minimum strength. In this, he was disappointed. Memo, Nolan for Chief of Staff, 28 Jul 21, sub: Relief of Thirteen Line Officers on Duty with Military Intelligence Division To Date, MID Documents.

[6] Memo for Chief of Staff, 19 Jun 37, sub: Increase in Number of Assistants to the Chief of Staff, MID Documents.

learn . . . at a dinner, more or less, over the coffee cups."[9] Even here the limitations were severe. Postwar economies forced the abandonment of a number of minor attache posts, and the scarcity of funds dictated that attache assignments be restricted to officers with private means of support, irrespective of their professional qualifications. Finally, the interwar years saw the rise of totalitarian governments and controlled and closed societies. Military attaches were allowed increasingly less freedom to collect useful intelligence in precisely those countries that posed the most dangerous threat to American security.[10]

Army Intelligence in the domestic arena was equally weak. This was partially the result of a general public reaction to some of the excessive actions of the Wilson administration against dissidents, both in World War I and during the postwar "Red Scare." Fortunately the impoverished peacetime volunteer Army had little to worry about in the way of threats posed by espionage, sabotage, and subversion. Thus the Army discontinued its countersubversive system in 1920 and recalled all MID regulations on the subject from the field. With only six agents on duty, the Corps of Intelligence Police narrowly escaped extinction when wartime emergency legislation expired that same year, but MID managed to keep the organization alive by detailing personnel to CIP duties from the Army's Detached Enlisted Men's List. The Negative Branch of MID, which had supervised the War Department's counterintelligence work, was less fortunate and closed shop in 1921.

All attempts to collect domestic intelligence ended soon afterward. This was caused by the rash actions of Lt. W. D. Long, an intelligence officer at Vancouver Barracks, who sent a circular letter to the county sheriffs of Oregon asking them to maintain a surveillance of suspect organizations. Included on the lieutenant's list were veterans' groups, the Nonpartisan League, and the American Federation of Labor. This list caused a considerable uproar when inevitably it was made public. The secretary of war ordered that all intelligence posts in the Army not authorized by tables of organization be discontinued, and that intelligence officers confine themselves to instructing troops in combat intelligence techniques. This left most of the forty-five CIP agents authorized in 1920 with little to do, and the force was repeatedly scaled back. By 1934 the Corps of Intelligence Police consisted of just sixteen noncommissioned officers, and a subsequent survey found that most of them were used as classified file clerks rather than as investigators. Only in the overseas departments and in the Eighth Corps Area on the Mexican border did the Corps of Intelligence Police still provide useful services.[11]

[10] One especially aggressive attache was Maj. Truman Smith. Posted to Nazi Germany, Smith obtained intelligence reports on the *Luftwaffe* from the American aviator and popular hero Charles Lindbergh, who repeatedly toured German aircraft factories as a guest of Reichsmarshal Hermann Goering and other Nazi top brass. *Washington Post*, 4 Nov 84, p. A–3.

[11] Of the 16 CIP agents surveyed, 10 were acting as confidential clerks for G–2s in the various corps areas, 5 were engaged in investigative work, and 1 was unfit. History of the Counter Intelligence Corps, vol. 4, p. 87.

If the Military Intelligence Division was collecting little foreign and less domestic intelligence over most of this period, it was not overly active in other areas. Although one section of MID was charged with intelligence training, it had no statutory responsibility to supervise such work, and the assistant chief of staff for operations and training refused to acknowledge its authority. As a result, in 1931 the head of the section was forced to confess that "the state and extent of combat intelligence training in the Army is not known to this branch, as it makes no inspections and receives no training reports."[12]

Another section of MID was charged with supervising the Military Intelligence Officers Reserve Corps (MIORC), which had been formed in 1921 to use the services of the large number of officers who had served in intelligence positions throughout the wartime Army. In theory this organization of reservists should have given the Army a trained and experienced mobilization base, but many reserve officers were in fact journalists who had served G–2 in public affairs positions, and by the time they were ultimately needed, they were too old and too high ranking to fill the positions the Army required. The younger reservists in MIORC had never served on active duty. Perhaps the only lasting contribution of MIORC was the adoption of the sphinx as its insignia, an action which had the effect of permanently associating this somewhat bizarre heraldic item with the field of Military Intelligence.[13]

Not everything was completely bleak in the intelligence field between the wars. Although hobbled by budgetary restraints, the Army began to take advantage of new technological developments that expanded the possibilities of intelligence collection. Advances in motorized transport significantly enhanced the Army's ground reconnaissance. By 1931 an Experimental Mechanized Force had been created—its scout element had armored cars and radio-equipped vehicles—and the cavalry began to field mechanized units in addition to its traditional horse troops. The Army Signal Corps experimented with methods of detecting aircraft and ships through thermal and electronic means, and by 1937 the Army had a pilot model of a mobile radar set. Although limited to short-range targeting functions, the principles it embodied would apply to more powerful sets that could perform an early-warning function, filling a critical gap in Army capabilities after the increased speed of aircraft had rendered acoustical techniques almost useless.[14]

The growth of the Army Air Corps also affected intelligence. Air Corps officers were incorporated into MID, and Air attaches supplemented the work of the regular military attaches abroad. At the technical level, aircraft development

[14] Radar developments in the Army up to 1941 are covered in Dulany Terrett, *The Signal Corps: The Emergency*, United States Army in World War II (Washington, D.C.: U.S. Army Center of Military History, 1956). For early experiments, see pp. 44, 46–47.

was steady, since this was the one part of the Army that Congress was willing to fund. The Air Corps made significant advances in aerial photography, including night photography, and in aerial mapping techniques, all of which potentially enhanced intelligence gathering. Much of the pioneering work in this area was done by Lt. George Goddard, who would ultimately go on to become an Air Force brigadier general.[15]

In practice, the technological advancement of the Army Air Corps was a two-edged sword. The observation squadrons of World War I had flown in flimsy biplanes, and these aircraft could take off from grassy strips and work in close support of tactical commanders. But the sophisticated high-speed monoplanes with ample "greenhouse" canopies which the Air Corps developed in the 1930s for observation work, otherwise advanced machines with greatly improved performance, no longer could operate from unimproved airstrips. Furthermore, aeronautical progress encouraged Air Corps leaders to aspire to an independent role. The Air Corps became increasingly interested in fighting an air war of its own, instead of providing ground support. Aerial reconnaissance was thus designed to support a strategic bombing campaign, not to assist the tactical commander on the battlefield. By 1935 most aircraft had been placed under the direct control of General Headquarters, Air Corps. Although observation groups were still assigned to Army corps areas, only eight observation squadrons were active, a trend that threatened to deprive Army commanders of adequate air intelligence support.[16]

The "Black Chamber" and the Signal Intelligence Service

Army Intelligence made its greatest advances in the field of cryptology during the years between the wars. Following World War I, MI–8's previously comprehensive responsibilities in this field were realigned. The Signal Corps took over the responsibility for communications security, employing William F. Friedman, a former AEF officer and Riverbank Laboratories cryptanalyst, as a one-man code compilation bureau. The Adjutant General's Office was tasked with printing and distributing the codes. Officially, MI–8's responsibilities were reduced to approving cryptosystems for Army-wide use and establishing regulations for their employment. In reality, however, MID continued to be deeply

15 Goddard has provided a useful autobiography in *Overview: A Lifelong Adventure in Aerial Photography* (Garden City, N.Y.: Doubleday, 1969).

16 Robert F. Futrell, *Command of Observation Aviation: A Study in Control of Tactical Airpower* (Maxwell Air Force Base, Ala.: Air University, 1956), p. 2. It should be noted that balloons and dirigibles were in the Army inventory of reconnaissance platforms in the early 1920s. A short but helpful overview of Air Corps support to ground operations between the wars is provided by Weinert, *A History of Aviation, Phase I*, pp. 2–4. In *Army Air Corps Airplanes and Observation, 1935–1941* (St. Louis: U.S. Army Aviation Systems Command, 1990). Howard Butler offers an alternative view to the standard interpretation of Air Corps history, arguing that the Air Corps remained firmly under the thumb of a ground Army–dominated General Staff during this period.

involved in cryptanalysis. In the fall of 1919 retired Maj. Herbert O. Yardley, wartime chief of MI–8, set up a clandestine government cryptanalytic unit in a brownstone house in New York City. Jointly funded by MID and the State Department, Yardley's bureau continued to work on diplomatic code–breaking, a task that MI–8 had initiated in World War I. Using material provided secretly by some of the major U.S. cable companies, Yardley and his small civilian staff achieved several notable successes, the most important of which was breaking the Japanese diplomatic code in time to give American diplomats a key negotiating edge during the Washington Peace Conference of 1921–1922.[17]

Despite the success of Yardley's bureau in producing hard diplomatic intelligence, it still ran into difficulties. Peacetime economies sharply reduced its funding. By 1929 the organization consisted of Yardley himself and a handful of assistants, and its functions seemed increasingly less relevant to both its sponsors. The United States had just signed the Kellogg-Briand Pact purportedly outlawing war, the international order seemed stable, and the State Department saw little need for secret intelligence in a world without enemies. On the other hand, the Army had no direct peacetime interest in the diplomatic cryptosystems Yardley's group exploited, while the clandestine and civilian nature of his bureau prevented its serving as a training vehicle for Army Intelligence reservists. By the spring of 1929 there was already a move to centralize all Army cryptologic functions under the Signal Corps, using Friedman's office as a nucleus. When Henry L. Stimson, a rather excessively upright statesman of the old school, became secretary of state that year, Yardley's fate was sealed. Discovering that the State Department had obtained access to decoded diplomatic messages, Stimson withdrew funding from Yardley's bureau. His attitude was later described: "Gentlemen do not read each other's mail."[18]

Loss of funding led to the termination of Yardley's organization. Yardley and his colleagues were offered employment in the new Signal Corps cryptologic agency, but they declined. The Civil Service pay scale could not match salaries subsidized by MID confidential funds. Instead, Yardley attempted to recoup his fortunes by writing *The American Black Chamber*, which publicly exposed America's code-breaking activities for the first time. The work was a best-seller, but proved to be a major diplomatic embarrassment for the United States and only further damaged American intelligence efforts. Yardley would later work as a cryptanalyst for Chiang Kai-shek in China and for the Canadian government, but he would never again be allowed to hold a position in any U.S. cryptologic organization.

---

17 Yardley recounted—some say embellished—his accomplishments in his book, *The American Black Chamber* (New York: Bobbs-Merrill, 1931). A brief biography can be found in David Kahn, *Kahn on Codes; Secrets of the New Cryptology* (New York: MacMillan Co., 1983), pp. 62–71.

18 Kahn, The *Codebreakers*, p. 360. A detailed study of the rise and fall of the Yardley organization is contained in SRH 29, A Brief History of the Signal Intelligence Service, pp. 3–12.

Upon the demise of Yardley's bureau, Army cryptanalysis and Army cryptography were both integrated into a new Signal Corps element, the Signal Intelligence Service (SIS), which also assumed responsibility for secret inks. The new unit was set up within the Signal Corps rather than the Military Intelligence Division to reduce its visibility and better meet the technical requirements of signals intelligence. After 1934, when it took over the printing and distribution of codes from the Adjutant General's Office, the SIS became the focal point for all Army cryptologic activity.

Friedman, who headed the Signal Intelligence Service until an Army officer became director in 1935, quickly recruited a small but talented staff. The four principal members of his initial group—mathematicians Solomon Kullback, Frank Rowlett, and Abraham Sinkov and Japanese linguist John Hurt—would all become prominent figures in U.S. Army cryptology in World War II. At first the thrust of the work was oriented towards theory, training, and the development of advanced cryptographic systems. The Army had fought World War I using codes. In 1922 the Army adopted a simple cylindrical cipher device, the M94, for tactical operations.[19] Friedman introduced a more secure but cumbersome strip cipher device, the M138. More importantly, he began developmental work on machine ciphers. The SIS provided the Army with the M134 and M134A "converters" to protect top-level communications. These were electromechanical cipher machines of great sophistication and security.[20] Meanwhile, in 1936 Friedman and Rowlett hit upon the cryptographic principles of an even more advanced machine cipher device. Unfortunately, funding was not immediately available to put the prototype into production.

The Signal Intelligence Service also began to set up an intercept organization, which Yardley's bureau, with its dependence on cooperative cable companies, had never attempted. A Provisional Radio Intelligence Detachment was organized at Fort Monmouth, New Jersey, in 1933. We may discern something of the flavor of the times from the fact that its first commander found none of the twelve men in his unit present for duty when he assumed command—all had been detailed to President Franklin D. Roosevelt's Civilian Conservation Corps. This detachment was later expanded to become a provisional company, and the 1st Radio Intelligence Company was formally activated at Fort Monmouth in 1938. Meanwhile, in September 1936 the Signal Intelligence Service had set up a chain of numbered monitoring stations in the overseas departments and in the Eighth and Ninth Corps Areas, creating SIS

---

19 The M94 was the brainchild of Joseph O. Mauborgne, an Army Signal Corps officer who later became a major general and Chief Signal Officer. It was an exact copy of a device invented by Thomas Jefferson.

20 The early history of the Signal Intelligence Service is described in SRH 131, Expansion of the Signal Intelligence Service. For the use of the term "converters," see SRH 349, Achievements of the Signal Security Agency in World War II, pp. 42–43.

detachments in five signal service companies. Since the Federal Communication Act of 1934 had made it illegal to divulge foreign communications, this had to be accomplished under tight security.[21]

These initial arrangements for providing the SIS with an intercept capability were not completely satisfactory. Tasking the 1st Radio Intelligence Company with an operational assignment interfered with the unit's primary mission, training for deployment in the field to support tactical elements. In addition, the intermingling of intercept and regular communications personnel in the existing signal service companies not only posed a security threat, but also worked against effective personnel management. Under Army regulations, trained intercept personnel working abroad were automatically returned to the general Signal Corps pool when they returned to the continental United States and thus were lost to the SIS. To solve these problems, a centralized signals intelligence unit, the 2d Signal Service Company, was set up at Fort Monmouth on 1 January 1939 to control all Signal Corps personnel at the permanent monitoring installations. The result was an efficiently functioning Signal Intelligence Service and an intercept organization that would represent the Army's principal strength in the intelligence field.[22]

The SIS paid less attention to intelligence collection at the tactical level. Under the Army's Protective Mobilization Plan, a World War I–style general headquarters was to be fielded in the event of any crisis demanding troop mobilization, and available troops would be concentrated as needed under one of the four field armies into which the Army had been divided in 1933. The actual field army selected would depend on the direction from which the threat was expected. These plans also specified that the existing 1st (and only) Radio Intelligence Company be placed in support of GHQ. To provide signals intelligence at field army level, the Signal Corps relied on the National Guard to organize two additional radio intelligence companies, one on each coast.[23] These modest preparations would soon be overtaken by the rush of events.

---

21 The sensitivity of the whole topic of communications intelligence during this period may be inferred from a revealing piece of Signal Corps correspondence on the subject, which ended with the statement "It is suggested that this letter be burned after perusal." Military Intelligence in Crisis

Ominous developments in the latter part of the 1930s finally woke the Army out of its long torpor. The Great Depression, which had ravaged the economy of the United States and focused the interests of the American people on domestic problems, had also profoundly rearranged the international order and set the stage for the rise of totalitarianism and the advance of aggression. Adolf Hitler was sworn in as chancellor of Germany in January 1933. He quickly turned his country into a one-party dictatorship. Under Nazi rule, Germany rapidly rearmed and entered into alliance with Fascist Italy and militarist Japan. International crises developed with monotonous regularity. Germany occupied the Rhineland in 1936, swallowed Austria in the spring of 1938, and humiliated Czechoslovakia with the disastrous settlement at Munich in the fall of that year. Meanwhile, its junior partners were also active. The Italian dictator Benito Mussolini invaded Ethiopia in 1935, and Japan, having seized Manchuria in 1931, went to war against all of China in 1937.

Britain and France responded with massive rearmament programs, but in the short run they relied on a general policy of appeasement to avert a European war, while ignoring Soviet attempts to resurrect their old World War I alliance with Russia. The American reaction was guarded. At President Franklin D. Roosevelt's direction, the Federal Bureau of Investigation (FBI) began investigating Nazi and Communist subversion in 1936, and Congress authorized modest steps to rebuild the nation's neglected defenses.[1] The size of the Army was increased, and the Military Intelligence Division was allowed to enlarge its attache system. Slowly, it also edged back into the counterintelligence arena, setting up a small Counterintelligence Branch in April 1939. That summer, concern about foreign espionage caused the Army to issue its first regulation dealing with the security of military information.[2] At the same time, the Army and

[2] The Army Regulation, AR 380–5, much revised, is still in effect.

the Navy formed the Interdepartmental Intelligence Committee with the FBI to coordinate the handling of espionage cases. However, the real threat to America's national interests would not be from within, but from without.

On 1 September 1939, the armed forces of Nazi Germany invaded Poland. Two days later, in response to previous treaty commitments, Britain and France declared war on Germany. World War II had begun. President Roosevelt proclaimed American neutrality but indicated that he did not expect American citizens to be neutral in their thoughts. On 8 September he declared a state of limited national emergency.

The U.S. Army of 1939 was unprepared for conventional warfare. As Army Chief of Staff General George C. Marshall later confessed, "We had no field Army. There were bare skeletons of three and one-half divisions scattered in small pieces over the entire United States."[3] Army troop strength was a little less than 174,000 men, and much of the equipment was still of World War I vintage. Although the Army Air Corps had received the lion's share of Army appropriations and attention, the planes of its sixty-two squadrons were obsolete by the standards of European combat. The restrictions imposed by the National Defense Act of 1920 on the size of the War Department General Staff were still in force.

The structure of the Army's intelligence element reflected the weakness of the whole. The Military Intelligence Division's small staff, still headed by a colonel, consisted of 20 officers, 3 enlisted men, and 46 civilians. Its elements were dispersed among four office buildings in the Washington, D.C., area. Intelligence collection was limited largely to what could be derived from the attache system. Although this system belatedly had been expanded, the representational nature of the attaches' mission necessarily limited the intelligence value of the product. Worse, only 16 Corps of Intelligence Police agents were available to provide counterintelligence support to the entire Army. The Signal Corps' Signal Intelligence Service had just 14 civilians and 1 Army officer on its Washington staff when Europe went to war, and they were not yet in a position to generate substantive intelligence. Efforts to rectify this situation were slow. In October 1939 a new intercept station was set up at Fort Hunt, Virginia. In November the Army authorized 26 additional civilians for the SIS. The headquarters of the 2d Signal Service Company moved to Washington, D.C., that same month, allowing it closer proximity to the Signal Intelligence Service which it supported.

In the spring of 1940 the deceptive tranquility of the "phony war" in Europe ended. In April Germany invaded Denmark and Norway, and in May Hitler launched his main offensive in the West. When it was over, a little more than a month later, France lay prostrate, Germany controlled Western Europe, and only a beleaguered Great Britain and the broad reaches of the Atlantic

[3] General George C. Marshall, *Biennial Report of the Chief of Staff of the United States Army, July 1, 1943, to June 30, 1945, to the Secretary of War* (Washington, D.C.: Government Printing Office, 1945), p. 117.

Ocean stood between the United States and the triumphant forces of totalitarianism. Meanwhile, in the East, Japan threatened to take advantage of the situation by incorporating the orphaned colonies of the beaten Western democracies into her "Greater East Asia Co-Prosperity Sphere." The world had been turned upside down.

At this point the United States at last began to look to its defenses. The Regular Army was now rapidly increased in size, Congress passing no less than three Supplemental Appropriations Bills for 1941, funding an Army of one million men. The legislation instituted a one-year draft, federalized eighteen National Guard divisions, and placed Reserve officers on active duty, while the Army organized a wartime General Headquarters. By the fall of 1940 the United States had negotiated a Destroyers-for-Bases deal with Great Britain, securing strategic military bases in British possessions in the Atlantic and Caribbean in exchange for fifty over-age destroyers. More important, during the second half of 1940 and throughout 1941, the Roosevelt administration labored strenuously to clear away or bypass neutrality legislation that impeded American support to Great Britain. This process slowly paved the way for American entrance into the war well before the Japanese attack on Pearl Harbor.

All these events had a great effect on Military Intelligence. Brig. Gen. Sherman Miles, the former military attache to Great Britain, took over the Military Intelligence Division, and the organization began to grow rapidly. As always, however, its initial priority was domestic, and its planners fretted tirelessly about German espionage and sabotage on the home front. In June 1940 MID, the Office of Naval Intelligence, and the FBI signed a formal delimitations agreement. Under its provisions, the FBI would take the lead in domestic intelligence; there would be no repetition of the World War I scenario in which Military Intelligence had assumed responsibility for surveilling American civil society. The agreement did give the Army responsibility for conducting investigations of those civilians employed or controlled by the military in the continental United States and of all civilians in the Canal Zone and the Philippines. That same month, the Military Intelligence Division sent out confidential instructions to intelligence officers, ordering them to set up a countersubversive program that would bring potential hostile agents on military installations to its attention. To handle these efforts, the Corps of Intelligence Police was expanded to an authorized strength of 42 agents in July and 188 in November.

MID planners were also concerned about the possibilities of German penetration into Latin America, where there were large ethnic German communities and important German business interests. Although the delimitations agreement had given intelligence responsibilities in this region to the FBI, the Army's Military Intelligence Division, with its existing attache system and military missions in Latin America, would not be denied a role. Thus, in July 1940 it moved to strengthen its capabilities for collecting foreign intelligence on Latin America by setting up a branch office in New York City. It seemed that the location

would provide both better access to reference material and improved relationships with American corporations doing business south of the border. About the same time MID was relieved of its responsibilities for supervising Army public relations, a function that would have diverted it even further from its primary missions, had it not been moved elsewhere.

While the Military Intelligence Division worried about domestic subversion and Fascist infiltration of Latin America, the more prosaic and demanding intelligence tasks were performed elsewhere. The Army Air Corps wanted an independent role in the field of intelligence, even though Air Corps officers were serving on the MID staff. Largely as a result of Air Corps initiatives, in September 1940 all the Army's technical services were directed to form their own intelligence staffs to collect information on foreign equipment and techniques, areas in which MID appeared to have little interest.[4] In addition, intelligence staffs were created for GHQ, for the new defense commands that sprang into existence, for the Army Air Forces when they gained autonomy in July 1941, and for subordinate tactical formations. The Engineer Reproduction Plant of the Corps of Engineers was transformed into the Army Map Service, laying a foundation that ultimately would provide indispensable cartographic intelligence for the American military.[5]

Even before it was assigned responsibility for technical intelligence, the Signal Corps was deeply involved in intelligence- and security-related activities. Its major contribution was in cryptanalysis. In August 1940, after twenty months of effort, a team of SIS civilians succeeded in breaking the Japanese diplomatic machine cipher. The unraveling of the riddle of the so-called Purple machine was accomplished by purely cryptologic means, without any access to the machine itself. The Purple analog built by SIS experts allowed the United States to read Japanese diplomatic messages as fast as their intended recipients. The strains of this intellectual accomplishment ultimately sent William Friedman, the senior cryptanalyst, into the hospital with a nervous breakdown. However, the feat allowed the United States to follow the tortuous workings of Japanese diplomacy starting in the fall of 1940.[6] Within a short time, the Army shared intercept and exploitation of the Purple material with the Navy on a daily rotating basis. The resulting decrypts of Japanese diplomatic communications were assigned the code name MAGIC, and their contents were closely controlled. At times, however, the arrangement led the

[6] Ronald William Clark, *The Man Who Broke PURPLE: A Life of the World's Greatest Cryptographer, Colonel William F. Friedman* (Boston: Little Brown, 1977), is the only full length biography of Friedman. Its worth can perhaps be gauged by the fact that there are two errors in the title: Friedman was a cryptologist, not just a cryptographer, and his highest rank in the Army Reserve was lieutenant colonel.

services to become rivals in rushing juicy tidbits produced by cryptanalysis to the attention of high officials.

The success of the SIS against Purple facilitated its expansion, and another hundred persons were added to its headquarters. Additional personnel were needed not only to perform cryptanalysis and translation, but also to meet the cryptographic needs of a much larger Army, especially since the SIS was now introducing important technical innovations in this area. The organization procured two new devices to improve the security of Army communications at both the tactical and strategic levels. For the first purpose, it acquired the rights to a small compact machine cipher designed by Swedish inventor Boris Hagelin. Under the designation M209, this became the mainstay of Army tactical communications. For high-level communications, SIS adopted the M134C electromechanical cipher machine from the Navy, assigning to it the short title SIGABA. Friedman and Rowlett had originally designed this machine, but prewar budgetary constraints had made it a Navy project. The SIGABA used rotors instead of one-time tapes for enciphering, and this gave communications arrangements much greater flexibility.[7]

The Signal Intelligence Service was not the only Signal Corps element involved in intelligence-related activities. The Signal Corps also had responsibility for radar. By May 1940 the corps had successfully developed fixed and mobile early-warning radar sets. The first radar-equipped aircraft warning company began operations in Panama a month later. This would have a substantial long-term effect on the evolution of Army Intelligence. Some Army officers defined radar itself as "another highly specialized type of signal intelligence."[8] But radar would also become an intelligence target, and its widespread use by all major powers would ultimately lead to the development of what is sometimes called the electronic battlefield.

1941: MID on the Brink

During 1941 the Military Intelligence Division grew to a strength of 200 officers, supported by 848 civilians. In addition to its New York branch, the organization now maintained regional offices in New Orleans and San Francisco to collect foreign intelligence. The changing nature of the international situation had finally refocused collection activities on Germany and Japan, as well as Latin America. However, MID's traditional primary information source, the attache system, had only limited capabilities against wartime Axis powers, even though it had grown to encompass 136 attaches on duty in 50 countries. In February 1941 Brig. Gen. Sherman Miles, the assistant chief of staff, G–2,

concluded that it was "imperative that the Army develop an efficient espionage service that can function independently of any nation," but nothing was done to implement this concept.[9]

The perceived inadequacies of American Military Intelligence in a situation of growing crisis caused deep concern. In April Miles fretted that "this Division has expanded considerably since last May, but always in a piecemeal manner," and admitted that "the work being done by the division is still far below what should be expected of the military intelligence of a great power in our present situation."[10] Others agreed, notably the president of the United States. In June 1941 Roosevelt appointed prominent lawyer and World War I hero William J. Donovan as coordinator of information, with a large mandate to establish an organization to collect intelligence and conduct radio propaganda.[11] But such an edifice could not be constructed overnight and its early efforts were, not surprisingly, somewhat amateurish. An agent dispatched to the Pacific, for example, reported that there would be no war that year, while Donovan's central staff estimated the combat strength of the German *Luftwaffe* at 29,000 war planes when in fact it was only 3,100.[12] Given the lack of urgency that characterized MID's own approach to collecting foreign intelligence on America's most probable enemies, Donovan's organization filled a vital need. But this did not preserve it from the enmity of MID, which resented the intrusion of a civilian organization with powerful political backing into what it regarded as its own preserve.

The clash between the two organizations was exacerbated by MID's having acquired an interest of its own in the area of propaganda in 1941. Unfounded credit had been given to German proficiency in manipulating public opinion and the subsequent role of propaganda in bringing about the defeat of France. Moreover, since the United States was not yet a belligerent, a radio war was about the only one in which it could participate actively. In July 1941, therefore, MID set up a special study group on "psychological warfare" under conditions of strict secrecy. Rivalry between MID and Donovan's office in this area thus began almost immediately and continued unabated even after America entered the shooting war and it became clear that it would take more than slogans to defeat the enemy.

[12] To be sure, the Army's estimates of *Luftwaffe* strength were almost equally exaggerated. See David Kahn, "U.S. Views of Germany and Japan," *Knowing One's Enemies: Intelligence Assessment Before the Two Wars*, ed. Ernest May (Princeton: Princeton University Press, 1984), pp. 492–93.

Counterintelligence Concerns

Although MID's role in foreign intelligence and propaganda provided a matter for dispute, coexistence with the FBI in the field of domestic intelligence was less of a problem, as the delimitations agreement gave the Army its own secure sphere of activities. However, Army Intelligence developed growing pains as it sought to fulfill its responsibilities. The Corps of Intelligence Police had expanded elevenfold by the beginning of 1941, and this expansion changed the nature of the force. Until then the appointment of CIP personnel had been centralized at the War Department level, but in January of that year appointment authority for agents was decentralized to the corps area and overseas department level in an attempt to gain more manpower. At the same time, MID authorized the creation of the Office of Chief, Corps of Intelligence Police, and the establishment of a CIP training school. The Army also approved the detail of officers to the Corps of Intelligence Police. In addition, to conduct specialized investigations, the Army attempted to recruit African-American and Asian-American agents for the first time in the organization's history.

The Corps of Intelligence Police continued to expand during the course of 1941. In April it was authorized a strength of 288 enlisted men, and this figure was raised to 513 in May. The growth was accompanied by renewed disputes over the degree to which the recruitment, assignment, and promotion of CIP agents should be centralized and who should supervise investigations. Traditionally, the G–2s of the various corps areas and departments had carried out the latter function. But the reserve officer who became the first head of the Corps of Intelligence Police, Maj. Garland Williams, wanted a centralized organization structured along the lines of the FBI, with its chief responsible to the secretary of war for "detecting and investigating" all matters pertaining to espionage, sabotage, and subversion.[13] He also believed that the decentralized personnel arrangements impaired the quality of his manpower. However, all proposals to strengthen the powers of the chief, Corps of Intelligence Police, were vigorously rebutted by the commanders in the field, and these arrangements remained unchanged. Williams protested in vain that this meant he would have to deal with "14 different policies, 14 different practices, 14 different methods of work, and, in general, 14 separate and distinct units."[14] The unhappy officer was soon reassigned to the Infantry School.

Lack of adequate central control over operations in the field thus presented a serious problem for the entire investigative effort. Agents too often were misused by commanders unfamiliar with counterintelligence work. On the other hand, the investigative work load in some commands resulted in agents' being pressed into service without ever undergoing basic training. And as the Army

[13] History of the Counter Intelligence Corps, vol. 4, p. 123.
[14] Ibid., p. 122.

adjutant general later explained to one of the corps area commanders, delegation of personnel procurement authority to the field had resulted in the recruitment of "a larger percentage of agents whose character, education, adaptability, and experience in no way qualified them for the duties they would be called upon to perform."[15]

Another type of problem presented itself when a rival organization emerged in the counterintelligence field. In September 1941 the newly created Provost Marshal General's Office took over the function of conducting all personnel background investigations of civilians applying for military or defense-related employment. Ninety CIP agents were transferred to the new organization, further intensifying both the shortage of manpower and the lack of centralized direction. For a time, the demands of the work load forced the Army to hire civilian investigators to supplement its force of CIP agents.

The Road to Pearl Harbor

Manpower problems were not restricted to the Corps of Intelligence Police, but were pervasive throughout the Army Intelligence community in 1941. The vast expansion of the nation's intelligence apparatus threatened to outstrip the supply of qualified people in all services. Although the Army reservists of the prewar Military Intelligence Officers Reserve Corps had been called up, only 573 existed, many of whom were actually public relations specialists rather than trained intelligence officers. Reserve intelligence training had not been an Army priority. Although the Corps of Intelligence Police and the Signal Intelligence Service now had specialized schools, located respectively at Chicago, Illinois, and Fort Monmouth, New Jersey, there was no institute to train intelligence personnel in other disciplines. The Operations and Training Division stubbornly refused to give the Military Intelligence Division any authority over intelligence training in general. Only in the area of language instruction was there some progress: a handful of officers were enrolled in language programs overseas, and the Fourth Army established a language school at the Presidio of San Francisco in the fall of 1941. By the end of the year, ninety students were learning the Japanese language.

But even if trained intelligence personnel had been available, there would have been little for them to do besides manning the traditional tactical intelligence staffs. The need for communications intelligence personnel and cryptanalysts was serious but limited, and there was no organization for gathering human intelligence or for acquiring information on a large scale. At the initiative of the State Department, both the Army and the Navy had briefly posted a handful of undercover agents in French North Africa in 1941, but these men were transferred to the control of Donovan's new agency soon after it came into

---

15 Ibid., p. 110.

existence in the summer of that year.[16] The entire intelligence apparatus thus seemed too disparate and too disorganized to pull itself together for the great contest ahead.

On the positive side, Army Intelligence could draw on the resources of an experienced ally for the first time since World War I. In 1941 secret staff talks between the top military leaders of the United States and Great Britain were accompanied by an intelligence liaison between the two countries. In February 1941 a party from the Signal Intelligence Service visited Great Britain and established a limited collaboration in the field of cryptology. The Americans brought with them a Purple analog for the British Government Code and Cypher School, the British cryptanalytic organization, thus furnishing the British with the solution for a cryptanalytic problem that had baffled their best efforts. This marked the beginning of a cooperation that would bring the United States unparalleled benefits. In the summer of 1941 a permanent British liaison officer was assigned to SIS. The British also helped out in other intelligence-related areas. In September 1941, for example, the Army dispatched an Electronic Training Group of 300 second lieutenants to England to study British developments in radar.

By the end of 1941 the Army had also put together a tactical signals intelligence organization. Seven signal radio intelligence companies numbered in the 100 series were now active, including the original 1st Radio Intelligence Company, now redesignated the 121st Signal Radio Intelligence Company. Additionally, there was a signal radio intelligence company, aviation, designed to provide communications intelligence to the Army Air Forces.[17]

However, there were still grave deficiencies in battlefield intelligence capabilities. Apart from the success of the Signal Intelligence Service in decoding Japanese diplomatic communications, the Army had only limited sources of intelligence collection and no way of moving intelligence down to commanders in the field, who still tended to rely on their own resources, much as they had done in the nineteenth century. The use of MAGIC, the Army's most valuable intelligence source, highlighted the problem. The cryptologic success of the SIS was simply not matched by intelligence exploitation of the product. Because the decrypts were so sensitive, they were closely held—only a few individuals within MID and the highest military and political figures in the administration were aware of their existence, and intelligence analysts were kept out of the picture for security reasons. As a result, although policy makers were exposed to individual messages, there was never an attempt to put the flow of the material into an ordered framework. As Friedman later put it, "each message represented only

a single frame, so to speak, in a long motion picture film"; unfortunately, nobody was in a position to see the whole movie.[18] The same security considerations denied key Army and Navy field commanders any knowledge of the existence of the material.

And so, in the end not even MAGIC could save the United States from military surprise at Pearl Harbor, when the Japanese attacked at dawn on 7 December 1941. High-level Japanese diplomatic messages had simply not contained any mention of Japanese military plans; consular messages had contained clues, but resources had not been available for the timely exploitation of low-level traffic. The Japanese Navy codes were still unbroken, and the Japanese fleet that struck Pearl Harbor had approached its target under strict radio silence. Although radar manned by the Signal Corps' Air Warning Service Company, Hawaii, had detected the Japanese attack formation 130 miles away, the reports were misconstrued at the operations center and no alert had been given. Pearl Harbor was both a military disaster and an intelligence failure.[19] Confronted by attack in the Pacific and a German declaration of war, Army Intelligence prepared to set matters right and bring victory out of defeat.

World War II
Military Intelligence at the Center

World War II confronted the U.S. Army with the problems of fighting a global conflict across enormous distances. The beginnings were not easy. During the first six months of fighting in the Pacific, the United States suffered an unprecedented string of military reverses. German U-boats in the Atlantic ravaged the sea lanes until early 1943, creating a serious shortage of shipping that threatened America's capacity to project its power overseas. However, the military problems were manageable. America's vast industrial base allowed the United States to equip a mobilized Army of 8 million men, with 89 divisions and over 1,000 squadrons of aircraft. By the end of 1943 much of this vast force had been deployed overseas. Following preliminary operations in North Africa and the Mediterranean, the invasion of Normandy in June 1944 allowed the U.S. Army to bring its main forces to bear against Germany on the decisive battlefield of continental Europe. In the Pacific, the secondary theater of war, America eventually launched a two-pronged attack on the Japanese Empire from bases in Australia and Hawaii. By August 1945 the war had been brought to a triumphant close.

The history of Military Intelligence in the war was paradoxical. Largely because of the success of British and American cryptanalysts in exploiting enemy communications, the Army ultimately was provided with better intelligence than it had ever enjoyed in its history. Yet all during the war, there was a constant drumfire of criticism directed against Military Intelligence. In late 1943 Secretary of War Henry L. Stimson agreed with his colleague, Secretary of the Navy Frank Knox, that "our two intelligence services are pretty bum."[1] The same year Admiral Ernest King complained of "overlaps and wasted effort in the various activities" of Army and Navy Intelligence.[2] In retrospect, the Army's World War II deputy chief of staff, Lt. Gen. Joseph McNarney, stated that Army G–2 "was always a headache for the War Department and was reorganized con-

[1] Troy, *Donovan and the CIA*, p. 317.
[2] Ibid., p. 316.

tinuously and unsuccessfully throughout the war."[3] Although the intelligence end product was superb, the machinery that produced it was beset by disorder. The situation was not improved by a high rate of turnover in MID's leadership: between 1941 and 1944, the Army had four different assistant chiefs of staff, G–2.

The onset of the war led inevitably to major changes in Army Intelligence. Pearl Harbor provided an obvious spur to greater efforts at interservice coordination on intelligence matters. A Joint Intelligence Committee (JIC) that brought together working-level representatives of MID and the Office of Naval Intelligence had a belated first meeting on 11 December, a month after it was first authorized. Once the Joint Chiefs of Staff were in place, a new JIC was formed, consisting of the heads of MID and the Office of Naval Intelligence (ONI). Membership in the committee was expanded to include representatives of the Coordinator of Information, the Department of State, and the Board of Economic Warfare. The JIC had the dual mission of providing intelligence advice to the Joint Chiefs of Staff and representing the United States in combined Military Intelligence matters with its British counterparts. The principals on the JIC were supported by a larger working group known as the Joint Intelligence Survey Committee. With the growing independence of the Army Air Forces, the AAF's principal intelligence officer, the assistant chief of air staff, intelligence (A–2), was added to the JIC in May 1943, and the subordinate body became known as the Joint Intelligence Staff.[4]

This joint structure did accomplish some useful purposes by fostering interservice cooperation. Under its supervision, a joint prisoner-of-war interrogation center was set up at Fort Hunt, Virginia, in May 1942 to process high-ranking German prisoners. A similar facility was organized at Byron Hot Springs, California, in December to handle Japanese prisoners. By the fall of 1942, Joint Army-Navy Intelligence Studies were being published, and small Joint Intelligence Collection Agencies were later fielded in North Africa, the Middle East, India-Burma, and China to acquire nontactical information of potential use to Washington. At the end of 1942 there was even a serious proposal to merge MID with ONI, creating a joint intelligence agency. However, this idea ran into too many practical difficulties, since MID performed broader functions than ONI, and the two organizations were not parallel. MID, for example, was an element of a larger staff but ONI was not, since the Navy had no such body.

The exchange of information between Army and Navy Intelligence was also hampered by tradition. Both service intelligence agencies had long been conditioned to operate independently and departmentally. Communications intelligence was particularly sensitive: until November 1944 the Navy did not share all information derived from this source with the Army, and no joint organiza-

---

[4] For a further discussion of AAF intelligence in World War II, the reader is referred to John F. Kreis, ed., *Piercing the Fog: Intelligence and Army Air Forces Operations in World War II* (Washington, D.C.: Air Force History and Museums Program, 1996).

tion to coordinate activities in this field was put in place until 1945.[5] The lack of secure telephone links between MID and ONI, even at the end of the war, reflected the limits on cooperation between the armed services in the intelligence field.

Although MID was willing to work with its Navy counterpart, it regarded cooperation with other players in the intelligence arena with distaste. Both military services distrusted the civilians, especially Donovan's organization. This rivalry did not abate even after the Office of the Coordinator of Information, shorn of its propaganda functions, was placed under the Joint Chiefs of Staff in July 1942, redesignated the Office of Strategic Services (OSS), and given a heavy fill of military personnel, with Donovan himself ultimately receiving general's stars. MID never allowed OSS intelligence analysts any access to high-grade communications intelligence (COMINT).[6] One of the motives behind the proposal for creating a joint intelligence agency was to strip OSS of most of its intelligence functions. Moreover, when plans began to be made for Operation TORCH, the invasion of North Africa, the Joint Intelligence Committee was carefully cut out of the picture. Instead, intelligence support to the operation was provided by a Joint Security Control group with its membership restricted to representatives from Army and Navy Intelligence. Later the Joint Chiefs of Staff used this body to coordinate deception operations.

The Reorganization of Military Intelligence

At the same time that Army Intelligence was beginning to embark on intelligence collaboration with other elements, it was also undergoing reorganization. The first change came about as a result of a wholesale shakeup of the Army staff system in March 1942. Army Chief of Staff General George C. Marshall and his top planners decided to sharply cut back the Army staff and to centralize control of operations in a War Department Operations Division, which would become a Washington command post for the chief of staff. Administrative duties previously performed at the staff level were to be delegated to new subordinate commands. The staff would become a body engaged exclusively in planning and supervision.

This change, which divided the Army into the Army Ground Forces, the Army Air Forces, and the Services of Supply (later redesignated as the Army Service Forces), had a major impact on the structure of Military Intelligence.

---

[5] Ray Cline notes that "Neither the JIC [Joint Intelligence Committee] Weekly nor any component of the OSS ever used signal intelligence in its reporting. I know from Navy experience that this source was essential for all authoritative all-source intelligence, and it was a serious limitation that OSS had only minimal exposure to intercepts." *The CIA under Reagan, Bush, and Casey*, p. 78.

[6] Army-Navy rivalry over communications intelligence was conducted almost at the level of the Cold War. At one point a senior Army Intelligence officer wrote: "It is now apparent that the Navy proposes to do business at arm's length. We should accept that attitude and act accordingly." Memo for General Bissell, sub: Army-Navy Agreement Regarding ULTRA, in *Listening to the Enemy*, ed. Ronald H. Spector (Wilmington: Scholarly Resources, 1988), p. 199.

Each of the components had its own intelligence staff. Initially, Army Ground Forces took over responsibility for combat intelligence training. The intelligence organization of the Army Air Forces (AAF) devoted itself to studying the technical and tactical aspects of the air-related threat, while the War Department G–2, in which AAF personnel were well represented, continued to have responsibility for strategic air intelligence. The Services of Supply, in addition to exercising supervision over counterintelligence operations in the United States, took over responsibility for the intelligence activities of the seven Army technical services: the Chemical Warfare Service, Corps of Engineers, Medical Corps, Ordnance Corps, Quartermaster Corps, Signal Corps, and Transportation Corps. Among other things, this meant that the Services of Supply now had jurisdiction over the Signal Intelligence Service, a step which had important adverse implications, since it placed the Army's most productive intelligence arm under a service organization with no background in intelligence and with low priorities for obtaining personnel and resources in this area.

The organization most affected, however, was the Military Intelligence Division itself. At the time the reorganization went into effect, it was by far the largest single element in the Army Staff, containing 50 percent of all officers on the staff and 60 percent of all other personnel. The March 1942 reorganization reduced the division to just 26 people, 16 of them officers. To carry out all the operating functions—collecting, analyzing, and disseminating intelligence—the new and theoretically separate Military Intelligence Service (MIS) was set up. Initially, MIS included an Administrative Group, an Intelligence Group, a Counterintelligence Group, and an Operations Group. By April 1942 the new organization already consisted of 342 officers and 1,000 enlisted men and civilians, and it continued to expand.

On paper, the separation of the Military Intelligence Division from its operating arm, the Military Intelligence Service, was a drastic change. In practice, it proved otherwise. The head of MID at the time was the rather imperious Maj. Gen. George V. Strong. Although charged with responsibility for carrying out the plan, Strong emphatically did not believe in it and effectively frustrated its implementation. He justified this bit of institutional sabotage on the grounds that he was still responsible for providing intelligence advice to the chief of staff and needed to retain command and administrative control over the assets required to accomplish his mission. As a result, until the general departed in early 1944, the separation between MID and MIS remained essentially a paper arrangement. By the end of Strong's tenure as assistant chief of staff, G–2, there were two organization charts for the Military Intelligence Service, one drawn to please the reformers on the General Staff, and the other reflecting actual command arrangements.

Although Army planners had an impact on Military Intelligence organization at the War Department level, the imperatives of the war itself were greater. At the time of Pearl Harbor, MID's production unit, the Intelligence Branch, was

internally divided into traditional geographic sections, and the organization still derived the bulk of its intelligence, apart from MAGIC, from the attache system. The involvement of the United States in actual overseas combat changed both the sources of intelligence and the information-gathering process. Intelligence production was now assigned to the Military Intelligence Service. MID's former Intelligence Branch became the Intelligence Group of the MIS and was reorganized to reflect the various theaters of war. In addition, new functional elements sprang up beside the area elements as the needs of wartime expanded the scope of MIS's interests.[7]

Perhaps the most important organizational change within the MID/MIS organization was the development of an element charged with exploiting sensitive communications intelligence. This occurred as a result of the weaknesses in handling such sources at Pearl Harbor. The restrictions on dissemination that had been placed on the MAGIC intercepts had left Army Intelligence oblivious to the Japanese threat. Immediately after the Pearl Harbor attack, Secretary of War Stimson called upon a prominent Chicago lawyer, Alfred McCormack, to examine the implications of the problem. McCormack recommended the creation of a branch within the Military Intelligence Service to deal with the processing of communications intelligence. The Special Branch was established in May 1942 with Col. Carter W. Clarke as its head and with McCormack, now commissioned as a colonel, as his deputy. To acquire the necessary high-caliber personnel to staff the new organization, McCormack drew heavily on lawyers from elite firms, who were given reserve commissions.[8]

The Special Branch was an important step in the rationalization of the Army's handling of communications intelligence. For the first time, analysts in sufficient numbers would have access to the material in ways that would allow them to exploit it properly for evaluation. MAGIC could now be viewed in its entirety and used to build up an intelligence picture. However, although the Special Branch was a step in the right direction, it was not the final answer. The rest of the Military Intelligence Service, cut off from compartmentalized intelligence, was forced to operate in a vacuum. Additionally, even though the branch received its intelligence from the Signal Intelligence Service, it did not control the operations of the SIS, which still remained under the direction of the Chief Signal Officer.

---

[7] Among the diverse elements of the Military Intelligence Service were MIS–Y, which ran an interrogation center for high-level German officers, and MIS–X, which was involved in making arrangements for procuring intelligence from captured Army Air Forces flight crews, as well as for implementing escape and evasion measures. Both organizations operated from a secret headquarters at Fort Hunt, Virginia. See Lloyd R. Shoemaker, *The Escape Factory* (New York: St. Martin's Press, 1990). Maj. Gen. Otto L. Nelson later commented, "Organizationally, G–2 was a mongrel, with many uncertain strains mixed in and not always recognizable." *National Security and the General Staff* (Washington, D.C.: Infantry Journal Press, 1946), p. 526.

[8] A detailed history of the organization is contained in "History of the Special Branch, MIS, War Department, 1942–1944," *Listening to the Enemy*, pp. 171–94.

The Special Branch was not the only organizational innovation introduced into the MIS. The Military Intelligence Service had inherited from MID small branches located in New York City, San Francisco, and New Orleans. In April 1942 a new branch was established in Miami, Florida, to counter the threat of Axis penetration and subversion in Latin America. In August the entire Latin American Section of the Military Intelligence Service moved to Miami. Successively redesignated the American Hemisphere Intelligence Command, the American Intelligence Command, and the American Intelligence Service, the unit became what one historian described as a "huge, semi-independent military intelligence agency."[9] It engaged in both counterintelligence activities and positive collection, controlling subordinate field offices in the Canal Zone and in Brazil, and operating its own intercept system to locate possible agent transmitters throughout Latin America. Additionally, MIS expanded its overseas operations further, setting up a small secret intelligence service in 1942 and a Military Intelligence Research Section, with offices in London and Washington, D.C., for exploitation of captured documents in January 1943.[10]

The Military Intelligence Division also ventured into areas rather far afield from pure intelligence work. For a brief time, one was psychological warfare. The Special Studies Group that had previously dealt with the subject became the Psychological Warfare Branch of MID shortly after the declaration of war. However, one year later the Joint Chiefs of Staff assigned the Office of Strategic Services responsibility for conducting all activities in this field, and the Army's Psychological Warfare Branch was discontinued. Nevertheless, MID eventually reassumed responsibility for the Army's remaining efforts in this area, setting up the Propaganda Branch in 1943. In a move that took the Military Intelligence Division even further afield from purely intelligence-related concerns, in April 1943 the organization was given responsibility for conducting the Army's World War II historical program.[11]

A function more pertinent to intelligence was that of training intelligence personnel. The Army had decided rather belatedly that intelligence training was an intelligence responsibility. The Army Air Forces had led the way in this area, opening up an AAF Intelligence School for their own personnel in February 1942. Classes were held at the University of Maryland until April, when the Army Air Forces acquired a more permanent facility at Harrisburg, Pennsylvania. In June 1942 the Military Intelligence Service activated its own

Military Intelligence Training Center (MITC) at Camp Ritchie, Maryland, a former National Guard installation.

The Camp Ritchie center trained order of battle specialists, photo interpreters, some linguists, and general intelligence personnel. After August 1944 the center also offered counterintelligence training. Intelligence personnel proceeded from Camp Ritchie to a staging area at Camp Sharpe, Pennsylvania, where they received additional combat training, were formed into teams, and assigned directly to theater control. Over 19,000 students passed though Camp Ritchie's gates during the course of World War II. The training offered at Ritchie may not have been perfect—officers in the European theater would later complain that members of their military intelligence specialist teams showed "a lack of basic military training and a certain ineptness about caring for themselves"—but it was a more extensive effort than the Army had ever before undertaken in this arena.[12]

To meet the special needs of the Army in the Pacific, the Military Intelligence Service also took over the direction of a separate school for Japanese linguists, with a student body composed primarily of second generation Japanese Americans known as Nisei. This school had been established originally at the Presidio of San Francisco, under Fourth Army control in the days before Pearl Harbor. In May 1942 it became the Military Intelligence Service Language School, moved to Camp Savage, Minnesota, and was greatly expanded. To acquire better facilities, the school moved once more to Fort Snelling, Minnesota, in August 1944. By the end of the war, it had graduated over 4,800 Japanese-language specialists, most of whom served in the Pacific theater as members of interpreter-interrogator-translator teams.[13] The Army also sponsored instruction for smaller numbers of Japanese, Chinese, and Russian linguists at selected universities, and the MIS itself trained 1,750 Army censorship personnel at Fort Washington, Maryland, until February 1944, when the Army Service Forces assumed the function. Army counterintelligence personnel assigned to MIS had their own separate school in Chicago until 1944.

Not all intelligence training was directly under the auspices of the Military Intelligence Service. The Signal Security Agency (SSA), SIS's wartime successor, provided cryptologic and language training for military and civilian personnel at Arlington Hall Station, Virginia, and maintained a school for officers and enlisted personnel at Vint Hill Farms Station, Virginia. Intelligence personnel for the Army Air Forces continued to attend the AAF facility in Harrisburg, Pennsylvania, until this school was relocated to Orlando, Florida, in the spring

of 1944. Finally, the responsibilities for training soldiers assigned to tactical signals intelligence units were peculiarly fragmented. Units were organized and trained both by the Army Ground Forces and the Army Air Forces, while advanced training was administered under SSA supervision at its own facilities and at Signal Corps installations at Fort Monmouth, New Jersey, and Camp Crowder, Missouri.[14]

The ULTRA Breakthrough

Events of the spring of 1943 would reshape the entire structure of Military Intelligence. In April Army cryptanalysts scored their first success against Japanese military codes. A month later, a party of officers from MIS and from the Signal Security Agency visited the British Government Code and Cypher School at Bletchley Park. For the first time, American Military Intelligence became aware of the dimensions of the British success against high-level German communications. British efforts in breaking the German Enigma and other ciphers used on command links had laid bare many of the most important secrets of the Nazi high command. The intelligence derived from this source, known as ULTRA, was disseminated by the British under rigidly controlled conditions. Although such intelligence had been provided to Eisenhower during the invasion of North Africa, U.S. Army Intelligence had not been fully aware of its origins. Now the British agreed to share this intelligence with the U.S. Army on an unrestricted basis, in exchange for reciprocal access to American communications intelligence on the Japanese.

These twin developments confronted Army Intelligence for the first time with the problem of disseminating communications intelligence to the field. The previous American success against the Purple machine, although providing valuable background information to Washington during the course of the war, had not had tactical implications. In contrast, ULTRA could be of immediate operational value. The problem was now to transmit this extremely sensitive combat intelligence from central processing centers in the United States and Great Britain to theater commanders thousands of miles away in a fashion that would avoid any compromise of the source of intelligence.

In response, the Special Branch adopted the existing British system of handling communications intelligence. New security classifications were introduced. At first, high-level communications intelligence was termed ULTRA DEXTER, lower-level material designated DEXTER. Later, ULTRA was reserved for the results of high-level cryptanalysis, while intelligence derived from breaking simpler systems was

---

[14] These intercept units, an officer of the Signal Security Agency commented, were "organized and trained by the ground forces in a rather 'hit-or-miss' manner without any particular reference to their ultimate employment." SRH 169, Centralized Control of U.S. Army Signal Intelligence Activities, p. 14.

termed CIRO PEARL or PEARL, and information produced from radio-direction finding was labeled THUMB. Ultimately, in order to mesh Army and Navy practice, PEARL and THUMB were merged into a single category, PINUP. Meanwhile, in April 1944 the U.S. Army at last adopted a "top secret" classification to provide a satisfactory equivalent to the British "most secret."

Terminology was only one aspect of the new procedures. The actual dissemination of ULTRA in the field was handled by special security officers (SSOs) selected and trained by the MIS Special Branch and operating under its direct command using special cipher systems. This was both faster and more secure than the usual practice of sending intelligence through successive layers of command channels. Again, this followed British practice. The first three American SSOs went out to commands in the Pacific in the fall of 1943. The British agreement that ULTRA supplied to American commanders in the European theater would henceforth be disseminated through American channels led to the procurement of eighty additional special security officers in December 1943.

At first, the SSOs were attached only to the highest level of commands. They had the dual mission of securing the vital ULTRA material and of explaining its significance to commanders and intelligence officers unfamiliar with the uses and limitations of high-grade communications intelligence. However, by July 1944 the decision had been made to disseminate ULTRA directly to field armies and equivalent AAF commands and even down to independently operating Army corps. This necessitated recruiting 172 more SSOs in August 1944. In addition, 65 enlisted men were brought into the system to operate communications, thus relieving SSOs from the necessity of deciphering their own messages. By the end of the war, the elaborate dissemination system was headed in each theater by a senior special security representative.[15]

The Army's own increasing successes in communications intelligence, combined with the new availability of the British COMINT product, helped bring about a general reorganization of the Military Intelligence Service. Because of the growth of its responsibilities, the Special Branch expanded to the point where it constituted the largest component of the MIS Intelligence Group. This created a situation in which much of the analysis performed at the War Department level was undertaken by individuals without access to the single most important intelligence source exploited in the war. Only a "very select few" top production officials had been granted access to the whole picture.[16]

General Strong's departure in February 1944 paved the way for an institutional readjustment. In April a committee headed by Assistant Secretary of War

---

[15] See "History of the Operations of Special Security Officers Attached to Field Commands, 1943–1945," *Listening to the Enemy*, pp. 199–204.

[16] Bidwell, History of the Military Intelligence Division, vol. 5, p. 221. Bidwell's treatment of the full implications of the reorganization is necessarily unsatisfactory, since he wrote before the ULTRA secret—and the exact duties of Special Branch—had been decompartmented and released.

John J. McCloy recommended that "extreme compartmentation" be eliminated.[17] As a result, the War Department completely reorganized its Military Intelligence organization. The Special Branch was abolished as a totally separate compartmented entity, although a new Special Branch was formed to handle dissemination of ULTRA to the field. A Military Intelligence Service separate from MID was reestablished and its internal structure realigned, with the organization ultimately reaching a peak worldwide strength of 1,500 officers, 2,000 enlisted men, and 1,100 civilians in October 1944.

The timing of the reorganization, however, demonstrated all too clearly that the nation's strategic decision makers still looked upon Army Intelligence as "a kind of reference service for data rather than for professional judgments."[18] The new arrangements went into effect in early June 1944. As distinguished historian and intelligence analyst Ray Cline later described the situation, the "G–2 [staff] was so little geared into high-level strategic decisions that it was engaged in a colossal struggle for office space when D-Day for the Normandy invasion came along: all of G–2's files were locked up sitting in safes in the halls waiting for moving crews when frantic requests for data on the landing zone situations began to descend on the hapless Army intelligence officers, who hardly knew each others' phone numbers, let alone what was in the files."[19]

The new-model Military Intelligence Service differed substantially from its predecessor. Internally, it was organized into three directorates: Administration; Intelligence; and Information, which supervised collection and dissemination. It now functioned independently of MID and was freed from some of the excessive compartmentation that had hobbled previous operations. Moreover, at last it could concentrate almost exclusively on the production of foreign intelligence. As a result of decisions made earlier in 1944, responsibility for counterintelligence and censorship had been allotted to the Army Service Forces, a move which rather explicitly downgraded the importance of these functions in the Army, and the MIS Counterintelligence Group that had previously exercised staff supervision over this area was thus abolished.

In addition, certain activities previously carried out at dispersed locations in the United States were now centralized in Washington, D.C. The American Intelligence Service operating from Miami, Florida, had been terminated in January 1944. Now that the war had been carried to the shores of Europe, America was no longer worried about Axis subversion in Latin America. Similarly, the branches previously established in San Francisco, New Orleans, and New York City had lost most of their usefulness as the war progressed and other sources of intelligence became available. By June 1944 the first two

of these branches had been shut down, and the New York branch would cease operations that December. However, it should be noted that the Corps of Engineers, which had its own intelligence office in New York City, continued to find the data bases available there to be essential in producing strategic Engineer Intelligence.

Unfortunately, while the new MIS was a changed organization, not everyone agreed that the changes had been for the better. The new Intelligence Directorate at the heart of MIS was organized on lines that soon proved to be confusing, with a layer of geographic "specialists" superimposed upon branches organized along functional lines.[20] It seems to have been envisaged that the specialists, who had no operating responsibilities, would act as a group of "wise men," producing a unified intelligence picture from the myriad details coming from the functional operating echelons. However, the geographical specialists questioned how they could produce cohesive results without controlling any assets, and the chief of the Military Intelligence Service felt they should be on MID's organization chart, not his own. In practice, functional areas of responsibility proved to be overlapping, the new arrangements separated the researchers from the report writers, and MIS found itself organized on different lines from any other intelligence organization with which it dealt.

Two months after the new reforms had been implemented, the chief of the MIS declared the new system "slow and cumbersome."[21] Col. Alfred McCormack, now director of Intelligence, was equally unhappy: the Special Branch he had painstakingly assembled was now dispersed throughout "53 separate branches, sections, and subsections," and he felt MIS was now under "about as impracticable a scheme of organization as could be devised."[22] Additional tinkering with the system went on until the close of the war, but a postwar study of intelligence organization at the General Staff level concluded that from the point of view of producing timely intelligence, the 1944 reorganization was "a total failure."[23]

Whatever its continuing internal weaknesses, MIS took a major institutional step forward. Since 1943 communications intelligence, MIS's main source of intelligence, had been under the control of the chief signal officer or of theater commanders.[24] In December 1944 MIS at last secured operational control over the Signal Security Agency, and was able to give direction to the Army's most important COMINT asset. This step also positioned MIS to take over this whole field of intelligence when the war came to a close.

The Counter Intelligence Corps

The Military Intelligence Service was not composed solely of collectors and analysts. For most of World War II, it also included personnel of the Army Counter Intelligence Corps (CIC), formed on 1 January 1942 as the successor to the Corps of Intelligence Police. The new organization had both a more appropriate name and initially a more centralized organization than its predecessor. In January the War Department took over control of all background investigations of prospective counterintelligence agents and in April centralized the issue of credentials. The CIC would be an elite force, picking its enlisted personnel from the cream of Selective Service inductees. As Maj. Gen. George V. Strong, the assistant chief of staff, G–2, put it, "the personnel of this Corps is of officer caliber."[25]

The question of overall control was not resolved finally, however. The service commands, as the corps areas were redesignated in March 1942, were the primary users of CIC agents in the first part of the war, and local commanders naturally wanted the convenience and flexibility of procuring their own counterintelligence personnel. For example, the commanding general of the New York Port of Embarkation began to recruit his own agents for the Transportation Corps in March 1942 and, although these individuals were issued Military Intelligence Division credentials, it was not until early 1943 that part of the contingent was assimilated into the Counter Intelligence Corps.

The scope of the CIC's responsibilities was vastly increased in March 1942, when the Army expanded its existing countersubversive program and gave it new guidelines, modeling it after the similar Army program of World War I. The new countersubversive operation latticed the nation's military establishment with "an elaborate and fine network of secret agents."[26] Intelligence officers secretly recruited informants within each unit, on an average ratio of one informant to every thirty men, resulting in a program of enormous proportions. By the summer of 1943 there were 53,000 operatives in just one of the nine service commands in the continental United States and over 150,000 such reports were being filed monthly once the system became fully operational. Although the countersubversive program was administered by unit and installation commanders, not by the Counter Intelligence Corps, CIC agents were assigned to follow up reports of subversive activity. At the War Department level, the process was monitored and coordinated by the Counterintelligence Group of the Military Intelligence Service, which exiled those suspected of sedition to special holding units in the remoter parts of the country.

Inevitably, the new work load led to the expansion and restructuring of the Counter Intelligence Corps. Expansion itself generated an additional work load,

[26] Ibid., p. 127.

since the official CIC history later estimated that the Counter Intelligence Corps in the continental United States allotted half its man-hours to investigate its own applicants. By July 1943 the Corps was authorized a strength of 543 officers and 4,431 enlisted personnel. Officers previously detailed to the organization were now formally transferred and additional officers allotted from officer candidate schools. In the past, all CIC enlisted men had held the rank of sergeant; now corporals and privates were added to the corps. This permitted functional differentiation. Sergeants served as special agents with full investigative powers, and corporals and privates held subordinate positions as agents and counterintelligence clerks. The new arrangements allowed some relaxation in the Counter Intelligence Corps' appointment standards. For a period in late 1942 and early 1943, service commands once more were allowed to procure and transfer agents and clerks, while Washington retained full control over special agents and officers. In line with the renewed authority given to the field, the Counter Intelligence Corps School in Chicago, previously responsible for training all CIC personnel, now confined its activities to providing advanced courses, allowing the service commands to provide introductory counterintelligence training.

Meanwhile, the Counter Intelligence Corps was forced to relocate its headquarters. At the end of 1942 the War Department, concerned that too many fit young officers were serving in staff assignments in Washington, stipulated that no more than one-third of the officers assigned to any element in Washington, D.C., could be below thirty-five years of age. This "Child Labor Law" literally drove the CIC out of town. In January 1943 the chief of the Counter Intelligence Corps and his staff moved to a dormitory of Goucher College, a fashionable girls' school in Baltimore, Maryland, that had been taken over by the government for the duration of the war.

While these developments were taking place, the Counter Intelligence Corps was beginning to find a new role with the fighting forces. Heretofore, almost all its duties had been concerned with security in the service commands or in base areas overseas. Special agents in civilian clothes had operated from offices, essentially working in much the same fashion as their civilian counterparts in the FBI. In some cases, CIC agents had been recruited and assigned without completing basic military training. However, when plans were drawn up for the American invasion of North Africa in the fall of 1942, it was decided that CIC personnel would be attached to tactical units in the field. The initial CIC experience with field service was not completely happy. The commander of the training camp to which the first group was assigned labeled them "a citizen army of misfits."[27] Nevertheless, the CIC personnel attached to the North African task force ultimately demonstrated their value in a tactical support role.[28]

[28] Powe and Wilson, *The Evolution of Military Intelligence*, p. 53.

Tactical employment gave the Counter Intelligence Corps a whole new raison d'etre. By the middle of 1943 the Army at last began to deploy a sizable portion of its strength overseas. The CIC was affected by this shift. With deployment of tactical CIC detachments to combat situations imminent, the CIC School in Chicago put its students in uniform and placed a new emphasis on counterintelligence operations under battle conditions. The same concern for making counterintelligence personnel ready for combat led to the creation of a Counter Intelligence Corps Staging Area in the summer of 1943 to better prepare units about to go overseas. The staging area, initially located at Logan Field in Baltimore, Maryland, soon moved to nearby Camp Holabird, beginning a long association between Military Intelligence and what would become known as "The Bird."

By the fall of 1943 the Counter Intelligence Corps appeared to have solved its initial problems and to have become an established part of the Army. Its organization manual finally had been approved, and the new tactical emphasis placed it in step with the rest of the Army. Agents increasingly served in uniform with the troops rather than working as anonymous "spooks" on the fringes of the military establishment. Finally, the War Department transferred control of CIC personnel from the Military Intelligence Service to the using agencies, again bringing the Counter Intelligence Corps into conformity with the rest of the military establishment.

However, the activities of the Counter Intelligence Corps still managed to generate criticism from both within and outside the Army, placing the corps in a bureaucratically vulnerable position. From the viewpoint of the wartime military, the CIC absorbed a disproportionate percentage of high-quality personnel and used them to accomplish what many regarded as a marginal mission. Tradition-minded Army officers disliked the whole business of counterintelligence operations, especially when they involved enlisted personnel investigating officers. The CIC's investigations of leftist individuals and groups were not universally popular with politicians, particularly since the War Department's Counterintelligence Group had used the results to exclude some well-connected young men from Officers' Candidate School. Moreover, some investigations were conducted with more zeal than prudence. In early 1943, for example, the White House discovered that CIC agents had installed listening devices in the hotel suite of the president's wife in an attempt to monitor the activities of individuals suspected of Communist leanings.[29]

Accumulated resentments eventually found official expression, leading to the temporary eclipse of the Counter Intelligence Corps. In July 1943 Lt. Gen. James J. McNarney, the Army deputy chief of staff, directed the Army inspector general to launch an investigation of the CIC. On 5 November 1943, all CIC agents were ordered out of Washington, D.C., and a day later the inspector gen-

[29] Joseph P. Lash, *Love, Eleanor: Eleanor Roosevelt and Her Friends* (Garden City, N.Y.: Doubleday and Co., Inc., 1982), p. 492.

eral submitted a devastating critique of the corps' operations and organization. Charging that many CIC investigations were "superficial, and unproductive of positive results except in rare instances," the inspector general found that the only thorough investigations were those made of applicants for CIC or of military and civilian personnel suspected of subversion. However, these categories were overly thorough, since they dragged on after all immediate allegations had been resolved. Moreover, when officers were investigated, CIC procedures resulted in the indiscriminate dissemination of reports containing unverified derogatory information "based on hearsay, gossip, and innuendo," all of which was "directly contrary to the inherent right of a commissioned officer of the U.S. Army to be advised of imputations and allegations as to his character." In any case, the countersubversive program that had generated much of the work load was nearly worthless, since the million reports submitted in the first part of 1943 had identified only 600 suspects, and it was possible that many reports had been made on the same individual.[30]

The inspector general's report equally criticized the organizational concepts that underpinned Counter Intelligence Corps operations in the continental United States. In the security field, he found, the activities of the Counter Intelligence Corps at least partially duplicated what was being done by the investigators assigned to the Provost Marshal General's Office. In addition, the existing counterintelligence system undermined the concept of command responsibility, since the G–2s in the service commands had to answer both to their commanding generals and to the Counterintelligence Group of the Military Intelligence Service.

The inspector general's report led to the immediate unraveling of the Counter Intelligence Corps. The countersubversive program was terminated, and most CIC agents in the continental United States were merged with the criminal investigators of the Provost Marshal's Office to form a new Security Intelligence Corps that operated under the control of the service commands. Although CIC detachments continued to serve with the Army Air Forces, the Manhattan Project, and tactical units, the presence of the Counter Intelligence Corps on the home front was effectively eliminated. The CIC School was transferred to the provost marshal general, its staging area closed, and the position of chief, Counter Intelligence Corps, abolished. The outgoing chief, Col. Harold R. Kibler, blamed the fall of his command on the enmity of the White House, specifically "Harry Hopkins and the Secret Service."[31] A little later the Counterintelligence Group of the Military Intelligence Service was also eliminated. For the moment, the Army had decided to practically abandon the field of domestic counterintelligence, limiting the CIC to a tactical support role overseas.

[31] FBI memo quoted in Lash, *Love, Eleanor*, p. 492. A more melodramatic but less accurate version of the imbroglio can be found in Richard G. Powers, *Secrecy and Power: The Life of J. Edgar Hoover* (New York: Free Press, 1987), pp. 265–66. "Supposedly, the President had been so furi-

This role, however, proved substantial. CIC detachments rolled up nets of enemy agents in Italy, landed in Normandy with the first wave of paratroopers, screened civilians in France, and arrested Nazi officials as U.S. forces overran Germany. In the Pacific, Counter Intelligence Corps units secured enemy documents on the remote islands of Micronesia and worked with local guerrillas rounding up collaborators in the Philippines. To be sure, some distrust of CIC continued throughout the war. Writing in 1946, two experienced Army intelligence officers noted that "the Counterintelligence [*sic*] Corps (CIC) in World War II was in many ways a peculiar organization, whose personnel (chosen hurriedly and under pressure for their educational rather than military qualifications) frequently got in everybody's hair."[32] However, counterintelligence support was essential for American units operating in the midst of an alien population, and 241 CIC detachments would serve in overseas theaters during the course of World War II.

In turn, success overseas revitalized the CIC at home. By the summer of 1945 it was clear that the evisceration of the Counter Intelligence Corps had deprived the Army counterintelligence function of essential institutional support just as needs were increasing. The Army's role in the occupation of a defeated Germany had placed new demands on the depleted CIC detachments in the European theater, and the pending expansion of military operations in the Pacific to the Japanese mainland threatened to pose even greater potential counterintelligence problems. But the Army now lacked any effective mechanism either to procure new counterintelligence specialists or to redeploy those it already had. Although the Military Intelligence Training Center at Camp Ritchie had begun training counterintelligence personnel in August 1944, the Camp Ritchie program stressed combat intelligence rather than counterintelligence. Moreover, there was no rotation base for the Army's counterintelligence personnel, since any members of the Counter Intelligence Corps shipped back to the United States were reassigned as individuals to the Army general replacement pool and were lost to their specialty.

These considerations led to the reestablishment of the Counter Intelligence Corps in the continental United States. In July 1945 the Office of Chief, Counter Intelligence Corps, was restored, a new CIC Center and School organized, and both elements placed under the control of the Intelligence Division of the Army Service Forces. Originally located at Fort Meade, the school soon moved to Camp Holabird. In August the Security Intelligence Corps was released from the control of the provost marshal and reassigned to the Intelligence Division, paving the way for its eventual merger into the CIC.

The Signal Security Agency

The development and expansion of the Army signals intelligence and communications security organization was governed by dynamics quite different from those affecting the structure of Army counterintelligence. Although the growth of the Counter Intelligence Corps was a function of the expansion of the countersubversive program and the need to create new units to give tactical support in the field, the Signal Intelligence Service and its successor organizations evolved largely as a result of increasing success in accomplishing the cryptanalytic mission.

The United States' entry into World War II naturally imposed new demands on the Army's Signal Intelligence Service. Up to this point, the SIS had achieved its main successes against intercepted diplomatic communications provided by its 2d Signal Service Company, which manned seven small fixed sites located at Fort Hancock, New Jersey; Fort Hunt, Virginia; Fort Sam Houston, Texas; the Presidio of San Francisco, California; Corozal, Canal Zone; Fort Shafter, Hawaii; and Fort McKinley, Philippine Islands. At the time of the attack on Pearl Harbor, the Signal Intelligence Service had a strength of 331, almost equally divided between the field sites and its headquarters in the old Munitions Building, a World War I–vintage structure in downtown Washington, D.C.

The shift from peace to war transformed the nature of the Signal Intelligence Service, for it now had to provide military as well as diplomatic intelligence. Initially, the organization concentrated on deciphering Japanese Army cryptosystems, since the Japanese posed the immediate military threat to U.S. forces. To do this, the SIS analysts had to master the elaborate and intricate system of Japanese military codes, which worked on cryptologic principles completely different from those used in the Purple machine of the Japanese Foreign Office. This required not only the expansion of the SIS headquarters, but also the reconfiguration of its intercept network, especially since its most advanced outpost, Fort McKinley, would soon be overrun.[33]

In March 1942 the Military Intelligence Division recommended to the chief signal officer that the SIS move from the Munitions Building into new quarters with greater security. MID also recommended that the Signal Intelligence Service establish two new primary monitoring stations, one on each coast of the United States. Under wartime conditions, these suggestions met a quick response. In June 1942 the Army took possession of Arlington Hall, a former girls' school in Arlington, Virginia, and transformed it into SIS headquarters. That same month, personnel of the 2d Signal Service Battalion, as the 2d Signal

---

[33] The fate of the SIS intercept post at Fort McKinley and of its survivors is detailed in "Reminiscences of Lieutenant Colonel Howard W. Brown," *Listening to the Enemy*, pp. 43–76, and in Michael Maslak, "Signalman's Odyssey," *Military Intelligence: Its Heroes and Legends*, pp. 133–61.

Service Company was now designated, began operations at Vint Hill Farms in Warrenton, Virginia, which had been selected as the site for Monitoring Station No. 1. A second major field station was soon organized at Two Rock Ranch near Petaluma, California.

Paradoxically, as the duties of the Signal Intelligence Service became more important, its relative organizational position within the Signal Corps began to sink steadily lower as the structure of the Signal Corps itself grew more elaborate. By July 1942 the SIS was separated from the Office of the Chief Signal Officer by four organizational layers. As a result the organization was realigned, and since the term "signal intelligence" was thought to be too revealing, it was also redesignated as part of this process, becoming the Signal Security Service in 1942 and the Signal Security Agency (SSA) in 1943. Meanwhile, the positions of chief, Signal Security Service, and commander, 2d Signal Service Battalion, had been merged in 1942, effectively converting the battalion into a personnel center for the enlisted ranks at Arlington Hall and for both officer and enlisted personnel in subordinate detachments manning intercept stations worldwide.[34]

During the first part of the war, the performance of the Army's signals intelligence organization was somewhat disappointing. In July 1942 it received responsibility for all intercept of diplomatic communications, a mission previously shared with the Navy, thus becoming the sole producer of MAGIC. However, despite its continuing successes in the diplomatic field, it found its main task—coping with the mysteries of Japanese military communications—intractable. No cryptologic continuity on Japanese military communications had been built up before Pearl Harbor, principally because of the impossibility of intercepting the existing Japanese military nets either in the home islands or on the mainland of East Asia. It was not until April 1943 that an initial entry was made into one of the principal Japanese Army systems, and General MacArthur's own cryptologic center in Australia made the discovery simultaneously. Even so, Arlington Hall was not able to read enough of the code to produce any intelligence until June of that year.

The summer of 1943, however, proved to be something of a watershed for the Signal Security Agency. Once cryptanalysis of Japanese messages proved to be possible, SSA expanded enormously, recruiting a largely civilian work force. There were 395 persons at agency headquarters at the beginning of 1943 and 3,455 by the end of the year. Although two large temporary buildings had been hastily constructed at Arlington Hall in the winter of 1942 to provide additional office space for this work force, the influx of new personnel still made for cramped quarters. However, in 1943 the War Department gave the British primary operational responsibilities for code breaking in Europe, which freed the SSA to concentrate most of its energies on the Japanese military problem.

---

[34] A conscientious, if pedestrian, account of the unit can be found in SRH 135, History of the 2d Signal Service Battalion.

The year 1944 saw the full maturation of SSA's activities. In January Australian forces captured the codes of the Japanese 20th Division at Sio on New Guinea. The find led to full exploitation of Japanese military communications and triggered another period of growth. By June 1944 over 5,100 civilians, most of them female, were working at Arlington Hall, assisted by 2,000 more military personnel. In the spring of 1944 the intercept facilities of SSA's 2d Signal Service Battalion were also extended when new fixed stations were established at New Delhi, India; Asmara, Eritrea; Fairbanks and Amchitka, Alaska; and Fort Shafter, Hawaii. In the fall the steady advance of American forces in the Pacific allowed another fixed site to be established on the island of Guam. Additionally, the 2d Signal Service Battalion assumed control over former Office of Strategic Services "listening posts" at Bellmore, New York, and Resada, California, converting them into security monitoring stations.[35]

Arlington Hall thus became the center of an enormous web of collection activity. Intercept was provided not only by the fixed stations of the 2d Signal Service Battalion, but also by Signal Corps tactical units under theater control in the field. By the end of the war, 26,000 American soldiers were involved, one way or another, with the intercept and processing of signals intelligence. In addition, U.S. Army collection efforts were supplemented by material forwarded to Arlington Hall by MacArthur's multinational center and by British, Canadian, and Indian sources. To process the material, which came by courier pouch and through forty-six teletype lines at Arlington Hall, the Signal Security Agency's military and civilian work force of 7,000 was supported by a battery of 400 IBM punch-card machines.

All this was conducted under the tightest secrecy, which would be maintained for thirty years. The stringent security measures that cloaked the Army's signals intelligence organization, however, denied it the credit and stature it deserved. That the positions of chief of the Signal Security Agency and commander of the 2d Signal Service Battalion continued to be combined under one colonel throughout most of World War II indicates something of the nature of the problem. Col. Preston W. Corderman, who had commanded the agency since 1943, finally received a brigadier general's star in June 1945.[36]

The assumption of operational control over the Signal Security Agency by MIS in December 1944 made sense for both organizations. By this time, the agency had become the Army's most significant producer of high-grade intelligence. The Military Intelligence Service now had control of targeting and could rearrange operational priorities. In addition, the change benefited the Signal Security Agency. As long as the agency had been simply a part of the Signal

---

[35] The OSS had originally used these stations to monitor Axis propaganda and news broadcasts.

[36] A short account of the SSA's code-breaking activities in World War II can be found in SRH 349, Achievements of the Signal Security Agency in World War II, pp. 1–38.

Corps, its request for increased personnel allotments had to pass through the chief signal officer and the general commanding the Army Service Forces, neither of whom were indoctrinated for communications intelligence or knew the true importance of the agency's mission. Col. Alfred McCormack of MIS's Special Branch believed that this factor had delayed the breaking of Japanese codes by a year.[37] The new arrangement ended this anomaly. Although the chief signal officer still retained administrative control of the SSA, the action was a significant first step toward the postwar integration of all Army communications intelligence under G–2 control.

A second step soon followed, precipitated by the growing, if belated, collaboration between the Army and the Navy in the communications intelligence field. At one point the Army had maintained closer COMINT working relationships with the British than with the U.S. Navy. In February 1945 Admiral Ernest King, Commander in Chief, United States Fleet, and Chief of Naval Operations, agreed with Army Chief of Staff General George Marshall to create the Army-Navy Communications Intelligence Board (ANCIB) to direct a joint effort in this field. The board would report directly to the two service chiefs, not to the Joint Chiefs of Staff, and would use as its staff support the existing Army-Navy Communications Intelligence Coordinating Committee (ANCICC), a working-level group set up on an informal basis in early 1944 by the Signal Security Agency and its Navy opposite number, OP–20–G. However, the new head of the Military Intelligence Division, Maj. Gen. Clayton Bissell, vetoed the idea on the grounds that "the Army cannot participate on an inter-service project of this sort as long as its own signal intelligence efforts remain as decentralized as they now are."[38] The Navy, Bissell claimed, had a monolithic communications intelligence organization, while MID controlled only the Signal Security Agency.

Bissell's bureaucratic ploy spurred the deputy chief of staff and the all-powerful Operations Division into relooking at the entire structure of Army signals intelligence. In May 1945 the War Department requested that the three senior Army commanders engaged in the war against Japan—Lt. Gen. Albert J. Wedemeyer, commanding general of the China Theater, Lt. Gen. Daniel I. Sultan, commanding general of the Burma-India Theater, and General of the Army Douglas MacArthur, commanding general of Army Forces, Pacific—submit their views regarding the desirability of unifying the whole Army communications intelligence effort under a single War Department agency. Only MacArthur opposed the idea, and even he agreed that he had no objections once the fighting had stopped. The stage thus had been set for a postwar reorganization of signals intelligence.

[38] Memo, Maj Gen Clayton Bissell for Deputy Chief of Staff, 2 Mar 45, sub: Army Navy Communications Intelligence Board—Establishment of, Army Cryptologic Records.

Communications Security

The Signal Security Agency was shield as well as sword in World War II, since the agency had the duty of protecting Army communications in addition to exploiting those of other nations. Here, the agency's performance was smoother since much spade work had been done before Pearl Harbor. Army communications security had already been enhanced by the development of various kinds of cipher machines. The problem of distribution was overcome successfully. By mid-1942 the Army had replaced its older M134s and M134As with the M134C, more commonly known by its short title, SIGABA. Issued down to division level, the SIGABA served as the backbone of the Army's secure high-level communications throughout the war. The handy little M209, designed for use at lower command echelons, was in the hands of American troops before the first American landings in North Africa in November 1942.

Technological advances in this area continued throughout the war, expedited by the streamlining of the developmental process. Until early 1942 responsibilities in the area of communications security had been fragmented. The Signal Intelligence Service had worked out the cryptologic principles for the cipher devices, the Signal Corps Laboratories had prepared the engineering plans, and private firms had done the actual manufacturing. Wartime needs for greater security and compartmentation made this arrangement obsolete, and the Signal Security Agency was assigned all developmental work, introducing numerous innovations in the process. New crypto-communications devices produced by the Signal Security Agency allowed direct on-line encryption of teletype messages as well as speech. By June 1943 the agency had developed a secure telephone apparatus used for transatlantic conversations between Roosevelt and Churchill and later employed to link theater commanders with Washington. The SIGSALY, as it was called, afforded high security, although with the device weighing ninety tons, its use was obviously confined to major headquarters. Smaller voice "scrambler" devices offering less security were made available to lower echelons of command.

In addition to producing and distributing various types of cipher machines, the Signal Security Agency supplied the Army with huge quantities of codes, strip ciphers, and key lists. It also monitored military communications to guard against security violations and disguised major military movements by creating false patterns of message traffic. The multifaceted communications security (COMSEC) operation absorbed the efforts of a sizable portion of agency personnel.[39]

---

[39] SRH 349, Achievements of the Signal Security Agency, pp. 39–50. This document does not mention, however, that the Army suffered one major compromise and one near disaster in its cryptographic program. In early 1942 the Axis Powers read the coded messages of Col. Bonar Fellers, the Army attache assigned to Cairo. This provided them with an inside view of British preparations in North Africa. Kahn, *Kahn on Codes*, p. 105. In 1945 an unguarded truck that contained a SIGABA belonging to the 28th Infantry Division disappeared in France. An investigation disclosed that the farmer responsible for the theft had only been interested in the truck. Thomas M. Johnson, "Search for the Stolen SIGABA," *Army* 12 (February 1962): 50–55.

The Electronic Battlefield

In addition to its traditional cryptologic functions, the Signal Security Agency assumed new responsibilities in the fields of electronic warfare and electronic intelligence. After Pearl Harbor the Signal Corps had transferred its Air Warning Service radar companies to the control of the Army Air Forces, ultimately turning over all responsibilities in radar development to the air arm. However, the Signal Corps continued to exercise staff supervision over Army radio countermeasures and "radio or radar deception" through a newly formed Protective Security Branch, which was reassigned to the Signal Security Service at Arlington Hall in December 1942. The transfer was made for administrative convenience, in an attempt to sidestep the provisions of the same "Child Labor Law" that had forced the move of CIC headquarters to Baltimore. It seemed easier to relocate the unit than to replace its trained and specialized personnel. However, the Protective Security Branch remained semi-autonomous.

Although the initial concern of the Protective Security Branch was to protect the Army's own communications from enemy jamming, it began to consider a more positive role as the balance of the war started to shift. In June 1943 the branch laid down the first guidelines for the use of countermeasures in the field. Only theater commanders could authorize the use of radio or electronic countermeasures, although task force commanders might be delegated this authority when actually engaging the enemy. At the same time, Army Ground Forces fielded two provisional countermeasures detachments to provide support in the 1943 summer maneuvers. In practice, however, American forces did not attempt communications jamming to any extent in World War II, since it would risk interfering with the vital flow of communications intelligence. The Americans made one significant attempt to disrupt enemy communications circuits during the Ardennes campaign, using electronic jamming equipment mounted in aircraft to interfere with the radio transmissions from German tanks.[40]

In other areas, the activities of the Protective Security Branch were more fruitful. The branch supported the Signal Security Agency's communications security program by monitoring traffic patterns on the Army's radio teletype links to ensure that pending military operations would not be compromised by a sudden surge of message traffic between two points. Additionally, the branch played a role in Army radio deception operations, training personnel, procuring equipment, and providing technical data. The 3103d Signal Service Battalion, activated in December 1943 for deployment in the European Theater of Operations (ETO), could simulate the communications nets of large formations. It

[40] Alfred H. Price, *The History of U.S. Electronic Warfare*, vol. 1 (Westford, Mass.: Association of Old Crows, 1984), pp. 177–78.

played an important role in diverting the Germans from the real locations of American troop concentrations before the invasion of Normandy. A smaller deception unit, the 3153d Signal Service Company, went to the Pacific in 1944.[41]

The branch's activities in electronic intelligence and electronic countermeasures—jamming enemy radars—were of even greater future significance. The rapid developments of radar technology in World War II and the employment of radar by both Germany and Japan meant that the new device became both an important new intelligence target and an object suitable for electronic countermeasures. In this exotic war, the Protective Security Branch, along with the rest of the Army's ground elements, played only a small role. The civilian Radio Research Laboratory of the National Defense Council conducted the initial research on methods of blinding enemy radar. The Army Air Forces generated the requirements in this field, since the threat posed by the early-warning and gun-laying radars of the day was against aircraft. Similarly, the Army Air Forces initially employed the first radar jammers and engaged in the first electronic intelligence operations from aircraft.

However, there proved to be a role for ground-based electronic countermeasures also. Under the aegis of the Protective Security Branch, a provisional unit, the 1st Signal Service Platoon (Special) was organized at Arlington Hall in July 1943 to find and jam enemy radar and moved almost immediately to Amchitka in the Aleutians. Since the Army could find no Japanese radars in the area, the unit subsequently redeployed to the island of Corsica in the Mediterranean and operated against German targets. Additional specialized companies and detachments were formed later, operating mainly in the Pacific.[42] The Signal Security Agency continued to exercise staff supervision over such units until April 1945, when most of the functions of the Protective Security Branch were transferred to other Signal Corps agencies. It would take another decade for electronic warfare and electronic intelligence to be reintegrated into the Army's communications intelligence organization.

Summation

The institutional evolution of the Military Intelligence structure in the continental United States during the World War II was slow and painful. Many factors hindered this process: the low resource baseline from which it had to begin; misplaced priorities; rivalry between Regular Army officers and the elite group of civilians who eventually received commissions and managed much of the effort; and the historical accident that had placed the Army's most important

---

[41] Deception operations, along with radar countermeasures, are covered in Thompson and Harris, *The Signal Corps: The Outcome*, pp. 315–16.

[42] For a thorough discussion of electronic warfare in World War II, see Price, *The History of U.S. Electronic Warfare*. Operations in the Aleutians are discussed on page 134.

collection arm, the Signal Security Agency, under the control of the Signal Corps rather than the Military Intelligence Division. In retrospect, some of the effort seems to have been misspent. Both the countersubversive program and the early focus on developments in Latin America may have diverted needed assets from more urgent areas. And it is clear that without British help in the way of example and assistance, the system would not have attained whatever efficiency it did. In the estimate of one official historian, the War Department's intelligence apparatus did not become effective until late 1944. Even then, serious defects remained in the internal organization of the Military Intelligence Service and in the degree of interservice cooperation in the communications intelligence field. It was not until May 1945 that the War Department developed a mechanism for setting intelligence priorities. It is perhaps unsurprising that the evolution of Army collection capabilities in the field would reflect the same pattern of awkward and uneven development.

6

World War II Intelligence in the Field

The Military Intelligence Service, the Signal Security Agency, and, for a time, the Counter Intelligence Corps were centrally directed organizations under the control of headquarters elements in the continental United States. However, the bulk of the Army's intelligence assets were in the field, at the disposal of commanders in the different theaters of operation established during the course of World War II. At the beginning of World War I, Brig. Gen. Joseph E. Kuhn had stated that intelligence was "as essential to modern armies as ammunition," and a second world conflict continued to demonstrate the truth of this dictum.[1] In all the various theaters there were certain uniformities of intelligence organization. Army officers served on combined intelligence staffs with various Allies. The theater signal intelligence service was operated on a compartmented basis separate from other intelligence activities, and assignment of intelligence and counterintelligence specialists to units was normally under centralized theater control. However, there were also differences in intelligence arrangements from theater to theater, depending on local conditions and circumstances.

In its allotment of campaign credits, the U.S. Army recognized the existence of only three great theaters of operation in World War II: the American, the Asiatic-Pacific, and the European–African–Middle Eastern. The actual command structure was more fragmented than this might suggest. During the course of World War II, major Army formations were committed to combat in four geographic areas: the Pacific Ocean Area (POA); the South West Pacific Area (SWPA); the European Theater of Operations (ETO); and the North African Theater of Operations (NATO), later redesignated the Mediterranean Theater of Operations (MTO). Paradoxically, U.S. Army contributions from an intelligence standpoint were greater in the Pacific area, but the European war had a larger impact on the ultimate organization of Army Intelligence. Most of American military resources in the field went into the fight against Germany, including the

[1] Powe, *The Emergence of the War Department Intelligence Agency*, p. 84

bulk of Military Intelligence assets. In addition, the nature of the language problem inherent in operations against the Japanese made Pacific requirements more specialized and less universal. The Army's focus on Europe and the relatively shorter distances between Washington and the field in this theater allowed lessons learned to translate rapidly into structural modifications.

Europe

The United States first entered the war in Europe as a junior partner. This was especially true in the field of intelligence, where Great Britain had developed extensive experience in field operations against the Axis, had a long tradition of successful intelligence operations, and had managed to break into the highest level of German communications with the help of its skilled cryptanalysts at Bletchley Park. British predominance in the communications intelligence field in Europe would continue throughout the war. The War Department was not apprised of the full dimensions of British success until mid-1943. The United States played no part in the exploitation of high-level German communications until 1944, when the Signal Intelligence Division of the European Theater of Operations, United States Army (ETOUSA), committed three American detachments in a War Department project to support the efforts of Bletchley Park.[2] Significantly, Eisenhower had a British G–2 in each of the theaters he successively commanded.[3]

From the intelligence perspective, the war in Europe was characterized by the gradual evolution of independent theater-level signal intelligence services, Military Intelligence services, and the institution of centralized control at the theater level over Army counterintelligence specialists. These developments took place at first in the Mediterranean and then in the European Theater of Operations.

When the Army entered World War II, it envisaged only two types of tactical signal intelligence units: radio intelligence platoons organic to the divisional signal companies and signal radio intelligence (SRI) companies assigned to field armies on a basis of one per army. The signal radio intelligence companies were quite sizable units, each with an assigned strength of slightly over 300 officers and men, internally divided into a headquarters platoon, an intercept platoon, a direction-finding platoon, and a wire platoon for communications. Neither of the two types had any analytical personnel. Analysis and translation were to be accomplished centrally by small radio intelligence staff elements at the theater and field army levels, as had been the case in World War I. These elements now reported to the chief signal officer,

[3] Unfortunately, the memoirs of Eisenhower's G–2 were written before the release of the ULTRA secret. Maj. Gen. Sir Kenneth Strong, *Intelligence at the Top: Recollections of an Intelligence Officer* (New York: Doubleday, 1969).

not the G–2. The arrangement left the corps level without any dedicated communications intelligence support.[4]

The process of restructuring the Army's intelligence instruments began with the invasion of North Africa in 1942.The operation was launched with good intelligence—the British provided intensive support in this area, including furnishing the American high command with ULTRA-derived material. However, in the crunch of combat, American Intelligence organization was deemed less than adequate. The organization of Army tactical signal intelligence proved to be particularly deficient. The divisional platoons, in exposed locations near the front, were in too great a danger of being overrun to practice their specialty securely; the radio intelligence companies, as organized, were too large and too unwieldy to be used to support the corps, the command level most in need of such intelligence. Central processing proved to be impracticable, and the limited staffs available at the field army level to handle signals intelligence proved to be completely inadequate. At the same time, the communications practices of the European members of the Axis presented large volumes of material sent in clear or low-level codes that were susceptible to timely forward exploitation.[5]

In the initial stages of the North African campaign, the British bolstered the raw and badly organized American signals intelligence units with their own personnel. In early 1943 the U.S. Army deployed a theater signals intelligence service to North Africa. The 849th Signal Intelligence Service—the only such service to receive a numerical designation—was originally intended to function as a staff section, operating under the Signal Intelligence Division of Armed Forces Headquarters. Instead, in a hasty improvisation, it became a field unit. As the historian of the 849th SIS noted, "the unit set up in an isolated ravine in North Africa, without a telephone, a foot of field wire, a radio set, or a power unit, to mention only a few of the more obvious necessities."[6] Even toward the end of the war, the unit was handicapped by the ad hoc nature of its creation. A report deemed "the present organization . . . amorphous and unsatisfactory."[7]

Despite its organizational deficiencies, the 849th Signal Intelligence Service provided tactical signal intelligence units with the necessary analytical support. When the fighting moved to Italy, the problem of signal intelligence was solved by breaking the unwieldy signal radio intelligence companies into detachments and adding a small analytical element from the 849th SIS to each detachment to accomplish processing. Although this arrangement presented certain administrative complexities, since each element had a different parent headquarters, it

served to provide adequate communications intelligence to American ground and air forces. Later in the war, the Army Air Forces' own signals intelligence units took responsibility for the air dimension.

Combat experience in North Africa and the Mediterranean led to an overhaul of the entire structure of Army tactical signals intelligence in Europe. In 1943 the War Department gave the Signal Intelligence Division of ETOUSA operational control of all radio intelligence units in the theater. Further reforms followed. A revision of the divisional tables of organization and equipment (TOEs) in November 1943 eliminated the radio intelligence platoon from the divisional signal company, although it is not clear that this change was always implemented in the field. New tables provided for the incorporation of two radio intelligence platoons into the corps signal battalion.

This organizational concept was not especially happy, since it repeated the mistake of lumping a small number of communications intelligence personnel with a larger unit performing an unrelated function, with all the security and operational disadvantages this entailed. In the Pacific, when this reorganization went into effect, a knowledgeable intelligence officer would find the corps-level radio intelligence platoon he observed "fatally handicapped by lack of information and planning."[8] In the European theater, however, planners found a better solution. They devised a completely new type of communications intelligence unit to support the corps—a small signal service company with an organic cellular detachment of analytical personnel. These companies, numbered in a sequence beginning with 3250, required less than half the personnel spaces allotted to the regular signal radio intelligence companies and were formed from in-theater resources.[9]

Meanwhile, the war's lessons and the Army Air Forces' wishes had led the War Department to authorize similarly self-contained units, designated "radio squadrons, mobile," to meet the special needs of the Army's air arm. These squadrons replaced the mix of signal radio intelligence companies, aviation, and monitoring platoons in signal service companies, aviation, which previously had supported the Army Air Forces. In addition to containing a large analytical section, the new squadrons could intercept both continuous wave (Morse code) and voice transmissions from dispersed locations.[10]

American forces in Great Britain were finally committed to the cross-Channel attack on 6 June 1944. Once fully deployed, they mustered an impres-

sive array of tactical signal intelligence units. Signal Security Detachment "D," a field element of the Signal Intelligence Division, ETOUSA, provided analytical support to the signal radio intelligence companies at the army-group and field-army levels, while AAF radio squadrons furnished signals intelligence to the numbered air forces. The signal service companies with their organic intelligence detachments operated in support of fourteen of the American corps that fought under Eisenhower. A similar type of unit was fielded in the Mediterranean Theater of Operations in 1945.

In theory, the signal radio intelligence companies were designed to fill the Army's communications security needs, as well as to provide signal intelligence. A section within the headquarters platoon of each company was allotted for communications monitoring. In practice, however, this function usually was neglected because of the press of more urgent duties. As a partial solution, the commander of Army forces in the Mediterranean area suggested that the Army develop a TOE for a new type of unit that could carry out a signal information and monitoring (SIAM) mission. Two such units were ultimately formed from Army assets in the Mediterranean: the 3151st Signal Information and Monitoring Company, which was assigned to the U.S. Seventh Army to support the invasion of Southern France, and the 3326th SIAM Company, which operated in support of the U.S. Fifth Army in Italy. These large units, each containing about 500 men, monitored Army communications for the dual purpose of checking for security violations and tracking the positions of the friendly units themselves. Under the fast-moving conditions of mobile warfare in Europe, normal command channels often operated too slowly, making such byproducts a useful tool for the field commander.[11]

Army counterintelligence organization in the field was also shaped by lessons learned in combat in North Africa and the Mediterranean. The first group of counterintelligence agents to be deployed had been a 71-man-strong detachment that accompanied the Western Task Force in the invasion of North Africa. Lacking in combat training, scattered in small sections over wide areas, and confronted by unsympathetic G–2s ignorant of the functions of the Counter Intelligence Corps, this initial element encountered many operational difficulties. However, under combat conditions, Counter Intelligence Corps personnel slowly resolved the initial problems. For example, new agents were trained in field security duties as well as in investigative functions. By mid-1943, with operations on Italian soil about to commence, all CIC agents in the theater were placed under the centralized administrative control of Counter Intelligence Corps, North African Theater of Operations, United States Army (NATOUSA). Also, a theater TOE had been developed, calling for 6-man divisional detachments and 13-man detachments at the corps level. Similar arrangements were introduced in the European Theater of Operations.

---

[11] Thompson and Harris, *The Signal Corps: The Outcome*, pp. 37–38, 65–67.

Some problems remained unsolved. Counter Intelligence Corps personnel were still controlled from Washington as part of the Military Intelligence Service. Although the rationale for this arrangement was Washington's fear that highly specialized counterintelligence assets otherwise might be misused, administration from 3,000 miles away created enormous problems. The arrangement slowed promotion in the field, and the CIC came to be nicknamed the "Corps of Indignant Corporals."[12] The attempt to run the Counter Intelligence Corps from offices in Washington also hampered local efforts to make timely adjustments in organization and doctrine based on field experience. The 6-man divisional detachments authorized in the Mediterranean area were obviously inadequate, since under combat conditions some CIC personnel needed to stay behind to provide continuity of coverage, while others advanced with their units. Moreover, the War Department tables of basic allowances (TBAs), under which detachments functioned, proved to be impracticable. Although CIC units were allotted equipment for performing the most elaborate investigations, they lacked adequate transportation.

Ultimately, these problems also were resolved. Counter Intelligence Corps personnel in the Mediterranean theater passed to local control in November 1943, and their counterparts in the United Kingdom made the same transition in April 1944. In January 1944 a new organizational table restructured Counter Intelligence Corps detachments along cellular lines, allowing units to be tailored to meet the requirements of varying echelons of command. In the ETO this resulted in the creation of a 17-man divisional CIC detachment composed of an administrative team and two operational teams. Larger counterintelligence detachments were attached to higher tactical echelons and to rear area service organizations. Finally, a more realistic allowance of equipment was secured, allocating a jeep to every two counterintelligence agents and giving the CIC the mobility it needed in a combat environment.

The problem of logically identifying CIC detachments was resolved in August 1944, when separate sequences of numbers were allotted to detachments serving with various levels and types of commands. Detachments serving with infantry and airborne divisions were given the numbers of their corresponding divisional organization: the 200 series was reserved for detachments serving with corps, the 300 series for those attached to field armies, the 400 series for CIC units attached to the theaters, the 500 series for detachments serving with armored divisions, and the 600 and 700 series for Counter Intelligence Corps elements attached to major formations of the Army Air Forces.

Intelligence specialists overseas not affiliated with the Counter Intelligence Corps were eventually organized under separate theater-level Military Intelligence services. These organizations evolved gradually. In the case of the

---

[12] History of the Counter Intelligence Corps, vol. 2, U.S. Army Intelligence Center, 1959, p. 87.

European Theater of Operations, the first non-CIC intelligence organizations to deploy in England were forward elements of MIS–X and MIS–Y: specialized sections of the War Department's Military Intelligence Service that were tasked respectively with assisting the escape attempts of downed American fliers and interrogating captured enemy personnel in depth. In April 1943 both elements were merged into a Military Intelligence Service detachment under theater control. With the arrival of additional diverse intelligence units, such as Military Intelligence specialist teams, censors, topographic and photographic intelligence personnel, and a training team, all field agencies except counterintelligence detachments were folded into the integrated, theater-level Military Intelligence Service, European Theater of Operations, in August 1943.

Intelligence specialists in the field operated in four types of teams during World War II: interrogation, interpreter, photo interpreter, and order of battle. In the European Theater of Operations, the first three types were allotted two officers and four enlisted men; order of battle teams had a single officer and two enlisted men. The Military Intelligence Service, European Theater of Operations, attached two prisoner interrogation teams and one of each of the other three types to each division, where they operated under the control of the divisional G–2. Larger numbers of teams were allotted to higher formations, and groups of teams at this level were sometimes formed into detachments with attached administrative personnel. Although the individual teams were small, the number of intelligence personnel assigned to them was considerable. The European Theater of Operations had 3,500 officers and men organized into specialist teams, not counting Military Intelligence personnel assigned to headquarters elements and to censorship duties.[13]

The collection of technical intelligence was not the responsibility of the theater-level Military Intelligence Service, but of "enemy equipment intelligence services" directed by the individual technical services. Technical intelligence personnel operated in teams at the field army level. Teams varied in size—the Signal Corps collection unit, for example, consisted of five officers and six enlisted men.[14] The efforts of the individual technical services in the field were supplemented by those of other organizations. The Army was represented on the Combined Intelligence Objectives Subcommittee, an element under the control of the Combined Chiefs of Staff which fielded joint United States–British, military-civilian teams to investigate scientific targets. The Army also played a leading role in the specialized mission, code named ALSOS, set up

[13] The activities of Military Intelligence Service specialist teams in Europe are discussed in detail in U.S. Forces, European Theater, *Report of the General Board*, Study no. 12, *The Military Intelligence Service in the European Theater of Operations* (U.S. Forces, European Theater, 1946). Brig. Gen. Oscar Koch, Patton's G–2, recalled that "each division had at least fifty auxiliary intelligence specialist personnel attached in the form of teams." Koch, *G–2, Intelligence for Patton* (Philadelphia: Whitmore, 1971), p. 131.

[14] Thompson and Harris, *The Signal Corps: The Outcome*, pp 165–66, 521.

at the instigation of the director of the Manhattan Project to look for evidence of German atomic research.[15]

In the war against Germany, technical intelligence teams often combined with other intelligence and counterintelligence personnel in ad hoc task forces to exploit newly liberated areas of intelligence interest. In Italy, "S Force" gave coverage to liberated Rome; "T Force" performed similar operations in France and Germany. These elements reached formidable size: the "T Force" that entered Paris contained representatives from seventeen different Allied intelligence elements and had a strength of 1,800, although most were administrative and security personnel.

Topographic intelligence was another specialized case. During World War I, the American Expeditionary Forces in France had placed this function within the G–2 section. In World War II theaters of operation, the function reverted to the Chief of Engineers, who maintained an Engineer Intelligence office. Mobile Engineer topographic battalions, relying on aerial photography, prepared maps. Field armies usually had a topographic engineering battalion, and a topographic Engineer company was assigned to each corps.[16]

For positive collection operations in the MTO and ETO, the Army relied on the Office of Strategic Services (OSS), the independent intelligence and special operations organization under the direct control of the Joint Chiefs of Staff. Although at the departmental level considerable rivalry existed between the OSS and the MID, Army commanders in Europe found the OSS a useful organization. In fact, Army personnel provided the bulk of OSS strength. In May 1944 friction in the European Theater of Operations was further eased when OSS and its British counterparts were directly subordinated to the theater commander under the newly created Headquarters, Special Troops, Supreme Headquarters, Allied Expeditionary Force. Members of OSS field units engaged both in collection and in special operations. Support was provided to Army units down to the division level. In addition, the X–2 Branch of OSS deployed small counterintelligence detachments. These detachments, which had access to selected ULTRA information, did not engage in active field operations, but provided CIC detachments information on enemy agents obtained at Bletchley Park.[17]

During World War I, the AEF's G–2 had been responsible for both propaganda operations and deception. This arrangement was not repeated in World War II. Eisenhower ran limited psychological warfare operations using pam-

17 OSS support for Army operations in World War II is described in Bradley F. Smith, *The Shadow Warriors: OSS and the Origins of the CIA* (New York: Basic Books, 1973), p. 203, and in Rhodre Jeffreys-Jones, *The CIA and American Democracy* (New Haven: Yale University Press, 1989), p. 307.

phlets and loudspeaker units through a special staff section, not through his intelligence staff. Planning the extensive deception operations that shrouded the time and place of the Allied landings was a British monopoly, carried out by the London Controlling Section. However, the U.S. Army deployed specialized units to support such operations in Europe, including Signal Corps elements and the 23d Headquarters, Special Troops, a composite unit that used rubber tanks, noise-making equipment, and dummy communications nets to simulate an armored division.

The Pacific

In the Pacific, Army Intelligence was structured a little differently. In the Pacific Ocean Area—the vast oceanic operational theater commanded by Admiral Chester W. Nimitz—the Army served as an adjunct to the Navy and the Marine Corps, and intelligence work was largely a naval preserve. However, an Army officer eventually did serve as J–2 controlling the Joint Intelligence Center, Pacific Ocean Area (JICPOA); Army topographic engineer companies provided JICPOA with mapping support; and two SRI companies were ultimately deployed.[18] In addition, toward the end of the war, a joint Army-Navy COMINT exploitation center, RAGFOR—for Radio Group, Forward—was set up on recaptured Guam to attack Japanese Army and Navy air-ground traffic, using the Army Air Forces' 8th Radio Squadron, Mobile, as its intercept arm.[19] This unit included Nisei interpreters. Military Intelligence interpreter, interrogator, and translator teams attached to Army divisions in the Pacific seem to have consisted of four, rather than six, persons.[20]

The major Army presence in the war against Japan was located in the South West Pacific Area, a theater that opened up when General Douglas MacArthur regrouped his forces in Australia following the American defeat in the Philippines. Here, organizational arrangements differed strikingly from those prevailing in the trans-Atlantic theaters. The creation of the SWPA committed the United States to the defense of beleaguered Australia. Significantly, the theater was directly subordinated to the U.S. Joint Chiefs of Staff, not to the Anglo-American Combined Chiefs of Staff. The objective situation, coupled with

20 Chandler and Robb, *Front-Line Intelligence*, p. 157. In September 1944 the TOEs for such linguist units were revised to call for four-man, rather than six-man, teams. War Department, Military Intelligence Service, History of Military Intelligence Training at Camp Ritchie, Maryland, 19 June 1942–1 January 1945, pp. 65–66, copy in INSCOM History Office files. However, the change was not implemented in the European theater. The Military Intelligence Language School at Camp Savage, not Camp Ritchie, provided linguist teams in the Pacific.

MacArthur's autocratic proclivities, allowed him to set up a U.S. Army staff to direct theater operations. At the same time, only limited American military assets were available initially. These considerations exerted strong pressure on the organization of intelligence in the theater. In contrast to the situation in Europe, U.S. Army Intelligence personnel in the SWPA were integrated into combined organizations under the direction of an American G–2, Brig. Gen. Charles Willoughby.[21]

In the spring of 1942 MacArthur set up a centralized cryptologic agency, Central Bureau, Brisbane (CBB). Headed by MacArthur's chief signal officer, Brig. Gen. Spencer Akin, a former chief of the Signal Intelligence Service, CBB was jointly manned by personnel of the U.S. Army and the Royal Australian Army and Air Force. The American component consisted at first of two officers and a few intercept operators drawn from a detachment of the 2d Signal Service Company on Corregidor, later reinforced by a signal service detachment furnished by Arlington Hall. The latter detachment included Col. Abraham Sinkov, one of the four men Friedman had initially recruited for the Signal Intelligence Service.

Thus, from the beginning Army Intelligence personnel in the Pacific were part of a high-level processing center that eventually broke Japanese military codes and thus generated ULTRA. Despite its name, CBB was not a static organization; an advance echelon of the Central Bureau accompanied MacArthur's GHQ in successive forward deployments, and by July 1945 almost the whole organization had been moved to San Miguel on the Philippine island of Luzon. By the end of the war, the Central Bureau had 1,500 personnel, more than half of them American, had acquired batteries of IBM machines, and was directing the collection efforts of four American signal radio intelligence companies and some ten equivalent British Commonwealth units.[22] In addition to this theater-level communications intelligence effort, an Army Air Forces radio squadron, mobile, operated in support of each of the two separate numbered American air forces assigned to the theater, and at least some tactical elements appear to have had their own radio intelligence platoons.

At the tactical level, communications intelligence was carried out in the South West Pacific Area under field conditions that differed significantly from those in Europe. Although the signal radio intelligence companies frequently operated in detachments, there was less requirement for analytical personnel to

---

21 The achievements of MacArthur's intelligence organization are documented (and glorified) in *Operations of the Military Intelligence Section, GHQ, SWPA/FEC/SCAP*, 10 vols. (Far East Command, 1948).

22 Discussion of Central Bureau Brisbane was inhibited for many years by the fact that the organization's host government preferred not to have the subject discussed. However, a photographic history of the American contribution was published shortly after the war. Curiously, the organization even was named somewhat inaccurately. It was hardly central—the naval communications intelligence effort was run on a completely separate basis—and it soon left Brisbane. One of the few open-source publications to mention it is D. M. Horner, *High Command: Australia and Allied Strategy, 1939–1945* (Sydney: George Allen and Unwin, 1982), pp. 224–46.

be decentralized at unit level in the Pacific, since Japanese low-grade systems "were practically nonexistent."[23] Furthermore, because of the vast distances in the Pacific, field sections were seldom close enough to the enemy to pick up low-powered tactical circuits.

The Central Bureau, Brisbane, was a purely cryptologic organization. A separate multinational organization, esoterically designated Section 22, General Headquarters, SWPA, was set up under Akin in 1943 to collect electronic intelligence on the rapidly increasing number of Japanese radar sets deployed in the theater. Section 22 differed from CBB in that it included representatives of the Navy and Marine Corps, as well as Signal Corps, Army Air Forces, and foreign personnel.

Other intelligence activities in the Pacific were also conducted on a multinational basis. The Allied Geographic Service provided topographic information on this little-mapped theater, while the Allied Translator and Interpreter Service (ATIS) blended Australian and American intelligence personnel into an integrated structure. Here, the nature of the target played a large part in the selection of personnel and in the approach to intelligence collection. Most of the 2,000 Americans who served in ATIS were Nisei, second-generation Japanese Americans. Because few soldiers of the Imperial Army surrendered, the emphasis was mostly on translation of documents written in the complex and polyalphabetic Japanese language. In Europe, three times as many interrogators as translators were needed. In the Far East, the ratio was reversed.[24]

Human intelligence collection operations in the SWPA came under the direction of the Allied Intelligence Bureau (AIB), because MacArthur barred the Office of Strategic Services from the theater. In addition to employing a network of stay-behind Australian coast-watchers to monitor Japanese shipping, the Allied Intelligence Bureau engaged in extensive penetration operations.[25] U.S. Army efforts in this field focused on the Philippine Islands where guerrillas already engaged in resisting the Japanese provided useful intelligence assets. To better exploit this resource, MacArthur fielded a special reconnaissance element largely manned by Filipinos recruited in the United States. This unit, the 1st Reconnaissance Battalion (Special), and its attached 978th Signal Service Company inserted radio-equipped teams by submarine into the islands to link with the guerrillas and collect intelligence.

Not all Army Intelligence assets in the Southwest Pacific Area, however, were integrated into combined operations. The U.S. Army ran its own counterintelligence operations, which were controlled by the G–2 of U.S. Army Forces, Far East

[24] Col. Sidney F. Mashbir headed the Allied Translator and Interpreter Service. An account of its operations can be found in Mashbir's rather melodramatically entitled book, *I Was an American Spy* (New York: Vantage, 1953).

[25] Col. Allison Ind, who headed the bureau, also wrote a book, *Allied Intelligence Bureau: Our Secret Weapon in the War Against Japan* (New York: McKay, 1958).

(USAFFE), the base command responsible for the administration and supply of Army elements in the SWPA. Due to difficulties in securing counterintelligence agents from the United States, because of the enormous distances that separated Australia from the North American continent, a CIC school under theater control was set up to procure and train counterintelligence personnel. After August 1944 Brig. Gen. Elliot Thorpe, the G–2, U.S. Army Forces, Far East, exercised control over thirty-nine CIC detachments scattered around the Pacific through the theater-level 441st Counter Intelligence Corps Detachment. Divisional detachments in the Southwest Pacific Area were smaller than in the European Theater of Operations, but were augmented by Filipino linguists once the fighting reached the Philippine Islands. Although counterintelligence was clearly a national responsibility—the Counter Intelligence Corps in Europe reported to G–2, European Theater of Operations, U.S. Army, not to G–2, Supreme Headquarters, Allied Expeditionary Force—the fact that Willoughby lacked control over counterintelligence produced much bureaucratic friction.[26] Interestingly enough, when all Army troops in the Pacific were placed under MacArthur's control through the creation of U.S. Army Forces, Pacific (AFPAC), in April 1945, counterintelligence operations were again allotted to a special staff section, not to G–2.

U.S. Army tactical elements in the theater operated under separate American command after the end of 1942 and were supported by their own intelligence structure. However, interrogators and document translators were provided by advance echelons of ATIS. Optimally, two officers and ten men would be assigned to a division. In April 1945 separate language detachments, numbered in the 100 series, were activated from ATIS assets. In August the system was bolstered by fifteen headquarters elements dispatched from the Military Intelligence Training Center at Fort Ritchie. These received designations as numbered intelligence service organizations.[27]

Army Intelligence assets in the South West Pacific Area also included an elite reconnaissance force, the ALAMO Scouts. This provisional unit was used to conduct the type of long-range operations that the OSS conducted in Europe. Small parties of scouts were landed by submarine and flying boat on remote

[26] The antagonism between the SWPA G–2, Maj. Gen. Charles Willoughby, and the USAFFE G–2, Brig. Gen. Elliott Thorpe, continued to be nourished after the war ended. The Willoughby-sponsored official intelligence history of Far East Command claimed that counterintelligence arrangements were "contrary to staff manuals and ultimately led to friction, overlap, duplication, and general inefficiency." *Operations of the Military Intelligence Section, GHQ, SWPA/FEC/SCAP*, vol. 3, *Intelligence Series* (I) (Far East Command, General Headquarters [GHQ], Military Intelligence Service, General Staff, 1948), p. 14. Thorpe, in his own book, *East Wind, Rain: The Intimate Account of an Intelligence Officer in the Pacific* (Boston: Gambit, 1969), is more reticent. One CIC agent assigned to SWPA has written personal reminiscences. See William A. Owens, *Eye-Deep in Hell: A Memoir of the Liberation of the Philippines, 1944–1945* (Dallas: Southern Methodist University Press, 1990).

[27] *Operations of the Allied Translator and Interpreter Section, GHQ, SWPA*, vol. 5, *Intelligence Series* (Far East Command, GHQ, Military Intelligence Service, General Staff, 1948), pp. 27–28.

islands, both to gather intelligence and to engage in special operations. The unit derived its name from ALAMO Force, which controlled all American tactical units in the SWPA until September 1944, when it was replaced by the Sixth Army.[28] Technical intelligence for the Army was collected by the 5250th Technical Intelligence Composite Company (Provisional), a unique unit commanded by a colonel and formed from intelligence personnel of six Army technical services in the South West Pacific Area.[29]

Common Collectors

In all of the worldwide theaters, Army tactical units also played a role in the Military Intelligence process. The S–2 of each maneuver battalion had an intelligence section of 1 sergeant and 6 other soldiers, while the staff of the division G–2 was comprised of 2 officer assistants and 9 enlisted personnel. For reconnaissance purposes, each infantry and armored regiment had an intelligence and reconnaissance platoon. At the division level, a reconnaissance troop was organic to each infantry division, and each armored division had its own reconnaissance squadron.[30] Groups of mechanized cavalry were available to higher echelons of command; however, in practice these units were usually employed as combat elements in a screening role, rather than as intelligence collectors. At the corps level, the field artillery observation battalion also provided some incidental intelligence input.

Ground reconnaissance assets were not the only collection elements available. One major source of intelligence was provided by the L–4 "Grasshopper" light aircraft, organic to all divisions and artillery groups. These planes were first introduced in 1942, when it became clear that the semi-autonomous Army Air Forces, which had prime responsibility for both photographic and visual observation, intended to implement its mission in ways that scanted the priorities of the ground forces. The ten light aircraft assigned to each infantry division were used primarily for artillery spotting, but, at least in the European theater, they flew 30 percent of their missions for general intelligence support.[31]

[30] Chandler and Robb, *Front-Line Intelligence*, pp. 35, 83, 87. The reconnaissance troops were sometimes known as "tincan cavalry," and were often diverted to nonintelligence functions.

[31] *Report of the General Board*, Study no. 20, *Liaison Aircraft with Ground Forces Units* (U.S. Forces, European Theater, 1946). The Army Air Forces observation squadrons and groups previously assigned to Army tactical units were resubordinated to AAF Air-Ground Support Commands in 1941; concurrently, it became all too apparent from the experience of the other warring air forces that existing observation aircraft could not survive in a combat environment. Ultimately, the "observation" mission was subsumed into reconnaissance, and carried out by stripped-down converted fighters and bombers assigned to the AAF's tactical air commands. Futrell, *Command of Observation Aviation*, pp. 6–29.

Conclusion

Several points in the field organization of Army Intelligence during World War II are notable. At the tactical support level, the Army organized Intelligence into a multitude of single-discipline teams and detachments. Intelligence work was still largely thought of as a staff function, not a line function, and intelligence specialist teams were attached to tactical formations to assist the G–2 staff.[32] This approach was reflected in unit structure. Signals intelligence, a specialized case, was carried out by company-size Signal Corps units and by the Signal Security Agency's single oversized battalion. In the other intelligence disciplines, there were no units larger than detachments or teams, apart from the provisional technical intelligence company that operated in the South West Pacific Area and a one-of-a-kind provisional 1st Combat Intelligence Platoon at Fort Richardson, Alaska.

As the war went on, the Army made some attempts to introduce higher-level organizational structures. To improve command and control of intelligence work in the field, by 1945 the Military Intelligence Training Center had activated twenty-six three-man military intelligence headquarters detachments, each capable of coordinating the efforts of several intelligence specialist teams. The compartmented work and reporting channels of signals intelligence also produced a more hierarchical form of organization. Such measures were, however, exceptional.

During the war, some commanders questioned the prevailing organizational concepts. Lt. Col. H. Gordon Sheen, who had served as the first chief of the CIC, proposed that intelligence battalions be formed from Army-level troops and attached down to corps level as needed. He envisioned an integrated multidiscipline battalion, consisting of a headquarters and headquarters company, a counterintelligence company, an engineer topographic company, a prisoner-of-war interrogation company, and a radio intelligence company.[33] However, Sheen was ahead of his time. It would take a dozen more years to integrate even counterintelligence and positive collection functions into a single unit, and much longer before signals intelligence could be brought under the same umbrella as the other intelligence disciplines.

Whatever deficiencies existed in the organization of Army Intelligence, it had at least performed well enough to help bring about victory in World War II. On 9 May 1945, Nazi Germany unconditionally surrendered to Allied forces. Japan followed suit on 14 August. The United States had fully achieved all its military objectives. However, victory did not bring security. As an

inevitable result of the destruction of German power in Central Europe, the forces of the Soviet Union had extended their influence deep into Europe. And the USSR, a totalitarian society committed to a messianic ideology, would prove to be as great a danger to the stability of the world order as had the Axis. The war had produced a quantum advance in technical progress, but the most ingenious of the new devices—the atomic bomb which the United States had invented and employed—in the long run threatened civilization itself. It was now the task of the U.S. Army and its Intelligence component to help keep the uncertain peace.

7

The Cold War and Korea

Euphoria over the American victory in World War II was short lived. It became apparent that the destruction of the Axis Powers had only created a power vacuum into which another totalitarian state, the Soviet Union, steadily and inexorably moved. The United Nations, created to guide a lasting peace, soon appeared to be a hollow shell, its Security Council paralyzed by Russian vetoes. Confronted by Soviet repression in Eastern Europe and Communist subversion in the West, the United States slowly moved to meet the new challenge. In this Cold War between East and West, at first the weapons were economic and diplomatic. The United States succored hard-pressed Greece and Turkey with military and economic aid in 1947, then moved to restore the destroyed economy of Western Europe with the Marshall Plan in 1948. A Soviet blockade of the Western zones in Berlin was countered by a massive airlift. Finally, the United States abandoned two centuries of tradition and joined in a peacetime military alliance with the European democracies when it became a member of the North Atlantic Treaty Organization (NATO) in 1949.

However, the threatening international scene was not reflected in America's military posture. The vast armies fielded in World War II had been demobilized quickly. Once the draft came to an end in 1947, the Army shrank to a strength of 550,000. Much of this force was tied down in occupation duty, with four skeleton divisions in Japan, two for a time in Korea, and another in Germany. In the summer of 1948 Congress renewed Selective Service, spurring recruitment and allowing a slight buildup of Army strength to about 600,000. Many Americans hoped that the American monopoly of the atomic bomb would preserve the peace. But the Soviets demolished this assumption in 1949 by exploding a nuclear device of their own. Meanwhile, stability in the Far East was deteriorating. By 1949 Communist Chinese armies had brought all of mainland China under the red flag. The United States had withdrawn its occupation troops from South Korea, and a Communist government in the North now stared balefully across the 38th Parallel at its democratic neighbor to the South. In June 1950 it marched across the border. In response, an unready America was drawn into a new war.

The shock of the Korean War—and the subsequent Chinese Communist intervention—transformed American national security policy. The Army grew to 1.5 million men, organized into twenty active divisions. Large forces were deployed not only on the Korean peninsula, but also on the continent of Europe. At the time, American leaders feared that the Korean attack might be an attempt to divert the West from a possible Soviet onslaught against the West European democracies. Originally, NATO had been a paper alliance; now it was backed up by American steel.[1] For a whole generation, American soldiers would man many of the lines first established in both Asia and Europe during the early 1950s. And Army Intelligence, initially reeling from two major surprises (the initial Korean attack and the later Chinese offensive) was ultimately revitalized.

Restructuring Military Intelligence

In the aftermath of World War II, Army Intelligence was affected not only by the massive postwar contraction of military strength, but by sustained organizational turbulence. This was brought about by two conflicting types of pressure. Some policy makers simply wanted to return to prewar conditions, dismissing wartime expedients as aberrations caused by a never-to-be-repeated crisis. Others attempted to make use of the lessons learned in World War II to create a better structure. As a result, much of the Military Intelligence architecture with which the country had fought World War II was dismantled and intelligence assets placed in new configurations.

During World War II, control of communications intelligence collection assets had been split between the Signal Security Agency and the theater commanders. This arrangement had created significant problems, since it was impossible to neatly separate the tactical aspects of communications intelligence from the strategic ones.[2] Even before the fighting had ended, the Army had decided to entrust exploitation of the electronic communications spectrum to a single agency. On 15 September 1945, the Signal Security Agency was separated from the Signal Corps and became the Army Security Agency (ASA), assuming command of "all signals intelligence and security establishments, units, and personnel" of the Army.[3] The new agency, which continued to function under direct control by the Army G–2 in Washington, inherited the mission, functions, and assets of its wartime predecessor and took over the communications intelligence and communications security resources previously at the disposal of theater and Air Force commanders. In addition to unifying the Army's cryptologic structure, the formation of the Army Security Agency also marked a brief

[1] A broad overview of U.S. defense policy during this period is provided in Doris M. Condit, *History of the Office of the Secretary of Defense, Volume II: The Test of War, 1950–1953* (Washington, D.C.: Historical Office of the Secretary of Defense, 1988).

[2] SRH 169, p. 59.

[3] Ibid., p. 85.

reversal in the tendency towards increased autonomy for the Army Air Forces in this field, since the AAF's radio squadrons, mobile, and other cryptologic assets were resubordinated to the agency.

Army counterintelligence organization also underwent a substantial restructuring. By the time World War II ended, the Counter Intelligence Corps and the Security Intelligence Corps formed in 1944 had both been placed under the Army Service Forces' director of Intelligence. Agents of both organizations now received the same training and operated under the same regulations. Under these new conditions it was obviously pointless to maintain two parallel counterintelligence elements. Accordingly, in April 1946 the Security Intelligence Corps was merged with the Counter Intelligence Corps. In May numbered CIC detachments were constituted to operate in support of each of the nine service commands and the separate Military District of Washington (MDW). These detachments were assigned numbers in a sequence running from 107 to 116.

President Harry S. Truman presented a different kind of organizational challenge to the Army when he abolished the wartime Office of Strategic Services on 1 October 1945. The assets of the OSS were divided: analytic personnel were shipped off to the State Department, but the bulk of the organization, consisting of military personnel trained in clandestine collection, counterintelligence, covert action, and black propaganda, combined into the new Strategic Services Unit under the War Department. However, the organization was not assigned to G–2, but to the Office of the Assistant Secretary of War, which created an anomalous situation.

The existence of the Strategic Services Unit forced a reexamination of the entire national intelligence structure, a task which the Lovett Board assumed at the end of 1945. An executive order early in 1946 established a new Central Intelligence Group, a rudimentary national-level intelligence agency. This prototype central intelligence agency was at first merely a cooperative interdepartmental activity that depended on the armed services and the State Department for its staff, budget, and facilities. However, it did serve as a holding area to dispose of what remained of the Strategic Services Unit, most of whose members were slated for demobilization with the rest of the Army.[4] Nevertheless, in 1946 a vestigial undercover capability still remained at the disposal of the U.S. intelligence community.

A further step in the immediate postwar reorganization of U.S. Army Intelligence came about in May 1946 when the Army did away with its wartime structure. Not unexpectedly, the reorganization gave greater power to the traditional Army Staff and to the heads of the old-line technical services. One important result of the post–World War II Army reorganization was that MID, now redesignated the Intelligence Division, was restored to its prewar status as one of five equal functional divisions on the War Department General Staff. Now

[4] Bradley F. Smith doubts that the SSU ever exceeded 750 people. *The Shadow Warriors*, p. 408.

headed by a director of Intelligence, the division was specifically intended to serve as an operating agency as well as an element engaged in intelligence planning and staff supervision. Fortunately for all parties involved, the Intelligence Division had already relinquished the task of preparing the Army's official histories, which it had taken on in World War II. The Intelligence Division's resumption of operating functions led to the abolition of the separate Military Intelligence Service.[5] In addition, the discontinuance of the Army Service Forces at this time resulted in the Counter Intelligence Corps' once more falling under the control of the War Department's Intelligence Division.

The Intelligence Division now set intelligence requirements for the Army, supervised collection, conducted evaluation, produced finished intelligence, and disseminated this information throughout the Army. Compartmented intelligence continued to be channeled through the Special Security System created in World War II. In November 1946 two separate detachments, both sharing a common commander, were set up within the division to manage the various Special Security Offices (SSOs). Detachment F supervised those at three locations in the continental United States; Detachment M directed a more extensive network overseas.

The Intelligence Division focused on the global requirements imposed by the rapidly deepening Cold War between the West and the Soviet Union. It had not only Army-wide intelligence taskings, but was responsible as well for satisfying national needs for political and economic intelligence. The 1946 reorganization placed the Intelligence Division and its director at an apogee of institutional power. The director of Intelligence had sole authority over the Army assets he needed to discharge his responsibilities. In addition to the internal resources which he controlled directly, he wielded influence in the management oversight of the Central Intelligence Group through his membership on the National Intelligence Board. The director also served on the board that governed national signals intelligence policy.

Almost immediately, however, the scope and autonomy of the Intelligence Division and its director came under attack. There were already conflicts in jurisdiction between the Intelligence Division and the intelligence arm of the now practically autonomous Army Air Forces. It was obvious that the pending creation of a separate Air Force, a process well under way by 1946, would result in the transfer of the air-oriented portions of Army Intelligence to the new service. There were other kinds of pressures at work. Many believed that lack of coordination between Army and Navy Intelligence had helped to bring about the disaster of Pearl Harbor. With tensions between the United States and Russia growing visibly, there was a demand to create a national-level intelligence

---

[5] James A. Hewes, *From Root to McNamara: Army Organization and Administration, 1900–1963* (Washington, D.C.: U.S. Army Center of Military History, 1975), p. 160, mistakenly indicates that MIS was redesignated as the Army Security Agency.

body with greater powers than the Central Intelligence Group to coordinate the activities of the service intelligence components and to specialize in gathering political and economic intelligence.[6]

Both of these pressures came to a head in June 1947, when Congress passed the National Security Act. The bill created an independent Air Force and simultaneously unified all armed services under the secretary of defense. These actions significantly affected the structure of Army Intelligence. The Air Force developed a separate intelligence organization of its own. Air attaches took their places beside military attaches; counterintelligence assets already serving with Air Force units were withdrawn from the Counter Intelligence Corps; the Army Security Agency gave up control of its three radio squadrons, mobile, and one radio security detachment to the new service.[7] Finally, in 1950 the Air Force established its own special security officer system.

The most important impact of the 1947 act, however, came with the establishment of the Central Intelligence Agency (CIA). This new national-level intelligence authority reported to the freshly created National Security Council (NSC). Unlike its predecessor, the CIA was not subordinate to the services, but had its own budget and personnel and a large mandate to independently gather and produce intelligence at its own discretion. The formation of the CIA did not directly interfere with the independence of Army Intelligence, but the role of the Army's director of Intelligence in influencing national intelligence decisions was decidedly curbed, although not eliminated, and the new agency assumed control over large areas of political and economic intelligence for which the Army had been responsible.

Postwar Operations: Human Intelligence and Counterintelligence

Under peacetime conditions, the Intelligence Division in the post–World War II period had at its disposal three major institutional elements: the Army attache system, the Counter Intelligence Corps, and the Army Security Agency. The oldest and most traditional of these, the attache system still provided the Army with 80 percent of its uncompartmented intelligence. The attache network was large—before the final separation of the Air Force and later

---

6 Considering the substantial American Intelligence successes in World War II, one is surprised at some of the sentiments expressed during the congressional hearings that led up to the establishment of the Central Intelligence Agency. Army Air Forces' General Hoyt Vandenberg expressed the opinion that the United States was "400 years behind" in the intelligence field, which he appeared to equate with clandestine human intelligence collection. *National Security Act of 1947: Hearing Before the Committee on Expenditures in the Executive Departments, H.R. 2319*, 80th Cong., 1st sess., 27 June 1947, p. 10.

7 ASA units transferred to AFSS were the 1st, 2d, and 8th Radio Squadrons, Mobile, and the 136th Radio Security Squadron. Frank M. Whitacre, *A Pictorial Review of USAFSS, 1948–1973: 25 Years of Vigilance* (San Antonio: U.S. Air Force Security Service, 1973).

economies by the Truman administration 285 officers were serving in seventy stations—and increasingly professional. As early as October 1945 the Intelligence Division had begun offering training courses to officers selected for attache duty, and by 1946 this effort was being directed by a Strategic Intelligence School. Although the work of its graduates was increasingly hampered by tight security measures in Communist countries, they continued to provide valuable military information from their far-flung assignments.

For a short period, the Intelligence Division also operated the Gehlen Organization, an intelligence apparatus inherited from the German Army of World War II. Maj. Gen. Reinhardt Gehlen, former head of German intelligence on the Eastern Front, thoughtfully had brought his complete files with him when he surrendered to the American Army. Gehlen, his documents, and his personnel were moved to the United States for a time and placed under Intelligence Division control.[8] Ultimately, the organization returned to Germany, passed under CIA direction, and finally became the nucleus of the present West German *Bundesnachrichtendienst*.

For counterintelligence, the Intelligence Division relied on the reestablished Army Counter Intelligence Corps, responsible for the procurement, training, and administration of all counterintelligence personnel. In the continental United States, six numbered Zone of Interior armies had taken over the functions of the nine former service commands following the dissolution of the Army Service Forces, and this brought about a realignment of existing CIC elements. Three CIC detachments were inactivated, and the 108th, 109th, 111th, 112th, 113th, and 115th Counter Intelligence Corps Detachments were subordinated respectively to the First, Second, Third, Fourth, Fifth, and Sixth Armies, while the 116th CIC Detachment continued to support the Military District of Washington. These geographic arrangements would remain unchanged for twenty years. Other counterintelligence units were attached to divisions based in the United States: to the Armed Forces Special Weapons Project that dealt with the military applications of atomic energy, to overseas commanders, and to the Intelligence Division itself. Usually, investigations continued to be supervised by the local G–2s, although the most sensitive cases were controlled by the director of Intelligence.

When the Counter Intelligence Corps first came under the command of the Intelligence Division, it was supervised directly by the division's counterintelligence staff element. However, it proved impracticable to exercise detailed control over a Camp Holabird–based organization from the Pentagon, so the position of chief, Counter Intelligence Corps, and commanding general, Counter Intelligence Corps Center, was authorized in April 1947. In short, the Counter Intelligence Corps had reverted to the institutional status it had originally held during the first part of World War II.

---

[8] Gehlen's defection and early connection with Army Intelligence are described in E. H. Cookridge, *Gehlen, Spy of the Century* (New York: Random House, 1971), pp. 115–54.

Holabird, redesignated a fort in 1950, soon became an important center of intelligence activities. In addition to housing the CIC's administrative headquarters and the Counter Intelligence Corps School, it was the seat of the Counter Intelligence Corps Board, which directed research and development and handled personnel matters. The fort also began housing certain field activities of the Intelligence Division of the General Staff. In 1950 the Central Personality Index, the name file which the Intelligence Division had set up the year before, was moved on post, and in 1951 Holabird became the home of the Army's Central Records Facility, which served as a centralized repository for the records of all the Army's personnel security investigations in the continental United States and contained microfilmed copies of the files of overseas CIC detachments.

In the aftermath of World War I, the Army had allowed its counterintelligence function to atrophy. This course was not paralleled after World War II. The Army was first confronted with the necessity of providing large occupation forces abroad with counterintelligence support and then by the security demands of the Cold War. As a result, while total Army strength melted away in the course of postwar demobilization, the number of CIC personnel declined only modestly, falling from a high point of 5,000 in World War II to 3,800. However, there was a worrisome decline in quality. Rapid demobilization of veterans and the termination of the draft eliminated the reservoir of skilled and highly educated personnel upon which the Counter Intelligence Corps had been able to draw. In World War II, two-thirds of all enlisted agents had been college graduates; half had possessed law degrees or the equivalent. Now, overseas commanders were soon reporting that only 10 percent of Counter Intelligence Corps School–trained personnel had completed a college education. The Army partially solved the problem by increasing the proportion of officers in the force and authorizing the recruitment of warrant officers. Moreover, not all trends were negative. In 1946 members of the Women's Army Corps (WAC) were admitted to the CIC School, and in 1950 CIC personnel were first trained to make use of a new and promising investigative technique, the polygraph.[9]

The years following the war saw the Counter Intelligence Corps come out on the losing side in several jurisdictional disputes. In 1949 the corps lost responsibility for the Army's industrial security program to the Provost Marshal General's Office. It also clashed with the Federal Bureau of Investigation (FBI). In 1947 President Truman issued Executive Order 9835 instituting a Federal Loyalty Program, which directed that all investigations of civilians be performed by the FBI. This contradicted the existing Delimitations Agreement between the armed services and the FBI, in existence since before World War II. Ultimately, the Army signed a new agreement with the FBI in 1949, allowing the FBI to investigate Army civilians in the Western Hemisphere, while the Army handled

[9] CIC activities in the postwar period are covered in History of the Counter Intelligence Corps, vol. 24, U.S. Army Intelligence Center, 1959.

investigations overseas. However, areas of friction between the two organizations continued to exist.

One problem, as the G–2, Sixth Army, pointed out perceptively, was "a basic difference in concept of subversive intelligence." The FBI's responsibility was "primarily for accumulation of admissible evidence to provide the basis for legal action against individuals or organizations, usually for acts which are already completed." Army Intelligence, on the other hand, functioned "primarily to forestall acts of violence or to prevent the spread of disorder; anticipatory planning is essential; and advance information on trends and developments must be continuously available."[10] As it turned out, these differences in concept would prove even more troubling twenty years later.

Much of the work of the Counter Intelligence Corps was performed abroad, as American occupation forces in Europe and the Far East first attempted to root out the remaining vestiges of Nazism and militarism and then faced the task of countering Communist subversion.[11] In Germany, all Army counterintelligence assets were consolidated into a single large unit, the 1,400-man-strong 970th Counter Intelligence Corps Detachment, which blanketed the American Zone of Germany with a network of regional and field offices. In 1948 this was converted into the 7970th Counter Intelligence Corps Detachment, organized under a table of distribution (TD) as a one-of-a-kind unit to perform a specific mission. The change brought about difficulties in obtaining personnel, however, and as a result the 7970th was superseded by a new TOE outfit, the 66th Counter Intelligence Corps Detachment, in 1949.[12]

The 441st Counter Intelligence Corps Detachment, at one point almost as large as its European counterpart, played a similar role in supporting the occupation of Japan. Counterintelligence in Japan was facilitated by the activation of a unique unit, the 319th Military Intelligence Company, formed in 1946 of Nisei interpreters from MacArthur's Allied Translator and Interpreter Section.[13] Although the Counter Intelligence Corps and its predecessor organization had accepted Japanese-American personnel since 1940, there were too few of them in Japan to meet the needs of the occupation. To remedy this situation, the men

11 Sometimes the Nazis were used against the Communists, as demonstrated in Allan A. Ryan, Jr., *Klaus Barbie and the United States Government: A Report, with Documentry Appendix, to the Attorney General of the United States* (Frederick, Md.: University Publications of America, 1984).

12 For Army lineage purposes, the distinction between TOE and TD units lies in the fact that TOE units are permanently placed on Army rolls and are activated and inactivated as needed, whereas TD units are organized on a one-time basis for a particular mission and are not perpetuated after discontinuance. A typical example of a TOE unit would be an infantry battalion, while a typical TD unit would be an Army garrison. Because of the peculiar demands of intelligence work, many intelligence personnel have historically served in TD (later TDA, or table of distribution and allowances) units.

13 However, the Translator and Interpreter Service—in April 1946 it lost its allied status and title—continued an independent existence under G–2 control.

of the 319th Military Intelligence Company were given theater counterintelligence credentials to make use of their invaluable language capabilities in assisting investigations.

Counter Intelligence Corps operations overseas faced their own special problems. Some higher commanders abroad objected to the idea of CIC agents living in civilian clothes apart from the structure of the Army as a whole and sought to remilitarize the operations. At one point, all counterintelligence personnel in Germany were put back into uniform and ordered into Army billets with considerable loss of operational effectiveness. Another problem was that some CIC personnel acclimatized themselves to life overseas all too well and had married foreign wives. In June 1950 the CIC chief issued an order that any CIC member marrying a foreign national without grant of a waiver would be terminated. Finally, operational necessity drew the corps into unfamiliar activities. In Germany, for example, CIC agents helped crack down on the black market. In most overseas commands, Cold War needs forced Counter Intelligence Corps units to engage in positive collection of intelligence. With no mechanism for gathering human intelligence at its disposal outside of the attache system, the Army was forced to misapply its counterintelligence assets to fill the void.

The Army Security Agency

The Intelligence Division's most important asset was provided by the newly formed Army Security Agency (ASA). In many ways the Army Security Agency was unique; its official historian later wrote that it was "within, but not part of, the overall military establishment."[14] A large portion of the headquarters continued to be staffed by civilian experts, and the agency's organizational pattern had no parallel in the rest of the Army. The Army Security Agency was put together on the "stovepipe" principle, and Arlington Hall controlled the activities of all units through a separate ASA chain of command. This distinctive vertical command structure, which provided centralized control over all Army signals intelligence and communications security assets, set ASA apart, as did the high walls of compartmented secrecy surrounding its sensitive operations. All that most members of the Army knew about the Army Security Agency was that they were not supposed to know anything about it.

As a separate entity within the Army, the agency was almost completely self-sufficient. In addition to conducting its own operational missions, ASA administered its own personnel system, ran its own school, arranged for its own supplies, and conducted its own research and development. The agency's cryptologic activities continued to be indispensable to the nation's security. The postwar drawdown of strength affected the ASA just as it did the rest of the armed forces, and the

---

[14] Army Security Agency, History of the Army Security Agency and Subordinate Units, FY 1951, vol. 1, p. 5.

organization had to be realigned to meet new national priorities. But the competence which had marked the activities of its predecessors was still there.

In the field, ASA's principal assets were seven large fixed field stations, most of them left over from World War II, at Vint Hill Farms, Virginia; Two Rock Ranch, California; Helemano, Hawaii; Clark Field, the Philippines; Fairbanks, Alaska; Herzo Base, Germany; and Asmara, Ethiopia. Although the headquarters of the 2d Signal Service Battalion was disbanded in 1946, having become redundant when the Army Security Agency established its own personnel system, the stations continued to be manned by lettered detachments of the battalion until May 1950, when all of ASA's TDA elements were redesignated as numbered Army Area Units in the 8600 series. Field stations were supplemented by tactical units—signal service companies and detachments—operating from semifixed positions. The ASA exercised command and control of overseas elements through its regional headquarters in Europe and the Pacific, and later through smaller headquarters elements in Hawaii, Alaska, and the Caribbean. Overall direction of the Army's cryptologic effort and necessary analysis and production work were centralized at ASA's Arlington Hall headquarters.

Since the Army Security Agency's mission had a national impact, it had to be responsive to requirements generated by agencies outside the Army. Initially, ASA operated under the umbrella of the Army-Navy Communications Intelligence Board established during World War II. Other players soon became involved in the results of ASA's work, however, and membership on the board was expanded. At first it became the State-Army-Navy Communications Intelligence Board, evolving a little later into the United States Communications Intelligence Board (USCIB), an element which included FBI and CIA participation.

As part of its mission, the agency supervised all Army communications security, produced and distributed all cryptomaterial, and served as the ultimate maintenance point for cryptomachinery. It also had responsibility for strategic communications cover and deception. All this entailed a substantial commitment of resources. The Army Security Agency's major effort in the communications security field after World War II was the replacement of the super-secure SIGABA with a cryptomachine that operated on less sensitive design principles, the SIGROD, later redesignated as ASAM–5. The idea was to place SIGABA in a reserve status for possible wartime demands, and to use SIGROD, the compromise of which would be less damaging.

ASA's initial organization proved short lived. Ever since World War II, the demand for the centralization of all cryptologic activities under the control of a single body had been increasing. By 1946 the Army had realized that both Army and Navy cryptologic organizations should be placed under the direction of a common agency to ensure a proper coordination of effort. The creation of an independent Air Force, with its own Air Force Security Service, seemed to threaten the field with greater fragmentation than ever before. In response, during 1949 the Armed Forces Security Agency was established under the Joint Chiefs of Staff.

The Armed Forces Security Agency, commanded by officers from the various services on a rotating basis, brought together at a high level all U.S. cryptologic operations and relieved the individual services of their direction and production functions in this field. In practice, the design concept behind this new agency proved flawed. The Armed Forces Security Agency was responsive only to the needs of the armed forces, leaving wider national concerns unmet. Moreover, the planned musical chairs rotation scheme for providing the agency's leadership destroyed administrative continuity.[15] In 1952 the National Security Agency (NSA), a civilian agency under the Department of Defense, replaced the Armed Forces Security Agency.

In 1949, however, it seemed that the formation of the Armed Forces Security Agency would gut ASA, reducing it to the role of a residual Army cryptologic agency with a function limited to ensuring Army communications security. In addition to giving up a major portion of its original mission, the ASA transferred most of its civilian staff to the new national-level agency, including William Friedman and almost the whole group of Signal Intelligence Service pioneers. A long Army tradition that stretched back to the days of the World War I Cipher Bureau thus passed to a joint service organization. The Army Security Agency met the organizational challenge by restructuring itself to meet Army-specific needs. After 1949 the agency turned its attention to developing mobile field units to support tactical commanders at every level, a task accelerated by the outbreak of the Korean War in June 1950.

Postwar Military Intelligence: Deficiencies

There were definite weaknesses in the structure of post–World War II Military Intelligence. Army Intelligence as yet had not become truly professional. Officers served in intelligence assignments on the basis of detail; their commissions, and in many cases, their career interests, lay with their basic branches.[16] Continuity in the more specialized areas of intelligence, such as counterintelligence and signals intelligence, rested in the pool of reserve officers who had continued in active service after World War II. Their numbers, however, inevitably diminished. To remedy this situation, in 1946 a panel of intelligence officers, the Forney Board, had recommended that a Military Intelligence Corps be established, consisting of both detailed and permanently assigned members. But other elements of the Army Staff had vigorously rejected the recommendation, on the usual grounds that any officer should be capable of performing intelligence duties.

---

[15] SRH 123, The Brownell Report, pp. 47–52.

[16] This tendency was reflected even at the top. In 1949 the Hoover Commission reported that "four of the last seven G–2's were without any intelligence experience whatsoever." Henry Howe Ransom, *The Intelligence Establishment* (Cambridge: Harvard University Press, 1970), pp. 109–10.

Training presented another problem. Under the new Army organization adopted in 1946, the director of Intelligence had limited responsibilities in the training field. The Strategic Intelligence School, the attache training facility under the direct control of the Intelligence Division, was an exception. So was the area of language training. In 1946 the Military Intelligence Service Language School organized in World War II was redesignated the Army Language School and moved to the Presidio of Monterey in California. There, it continued to function under Intelligence Division control until it was resubordinated to Sixth Army headquarters in 1950.[17] The Intelligence Division also maintained lettered language detachments in Germany, Japan, and (briefly) China for advanced individual instruction. The Army Security Agency had a training school for its own personnel. Originally located at Vint Hill Farms, near Warrenton, Virginia, the school relocated to Carlisle Barracks, Pennsylvania, in 1949 and found a more permanent home at Fort Devens, Massachusetts, in 1951. The Counter Intelligence Corps maintained an equivalent institution at Fort Holabird.

Linguists, signals intelligence personnel, and counterintelligence specialists were all needed in peacetime. However, there was no similar demand for photo interpreters and order of battle specialists. As a result, the combat intelligence specialties were allowed to atrophy. The Military Intelligence Training Center at Camp Ritchie, Maryland, which had trained combat intelligence specialists during World War II, was closed shortly after the war came to an end. The Army General School at Fort Riley, Kansas, offered some intelligence courses, but the Army Ground Forces, not the director of Intelligence, had jurisdiction over its offerings.

Lack of trained personnel, along with lack of money, meant that the TOE for a Military Intelligence Service Organization issued in 1948 could not be implemented. On paper, the Military Intelligence Service Organization was a model plan, calling for intelligence organizations made up of cellular teams tailored to meet the intelligence requirements of each level of command. The concept called for administrative, linguist, and nonlinguist teams, each made up of one officer and two enlisted personnel. A Military Intelligence Service platoon made up of appropriate teams would support each division, while MIS companies and battalions would perform similar functions at corps and army level, respectively. Overall control would be vested in a group commander at theater level. Subordinate commanders would perform administrative and housekeeping duties only.[18] However, none of the larger units envisaged by the arrangement was ever organized in peacetime. Apart from ASA units and the CIC's oversized detachments, by 1949 the only intelligence unit in the U.S. Army larger than a platoon was the Nisei-manned 319th Military Intelligence Company in Japan.

17 One of the first heads of the Army Language School was Brig. Gen. Elliott Thorpe, MacArthur's former counterintelligence chief.

18 TO&E 30-600, M.I.S. Organization: A Pictorial Presentation . . . (January 1952) (Fort Riley, Kans.: Army General School, 1952).

The same problems of inadequate resources also plagued the intelligence elements in the Army's reserve components. The situation here was considerably better than it had been after World War I, since there were many more intelligence-trained officer and enlisted personnel, and various types of intelligence units had been formed, including new strategic intelligence detachments and signals intelligence units. The Army's Reserve Officer Training Corps (ROTC) had also instituted programs for training both Military Intelligence and Army Security Agency officers. However, reserve unit training was weak, with equipment lacking, and the Military Intelligence Reserve's officer component was imbalanced. Of the over 10,000 Military Intelligence Reserve officers, there were too many field grade and too few company grade personnel to meet mobilization needs.

At the level of tactical collection, although technological advances afforded some improvements, this was counterbalanced by the shrinking of collection assets within the skeleton Army. Although additional aircraft were assigned to the division, and a new type of light plane, the L–19 (later the O–l "Bird-dog"), specifically designed to meet Army observation requirements, entered the inventory in 1950, there were not very many divisions left to support. Similarly, the flash- and sound-ranging capabilities of the field artillery observation battalion were now supplemented by radar, but by 1950 there was only one observation battalion left.

Finally, there were gaps in the intelligence architecture. What little electronic warfare and electronic intelligence capacity remained in the Army was controlled by the chief signal officer and operated without reference to the Army Security Agency, even though it was already all too clear that jamming would certainly have a great effect on the collection of signals intelligence in any wartime situation. Except for the attache system, the Army still lacked any dedicated capabilities for collecting human intelligence in peacetime, although Counter Intelligence Corps units overseas did provide some incidental positive intelligence. It would take the impact of another crisis to force the Army to reevaluate its intelligence structure and to make the necessary improvements. In June 1950 the crisis arrived.

Korea

The war in Korea confronted the U.S. Army with two major intelligence failures within the space of six months. The initial North Korean invasion came as a surprise, as did the later Chinese intervention. In each case Army Intelligence had been aware of hostile capabilities and had misinterpreted intentions. The reasons, apart from normal human fallibility, were unsurprising. Peacetime budgetary constraints had depleted Army Intelligence assets, and what remained had been targeted against Soviet Russia and the European threat. The Korean peninsula had been declared beyond America's defense perimeter and therefore outside the jurisdiction of the major theater commander in the Far East. The hard fact was that before June 1950 Korea was not

high on the list of intelligence priorities for either the CIA or the Army. Once the conflict began, political and diplomatic constraints limited the ability of American collection assets to provide a definite early warning of the thirty-division Chinese attack that ultimately materialized.

Army Intelligence initially responded to the outbreak of hostilities in Korea through desperate improvisation. There were only two Korean linguists on the staff of MacArthur's G–2. The Technical Intelligence Section of the Far East Command had been disbanded in 1949. The four occupation divisions in Japan had been stripped of their tactical Counter Intelligence Corps detachments, and when they deployed to Korea provisional CIC detachments had to be cobbled together from the assets of the 441st Counter Intelligence Corps Detachment in Japan. The three Army Security Agency units in the Far East were manning semifixed installations and were unable to take the field. Not until October did the first sizable ASA unit, the 60th Signal Service Company, reach the Korean peninsula, and the company had to be transported from Fort Lewis, Washington. In the meantime, the Eighth Army depended for cryptologic support upon a small unit organized by making use of locally available resources. Communications security was lax, both among Republic of Korea (ROK) troops and the Eighth Army. The Eighth Army had come from restful occupation duty in Japan, and the chief of the Army Security Agency put it, with some exaggeration, "They receive about 400 violations a minute over there."[19] Communications security was threatened further by the initially fluid tactical situation; several high-level machine cipher devices had to be destroyed to prevent their capture in the early stages of the fighting.

Chinese intervention created another set of problems. The security-conscious Chinese initially approached the battlefront completely undetected, even though MacArthur personally conducted a visual reconnaissance mission over North Korea.[20] Even after the Chinese engaged, ground patrols repeatedly lost contact with the enemy. In a desperate attempt to find out more about the Chinese advance, Korean nationals equipped with smoke grenades were air-dropped into the intelligence vacuum to signal the presence of the enemy. General Matthew Ridgway assumed command of the Eighth Army in late December 1950 at the height of the crisis. He found himself confronted with an intelligence map showing only "a big red goose egg . . . with '174,000' scrawled in the middle of it" north of his lines, all that Army Intelligence knew then

[20] D. Clayton James, *The Years of MacArthur*, vol. 3, *Triumph and Disaster, 1945–1964* (Boston: Houghton Mifflin, 1985), p. 216. Intelligence problems presented by the Chinese intervention are discussed at length (insofar as security considerations allowed) in Roy H. Appleman, *South to the Naktong, North to the Yalu, June–November 1950*, U.S. Army in the Korean War (Washington, D.C.: U.S. Army Center of Military History, 1961), pp. 757–65, 769–70. Some additional insights are contained in Eliot A. Cohen and John Gooch, *Military Misfortunes: The Anatomy of Failure in War* (New York: Free Press, 1990), pp. 175–82.

about the strength and disposition of the enemy. The following month, he too undertook a personal aerial reconnaissance behind enemy lines.[21]

The inadequacy of the Army's tactical intelligence capabilities on the Korean peninsula took many months to rectify. As late as 1951 a survey revealed that only 7 percent of Eighth Army personnel holding intelligence positions had either previous training or prior experience in intelligence, which spurred the creation of a Far East Command intelligence school at Camp Drake, Japan. Intelligence exploitation was handicapped also by the Army's limited supply of Mandarin linguists. Even toward the end of the war, deficiencies abounded. Ridgway's successor with the Eighth Army, General James Van Fleet, commented that there were still serious problems in aerial photography, aerial visual reconnaissance, covert collection, ground reconnaissance, and communications reconnaissance. He went on to observe: "During the two years that the U.S. Army has been fighting in Korea . . . it has become apparent that during the between-war interim we have lost, through neglect, disinterest, and possible jealousy, much of the effectiveness in intelligence work that we acquired so painfully in World War II. Today, our intelligence operations in Korea have not yet approached the standards that we reached in the final year of the last war."[22]

Nonetheless, the shock of the Korean conflict did give a new impetus to the development of Army Intelligence, causing a rapid growth both in personnel and in organizational structure. The strength of the Office of the Assistant Chief of Staff, G–2, as the Intelligence Division was called after April 1950, grew to exceed 1,000 men. The SSO system managed by G–2 was expanded to service the three corps which the United States committed to Korea. In addition, the role of the SSO became significantly enhanced. In 1949 these officers had begun to provide an "eyes only" system of private communications to commanders. After the Korean War, special security officers became deeply involved in the production of finished intelligence for the commands they supported.

Changes were not confined to the Army Staff level. The Counter Intelligence Corps more than doubled; the position of chief of the Counter Intelligence Corps was elevated to a major general's slot. The largest CIC unit, the 66th Counter Intelligence Corps Detachment that supported USAREUR, was raised to group status in 1952. At the outset of the Korean War, a counterintelligence detachment was organized to protect the Pentagon, and subse-

21 General Matthew B. Ridgway, *Soldier: The Memoirs of Matthew B. Ridgway*, as told to Harold H. Martin (Westport: Greenwood Press, 1974), pp. 205, 216. Another senior commander was even more personally involved in reconnaissance activities in this war. In January 1951 the Air Force chief of staff, General Hoyt S. Vandenberg (a former Army assistant chief of staff, G–2), joined a ground patrol twelve miles in front of the main U.N. lines while on an inspection trip to Korea. James F. Schnabel, *Policy and Direction: The First Year*, U.S. Army in the Korean War (Washington, D.C.: U.S. Army Center of Military History, 1990), p. 327.

22 Bidwell, History of the Military Intelligence Division, vol. 7, p. 1080.

quently was incorporated as a subelement into the newly activated 902d Counter Intelligence Corps Detachment. This unit, operating under the direct control of the assistant chief of staff, G–2, was tasked with conducting exceptionally sensitive worldwide missions in support of Department of the Army requirements. Another development in the counterintelligence field that took place during the Korean War was the creation of Technical Service Countermeasures teams to ferret out possible listening devices, an initiative prompted by the 1952 discovery that the Great Seal of the U.S. Embassy in Moscow had been "bugged" by the Soviet Intelligence Service.

In the field, large intelligence organizations were developed to meet the needs of the combat forces. The Military Intelligence Service Organization concept at last became a reality, and tactical groups, battalions, and companies of intelligence specialists were formed to support the Army around the globe. The first Military Intelligence service group, the 525th, was organized in December 1950; its commander, Col. Garland Williams, had been the first Chief of the Corps of Intelligence Police before Pearl Harbor.[23] Two additional groups were activated before the Korean War came to an end—the 500th Military Intelligence Service Group in Japan, which absorbed the personnel and mission of the old Translator and Interpreter Service, and the 513th Military Intelligence Service Group in Germany. Five Military Intelligence Service battalions were also activated, along with numerous numbered companies and platoons. Additionally, four Military Intelligence Service groups and ten Military Intelligence Service battalions, all in the 300 series, were activated in the Organized Reserve Corps, redesignated the Army Reserve in 1952.

Korea was a limited war: at first the conflict was described not as a war at all, but as a United Nations "police action."[24] This had limited the scope of certain kinds of intelligence activities. The intelligence community made no attempt to revive the World War II Counter Subversive program which had laced the Army's ranks with informers. Censorship activities were limited, and the press was allowed to operate under a "voluntary" self-censorship until the spring of 1951. The assistant chief of staff, G–2, did set up an Army Security Center in Washington, D.C., to handle high-level prisoner interrogation and document exploitation, but this turned out to be less important than its World War II predecessors, since enemy prisoners of war were retained in Korea, and few high-ranking prisoners were captured. However, some World War II precedents were found useful. In Operation INDIANHEAD, a multidiscipline intelligence task force—a World War II "T" Force in miniature—was dispatched to sift through the rubble of Pyongyang after that

23 During World War II, Williams had also been in charge of supply and procurement for the OSS.

24 T. R. Fehrenbach, *This Kind of War: A Study in Unpreparedness* (New York: MacMillan Co., 1963), p. 90.

North Korean capital was overrun by United Nations troops.[25] And the various collection techniques perfected in World War II proved useful in the new conflict.[26]

The Korean War revitalized the Army Security Agency, which found a new role in providing support to tactical operations. During the course of the war, the agency reorganized and redesignated its existing signal service companies as communication reconnaissance companies and activated new communication reconnaissance companies, battalions, and groups to support tactical commanders at every level.[27] The new concept placed a communication reconnaissance group in support of the field army. The group would command subordinate ASA units and had the mission of dispatching liaison teams to the combat divisions. At the corps level, flexibly organized communication reconnaissance battalions directed the activities of separate numbered companies.

By the end of the Korean War, the Army Security Agency's 501st Communication Reconnaissance Group was supervising the operations of three attached battalions and five companies in support of the Eighth Army. Another major ASA tactical element, the 502d Communication Reconnaissance Group, commanded subordinate units giving support to the expanded Army presence in Europe. The 503d Communication Reconnaissance Group served as a command and control element for various ASA units in the continental United States. Additionally, new field stations had been established in Europe and the Far East. After 1951 the position of chief of the Army Security Agency was usually filled by a major general.[28]

Finally, the Army at last took steps to enhance its human intelligence collection capabilities. Confronted by an almost complete intelligence void in the early stages of the Korean War, it expanded an existing small intelligence element set up by the Far East Command following the withdrawal of American occupation troops in 1949 into a full-fledged collection organization. Initially, a provisional

25 Memo, GHQ, FEC, Military Intelligence Section, 6 Feb 51, sub: After Action Report, Task Force INDIANHEAD, INSCOM History Office.

26 In *The Korean War* (New York: Simon and Shuster, 1987), p. 244, Max Hastings states that "throughout the war United Nations intelligence about Chinese and North Korean strategic intentions remained very poor." It should be pointed out, however, that not all material bearing on the subject has been released yet.

27 The buildup of the Army Security Agency that took place during the Korean War was facilitated, in part, by the deployment of the two ASA companies in the National Guard and two other ASA companies in the Organized Reserve Corps.

28 However, none of the three general officers who headed up the Army Security Agency during the period of the Korean conflict possessed any background in Military Intelligence. ASA chief Brig. Gen. William Gillmore admitted, "I have had no experience in this line of work. I am going to depend on you people for guidance and support all the way through." ASA Staff Meeting Notes, 15 Aug 50, Army Cryptologic Records. In contrast, the first three chiefs of the Army Security Agency—Brig. Gen. Preston W. Corderman, Col. Harold G. Hayes, and Brig. Gen. Carter W. Clarke—had all served in communications intelligence during World War II.

CIC unit, the 442d Counter Intelligence Corps Detachment, used tactical liaison office teams assigned to each division to dispatch locally recruited line-crossers. These generally unskilled and untrained Korean agents were told to gather whatever low-level intelligence they could.[29]

Following the Chinese intervention, this approach expanded greatly. The provisional status of the 442d Counter Intelligence Corps Detachment was dropped. The divisional teams continued to function, but, in addition, the Army undertook more ambitious collection projects. By the summer of 1951 the Army was devoting increasing resources to the effort. Since the mission was not really appropriate for the Counter Intelligence Corps, the 442d was inactivated and its functions assumed by the 8240th Army Unit, a TD-based organization with elements in both Japan and Korea. The Counter Intelligence Corps personnel initially transferred to the 8240th Army Unit were replaced gradually by specialists from other intelligence disciplines.

In late 1951 the scope of the unit's mandate widened to include special operations. This came about when the Eighth Army unit supporting Korean guerrillas on the offshore islands was integrated into the 8240th Army Unit in accordance with doctrine that such activities belonged at the theater level. At the same time, the 8240th Army Unit itself became the Army element of Combined Command Reconnaissance Activities, Korea, a theater-level joint-service agency created to coordinate intelligence and special operations activities in the war zone.

By the time the Korean armistice was signed in the summer of 1953, the 8240th Army Unit had 450 military personnel assigned and had evolved into an Army simulacrum of the World War II OSS. It not only provided the Far Eastern Command with information, but also ran a 20,000-man private army of Korean guerrillas, the United Nations Partisan Forces in Korea. With five infantry and one airborne regiment, the Partisan Forces harassed the enemy from bases on islands off the shores of both coasts of the Korean peninsula. As if all this were not enough, the 8240th also engaged in an extensive program of "black propaganda."[30]

Summation

The Korean War was another major milestone in the development of Army Intelligence. It revived intelligence capabilities which had grown moribund in the post–World War II retrenchment. It also witnessed the development of large-scale intelligence formations in the field. For the first time, Army Intelligence personnel were organized into groups and battalions. However,

---

[29] S. L. A. Marshall mentions such collection activities in his book, *The River and the Gauntlet: Defeat of the Eighth Army by the Chinese Communist Forces, November 1950, in the Battle of the Chonchon River, Korea* (New York: Morrow, 1953), pp. 3–4.

[30] Alfred H. Paddock, Jr., *U.S. Army Special Warfare: Its Origins* (Washington, D.C.: National Defense University Press, 1982), pp. 100–108.

although the Army Security Agency imposed these arrangements on its reserve components in the aftermath of the war, the Army decided that large reserve units were not needed in the other intelligence disciplines, and by mid-1953 all the Military Intelligence Service groups and battalions in the Army Reserve had been inactivated.[31] For the next few years, the Military Intelligence presence in the Army Reserve would be confined largely to numerous small counterintelligence, censorship, or strategic research and analysis detachments.

In addition, the war can be seen as a milestone in the development of intelligence technologies. The war itself was fought mostly with World War II equipment. The venerable M209 still provided communications security for tactical units. The light planes organic to the divisions were only slightly improved versions of the Piper Cubs that had given the Army reconnaissance support in the previous conflict. ASA's radios as well as its trucks represented war surplus. Yet this was beginning to change. A new family of cipher machines began to enter the Army inventory at this time. Scientists started to find ways in which new and evolving technologies could be applied to the Military Intelligence field. In 1953 the Army became involved in Project MICHIGAN, a research and development effort in which civilian scientific personnel explored the possibilities of using various types of manned aircraft, drones, balloons, and missiles carrying television and other sensors to allow surveillance and target location up to 200 miles behind enemy lines.[32] The new technologies under development would have profound consequences for the structure of Army Intelligence in the years that followed.

---

[31] For reasons which have escaped documentation, all reserve component ASA units after the Korean War were in the Army Reserve, not the National Guard.

8

From Korea to Vietnam

During the twelve years that elapsed between the signing of the Korean armistice in 1953 and the first commitment of American combat troops to defend South Vietnam in 1965, the Army was affected by the fluctuations of U.S. national security policies and defense management structures. Responding to American dissatisfaction with the bloody and ultimately indecisive fighting in Korea, the Eisenhower administration that took office in 1953 adopted a "New Look" in defense policies. America, it declared, would no longer be bogged down in ground warfare at a time and place of the adversary's choosing. Instead, the United States would meet aggression with the "massive retaliation" of strategic atomic weapons.

This policy called for a reduction of land forces. The Army was drastically retrenched. Policy makers' belief that increasingly available tactical nuclear weapons would be decisive in any future conflict led to the revamping of the basic force structure in 1957. New "pentomic" divisions supposedly capable of operating in a nuclear environment were organized, and the Army regiment was abolished as a tactical entity in favor of smaller and more flexible battle groups. However, massive retaliation was never invoked. The Soviet threat continued after the death of Stalin, but its initiatives evolved in ways that could not be countered suitably by American preponderance in the nuclear weapons arena. The French defeat at Dien Bien Phu in 1954 led to the creation of a new Communist state in North Vietnam. Soviet power, hitherto confined to the Eurasian land mass, catapulted across the oceans. Soviet arms and influence appeared in Egypt, and a pro-Communist regime came to power in Cuba. Simultaneously, the Soviets startled the Americans with their success in the area of guided missiles; "Sputnik," the first orbiting satellite, was launched in 1957.

Taking advantage of a belief that the United States was not coping adequately with these new Soviet challenges, Democratic presidential candidate John F. Kennedy's campaign of 1960 focused on the need to meet the broad Communist challenge. Upon election, Kennedy and his secretary of defense, Robert S. McNamara, scrapped the strategy of massive retaliation in favor of a new doc-

trine, "flexible response," in which America would meet any military challenges with the gradually increasing employment of deterrent force.[1] Coupled with a fresh crisis regarding the status of Berlin, the new emphasis on conventional forces powered the expansion of the Army, which soon rose to a strength of 1.2 million. New Army leaders found the pentomic division organization unsatisfactory for protracted fighting in a nonnuclear environment, and introduced a new divisional structure, the so-called Reorganization Objective Army Division (ROAD). Finally, McNamara's zeal for cost effectiveness led to a substantial restructuring of the whole Defense Department and of the individual services. As usual, Army Intelligence was affected by the currents of the times.

Military Intelligence at the Center: The 1950s

At the Army General Staff level, intelligence benefited from an expansion of its sources and technological capabilities during the post–Korean War era. Previously, the foreign intelligence collection resources of the Army Intelligence staff during peacetime had been confined to overt human intelligence provided by the attache system and signals intelligence collection. Now the Army augmented these sources with other types of intelligence collection. Its capabilities for collecting both human and electronic intelligence became increasingly significant. In addition, photographic intelligence became a viable peacetime source for the first time. After 1956 imagery from national-level sources became available to the Army. To take better advantage of this, the Army's existing Photo Interpretation Center at Fort Holabird established a special exploitation unit in the Washington, D.C., area.

Other developments at the Army Staff level under the Eisenhower administration were also significant. On the domestic front, the assistant chief of staff, G–2, regained control of the Industrial Security Program from the Provost Marshal General's Office in 1953, a reorganization that gave it custody of the extensive investigative data base compiled on Army contractor employees. Exploitation of growing masses of intelligence data was enhanced also by G–2's use of automatic data processing techniques. In 1957 the Radio Corporation of America began work on Project ACSI-MATIC, an intelligence data system that became operational in 1960.

However, intelligence was still something of a second-class citizen in the Army. In 1955 the Army's deputy assistant chief of staff, G–2, confessed that he viewed his appointment "almost as the kiss of death."[2] And in two important respects, the Army Intelligence staff lost ground during the Eisenhower years—

[1] A useful overview of defense and intelligence-related developments during the Eisenhower and Kennedy administrations can be found in Alan R. Millett and Peter Maslowski, *For the Common Defense; A Military History of the United States of America* (New York: Free Press, 1984), pp. 508–41.

[2] Ransom, *The Intelligence Establishment*, p. 116

it declined both in status and in budget. In 1955 the assistant chief of staff, G–2, lost command of the Army Security Agency. In 1956, during the course of another Army-wide reorganization, his office lost both its name and its equality with other major staff elements. Under the terms of the reorganization, the three other principal staff functions—personnel, operations, and supply—were assigned to deputy chiefs of staff. But Army Intelligence, now headed by the assistant chief of staff for intelligence (ACSI), remained at the assistant chief level.[3] The implicit downgrade preceded budget cuts and pressure on the Office of the Assistant Chief of Staff for Intelligence (OACSI) to move operational personnel out of its official table of distribution and to reduce personnel occupying headquarters slots. Ever since the late 1940s the intelligence section of the General Staff had maintained smaller operating elements in the field. After 1956, however, ACSI was forced to shift as many operational functions as possible from headquarters to field agencies.

The first step in this process began in 1956, when the ACSI staff element assigned to manage the industrial security program was reorganized as the Industrial and Personnel Security Group and transferred to Fort Holabird. In 1960 the new Technical Intelligence Field Agency assumed the mission and functions of ACSI's technical intelligence branch. The agency soon moved to Arlington Hall Station, where it was collocated with the intelligence elements of five of the seven Army technical services. Similarly, the OACSI component of the National Indications Center, a joint-service element designed to provide warnings of impending hostile attack, became a separate field detachment, as did the topographic collectors incorporated into the U.S. Army Geographic Specialist Detachment in early 1961.

Pressures on the existing structure of the Army's Intelligence staff came from outside as well as from within the Army. In 1958 the Department of Defense was reorganized. The old organizational concept, under which one service had served as executive agent for the Joint Chiefs of Staff (JCS) in war (as the Army had done in the Korean conflict) was abolished, and the armed forces of the country were placed in a system of unified and specified commands under JCS control.[4] The U.S. Communications Intelligence Board and the Intelligence Advisory Committee were concurrently abolished and their consolidated functions transferred to the new U.S. Intelligence Board (USIB). This reorganization reduced the role of the individual services to procuring, training, and fielding forces that would then pass under a JCS-directed command structure. Although the new arrangement did not immediately affect the Army's departmental intelligence agency, its implications for the future of Army Intelligence would soon become apparent.

Reshaping the Tools

One of the most significant developments within Army Intelligence during the 1950s was the conversion and expansion of the existing Counter Intelligence Corps Center at Fort Holabird into an Army Intelligence Center. This came about as an indirect byproduct of two separate initiatives. One of them was a movement begun during the Korean War to make intelligence more professional. Knowledgeable intelligence officers had become concerned about the difficulties of retaining a cadre of trained intelligence personnel in peacetime. Intelligence was not a basic branch of the Army, and most intelligence officers were reservists on detail. In 1950 a legislative oversight had even temporarily eliminated the Military Intelligence Reserve first created in 1921. This had been corrected in 1952 with the creation of two separate reserve branches, Military Intelligence (redesignated Army Intelligence in 1958) and Army Security. But since only reserve component officers could be commissioned in these branches, the active Army lacked any focus for intelligence career professionals.

The massive opposition of Army traditionalists to the establishment of an Intelligence Branch in the Regular Army led the assistant chief of staff, G–2, to advocate a more modest reform. In early 1952 he put forward a proposal to create the new Corps of Reconnaissance, U.S. Army. This corps would have incorporated all intelligence assets at the division level and above, including the units of the Army Security Agency. The plan would have provided Army Intelligence with a centralized institutional framework, but still would have allowed commanders their traditional prerogative of selecting their own intelligence staffs regardless of the branch to which they belonged. Even though this concept posed less threat to vested interests than a new separate branch, it never won acceptance.

As a fallback position, in June 1953 the assistant chief of staff, G–2, came up with a new program. He recommended that an intelligence board be established and collocated with a single intelligence school, a field intelligence center, and the intelligence units in the Army's central reserve in the continental United States. Fort Holabird, with its existing Counter Intelligence Corps School and Center and its counterintelligence records facility, would be the most logical site for the new arrangement.

The second factor leading to the expansion of Holabird's role was the Army's decision to make its collection of human intelligence more professional. The experience of the Korean War, when the Army had to improvise a collection apparatus, had caused the Army see that such work was a permanent peacetime requirement. At the end of 1952 General Matthew Ridgway, then Supreme Allied Commander, Europe, specially recommended that the Army organize its own institutionalized human intelligence collection element. Such a force would meet Army needs and at the same time prevent any future diversion of Counter Intelligence Corps assets from their assigned functions. Ridgway's recommendations were accepted and endorsed by the chief of staff in early 1953. In

November 1953 the Army issued a regulation that set standards for procurement of personnel to carry out this new function.

These twin developments resulted in a steady expansion of the scope and nature of the responsibilities assigned to the chief, Counter Intelligence Corps. In April 1954 the Department of Field Operations Intelligence was added to the existing training facility at Fort Holabird. As a result, collection personnel began to train side by side with CIC agents. This was just the beginning of a snowballing accretion of new activities that fell under the control of the CIC chief. In August 1954 he assumed command of the former G–2 Records Facility at Holabird, which contained the Army's counterintelligence files. At this point, the Counter Intelligence Corps Center was redesignated the Army Intelligence Center, and the chief, Counter Intelligence Corps, assumed a new title as the center's commanding general. In March 1955 an Army Photo Interpretation Center was established at Fort Holabird. Finally, during the same month, responsibility for conducting training in combat intelligence transferred from the Army General School at Fort Riley to the new U.S. Army Intelligence Center and School at Holabird.[5] The arrangement centralized almost all intelligence training at one post. Only the G–2's Strategic Intelligence School in Washington, D.C., and the Army Security Agency facility at Fort Devens, Massachusetts, remained outside the complex.

In practice, the original concept of an all-embracing Army Intelligence center was never quite realized. It seems to have been the intention of Maj. Gen. Arthur C. Trudeau, the assistant chief of staff, G–2, that Holabird would become the directing hub for Army Intelligence. Under the original plan, the chief, Counter Intelligence Corps, in his capacity as commanding general of the U.S. Army Intelligence Center, would not only assume responsibility for training all Army Intelligence personnel, but would also take over responsibility for their administrative supervision. This arrangement would have extended the benefits of the CIC personnel structure to the rest of the Army Intelligence community. Although the concept was approved by the Army chief of staff, it was not completely implemented, and the center never achieved the position of importance originally envisioned for it. However, it did serve as a basis for more modest reforms and initiatives.

The year 1955 also witnessed the inception of an intelligence civilian career program within the Army. This step, first advocated by the second Hoover Commission on governmental reform, would augment nontactical Military Intelligence units with trained civilian specialists who would provide continuity to operations. Three hundred such positions were authorized originally. Actual implementation began in 1957, overseen by an Administrative Survey Detachment organized within the Army Intelligence Center. However, the Army soon began to have second thoughts about the program. Civilians were limited

[5] General Order (GO) 20, Headquarters, Department of the Army (HQDA), 11 Mar 55.

to working a forty-hour week and were not under court-martial jurisdiction. Moreover, Army leaders believed it was counterproductive to keep civilians on indefinite assignments in any one single geographic area. As a result, they limited the effort to employ more civilians.

Meanwhile, the Army Intelligence Center became involved in an attempt to remedy some of the perceived deficiencies in field intelligence programs. Initially, the commanding general, Army Intelligence Center, was responsible for training new field operations intelligence specialists, but had no authority over their assignments in the field. Some human intelligence collectors were in units under theater control, organized years before the field operations intelligence program, as such, had come into existence; others served in a detachment under direct ACSI control. The field operations intelligence program thus operated under a separate and less rigid personnel system than the Counter Intelligence Corps. Its military occupational specialty (MOS) could be awarded by ACSI and by theater commanders as well as by the Army Intelligence Center, and the Army could recruit individuals whose foreign connections would have barred them from enlisting in the Counter Intelligence Corps.

The differences between these two intelligence elements soon led to an unhealthy rivalry. As one report pointed out, "there is too much bickering and snideness at the [Intelligence] Center regarding these two fields."[6] The situation was made worse by the fact that intelligence officers on the Army Staff and in Europe considered field operations intelligence personnel better qualified to handle especially sensitive counterespionage operations than CIC agents. But Counter Intelligence Corps members saw any such transfer of functions as "an emasculation of CIC."[7] Another problem area arose when field operations intelligence personnel, because of the nature of their mission requirements, lacked an adequate rotation base in the continental United States. Although a majority of CIC billets were in the United States, four-fifths of those billets in the field operations intelligence program were overseas.

Eventually, the ACSI decided that it would be more economical and efficient to merge all field operations intelligence assets with the Counter Intelligence Corps and cross-train personnel to serve both as counterintelligence agents and as human intelligence collectors. Accordingly, a consolidated Intelligence Corps, commanded by the former CIC chief and operating under tight centralized control, was created on 1 January 1961. The new organization incorporated slightly over 5,000 personnel, about 85 percent of whom came from CIC. Entrance requirements for the Intelligence Corps were less restrictive than they had been for the old Counter Intelligence Corps.

[7] Memo for Commanding General, 10 Dec 58, sub: Long Range Policy and Planning Committee for USAINTC, RG 319, NARA.

Attempts to bring the new organization even closer to the Army mainstream soon followed. During the 1950s the Counter Intelligence Corps had embodied the "best and the brightest." Ever since the Korean War, the draft had furnished it with a steady stream of college-trained applicants attracted to the idea of fulfilling their service obligation by working in civilian clothes in a glamorous and exotic field, and the CIC had been able to choose among them. Unfortunately, most of these individuals did not show any propensity for making intelligence work a career. The retention rate was abysmal—7 percent for lieutenants and just 3 percent for enlisted personnel. Accordingly, the Army decided that "selection of applicants must be made with consideration for those offering the best career potential and not necessarily the bright college student."[8] The Intelligence Corps would accept only applicants who volunteered for a three-year enlistment. At the same time, the age limit for enlisting in the corps was lowered and brought into line with the rest of the Army; eighteen-year-old personnel now became eligible for entry-level positions involving clerical rather than investigative duties. Finally, in 1965 the minimum Army General Test score for joining the Intelligence Corps was lowered from 110, the same requirement imposed on officer candidates Army-wide, to 100, which more closely approximated the Army average.

The Army Security Agency

If Fort Holabird was one pole of Army Intelligence in the 1950s, Arlington Hall Station was the other. Arlington Hall continued to serve as headquarters for the ASA, the largest single intelligence and security element in the Army, and it also came to house intelligence elements of five of the Army's technical services after the consolidation of NSA headquarters at Fort Meade in 1957 made office space available. During the Eisenhower administration, Arlington Hall's main Army tenant, the Army Security Agency, grew steadily. Personnel strength rose from 11,500 in 1952 to 18,300 by 1957; new field stations and tactical units appeared; and a substantial restructuring of the agency's mission took place.

By 1954 the Army Signal Corps was fielding a number of units to collect electronic intelligence and continued to be responsible for the conduct of electronic warfare. In April 1954 the Department of the Army analyzed the feasibility of combining all these capabilities into a single agency. As a result of this study, the Army Security Agency took over responsibility for electronic intelligence and communications-related electronic countermeasures (ECM) from the Signal Corps in 1955, assuming control of a number of dispersed units and a battalion and four companies stationed at Fort Huachuca, Arizona. In return, the agency surrendered its responsibilities for Army cryptologistics and cryptomaintenance, along with associated personnel, to the Signal Corps.

---

[8] Min, Intelligence Corps Commanders' Conference, 1961, sec. 10, p. 7, RG 319, NARA.

In budgetary terms, the reorganization was significant: the Army was introducing a new generation of machine cipher devices to replace the venerable M209, and purchase of the new machines had consumed 60 percent of the Army Security Agency's fiscal year 1953 budget. However, the change had the important benefits of eliminating duplication of facilities and allowing for proper integration of signals intelligence with electronic intelligence. The term signals intelligence (SIGINT) was now redefined and used to refer to both of these functions. Actual implementation of this mission transfer was delayed for a short time until the Signal Corps personnel transferred to the Army Security Agency had their clearance levels upgraded.

The new arrangements meant that the Army Security Agency was no longer exclusively an intelligence organization. By acquiring responsibility for electronic warfare, the agency now managed a weapons system, even though the weapon was invisible. In recognition of this change, the Army Security Agency became a Department of the Army field operating agency on 23 June 1955.[9] It now reported directly to the Army chief of staff, not to the assistant chief of staff, G–2. However, the agency continued to focus primarily on the cryptologic mission, and electronic warfare in practice did not receive much emphasis.

Having acquired responsibility for electronic intelligence and electronic warfare, the Army Security Agency made further attempts to enlarge the scope of its mission. In September 1955 the chief, Army Security Agency, recommended to the Army chief of staff that his organization be given the responsibility for dissemination and protection of sensitive compartmented information Army-wide, thus eliminating the special security officer system maintained by the assistant chief of staff, G–2, which had just been consolidated into a single element, Detachment M. The rationale for this proposal was economy. However, both the Army's Intelligence staff and commanders in the field vigorously resisted it. Intelligence personnel claimed that the Army Security Agency was not qualified to produce the all-source intelligence which special security officers provided to their supported G–2s. Field commanders unanimously endorsed the existing arrangement, pointing out that ASA units were not conveniently located in or near the major Army headquarters and that eliminating the special security officers would deprive them of their secure "back-channel" communications. The Army chief of staff tabled the proposal, but the Army Security Agency refused to drop the issue. The bureaucratic struggle over the matter would go on for the next two decades, at times fought with considerable acrimony.

The Army Security Agency pursued other initiatives with greater success. In 1956 the agency became aware for the first time of the possibility that emissions radiating from electronic data processing equipment might compromise security and initiated a program, nicknamed TEMPEST, to counter the threat. In 1957 the U.S. Army Security Agency Board was created to provide long-range planning,

[9] AR 10–122, *Organization and Functions, Army Security Agency*, 23 Jun 55.

and in 1960 its functions were expanded to include combat development. At the same time, the Army Intelligence Board at Fort Holabird acquired parallel responsibilities for overseeing combat developments in the field of human intelligence. Meanwhile, the ASA and its field stations underwent redesignation. As a result of an Army-wide change, the agency became the U.S. Army Security Agency (USASA) on 1 January 1957. Concurrently, its fixed field stations, which previously had been known as numbered Army administrative units in the 8600 series, acquired new designations as numbered USASA field stations.[10]

The agency's tactical elements underwent a more significant restructuring during this period. During the Korean War, the Army Security Agency had operated with flexible battalion headquarters overseeing the operations of independent security and collection companies. In 1955 fixed battalions with organic companies combining both functions were created, and in 1956 all communication reconnaissance units were redesignated as Army Security Agency units. However, in 1957 the secretary of defense's decision to cut the Army's strength by a total of 50,000 threw the force structure of the agency into disarray. The decrement left the ASA without sufficient personnel to fill its existing tactical TOE units, which at the time accounted for about a quarter of its total strength. In response, the Army Security Agency inactivated all its TOE units and replaced them with mission-tailored units based on individual tables of distribution. The new TD units included the 507th and 508th U.S. Army Security Agency Groups, located respectively in Germany and Korea, and six U.S. Army Security Agency battalions numbered from 316 to 321. These units were given the designator U.S. Army Security Agency to distinguish them from Army Security Agency TOE units. The battalions retained the fixed structure of their TOE predecessors.

Originally, the Army intended this as a temporary measure, to remain in force only until new organizational tables could be drawn up. In practice, however, the ASA continued to operate exclusively with TD units until 1962, when tactical TOE units were formed in the continental United States to support the Army's new strategic reserve for contingency operations. Later, additional TOE elements were activated to serve in Vietnam. Some of the mission-tailored TD units soon acquired new and exotic designations as special operations units and special operations commands.

The U.S. Army Security Agency was the principal tenant at Arlington Hall after 1957, but not the only one. Intelligence elements of five technical services ultimately located there. Only the Corps of Engineers, the intelligence arm of which was concentrated in the Army Map Service, and the Quartermaster Corps held back, although the Ordnance Corps also maintained a separate missile intelligence center at Redstone Arsenal. Although most of these technical service intelligence units engaged in analysis and production, the Signal Corps contin-

10 GO 58, *Army Security Agency*, 13 Dec 56.

ued to engage in some specialized collection activities even after it had surrendered its electronic intelligence and communications-related electronic warfare functions to the Army Security Agency.

Military Intelligence in the Field

Until the late 1950s the tactical formations of the Army received their intelligence support from Military Intelligence specialist units put together on the cellular principle. Combat intelligence units were organically separate from counterintelligence units under this arrangement, and the G–2s of the supported units had to coordinate the efforts of the two diverse elements themselves.

At the end of 1957 the Army introduced a new category of intelligence units organized under a concept plan entitled the Military Intelligence Organization. Under this plan interrogators, photo interpreters, order of battle specialists, and other combat intelligence personnel were integrated into single units with counterintelligence and collection elements. These new units operated under a fixed table of organization and were designed to be administratively self-sufficient.

Under the Military Intelligence Organization concept, the basic building block was the Military Intelligence battalion supporting a field army. This unit had its own specialized organic companies: a headquarters and headquarters company containing photo interpreters, order of battle and technical intelligence specialists, and censorship personnel; and lettered linguist, security, and collection companies. In addition, the battalion furnished tactical units down to the division level with attached multidiscipline intelligence detachments.[11] The creation of the Military Intelligence Organization was one of the first steps in bringing truly multidiscipline intelligence support to the field. Only ASA units remained outside the new organizational structure because of the Army Security Agency's vertical, or "stovepipe," command structure and its tight centralization and compartmentation.

In practice, implementation of the new force structure was limited. Under the Military Intelligence Organization concept, four Military Intelligence Battalions eventually were reorganized: the 319th and 519th in the continental United States; the 532d in Germany; and the 502d in Korea. However, only the headquarters and headquarters companies and linguist companies were initially activated in the two battalions in the United States.[12] Meanwhile, the bulk of Army

---

[11] A major factor behind the Military Intelligence Organization concept was the belief that under the new arrangement, "personnel losses resulting from decentralized administration or misassignment are less likely to occur." Folder, Military Intelligence Support in the Field Army, 1960, Background of MI Branch/Corps file, INSCOM History Office, Fort Belvoir, Va. A more detailed description of the organization can be found in Irving Heymont, *Combat Intelligence in Modern Warfare* (Harrisburg: Stackpole Co., 1960), pp. 124–29.

[12] The 519th Military Intelligence Battalion eventually received active Companies B and C in 1962.

counterintelligence and field operations intelligence personnel continued to serve in single-discipline cellular units supporting the theaters and the Zone of Interior armies until 1961, when consolidated Intelligence Corps groups and detachments were formed.

Not all intelligence disciplines were well served by this new arrangement. In the continental United States, linguists had to be concentrated at battalion level, rather than spread among the detachments that were attached to divisions and other tactical units, as the Military Intelligence Organization concept dictated. Each detachment might be involved in several contingency plans, and each plan often required expertise in a different language. There was simply no way to assign the appropriate linguists to a Military Intelligence detachment until actual implementation of a specific plan or major field exercise began.

Photo interpreters also fit rather uneasily into the new structure. At the tactical level such personnel lacked access to the imagery that national-level reconnaissance elements began to generate in the late 1950s, and thus felt that their skills were not being adequately used. Units based in the United States had no operational mission, and photo interpreters found themselves all too often assigned to housekeeping and administrative positions unrelated to their specialty. Detailed to kitchen police and other "rock-painting" chores, many felt slighted and complained of "harassment."[13]

To remedy the situation, in 1963 the Army Intelligence Center proposed that all photo interpreters in the United States be placed under centralized control in the same fashion as the Army's linguists. They could find more useful employment either at the Army Photo Interpretation Center or with the Army's lone specialized tactical photo unit in the United States. However, field commanders strongly resisted the proposal on the grounds that stripping Military Intelligence detachments of their photo interpreters would deprive G–2s of access to this intelligence field and would result in equipment maintenance problems. The status quo thus continued.

Finally, the Army continued to neglect tactical-level technical intelligence. There were no provisions for a technical intelligence company in the initial TOEs for the Military Intelligence battalion (field army), and it would take ten years for the Army to remedy this discrepancy. By that time, the Vietnam conflict would be in full swing, creating an insatiable demand for personnel resources, and only one field army–level battalion would ever receive its technical intelligence company.

At the tactical level, intelligence organization was also influenced by the Army's increasing reliance on aircraft. By 1960 there were 5,000 aircraft in the Army inventory. Many of them were helicopters, items that had first seen extensive use in medical evacuation during the Korean War. It soon became apparent

---

[13] Memo, 8 Feb 63, sub: Centralization of Image Interpreters under USAPIC, RG 319, NARA.

that improved versions of rotary-wing aircraft could serve as useful reconnaissance assets. During the course of the 1950s the Korean-vintage L–19 that had served as the all-purpose workhorse within the division was phased out in favor of the helicopter, and aircraft within the division were concentrated in larger formations. Under the structure of the pentomic division fielded in 1957, Army aviation within the divisions was consolidated into company-size units. The ROAD division of 1962 included a complete aviation battalion, one company of which was equipped with scout helicopters. In addition, observation helicopters were assigned to divisional artillery, and a helicopter-borne aerial cavalry troop formed part of the divisional reconnaissance battalion.[14]

Along with its helicopters, the Army also developed more sophisticated fixed-wing aircraft for reconnaissance. In 1962 it acquired the AO–1 Mohawk. This twin-engine craft came in three configurations: one equipped with a high-performance camera; one with newly developed infrared night vision equipment; and the third with the equally new side-looking airborne radar device. Mohawks were employed both in divisional aerial surveillance and targeting platoons, as well as in aerial surveillance companies that operated at corps level.[15]

In addition to developing its own aerial assets, the Army took steps to improve its interaction with Air Force tactical reconnaissance. To better exploit aerial photography produced by Air Force reconnaissance squadrons, the Army fielded the 1st Air Reconnaissance Support Battalion in 1959. The unit consisted of a headquarters and headquarters detachment, a signal air photo reproduction and delivery company, and a photo interpretation company. A similar unit, the 24th Air Reconnaissance Support Battalion, was activated in the Army Reserve the same year, thus becoming the first non-ASA intelligence battalion active in the reserve components since the Korean War. In 1961 the Army activated another Regular Army air reconnaissance support battalion to support the Seventh Army in Germany, and in 1962 these units were reorganized and redesignated as Military Intelligence battalions (air reconnaissance support), or "Mibars." Two years later it devised a new TOE for this type of unit that provided for a headquarters and headquarters company and four lettered imagery interpretation detachments.[16] The diverse nature of the products which photo interpreters now had to manage—infrared and radar imagery, as well as conventional photography—led to the Army's redesignating photographic intelligence as imagery intelligence in 1964.

There were also new developments in the Army's arrangements for ground reconnaissance. From 1957 on, each combat division had its own reconnaissance battalion. The successive restructurings of the division in 1957 and 1962

[16] 373 Card, 1st Military Intelligence Bn, Unit Data Branch, U.S. Army Center of Military History.

meant that reconnaissance assets previously held at the regimental level were moved down, first to battle group, and then to battalion. An armored cavalry platoon and a ground surveillance section equipped with mobile radar sets became part of the headquarters company of each infantry battalion.

Intelligence Support to the Theaters

By the late 1950s the deployment of the Army overseas had become fixed in a pattern that would remain largely unchanged for the duration of the Cold War.[17] The completion of the European buildup, the drawdown of forces in Korea, and the signing of a peace treaty with Japan resulted in a force structure that gave the Army five divisions in Europe and two in Korea, commanded respectively by the Seventh and Eighth Armies. The diversity of the theaters, the disparate numbers of the supported forces in each one, and the differing nature of intelligence requirements in Europe and in the Pacific dictated that arrangements for intelligence support would not be uniform. Moreover, even if the positioning of troops on the ground remained relatively static, theater command relationships did not, and these shifts also impacted on the theater intelligence structure.

In Europe a continuing flood of refugees from behind the Iron Curtain provided American forces with ample opportunities for intelligence exploitation. From 1951 to 1962 collection of intelligence from border crossers was carried out by the Seventh Army's 532d Military Intelligence Battalion, a field-army type of unit organized under the Military Intelligence Organization concept and headquartered in Stuttgart-Vaihingen, Federal Republic of Germany. During an average year, the battalion screened between 20,000 and 30,000 refugees.

At the theater level, counterintelligence support for U.S. Army, Europe (USAREUR), was provided by the 66th Counter Intelligence Corps Group. This unit, with headquarters in Stuttgart, provided counterintelligence coverage through a network of regional and field offices that not only extended over West Germany but also reached occupied Berlin and the USAREUR Communications Zone in France. The 513th Military Intelligence Service Group, activated at Oberursel, Federal Republic of Germany, in 1953 to take over operations previously performed by the 7077th USAREUR Intelligence Center, soon was redesignated the 513th Military Intelligence Group and then expanded its scope of activities to include active collection. With the inception of an Army civilian intelligence career program in the 1950s, both units received large TD augmentations of civilian specialists.

In 1959 USAREUR experimented with organizing intelligence work on an area rather than on a functional basis. Consequently the 513th Military

---

[17] Strategist Edward M. Luttwalk noted in 1984, "Our deployment overseas resembles geological layers, each the enduring residue of some past crisis or war, now hardened into a 'commitment.'" *The Pentagon and the Art of War* (New York: Simon and Shuster, 1984), p. 73.

Intelligence Group was given northern Germany as its area of responsibility, and the 66th Counter Intelligence Corps Group (later successively redesignated as the 66th Military Intelligence Group and the 66th Intelligence Corps Group) was allotted the south, where the preponderance of American forces was stationed. This arrangement caused more problems than solutions and was later abandoned.

Meanwhile, opportunities for exploitation of sources began to diminish. In 1961 the construction of the Berlin Wall and the simultaneous imposition of tighter border controls by East Germany effectively shut off the refugee flow. This development reduced the need to have three large intelligence units with partially overlapping responsibilities in Europe. As a result, in 1962 there was a major realignment of intelligence resources. The 513th Intelligence Corps Group, as it was now designated, assumed complete responsibility for active intelligence and certain sensitive counterespionage missions for USAREUR, while the 66th Intelligence Corps Group was reassigned to Seventh Army and assumed the mission of the inactivated 532d Military Intelligence Battalion. During this process, the group lost its regional form of organization and emerged as the command headquarters for various numbered Army Intelligence units, including the tactical intelligence elements attached to the Seventh Army's corps and divisions.[18]

Cryptologic support in the theater was provided by an entirely separate organizational structure, in conformity with Army practice. The U.S. Army Security Agency maintained a theater headquarters in Frankfurt that exercised command and control over various field stations in Europe and over a group headquarters with three subordinate battalions and some other units operating in support of the Seventh Army.

In the Pacific, following the conclusion of the armistice in Korea, the Army broke up its elaborate intelligence and special operations organization, the 8240th Army Unit. Under conditions of relative peace, the Korean partisan forces it had mustered were transferred to the control of the South Korean government, the least productive of its operations terminated, and its mission restricted to intelligence collection. The unit's Korean-based element, the Army Collection Detachment, continued to report to a theater-level Army command reconnaissance activity until 1961, when a number of Army Intelligence assets in Korea combined to form the 502d Military Intelligence Battalion. The other elements used to form the battalion came from the 308th Counter Intelligence Corps Detachment and the Eighth Army's 528th Military Intelligence Company, which were concurrently inactivated.

At the theater level, U.S. Army Forces, Far East (USAFFE), served as the Army's principal headquarters element in the Pacific until 1957. It was supported

[18] It should be pointed out that in addition to the units which supported USAREUR and Seventh Army during this period, the 450th Counter Intelligence Corps Detachment provided security to Supreme Headquarters, Allied Powers in Europe, from 1951 on. The unit was redesignated the 650th Military Intelligence Detachment in 1966 and upgraded to group status in 1970.

by an elaborate intelligence architecture directed by the USAFFE G–2 in Tokyo, Japan. The organization's principal human intelligence collection arm was the U.S. Army Command Reconnaissance Activity, Far East. The other major field elements were the 500th Military Intelligence Group, an interpreter unit, and the 441st Counter Intelligence Corps Group. These three units reported to the U.S. Army Intelligence Support Center, Japan, under command of a brigadier general.

The Eisenhower-Kishii agreement of 1957 led to a drawdown of American troop strength from Japan and relocation of the Army's main Pacific headquarters from Tokyo to Hawaii. The discontinuance of USAFFE and the establishment of United States Army, Pacific (USARPAC), led to a rapid decrement in Japan-based Military Intelligence assets. The 500th Military Intelligence Group was inactivated, the Intelligence Support Center discontinued, and the functions of both organizations absorbed by the successor of the U.S. Army Command Reconnaissance Activity, Far East, the U.S. Army Command Reconnaissance Activity, Pacific. Following the departure of most American troops from Japan in 1959, the 441st Counter Intelligence Corps Detachment, as it was now known, was in turn inactivated. In 1961 the U.S. Army Command Reconnaissance Activity, Pacific, was discontinued and the 500th Military Intelligence Group once more reactivated to carry out all aspects of the human intelligence mission. This group redeployed to Hawaii in 1965, a move dictated by the U.S. government's attempts at that time to reduce the outflow of gold reserves overseas.

U.S. Army Security Agency operations in the Far East were under the direction of a regional headquarters located in Tokyo until 1958. This was consolidated briefly with ASA headquarters elements in Hawaii from 1958 to 1960 to become the U.S. Army Security Agency, Pacific. In 1960 it returned to Tokyo, where it remained until it again relocated to Hawaii in 1965. The withdrawal of the agency's Pacific headquarters back to American soil also came about because of the government's concern over the balance of payments.

After 1957 the Eighth Army in Korea received its cryptologic support from the 508th U.S. Army Security Group (a TD unit) and the 321st U.S. Army Security Agency Battalion, another TD unit. The battalion was discontinued in 1964—another casualty of the government's worries about the gold flow.

One unique feature of the Pacific theater was the existence of the U.S. Army Intelligence School, Pacific. Unlike other Army Intelligence training facilities overseas, the Pacific intelligence school, set up on Okinawa in 1958, trained foreigners, not Americans. The students from seven different countries bordering the Pacific basin took courses in combat intelligence and counterintelligence techniques until the reversion of Okinawa to Japanese sovereignty brought operations to a halt in 1975.[19]

The McNamara Revolution

The outcome of the presidential election of 1960 led to major changes in the structure of the Army and the Army's intelligence components. President John F. Kennedy rejected the strategic assumptions of the previous administration, believing that any military challenge had to be met through graduated deterrence. This approach placed a new emphasis on the importance of the nation's conventional forces, including the Army. Kennedy selected Secretary of Defense Robert S. McNamara to implement the new strategy. In carrying out his assignment, McNamara, a former Ford Motors executive with a background in systems analysis, proved to be the very model of a rationalizing, centralizing bureaucrat. Making the most of the powers of his office, McNamara introduced a series of reforms that altered the way the American military machine was constructed and had a profound effect on the Army Intelligence community.[20]

Since 1958 there had been discussions at the national level concerning the advisability of setting up some kind of intelligence agency at the Department of Defense (DOD) level to better coordinate the intelligence elements of the armed services. In 1960 a Joint Study Group had criticized the existing arrangements within the Military Intelligence community. Three separate and uncoordinated service intelligence agencies, each with its own parochial bias, could not provide DOD with the integrated intelligence it needed to formulate a coherent national strategy. Air Force Intelligence in particular had embarrassed policy makers, since its estimates of alleged "bomber gaps" and "missile gaps" between the United States and the Soviet Union were widely disseminated and later demonstrated to be incorrect.[21]

Once in office, McNamara became a vigorous proponent of centralization, especially with respect to Military Intelligence operations under DOD. As a result, the Defense Intelligence Agency (DIA) began operations on 1 October 1961. The new organization would impose the same kind of centralized direction and control on the general Military Intelligence program as NSA was already providing to signals intelligence. Its creation meant that Army Intelligence would become a distinctly subordinate element within a wider Military Intelligence structure and marked a further cutback in ACSI's powers and responsibilities. However, this did not happen immediately. At its inception, DIA consisted of a cadre of twenty-five people housed in 2,000 square feet of borrowed office space in the Pentagon. The new agency pulled together rather slowly at first, initially taking on only the estimative, current intelligence, and requirements missions from the service intelligence agencies.

---

[20] One standard biography of the secretary of defense, Henry L. Truehitt's *McNamara* (New York: Harper and Rowe, 1971), has little to say about his role in Army reorganization.

[21] The role of Air Force Intelligence as a "loose cannon" and how this helped bring about the formation of DIA is documented in John Prados, *The Soviet Estimate: U.S. Intelligence Analysis and Soviet Military Strength* (Princeton: Princeton University Press, 1986), pp. 43–44, 93, 115–16, 124.

Meanwhile, McNamara was reorganizing the Army itself in ways that had a substantial effect on the Army's intelligence architecture. In 1962 the secretary of defense implemented Project 80, which involved the wholesale restructuring of the Army into functional, centralized commands. In the process, ACSI lost control over intelligence training, research and development, and doctrinal matters. Five of the Army's technical services were abolished, with only the Corps of Engineers and the Office of the Surgeon General remaining in place, and their intelligence personnel were split up among a number of different elements.[22]

A few order of battle specialists from the dissolved technical services joined the ACSI staff. A larger group engaged in scientific and technical intelligence became part of a new Foreign Science and Technology Center or stayed in place at the Army Missile Intelligence Agency which the Ordnance Department maintained at Redstone Arsenal. Both of these centers were assigned to the Army Materiel Command, which McNamara had just created. The largest group, consisting of 700 persons engaged in area analysis, was absorbed into the Area Analysis Intelligence Agency established at the direction of the chief of Engineers.

The Area Analysis Intelligence Agency was intended to be only a temporary holding area. When DIA assumed production responsibilities in 1963, the organization was discontinued, and its personnel, together with part of the OACSI staff, transferred to DIA. All in all, the Army contributed 1,000 spaces and its ACSI-MATIC computer system to the new DIA Production Center. In the process, OACSI lost 235 spaces, one-third of its strength, to the new agency. The centerpiece of OACSI had been its Directorate of Foreign Intelligence, the intelligence production unit. This was reduced to a shell, retaining only a residual responsibility for analyzing and interpreting national agency production in support of the Army and in maintaining liaison with DIA. As a result of this devolution of responsibilities, the center of gravity of Army Intelligence would move from the staff in Washington, D.C., to the units in the field.

However, even after the reorganization of 1963 DIA did not hold a complete monopoly over the production of intelligence for the Army. Subordinate elements within the Army continued to conduct production activities. These included the Army Materiel Command, with its two scientific and technical intelligence centers; the Office of the Chief of Engineers, which administered the Army Map Service; and the Office of the Surgeon General, which still had the responsibility of meeting some of the Army's medical intelligence requirements. In addition, a new production element was formed at Fort Bragg, North Carolina, to support the mobile reserve forces assigned to the Continental Army Command (CONARC).

Other intelligence-related functions previously performed by the Army were also centralized. In 1963 the Army's Strategic Intelligence School was merged with its Navy counterpart to form a new Defense Intelligence School, which

---

[22] Hewes, *From Root to McNamara*, p. 364.

began to provide training for attaches from all the military services. The process was carried through to its logical conclusion in 1965, when DIA assumed control over the military attache system that had served as an Army information source since 1889. All service attaches were integrated into the new Defense Attache System. Meanwhile, the Defense Language Institute had replaced the separate language schools previously maintained by the services.

Although DIA acquired production and collection assets from Army Intelligence, another new McNamara creation (the Defense Supply Agency) asserted itself on the counterintelligence front. In March 1965 this agency took over the whole field of industrial security, absorbing all the related spaces from ACSI's Industrial and Personnel Security Group. Ever since World War II, the function had rebounded between G–2 and the Provost Marshal General's Office. The new arrangement seemed to mark a definitive end to this particular jurisdictional dispute within the Army.

OACSI responded to these institutional challenges in much the same way as ASA had met the threat of the Armed Forces Security Agency: it found a new role in devoting itself to Army-specific needs. Shorn of many of its operational functions, OACSI reoriented itself and began providing intensified staff supervision to intelligence areas of growing interest to the Army. In the summer of 1963 the Directorate of Surveillance and Reconnaissance was added to the Army's Intelligence staff to develop the doctrine and hardware that would allow the Army to glean information from the battlefield through innovative technologies. Additional new Directorates of Security and Combat Intelligence were formed in 1964 to supervise functional areas of primary interest to the Army. The Combat Intelligence Directorate included a section responsible for overseeing developments in the fields of special warfare and foreign assistance. Finally, OACSI found ways to edge back into fields of activity theoretically preempted by DIA. In 1963 it set up a Special Research Detachment as a liaison element at NSA, soon expanding it into an all-source production element. The same year the Special Security Detachment formed an Intelligence Support Branch to provide the Army Staff with current intelligence.

The U.S. Army Intelligence Command and the U.S. Army Security Agency

The McNamara-directed reorganization of the Army had significant consequences for the Army Intelligence Center at Fort Holabird, Maryland. The center, commanded by the chief of the Intelligence Corps, had functioned as a field operating agency under direct ACSI control. Two of its main assets were the Army Intelligence School and the Army Intelligence Board, charged with framing doctrine and developing specialized equipment. The McNamara restructuring intruded on both of these arrangements. The Intelligence School was resub-

ordinated to CONARC and the functions of the Intelligence Board split between the Army Materiel Command and another McNamara creation, the Combat Developments Command.

As a result, ACSI created a new administrative entity, the U.S. Army Intelligence Corps Activity, which took over the remnant of the former Intelligence Center's assets and residual functions. The organization served as a vehicle through which the chief of the Intelligence Corps could exercise control over those elements the McNamara restructuring had left under ACSI jurisdiction. These consisted of the Army's counterintelligence records facility, a new Intelligence Corps Supply Activity, the Strategic Intelligence School (until its transfer to DIA), the Army Photo Interpretation Center, and the Administrative Survey Detachment that supported the Intelligence Civilian Career Program which ACSI had started in the 1950s. However, the establishment of the Army Intelligence Corps Activity did nothing to alleviate the confusion in the intelligence command chain resulting from the reorganizations. Since the chief of the Intelligence Corps continued to act as commandant of the Army Intelligence School and commander of Fort Holabird, he now reported simultaneously to three different superiors. As commanding general of the U.S. Army Intelligence Corps Activity and chief of the Intelligence Corps he was responsible to ACSI, but he was under the jurisdiction of CONARC in his capacity as school commandant and subordinate to the U.S. Second Army in his role of post commander. This Rube Goldberg–like arrangement offered no promise of stability.

These changes represented only the beginning of the restructuring of Army counterintelligence organization. In 1963 and 1964 the Army undertook a major study of its personnel security system, an effort spurred by the discovery that an Army sergeant in a sensitive position at the National Security Agency had been passing information to the Soviets for years without being detected.[23] The study, Project SECURITY SHIELD, found serious weaknesses both in the traditional decentralized approach to counterintelligence operations and in the coordination that existed between Army counterintelligence and the criminal investigators of the Provost Marshal General's Office. SECURITY SHIELD led to yet another wholesale reorganization of Army counterintelligence.

On 1 January 1965, the Army created the U.S. Army Intelligence Corps Command as a Department of the Army major field command. Operating under a new design concept, the command took over centralized direction over all counterintelligence operations in the continental United States. The Intelligence Corps Command assumed authority over the seven Intelligence Corps groups that had previously operated under six armies and the Military District of Washington. (The large CIC detachments in the United States had been redesig-

---

23 The errant sergeant was Sfc Jack Edward Dunlap. The story of the case can be found in James Bamford's popular but highly unauthorized book, *The Puzzle Palace: A Report on NSA, America's Most Secret Agency* (Boston: Houghton Mifflin, 1982), pp. 150–53.

nated as "groups" between 1956 and 1959.) At the same time, the Army ordered the field offices of the Intelligence Corps Command and the provost marshal's Criminal Investigation Division (CID) to be brought together wherever possible, and the records of the CID repository removed from Fort Gordon, Georgia, and collocated with the counterintelligence records at Fort Holabird.

The creation of the Intelligence Corps Command gave its commander, the chief of the Intelligence Corps, operational responsibilities for the first time in the history of Army counterintelligence. At the same time, he lost certain assets. Not all the elements of the former Army Intelligence Corps Activity were transferred to the new command. Since the Intelligence Corps Command was intended to be purely a counterintelligence organization, the Army Imagery Interpretation Center, as the Photo Interpretation Center had been redesignated, reverted back to the direct control of the ACSI.

There were still certain anomalies in the new pattern of organization. Despite its title, the Intelligence Corps Command controlled only about half of all Intelligence Corps personnel in the continental United States. The rest were on school or organizational staffs, with the TOE organizations supporting tactical elements in the field, or in the "pipeline." Intelligence Corps personnel deployed outside the continental United States were not a part of the new command. The Intelligence Corps Command's commander, in his other capacity as chief of the Intelligence Corps, thus had substantial administrative responsibilities extending beyond his own command; and the Intelligence Corps he headed was engaged in active intelligence collection as well as in counterintelligence. The creation of the new headquarters also had left the chain of command more tangled than ever. Its commander now wore four hats. As head of a major field command, he now reported directly to the Army chief of staff, in addition to reporting to ACSI, the commander of CONARC, and the commander of the U.S. Second Army in his other various roles.[24]

In one sense, this arrangement conformed to the civilian theories of matrix management popular in the 1960s. Matrix management held that someone marketing refrigerators to Latin America should report to a vice president for marketing, a vice president for refrigerators, and a vice president for Latin America. But the scheme did not accord with normal Army command procedures and was in practice unworkable. Not surprisingly, reorganization plans were begun as soon as the new command had been assembled. The U.S. Army Intelligence Corps Command lasted just six months.

There seemed to be only two possible solutions to the organizational tangle created by the existence of the Intelligence Corps Command. One duplicated

The integrated staff serves four masters." Fact Sheet, U.S. Army Intelligence Corps Command, p. 2. U.S. Army Intelligence Command file, INSCOM History Office.

the Army Security Agency's centralized, vertical command structure, creating a self-sufficient organization. However, because of its mission, that agency was a special case, and its organization had no parallel in the rest of the Army. The other solution, the one adopted, decentralized the structure of the Intelligence Corps Command.

The U.S. Army Intelligence Command (USAINTC) was created on 1 July 1965 to conduct counterintelligence operations within the continental United States.[25] The combined headquarters organization of the former Intelligence Corps Command was broken up, and the Army Intelligence School and Fort Holabird placed under separate commanders. Functions previously performed by the Intelligence Corps Command that were unrelated to counterintelligence—administering the intelligence civilian career program and procuring intelligence-related supply items—reverted to ACSI, resulting in the establishment of the Administrative Survey Detachment and the Intelligence Materiel Development Support Office as separate field operating activities. Finally, the Intelligence Corps itself was discontinued in March 1966, and its personnel functions shifted to the Department of Army level. This ended the Army's attempts to integrate human intelligence and counterintelligence personnel under a single organizational structure. Discontinuance of the Intelligence Corps also resulted in the redesignation of all Intelligence Corps units as Military Intelligence units.[26]

The creation of the U.S. Army Intelligence Command meant that the Army counterintelligence organization had been turned inside out. The old Counter Intelligence Corps had selected, trained, and administered Army counterintelligence personnel, but counterintelligence operations themselves had been decentralized under the control of local Army commanders. The new major Army field command was a centralized operational organization without any personnel or training functions. The demise of the Intelligence Corps ended a special tradition that went back to the Corps of Intelligence Police in World War I, but the new arrangements meant that Army counterintelligence was now aligned with the rest of the Army.

If McNamara's organizational innovations destroyed the Intelligence Corps, they left the Army Security Agency substantially untouched. Because of its specialized mission and compartmented operations, the agency escaped the loss of its training and research and development functions. Instead, it expanded physically, geographically, and functionally. An ASA element, with the in-country designation of the 3d Radio Research Unit, deployed to Vietnam to support the ongoing advisory effort as early as 1961.[27] The agency also acquired an impor-

tant new acoustical intelligence mission in 1962, following the abolition of the Signal Corps as an Army technical service. A year later, the Army Security Agency achieved a monopoly of Army electronic warfare functions when it took over control of the noncommunications-jamming function and associated units from the Signal Corps. In 1964 it set up its third field station in the continental United States at Homestead, Florida, to better meet new mission requirements which had evolved in the early 1960s. Finally, the agency's independence and unique position within the Army was ratified on 14 April 1964, when it achieved the status of a major Army field command.[28]

The Army Intelligence and Security Branch

The changes within the Army Intelligence community during the 1960s were not confined to shifts in function and in command relationships. Army Intelligence took a giant step in the direction of full professionalism in 1962, when the Army Intelligence and Security Branch was set up as a basic branch of the Regular Army. This development was long overdue. Since World War II, intelligence professionals had argued that the very existence of intelligence units created the need for a separate intelligence branch. The logic of this argument was increasingly reinforced by practical necessities. The pool of reserve officers capable of filling intelligence slots was becoming exhausted. Without a reform in the Army personnel system, analysts projected that half the Army's intelligence officer positions would be without qualified occupants by 1965. The incumbent ACSI, Maj. Gen. Alva R. Fitch, pushed vigorously for the creation of a new branch to remedy the situation. Yet even the Army Intelligence community was divided on the issue. The ASA chief protested that the proposed integration of signals intelligence officers with other intelligence personnel would be like putting infantry and artillery into one branch. But Fitch won his case. The new branch came into existence formally on 1 July 1962.[29]

The Army Intelligence and Security Branch embraced about 5 percent of officers in the active Army. The initial group joining the branch consisted of 283 Regular Army and 3,652 reserve officers who had a background in intelligence or were assigned to intelligence positions. A quarter of the group consisted of cryptologic specialists; the remainder broke down about evenly into combat intelligence personnel and members of the Intelligence Corps. The formation of the new branch significantly enhanced the Army's capacity to promote and retain qualified intelligence officers.

---

[28] GO 14, HQDA, 14 Apr 64. As a result of this upgrade in status, the chief, Army Security Agency, assumed the new title of commanding general, Army Security Agency.

[29] Marc B. Powe and Edward E. Wilson, *The Evolution of American Military Intelligence* (Fort Huachuca, Ariz.: U.S. Army Intelligence Center and School, 1973), p. 105.

However, the new branch had problems initially. It contained only a small number of Regular Army officers, and many of the reserve officers brought into the Army Intelligence and Security Branch lacked higher education or prospects for career advancement. The branch was designated as one that performed a combat service support function, not the most prestigious role in the Army. Finally, it was the only branch in the Army without a common basic course. Although most Intelligence officers attended Fort Holabird for training, Army Security Agency officers still trained separately at the U.S. Army Security Agency Training Center and School (USASATC&S) at Fort Devens, Massachusetts. Nevertheless, within the space of four years, much of Army Intelligence had been reconfigured. The new structure would meet its first test in the foreign and domestic challenges during the war in Vietnam.

Vietnam and Beyond

The 1960s began with brave promises; however, events soon began to go awry. Although successive crises with the Soviet Union over Berlin and the Soviet deployment of missiles to Cuba were resolved peaceably, the Viet Cong insurgency in South Vietnam continued to fester, despite the involvement of an increasing number of American military advisers. In early November 1963 a beleaguered President Ngo Dinh Diem of South Vietnam was assassinated during a coup by his own Army. Intended to stabilize the deteriorating security situation in South Vietnam by removing an unpopular leader, the coup had the opposite effect. As a revolving-door series of ephemeral governments came and went in Saigon, Communists gained an increasing foothold in the countryside. Meanwhile, President John F. Kennedy had been assasinated in Dallas; his successor, Lyndon B. Johnson, had a wealth of experience in domestic politics but no substantive understanding of foreign affairs. Johnson won election in 1964 on a platform of peace and social reform, but soon found that developments in Vietnam would imperil both goals. By early 1965 a Viet Cong victory seemed imminent.

America responded initially with limited air raids against the Viet Cong's sponsor, North Vietnam. When this action proved unproductive, ground troops were committed to the South under the direction of the Military Assistance Command, Vietnam (MACV), a joint, Army-dominated "sub-theater" headquarters. The North Vietnamese countered by steadily increasing their war buildup, sending in their own regular forces to supplement the activities of the guerrillas. Thus the United States lurched into an undeclared war.[1] On the American side, this remained a limited effort. The president's main focus was on constructing a "Great Society" at home, and he regarded the war in Southeast Asia as an unpleasant distraction. As a matter of deliberate management, the conflict was fought without passion, without censorship, without mobilization, and without raising taxes. Increasingly, it was fought without

[1] For a caustic evaluation of the Johnson administration's conduct of the war, see David Halberstam's *The Best and the Brightest* (New York: Random House, 1972).

popular enthusiasm. On the other hand, for the North Vietnamese and their Viet Cong proxies, the war was total.

By the end of 1967 an American Army of 485,000 soldiers and marines, backed up by an enormous logistical system, had deployed in country; and officials talked brightly that there was now "light at the end of the tunnel."[2] The Tet offensive at the beginning of 1968 dispelled this dream, however. It broke the will of an administration and shattered the confidence of the American people. After Tet, all roads ran downhill. The Johnson administration decided to stop reinforcing the war effort; its successor chose to withdraw gradually from the war and return the tar baby to the luckless South Vietnamese. In the meantime, the United States was unraveling on the domestic front. Racial unrest resulted in rioting on a massive scale, while an increasingly violent antiwar movement grew in strength on the nation's campuses.

What ensued was an almost complete debacle. A cease-fire in place in Vietnam at last was signed in Paris in 1973. A similar agreement, signed in Korea twenty years before, had endured. However, the government of South Korea had been in full control of its own territory, and American military might had backed up the agreement. Neither of these conditions proved true in Southeast Asia. Hundreds of thousands of North Vietnamese troops remained in place in the South, and a peaceful end to the conflict seemed remote. American ground forces were completely withdrawn from Vietnam, and any chance that the peace settlement would stand was undermined by the disintegration of the Nixon administration amid the toils of the Watergate scandal. Confronted by a North Vietnamese blitzkrieg and abandoned by its American allies, in 1975 the South Vietnamese government collapsed.[3]

All of these events had a massive impact on Military Intelligence. Some structural changes that took place during this period were driven by new developments in technology. Most, however, were brought about by the military commitment to Southeast Asia and its manifold repercussions. The Vietnam conflict, its domestic side effects, and the economic and psychological constraints produced by the outcome of the venture all worked to reshape the organization of Army Intelligence.

Vietnam: Buildup and Deployment

The Vietnam conflict proved a formidable challenge to Army Intelligence, as well as to the rest of the American defense establishment. The Army was forced to function in an unfamiliar environment and deal with an unfamiliar language, under rules of engagement giving the enemy a chance to accept or decline battle

[2] Kathleen J. Turner, *Lyndon Johnson's Dual War: Vietnam and the Press* (Chicago: University of Chicago Press, 1985), p. 211.

[3] It should be noted that the official Army photo history of the Vietnam War, which begins its coverage in 1945, tactfully chooses to end its account in 1973.

at will. The detailed, quantified information which the decision makers of the day demanded was not easy to develop when the enemy was a guerrilla under jungle canopy, and when the exact state of the "hearts and minds" of an indigenous population involved in a civil war was so hard to assess. Under such conditions it is not surprising that the performance of Army Intelligence engendered controversies that lived on long after American troops had left Southeast Asia.[4]

Previous conflicts had witnessed a vast expansion of the Army's departmental-level intelligence staff. However, these conflicts had been fought before the subordination of Army Intelligence to unified intelligence agencies. In Southeast Asia, the Defense Intelligence Agency would be responsible for the analytical effort. As a result, the OACSI staff actually contracted over the course of the war, and its internal organization was shaped as much by factors such as the increased availability of computer support, the need to manage new technologies, and the necessity for coping with counterintelligence problems on the domestic front as it was by the war in Southeast Asia itself. The real growth of the Army's intelligence and security organization was in the field. The Army Security Agency built up to a strength of 30,000, one-fifth of which was deployed in Vietnam at any one time, and other components grew correspondingly.

As long as the American military presence in South Vietnam had been confined to an advisory role, the demands on the Army's intelligence resources had not been excessive. In early 1965 the MACV was receiving intelligence support from a collection detachment subordinate to the Japan-based 500th Intelligence Corps Group, a counterintelligence detachment, and some two hundred intelligence officers serving as advisers with South Vietnamese troops. In-country cryptologic work was handled by the Army Security Agency's 3d Radio Research Unit (RRU), which comprised aerial as well as ground-based elements.[5]

The influx of American troops in large numbers changed all this. In response to the requests of Maj. Gen. Joseph A. McChristian, MACV assistant chief of staff for intelligence, or J–2, in 1965 the 525th Military Intelligence Group was deployed in packets from Fort Bragg, North Carolina, to serve as command and control headquarters for the intelligence effort.[6] It was joined by the 1st Military Intelligence Battalion (Aerial Reconnaissance Support) and the 519th Military Intelligence Battalion (Field Army). Soon afterward, two additional Military Intelligence groups were introduced, built up from cellular teams dispatched from the United States. These were the 135th Military Intelligence

Group, a counterintelligence unit, and the 149th Military Intelligence Group, with a collection mission.[7] The groups absorbed the personnel and functions of the 519th Military Intelligence Battalion's counterintelligence and collection companies. Meanwhile, the 519th was itself greatly expanded to support four combined United States–Vietnamese processing and production centers. The unit included a large technical intelligence detachment augmented by detachments from the Army technical branches.

In the fall of 1967, following the departure of General McChristian, there was another substantial reorganization of intelligence units within South Vietnam. The 525th Military Intelligence Group restructured its subordinate units into six provisional battalions, respectively located at Da Nang, Nha Trang, Bien Hoa, Can Tho, Saigon, and (for a time) Tan Son Nhut Air Base; the 135th and 149th Military Intelligence Groups subsequently were inactivated.[8] This effort was supplemented by the activities of over six hundred intelligence advisers serving with the Vietnamese; by intelligence detachments attached to all independent brigades and higher formations; and by aerial surveillance companies that operated in support of the "field forces," Army corps-level headquarters organizations with additional advisory functions. Army Special Forces and the Vietnamese Montagnards under their control also played a significant role in furnishing combat intelligence.

Army Security Agency support in country expanded as well. At the height of the war effort, the agency's 509th Radio Research Group, which had replaced the 3d Radio Research Unit, commanded a fixed field station at Phu Bai; the 224th Aviation Battalion (Radio Research); the 303d and 313th Radio Research Battalions, each attached to an Army field force; a communications security company; and some twenty direct support units (DSUs) attached to divisions and brigades.[9] Other ASA assets positioned in Thailand and the Philippines also supported the cryptologic effort.

As it evolved, the Army Intelligence effort in Vietnam became heavily committed to collaboration with the South Vietnamese, who knew the language and terrain and already possessed a useful, if fragmented, data base. General McChristian organized a Combined Intelligence Center at Tan Son Nhut Air Base near Saigon, manned by U.S. and South Vietnamese personnel and under the joint control of MACV and the South Vietnamese high command. Similar combined centers handled prisoner-of-war interrogation, document exploitation, and analysis of captured materiel.[10] In a kind of reverse advisory role,

[10] McChristian, *The Role of Military Intelligence*, pp. 21–78. A description of the Combined

South Vietnamese Military Intelligence detachments worked directly with American formations at the level of independent brigade and above.

Vietnamese assistance was necessary because of some American deficiencies. Vietnamese linguists were in especially short supply, which made close cooperation with the South Vietnamese essential. And although there had been an American advisory presence in the country since the 1950s, America went into the war without benefit of an adequate intelligence data base. At the time DIA was formed, ACSI had delegated the task of compiling order of battle data for Southeast Asia to the U.S. Army, Pacific, while USARPAC in turn had assumed that the Military Assistance Advisory Group, Vietnam, was carrying out this responsibility. In reality, no one had done the job, and American combat forces deploying into Southeast Asia had been confronted with an intelligence vacuum.[11]

Moreover, although the McNamara regime had strengthened the previously neglected conventional forces, the Army still lacked enough trained intelligence professionals to meet its needs in Vietnam. It took a long time for the Army's intelligence training establishment to retool to meet the needs of the conflict. The Army Intelligence School did not begin to offer a Vietnam-oriented short course until 1968, and training for intelligence officers serving as advisers at the district and province level in Vietnam was not provided until 1970. Moreover, in this conflict, the reserve components could not compensate for the deficiencies of the Regular Army. There was a substantial Military Intelligence presence in the reserves, but linguistic skills were lacking, and in any case the administration had declined to deploy them. This may have been a blessing in disguise, since unit readiness in many cases was low. Maj. Gen. Charles Denholm, commanding general, U.S. Army Security Agency, deemed the ASA reserve units "almost useless."[12]

As in previous wars, communications security in the field continued to be a major problem for the Army. This was aggravated by the compartmentalized nature of the war, the extensive use of aircraft, and above all by the ubiquitousness of the radio-telephone. A Vietnam-era division, for example, had 3,000 of

Intelligence Center, Vietnam (and much else), is contained in Bruce E. Jones, *War Without Windows: A True Account of a Young Army Officer Trapped in an Intelligence Cover-Up in Vietnam* (New York: Vanguard Press, 1987). See also Col. Huang Ngoc Lung, *Intelligence*, Indochina Monographs (Washington, D.C.: U.S. Army Center of Military History, 1982), pp. 82–83. Lung feels that the relationship between U.S. and Vietnamese intelligence did not become "really close and effective" until 1969.

11 General Bruce Palmer, Jr., *The 25-Year War: America's Military Role in Vietnam* (New York: Simon and Shuster, 1984), pp. 39–40.

12 The Secretary of the Army's Program for Command Supervision of Readiness: Command Presentation by U.S. Army Security Agency, 10 Sep 68, p. 19, Army Cryptologic Records. During the Berlin Crisis of 1961 the deployment of two ASA battalions had ended in a fiasco; the units were so ill trained that that they never got beyond the gates of the ASA Training Center and School at Fort Devens, Massachusetts. Eventually, the 241st and 277th Military Intelligence Detachments were called into federal service in the token reserve mobilization following the Tet offensive, but they never went overseas.

these transmitters, compared to 225 in a representative World War II division. Proper communications security often required units to shift radio frequencies and call signs. But the crowded electromagnetic environment presented by a communications-rich war meant there were not enough available frequencies, while helicopter companies that operated over hundreds of miles in support of units drawn from a number of nations found that any change in call signs produced paralyzing confusion. The Army's manpack speech security devices were too heavy and cumbersome to be lugged through the jungle easily, and troops resorted to the use of homemade radio-telephone codes that became transparent all too easily. Many commanders preferred to ignore the whole problem, choosing to sacrifice security considerations to speed and availability of communications.[13]

There were other shortfalls. At first, lower-echelon commanders complained that they were deprived of vital timely intelligence, either because of compartmentation considerations or because scarce intelligence assets were being held under close control at higher levels. Ultimately, however, Army Intelligence constructed a serviceable organization in Vietnam, even though some of its problems were never solved. Units down to the maneuver battalion learned to coordinate intelligence with operations by establishing joint tactical operations centers. Commanders improvised special companies with the capacity to conduct long-range reconnaissance patrols; in 1969 the Army formally made these units elements of the 75th Infantry and designated them as "Rangers."[14] The Army also met the expanding intelligence and security needs of the combat divisions committed to Vietnam by expanding their intelligence detachments to full companies and providing the divisions with TOE ASA companies in direct support. In addition, Special Security Offices in each division disseminated the most sensitive intelligence derived from national-level acquisition systems. Intelligence sources available only to high-level commanders for strategic applications during World War II now could be put to tactical use. As the war progressed, the number of individuals indoctrinated for compartmented intelligence in combat divisions tripled.

Additional ground intelligence was provided by the teams of the 5th Special Forces Group, 1st Special Forces, in Vietnam and the Vietnamese Civilian Irregular Defense Groups they advised. The Special Forces camps, scattered along the thinly populated interior spine of South Vietnam, served as an outpost screen to detect the movement of infiltrating enemy columns. Besides engaging in ground reconnaissance, the Special Forces conducted intelligence and counterintelligence operations through their contacts with the local Montagnard tribesmen. Members of the Special Forces also served as the Army component of the MACV Studies and Observation Group, a joint service element under JCS

supervision that collected intelligence and carried out special operations in denied areas in conjunction with its Vietnamese counterpart organization.[15]

American advisers also contributed to the intelligence effort. Working hand in hand with their Vietnamese counterparts at the province and district levels, they became increasingly involved in an attempt to identify and neutralize the Viet Cong infrastructure that supported the insurgency through a network of district intelligence and operations coordinating centers established throughout South Vietnam. The centers had "a dual mission to produce and exploit *both* VC infrastructure and tactical Military Intelligence." Originally begun as a unilateral American effort to upgrade the effectiveness of Republic of Vietnam security organizations, the program was formally embraced by the South Vietnamese government in 1968 and assigned the dual code name PHOENIX/PHUONG TRANG.[16]

Better cryptologic support to the field came about when the Army Security Agency established management centers to service each Army field force and introduced tactical direct support units down to the level of the individual combat brigades. In the process, the agency moved into the front lines. ASA special operations personnel worked with the patrols of the Special Forces, and an ASA element mounted in armored personnel carriers was organized to provide support to the 11th Armored Cavalry Regiment.[17] The guerrilla nature of the war meant that Army Security Agency personnel usually working in safe rear areas were exposed to hazard. The large fixed field station at Phu Bai was maintained as a fortified camp, bristling with minefields, concertina wire, pillboxes, sandbagged bunkers, watchtowers, trenches, and mortar positions. ASA casualties during the Vietnam conflict were many times greater than during the Korean War.[18]

16 ICEX Newsletter 67–4, 4 Dec 67, p. 6. By 1969, however, the Army command in Vietnam had become disenchanted by the program because of the perceived excesses of the Provincial Reconnaissance Units that served as executive agents in "neutralizing" Viet Cong cadre. Jeffrey J. Clarke, *Advice and Support: The Final Years*, United States Army in Vietnam (Washington, D.C.: U.S. Army Center of Military History, 1988), pp. 379–80. Perhaps participants took too literally the injunction to take "a 'rifle shot' approach" in dealing with the infrastructure problem. ICEX Briefing Paper, 30 Aug 67, p. 1. A recent detailed examination of PHOENIX is Dale Andrade, *Ashes to Ashes: The Phoenix Program and the Vietnam War* (Lexington, Ky.: D.C. Heath, 1990). For the personal account of an Army participant in this much maligned and misunderstood program, see Stuart H. Herrington, *Silence Was a Weapon: The War for the Vietnam Villages, A Personal Perspective* (Novato, Calif.: Presidio Press, 1982).

17 Some of these ASA activities are captured in photographs in John P. Finnegan, *Military Intelligence: A Picture History* (Washington, D.C.: Government Printing Office, 1985), pp. 167–68.

18 Casualties among Military Intelligence personnel were not restricted to members of the Army Security Agency. During the Tet offensive, the Hue detachment of the 525th MI Group was overrun and its members killed or captured. The first Medal of Honor ever granted to a Military Intelligence officer was awarded posthumously to 1st Lt. George Sisler, assistant intelligence officer of a Special Forces team.

In the area of communications security, the Army Security Agency sought to bring about improvement by changing its approach. During the first stages of the war, tactical units in the field received communications security support from their attached ASA companies and detachments. At that time, communications security was conceived of as essentially a police-type function of monitoring friendly communications and warning of possible compromises. This arrangement proved to be ineffective, producing conflicts with supported commanders. As a remedy, the agency evolved a new concept of "before the fact" assistance, having its personnel serve as advisers rather than as policemen.[19] Under this doctrine, communications security personnel assisted in planning operational communications procedures and instructed troops on the necessity of communications security. To implement this better, in 1969 the agency's in-country communications security assets were withdrawn from the direct support units and concentrated in the 101st Radio Research Company. A similar centralized ASA security company was also formed in Europe. The new, nonpunitive approach was facilitated by the simultaneous fielding of the Nestor family of speech security devices, which eliminated much of the security problem at the source.[20]

Organizational innovations in the intelligence and security field were supplemented by the introduction of new technologies. Airborne electronic support, first pioneered in Vietnam and conducted from fixed-wing aircraft and later from helicopters, was one.[21] Other elements of Army Intelligence were able to make productive use of gadgets such as unattended ground sensors and "people-sniffers." Infrared and side-looking airborne radar sensors supplemented the traditional visual and optical techniques of aerial observation, while the pairing of observation and armed helicopters into "pink teams" with the dual missions of finding and fighting gave another dimension to traditional aerial reconnaissance. At the top, MACV's J–2 staff slowly automated its intelligence data base and collection management procedures.

In the end, of course, it was not enough. Although Army Intelligence could provide the higher commanders with significant forewarnings of the 1968 Tet offensive, the intensity of the enemy attack was underestimated. But the fact remains that Army Intelligence could provide the kind of warning before Tet in 1968 that it had been unable to furnish before the Battle of the Bulge in 1944. However, despite the similar military outcomes of the Tet and Ardennes counteroffensives—in each case, the enemy scored some disconcerting gains, but paid for them with disproportionate losses—Tet did something that the German

[21] The 224th Aviation Battalion (Radio Research) managed the fixed-wing assets, flying 100 aircraft at the height of the conflict. Included in its inventory was a handful of four-motored reconverted patrol bombers acquired from the Navy.

Ardennes offensive had not done: it convinced the home front that the war could not be won. The fighting went on, but negotiations and a program of Vietnamization became the order of the day. As the American military presence in South Vietnam shrank, so did the presence of Army Intelligence. The last Army Intelligence elements left South Vietnam in 1973, following the signing of the Paris Peace Accords.[22]

The Vietnam conflict had furnished Army Intelligence with a short list of lessons learned and a long list of casualties. The war's effects on the structure of Army Intelligence were not confined to Vietnam. The rapid turnover of personnel engendered by the policy of troop rotation adversely impacted the cohesion and professional capacity of units far removed from the war zone, as had the diversion of equipment and spare parts to the fighting front. On the home front, the war and the opposition it provoked led Army Intelligence into a situation that compromised its image. Finally, the antimilitary and anti-intelligence reaction that prevailed in America as the Vietnam conflict came to a close posed deep threats to the whole Army Intelligence organization.

The U.S. Army Intelligence Command and the Home Front

Even while the fighting went on in Vietnam, Army Intelligence was actively engaged in operations in another area, the American home front. The principal Army player here was the U.S. Army Intelligence Command (USAINTC), the Army counterintelligence element formed in 1965 to conduct operations in the continental United States. The command had been allotted substantial personnel to carry out its mission. Its seven Military Intelligence groups controlled a network of 300 field and resident offices across the nation. The merger of Army counterintelligence and criminal investigative records into the Investigative Records Repository (IRR) gave the command a massive data base, which was supplemented in 1966 when USAINTC became the DOD agent administering the newly created Defense Central Index of Investigations, a master file of all counterintelligence and criminal investigations performed by the armed services, and the National Agency Check Center, which performed records searches on files maintained by non-DOD agencies such as the Federal Bureau of Investigation (FBI) and local police departments. By 1967 the command had extended its responsibilities beyond its original jurisdiction, assuming the case control function for routine background investigations requested by the major commands overseas.

Centralizing counterintelligence operations in the United States under a single Army command produced the desired effects in terms of speed and efficiency. The new organization not only had a greater capacity to coordinate and conduct counterespionage investigations against military suspects but also was bet-

---

22 Individual Army Intelligence personnel did remain behind as members of the Defense Attache's Office.

ter able to conduct background investigations. Under the old decentralized system, it had taken an average of ninety-seven days to process a standard background investigation. By 1967 USAINTC completed these investigations in an average time of thirty-one days. However, centralization would prove to have less desirable effects. It gave Army counterintelligence a high profile, and gave civilian policy makers an organization to task for domestic intelligence collection in what was rapidly becoming a time of trouble. The end result for Army Intelligence was less than satisfactory.

Under delimitations agreements dating back to the 1940s, the FBI had primary responsibility for counterintelligence investigations of civilians in the continental United States. Army counterintelligence confined its attention to the military and to those civilians who applied for security-sensitive civilian and military positions with the Army. Most of the Army's counterintelligence effort and resources were devoted to background investigations of the latter. However, the events of the 1960s conspired to break down the neat demarcation line between military and civilian counterintelligence jurisdiction in the United States and to draw Army Intelligence deeply into civilian affairs. Federal troops were frequently alerted and occasionally deployed to restore order when local authorities were unable to maintain control in the numerous crises of the period. Commanders needed intelligence support, and it quickly became apparent that it was too late to attempt to gather intelligence once an actual troop deployment had begun. It also became apparent that the existing civilian intelligence agencies were fragmented and often ineffectual.

The FBI may have had theoretical responsibility for civilian counterintelligence, but its director, J. Edgar Hoover, was aging and increasingly uncooperative. The bureau itself, although having a good track record in apprehending interstate car thieves, kidnappers, and the occasional spy, was primarily a crime-fighting agency with neither the capacity nor the inclination to produce finished domestic intelligence. Moreover, the overwhelming majority of FBI agents were middle-aged white males, limiting the bureau's capability to conduct effective undercover work against the radical black and student groups that seemed to pose the greatest threat to national security. As conditions of disorder became progressively worse, the Army moved to fill an intelligence void.

Local commanders had first begun to request counterintelligence support from the assets they controlled during the civil rights disturbances in the South in the first part of the decade. USAINTC became involved in giving crisis support soon after it had been set up, as a result of Army involvement in the Watts rioting in August 1965. The command formulated its first contingency plan for collecting domestic intelligence in early 1966. STEEP HILL, as the plan was code named, was designed to be implemented only after there had been an actual deployment of federal troops.

The command soon realized that STEEP HILL, redesignated GARDEN PLOT in 1967, was inadequate. For USAINTC to be of any help to Army commanders in

a civil disturbance situation, it would have to begin collection as soon as there was any likelihood of a deployment of federal troops. To meet the requirement, the command devised a new collection plan, ROSE HILL, later redesignated PUNCH BLOCK and LANTERN SPIKE, successively. Unrest in America's cities caused PUNCH BLOCK to go into effect eight times during the summer of 1966. By this time, in the words of the USAINTC official history, civil disturbance collection had become a "minimal, but increasing" part of the command's work load.[23]

The troubled summer of 1967 brought matters to a head. The LANTERN SPIKE civil disturbance collection plan was implemented four times, and federal troops were actually committed to deal with a major riot in Detroit. As a result of the Detroit disturbances, Deputy Secretary of Defense Cyrus Vance, who had served as the agent of the Executive Branch in handling the federal intervention, tasked the Army with "reconnoitering the major cities" to gain information on critical elements of topography and vulnerability before troops were sent in again. He also suggested that "the assembly and analysis of data with respect to activity patterns is also needed."[24] This put the Army into the domestic intelligence business on a greatly enlarged scale.

After the Detroit riots, the priorities of the U.S. Army Intelligence Command changed perceptibly. The Army now began to collect intelligence data that would not only allow it to intervene effectively in urban riots, but would also help it to cope with the threat of the increasingly violent antiwar movement. By 1967 the popular consensus in support of American commitment to Vietnam was beginning to waver. An uncensored media had brought the horrors of war to American living rooms, and the Johnson strategy of fighting a painless war by allowing generous exemptions for college students while tripling the draft call had made a time bomb out of the nation's campuses. Radical students and others had started to challenge not only the war, but the whole American system allegedly responsible for it. The Army now felt it had to defend its personnel and installations from possible subversion, sabotage, and even guerrilla warfare. In response to these perceived menaces, USAINTC steadily widened its collection activities, and the files of the Intelligence Records Repository began to bulge with the names of individuals and groups with no connection to the Department of Defense except their reputed opposition to it.

[23] U.S. Army Intelligence Command Annual Report of Major Activities, FY 1971, p. 40, copy in INSCOM History Office files.

[24] Ibid., p. 41. Vance was not the only high government official interested in Army collection capabilities against civil disorders. In late 1967 Attorney General Ramsey Clark established the Inter-Divisional Information Unit in the Justice Department "to make full use of available intelligence." For the first two years of its existence, the unit drew heavily on Army counterintelligence for its data. Paul Cowan, Nick Eggleson, and Nat Hentoff, *State Secrets: Police Surveillance in America* (New York: Holt, Rinehart, and Winston, 1974), pp. 14–15.

The rioting that devastated the nation's capital following the assassination of Dr. Martin Luther King, Jr., was the final straw. In response, OACSI set up civil disturbance units in its Counterintelligence and Counterintelligence Analysis Branches in 1968, and the Department of the Army issued a classified Civil Disturbance Collection Plan levying intelligence requirements upon USAINTC that were so sweeping that they could not be filled by the traditional methods of overt collection or liaison with FBI and local law enforcement officials.

To accomplish the tasking, the command had to initiate an extensive collection program against domestic targets. And by now, Army Intelligence elements other than USAINTC were also involved in the domestic intelligence field. In an independent effort, CONARC and several Zone of the Interior armies had deployed counterintelligence personnel from their tactical units to engage in domestic collection operations and had compiled computer data bases on suspected potential troublemakers. The Army Security Agency had used its own assets on several occasions in 1967 and 1968 to monitor the demonstrators' citizen-band radios.

Even at the height of this type of activity, the bulk of USAINTC's resources remained committed to the traditional role of conducting background investigations. But the amount of activity devoted to domestic intelligence had a significance beyond its limited size. The perceived domestic crisis, coupled with Johnson administration demands for more and more information, led Army Intelligence into dangerous waters. Its activities crossed the traditional dividing line between the civilian and military in American life and overstepped the law, since neither the collection activities nor the civilian intelligence data bank of USAINTC had been authorized by statute.[25]

As early as 1969, after a change of administrations, Robert F. Froehlke, assistant secretary of defense for administration, expressed doubts about the wisdom of the whole operation. The Army went beyond its own requirements to involve itself in civilian concerns to such a degree, and the assistant secretary was concerned that the Army might be diffusing its limited intelligence assets, trying to collect intelligence on too large a portion of American society. As Froehlke ruefully admitted, the demands made upon USAINTC for domestic intelligence had gone "substantially beyond the capability for Military Intelligence units to collect. They reflected the all encompassing and uninhibited demand for information directed at the Department of the Army."[26]

What ended the Army's domestic intelligence program, however, was not doubts, but public exposure. In early 1970 the American Civil Liberties Union sued the Army and the U.S. Army Intelligence Command for "spying on civil-

[26] U.S. Army Intelligence Command Report of Major Activities, FY 1971, p. 48.

ians."[27] The subsequent publicity, accompanied by recriminations from politicians and journalists, led not only to the end of this particular program, but ultimately to the end of USAINTC itself. The whole Army Intelligence community had suffered a major setback.

Beyond the Battle: Intelligence Trends in the 1960s

The Vietnam War and the domestic crisis within the United States were not the only forces exerting pressure on the structure of Army Intelligence during the 1960s. Increasing technology also shaped its development. This was especially important for the Army Security Agency. Personnel and financial constraints also impinged upon the structure of Army Intelligence during this period. The Army was engaged in fighting a large-scale war in Southeast Asia for which the country had never been properly mobilized. The short tours of duty in Vietnam caused constant personnel turbulence. The demands of the war gutted units outside the combat zone of equipment as well as people; ASA, with its dependence on high technology, was particularly affected. By the end of 1968 those ASA tactical units not actually committed to Vietnam, having been stripped of equipment and spare parts, delivered only 50 percent of their support requirements.

The financial problem was compounded in that the United States had an unfavorable balance of trade, and policy makers at the national level were constantly concerned with the bleeding away of America's gold reserves. Economic as well as technological considerations prompted the drive to consolidate many of ASA's European operations at a major new facility in Augsburg. Financial pressures were also partially responsible for the consolidation of the two Military Intelligence groups in Europe into a single unit in 1969. The headquarters of both the 513th and 66th Military Intelligence Groups moved to Munich, Germany, where the 66th absorbed the personnel and functions of the former.

Although Army Intelligence had its problems during this era, it improved its institutional position in a number of ways. One of the most significant advances was in professional development. As a result of a study undertaken by the Norris Board, the Army Intelligence and Security Branch was redesignated the Military Intelligence (MI) Branch on 1 July 1967. The new title symbolized the unity of the intelligence field rather than its diversity. More important, the Army assigned the renovated branch an official combat support function, whereas the old branch had been designated as a combat service support organization only.

---

[27] Palmer, *The 25-Year War*, p. 83. A surprisingly measured evaluation of what all this amounted to can be found in Cowan et al., *State Secrets*, p. 13. "The overall picture is of a moderately large bureaucratic apparatus built to conduct formal interviews for background checks and trying to do the impossible job of predicting major social disorders. It sponged off the FBI for most of its information and used plainclothes operatives for the rest. The information filled numerous computerized files, caused irrelevant briefings, and did little else—within the army."

The upgrade presented the prospect of attracting better officers to intelligence careers and providing members of the branch with greater access to the system of Army higher education that had become professionally indispensable for military career advancement.

As a step toward providing further integration of the various intelligence disciplines within the Military Intelligence Branch, in 1968 the U.S. Army Intelligence School began to offer an MI Officers Advanced Course intended for Army Security Agency officers, as well as for other Military Intelligence professionals. This step was taken in accordance with the recommendations of the Haines Board, another Army study group that had concentrated on deficiencies in intelligence training.[28] The new advanced course did not completely solve all the problems associated with the area, since the Haines Board's proposal to consolidate the Army Security Agency Training Center and School with the Army Intelligence School was not accepted, but the branch course represented a major step in breaking down the wall of isolation between signals intelligence officers and those with other intelligence specialties.

There were also new organizational developments. The Army Intelligence staff moved back into the field of intelligence production, as the Army soon discovered it had needs in this area that DIA could not fulfill. By 1966 OACSI's Special Research Detachment, originally set up as a liaison group with NSA, had become a full-fledged production center. The same year, OACSI created a threat analysis element to produce Army-specific studies. By 1967 even DIA had to admit that the task of conducting all Military Intelligence production simply was too great for one organization and agreed that the Army and the other services should provide "special finished intelligence" directly related to departmental missions.[29] Two years later, USAREUR organized its own production element, the U.S. Army Intelligence Center, Europe.

The Army's mechanism for disseminating its most secret intelligence also was expanded significantly. In 1965 ACSI had decided to attach special security offices to each Army division by fiscal year 1968. Although every Army division assigned to Vietnam had such support, the constraints on resources imposed by the fighting in Southeast Asia prevented implementation of the plan worldwide. However, the system expanded into other areas, as Army requirements for access to sensitive compartmented intelligence grew. In addition to servicing military and diplomatic needs, the Special Security Detachment increasingly became involved in providing private contractors with the highly classified information they needed to do research and development for the government. In 1967 the steady growth of these tasks led the Norris Board to recommend that the Army establish four geographic Special Security regions to act as subor-

[29] Intelligence Organization and Stationing Study (IOSS), Aug 75, Exec Sum, p. 29, copy in INSCOM History Office files.

dinate headquarters for the Special Security Detachment's fifty-five field offices. The recommendations were accepted, and shortly afterward the status of the detachment was upgraded to that of a "group" headquarters.

The Army Security Agency was substantially restructured during the course of the 1960s. TOE units were reintroduced to the United States and Vietnam, and in 1966 all the agency's battalions were converted from a fixed to a flexible structure. There were also more cosmetic changes. At the end of 1967 the Department of the Army decided that TDA units would no longer bear numerical designations. As a result, on 15 December 1967, the Army Security Agency's numbered field stations, special operations commands, and special operations units received new geographic designators. Finally, the Army undertook some qualitative initiatives in the human intelligence field, even though resources and personnel allocated to this area declined steeply after 1963. In 1969 ACSI organized a field operating agency to direct certain programs in this area.

Westmoreland, McChristian, and Military Intelligence

In mid-1968 the former MACV commander, General William Westmoreland, became the Army chief of staff and subsequently supervised three major organizational changes within Army Intelligence. The first came about in 1969, when Westmoreland reviewed the organization of the Army Staff and decided that the number of field operating agencies under ACSI's direct supervision was not compatible with the proper organization of a DA staff element. ACSI's job, in Westmoreland's estimation, entailed staff supervision and program management, not operations. As a result, OACSI underwent a sweeping reorganization. Six major elements were spun off and resubordinated to USAINTC. These included the 902d Military Intelligence Group, which had previously performed high-level counterintelligence operations under direct ACSI control; the Administrative Survey Detachment, which ran Army Intelligence personnel programs; the Personnel Security Group, which adjudicated loyalty and suitability cases for the Army; the Army Imagery Interpretation Center; the Intelligence Materiels Supply Office; and the newly created field operating agency for human intelligence.[30]

In certain ways, the new reorganization amounted to another reinvention of the wheel. At the Army Staff level, it meant returning to the organizational principles originally adopted during World War II. The U.S. Army Intelligence Command was transformed from the continental United States–focused counterintelligence organization originally planned into a simulacrum of the earlier U.S. Army Intelligence Corps Activity. In addition, however, the command assumed control of sensitive operations heretofore controlled only at the DA

---

30 *Department of the Army Historical Summary, Fiscal Year 1970* (Washington, D.C.: U.S. Army Center of Military History, 1973), p. 82.

level, a trend strengthened in 1972 when OACSI transferred its Special Research Detachment to the command.

A second change that came about at this time was an enlargement of OACSI's area of functional responsibilities. Army Intelligence had delegated oversight of the Army's mapping work to the chief of Engineers since World War II. In 1969 Westmoreland directed ACSI to assume staff supervision of certain Army topographic activities, and the Engineer Topographic Command was created to carry out the map-making function by consolidating the Army Map Service with other Engineer elements involved in topography. ACSI also took over staff supervision of Army weather intelligence at this time.

The last organizational innovation of the Westmoreland years initially promised to be the most sweeping. Early in 1969 the ACSI, Maj. Gen. Joseph A. McChristian, who had served as Westmoreland's J–2 in Vietnam, concluded that the Army's fragmented intelligence assets in the continental United States were too physically dispersed to provide the Army with enough support. Reviving the old proposal of the 1950s, he recommended concentrating them in a single intelligence center. The proposal did not, however, touch upon the operations of the Army Security Agency.

McChristian initially had an ambitious concept for the center. It would concentrate in one location an operational intelligence headquarters much like the one McChristian had set up in Vietnam, a counterintelligence center (essentially USAINTC), the U.S. Army Intelligence School, support troops, and tactical units. This would give many elements of the Army Intelligence community a home for the first time. The tactical units and aircraft would be necessary because McChristian felt that one of the center's main purposes would be to give the troops realistic intelligence training in the field. The first plans called for the center to have a troop base of 21,000.

The existing Army Intelligence center at Fort Holabird, Maryland, was obviously unsuited for such an expanded role. The post was small, and the training requirements imposed by the Vietnam War had greatly overcrowded it. The post was hemmed in by an industrial area that precluded expansion. Although the streets of Baltimore were as good a place for counterintelligence agents to practice surveillance techniques as anywhere, Holabird offered no room for field maneuvers. In addition to all these liabilities, the air space in the area was overcrowded, and the electromagnetic environment was cluttered. In a search for an alternative, the initial survey team narrowed the choice to Fort Riley, Kansas, and Fort Huachuca, Arizona, and selected the latter.

At this point, the plan for a new Army Intelligence center began to narrow sharply in scope. Planners soon realized that although Fort Huachuca offered space, it had little water. McChristian then suggested that Fort Lewis, Washington, might be developed as an alternative site, but the post would have needed extensive rehabilitation, and this would take too much time and money. Because of these constraints, the proposed composition of the center shrank,

and then shrank again. It turned out that Fort Huachuca could not comfortably accommodate even a brigade of supporting troops. Originally, planners had thought that the U.S. Army Intelligence Command would move bodily to the new center, leaving behind a kind of USAINTC rear, consisting of a Directorate of Investigative Records to administer the command's bulky and hard-to-move data base. This idea was scrapped also. Since most of USAINTC's activities were in support of the Department of the Army and other national-level agencies, the command could not practicably move beyond the Washington-Baltimore corridor.

Ultimately, the composition of the new Army Intelligence center was scaled down drastically. The final version of the center included the Army Intelligence School and the U.S. Army Combat Development Command Intelligence Agency, together with Army combat surveillance and electronic warfare activities already in place at Fort Huachuca, all of this supported by a bare minimum of tactical units. As part of the process, the Army Intelligence School was redesignated and given the more prestigious title of the U.S. Army Intelligence Center and School. The school moved to its new desert home at Huachuca in phases during the first part of 1971.[31] By this time, events were in process that would be much more damaging to Army Intelligence than the reduced plans for its new center.

Lean Years

The early 1970s saw the U.S. Army in decline. The decision to stage a phased withdrawal from Vietnam led to a drastic cut in troop strength, and between 1969 and 1973 the Army shrank in size by almost half, from a force of 1.5 million to one of 800,000. More important, its ranks were plagued with incidents of drug abuse, racial turmoil, and lack of discipline. The final elimination of the draft in 1973 deprived the Army of its reservoir of college-trained enlisted men and confronted it with daunting recruitment problems. Operating in an environment of constraints, the Army would have to rely increasingly on reserve forces to meet any future combat contingencies. The STEADFAST reorganization of 1973 made this dependence on the reserve components explicit, in addition to retrenching the Army Staff and realigning much of the Army's command structure.[32] If the Army as a whole struggled during this period, Army Intelligence was particularly hard hit. It fell victim not only to popular disillusionment with the results of the war, but also to public indignation against alleged counterintelligence abuses.

The unraveling of the Army's domestic counterintelligence program began in the first months of 1970, when the American Civil Liberties Union initiated a lawsuit against the Department of the Army and the U.S. Army Intelligence

32 *Department of the Army Historical Summary, Fiscal Year 1973* (Washington, D.C.: U.S. Army Center of Military History, 1977), pp. 45–46.

Command on the grounds that they were involved in illegal surveillance of civilians. The initial suit was followed by a fire storm of adverse media publicity, all of which culminated in a congressional investigation in early 1971. The controversy had immediate effects on USAINTC. On 19 February 1970, all civil disturbance and civilian biographic data stored in the Investigative Records Repository were ordered destroyed. A similar purge was ordered of the independent domestic intelligence data bases maintained by CONARC and several of the field armies in the continental United States. The ambitious Civil Disturbance Information Collection Plan was formally rescinded in June. The U.S. Army Intelligence Command went into a 180-degree reversal, of course. As the command's official historian stated, "instead of collect, process, and store, the order of the day was research, screen, and destroy."[33] The effect of the "spying on civilians" charges was to degrade the whole counterintelligence mission. By the end of February 1971 the Army had suspended all USAINTC counter-subversive and offensive counterespionage activities.

These new developments soon affected the organizational structure of Army counterintelligence. On 1 March 1970, the Defense Investigative Review Council was set up under the assistant secretary of defense for administration to exercise general supervision over the counterintelligence activities of all the armed services and to curb any possible abuses. After some deliberation, the council decided to centralize all service-connected background investigations under a new civilian body, the Defense Investigative Service, which was established at the end of 1971 and became operational in October 1972.[34] Meanwhile, contrary opinions had been voiced. In June 1970 presidential assistant Frederick Huston, unnerved by the depth of dissent over the recent American incursion into Cambodia, suggested that all government intelligence agencies conduct their operations without regard to legal or Constitutional niceties. His views did not prevail.[35]

The formation of the Defense Investigative Service was the beginning of the end for the U.S. Army Intelligence Command as a major Army headquarters. Conducting standard personnel background investigations had been the command's bread and butter, constituting 90 percent of its work load. USAINTC had to give up 1,400 personnel spaces to the new agency. Three of its Military Intelligence groups were inactivated, and the number of field offices was reduced from 303 to 50. The command turned over control of the Defense Central Index of Investigations and the National Agency Check Center to the Defense Investigative Service. USAINTC retained custody of Army counterintelligence files, but the criminal investigation records held by the Intelligence

35 Theodore H. White, *Breach of Faith: The Fall of Richard Nixon* (New York: Dell Publishing, 1976), pp. 174–77.

Records Repository were removed from its control and assigned to a new U.S. Army Criminal Investigation Command. Since 1949 a major general had controlled Army counterintelligence activities. By 1972 the U.S. Army Intelligence Command was under the command of a colonel.

After the Army Intelligence School moved to Fort Huachuca, Fort Holabird became superfluous to Army Intelligence. In the interests of economy, USAINTC relocated in the summer of 1973 to Fort George G. Meade, Maryland, a large, multipurpose post. However, since the records of the Army Criminal Investigation Command remained behind at Holabird, the move was a further blow to the concepts behind the SECURITY SHIELD study of 1964. By 1974, USAINTC had lost most of its mission responsibilities and numbered less than 2,000 persons. In addition, the Office of the Secretary of Defense criticized that the Army's counterintelligence structure was top heavy in management and not cost effective.

USAINTC's remaining activities hardly seemed significant enough to warrant its retention as a major command, especially at a time when the Army was under heavy pressure to reduce its headquarters establishments. The command was particularly vulnerable to charges of managerial layering—it shared Fort Meade with the headquarters of a major subordinate unit, the 109th Military Intelligence Group. Another major element, the 902d Military Intelligence Group, had been programmed to move to Fort Meade in the summer of 1974. As a result, the Army discontinued the command on 30 June 1974.[36] On the same day, the Army also inactivated USAINTC's three remaining Military Intelligence groups with area responsibilities for the continental United States and reassigned the Army Imagery Interpretation Center and Special Research Detachment to ACSI's direct control.

USAINTC was replaced by the U.S. Army Intelligence Agency, a field operating agency directly subordinated to ACSI with an initial force structure of just two CONUS counterintelligence groups: the 902d Military Intelligence Group, which lost its traditional high-level mission and became responsible for the geographic area east of the Mississippi, and the 525th Military Intelligence Group, of Vietnam fame, which was reactivated to perform a parallel mission in the western part of the United States. The agency inherited (sometimes in rearranged form) some smaller miscellaneous elements from USAINTC: a technical service activity providing polygraph, technical service countermeasures, and computer security assistance; the U.S. Army Counterintelligence Support Activity, comprising the Investigative Records Repository and the Personnel Security Group; and the Administrative Survey Detachment.

USAINTC was not the only part of the Army Intelligence community affected by the currents of the times. Centralization and economy were the watch-

---

words of the day. In 1970 a blue ribbon panel appointed by President Nixon had called for much greater integration of service intelligence activities at the DOD level. The Defense Investigative Service was just one of three new Department of Defense agencies that the Nixon administration created to assume intelligence functions which the uniformed services previously had performed. In 1972 the Army topographic assets that ACSI had supervised since 1969 were integrated into the new Defense Mapping Agency.[37] During the same year, an attempt was made to integrate all service cryptologic elements into a Central Security Service that would act as the military arm of the National Security Agency. This threatened to strip the Army of much of its remaining role as a manager in the cryptologic field. In practice, however, the Central Security Service did not live up to its initial expectations, and the reorganization did not bring about any substantial change in the relationship between the Army Security Agency and the National Security Agency.

The Army Security Agency, although still the largest single intelligence element in the Army, shared the problems of the greater Army during this period. It had to deal with strength ceilings, recruiting problems, and diminished funding. Additionally, it suffered from the problems caused by a large shortfall of equipment and spare parts in the field. As a result of the demands of the war in Vietnam, much of the remaining equipment was obsolete and ill suited to the demands of a high-intensity conflict.

The retrenchment of the agency began in 1970, when it turned over its acoustical intelligence mission to the U.S. Air Force. In 1971 the Army discontinued the 507th and 508th U.S. Army Security Agency Groups, located respectively in Europe and in Korea, and replaced them with smaller elements: the 502d Army Security Agency Group, a TOE unit, in Europe and an unnumbered field station in Korea.[38] The reduction continued inexorably as the agency stood down from Vietnam and closed long-established field stations. Of the 99 separate units which ASA fielded in 1970, only 73 still existed in 1972. For reasons of economy, ASA's traditional regional headquarters in Europe and the Pacific were discontinued in 1972.

Meanwhile, the approaching end of the draft made questionable whether the Army Security Agency could enlist enough men to meet mission requirements. As a result, for the first time in its history the agency began recruiting women for cryptologic specialties. Although WACs had served with the SSA's 2d Signal Service Battalion in the continental United States during World War II, the WAC detachment stationed at Arlington Hall at the time of the Korean con-

[38] The discontinuance of the 508th USASA Group in Korea in 1971 took place in the context of a major reduction in troop strength there. This drawdown was part of the implementation of the "Nixon Doctrine," which sought to shift the main burden of providing ground forces for defense to our allies.

flict had performed largely administrative functions. By 1976, however, one-tenth of ASA's uniformed personnel worldwide were female.

Although the Army Security Agency was deeply affected by developments in the cryptologic field, it survived the STEADFAST reforms intact. STEADFAST had resubordinated almost all Army training centers, including the U.S. Army Intelligence Center and School, to the newly created Training and Doctrine Command (TRADOC), but ASA's vertical command structure allowed it to retain its own training base. However, the 1973 reorganization of the Department of the Army did have its effect on Army Intelligence at the staff level. In line with the thrust of STEADFAST, the staff of the Office of the Assistant Chief of Staff for Intelligence was reduced by one-third between 1973 and 1974.[39] Production and support functions previously carried out within OACSI were transferred to separate detachments with their own TDAs in 1973, and responsibility for administering attache personnel was transferred to the Administrative Survey Detachment in 1974.

A Time of Transition

After the setbacks of the early 1970s, Army Intelligence began to regroup. Even though it operated under continuing personnel and fiscal restraints, the Army Intelligence community undertook a series of initiatives that would put it in a better position to respond to future challenges.

The U.S. Army Intelligence Agency (USAINTA), established in mid-1974, was originally intended as a low-profile organization with the narrowly limited mission of conducting the Army's residual counterintelligence operations in the continental United States. The assets initially assigned to the new agency were modest. Moreover, its mission was constrained and its activities hampered by congressional legislation, congressional investigations, and executive orders that cumulatively had a chilling effect on counterintelligence operations.[40] By early 1975 the agency's Investigative Records Repository was required to establish a Freedom of Information Act Office to respond to queries from the public about the contents of the Army's files. However, the agency came into existence just at the time that the disestablishment of U.S. Army, Pacific, made it necessary to resubordinate USARPAC's 500th Military Intelligence Group, primarily a collection element. For want of any more plausible arrangement, the Army gave the U.S. Army Intelligence Agency command of the orphaned group, thus acquiring an area of overseas intelligence responsibility that had been denied its predecessor, USAINTC. Since

---

[39] *Department of the Army Historical Summary, Fiscal Year 1974*, p. 38.

[40] A telling indication of the disfavor into which any type of military counterintelligence operation had fallen at this time was Congress' decision in 1974 to discontinue all military censorship units in the reserve components.

the 500th Military Intelligence Group no longer had the mission of supporting a major Army headquarters in Hawaii, it redeployed to Japan in the summer of 1976.

The Army's desire to realign its counterintelligence command and control system to better satisfy the civilian leadership also contributed to the expansion of the U.S. Army Intelligence Agency's geographical area of responsibility. The Defense Investigative Review Council established guidelines that prohibited Army investigations of non–DOD-affiliated civilians within the fifty states and the Panama Canal Zone, but less stringent prohibitions were in effect overseas. To ensure uniform adherence to these policies, it seemed wise to bring all counterintelligence operations within the council's jurisdiction under the control of a single agency. This again resulted in USAINTA's assuming responsibilities that USAINTC had never exercised. The U.S. Army Intelligence Agency gained control of counterintelligence investigations in the Canal Zone and Hawaii and was assigned command of the 901st MI Detachment, which previously had reported directly to the Defense Nuclear Agency. Moreover, the command began to diversify the scope of its activities, upgrading and redesignating its technical services element as the Operational Security Group and embarking on initiatives in collecting human intelligence.

ACSI's Special Security Group also expanded its activities. With the fighting in Vietnam over, the group could at last find enough resources to implement its long-delayed plan to provide each Army division with a special security office. Experience gained in Vietnam had demonstrated this to be a necessity under conditions of modern warfare.

The Army Security Agency also began to evolve in fresh directions. The first step was to give ASA's signal security activities in the Western Hemisphere an organizational base that would conform to the new doctrine that stressed providing advice and support to commanders on signal security issues, rather than monitoring communications to detect violations. This concept emphasized the positive aspects of security rather than the negative, and it allowed ASA to deal with the possibility that improperly secured electronic equipment could now pose as much of a security hazard as badly trained communications personnel. To facilitate this approach, the agency organized the Signal Security Activity at Vint Hill Farms Station in June 1975.

The Signal Security Activity took over a support function that previously had been fragmented among eleven separate units in the continental United States, Alaska, and the Canal Zone. Four subordinate field detachments, each with a TEMPEST capability, monitored the possibility of information compromise from electronic emanations. At the same time, the Army shifted general staff supervision over the communications security/signal security area from ACSI to the assistant chief of staff for communications and electronics. Among its other advantages, the transfer distanced the Army Security Agency from any further charges of "spying on civilians."

Even more important for the Army Security Agency was the growing importance of electronic warfare, part of the agency's mission since 1955. In 1969 the Joint Chiefs of Staff expanded the definition of electronic warfare beyond the accepted "jamming" and "antijamming" roles to encompass the new concept of electronic support measures, which embraced threat detection and avoidance, targeting, and homing. Because of the nature of the combat situation in Vietnam, electronic warfare had played almost no role in that conflict. However, the rapid development of electronic warfare technology and the emphasis given to "radioelectronic combat" in the fighting doctrine of what was then the Army's most probable future adversary made it clear that things would be very different in any potential high-intensity war.[41]

Unfortunately, the agency's traditional emphasis on its cryptologic mission and the damage the Vietnam conflict had caused, both to equipment readiness and to research and development, had left it poorly positioned to meet the electronic warfare threat. In 1972 the Army's Scientific Advisory Board estimated that less than 10 percent of Army Security Agency resources were devoted to electronic warfare and pointed out that much of the available equipment was obsolete.

In response, the agency began to restructure itself to give greater electronic warfare and signals intelligence support on the tactical level. Aerial platforms were fielded in Europe and Korea, and the agency began to develop new types of units that could integrate signals intelligence with electronic warfare. These units were to coordinate with the tactical formations they supported through ASA-manned elements within unit tactical operations centers responsive to the needs of both the intelligence and operations staff officers. The events of the Arab-Israeli War of 1973 gave a striking demonstration of the importance of electronic warfare even in a mid-intensity conflict. In the aftermath of this conflict, Maj. Gen. George Godding, commanding general, U.S. Army Security Agency, proposed that his organization be redesignated the U.S. Army Electronic Warfare Command. Although the proposal was not accepted, it showed that ASA was now prepared to redefine its traditional mission.

By the end of 1974 the structure of Army Intelligence was in flux. It was still adjusting to painful shortages of money and personnel, while at the same time major components of the Army Intelligence community were moving in new directions. However, changes were being made on a piecemeal basis, without any overall plan or centralized guidance. The Army secured a chance to impose a new coherence on its intelligence structure on 31 December 1974, when the chief of staff directed the implementation of a comprehensive study he hoped would impose some cohesion on the many significant changes in process.

Reorganization and Renewal

The year 1975 marked a low point for both America's influence on the international scene and the institutional position of the Army. The growing power of the Organization of Petroleum Exporting Countries (OPEC), first manifested at the time of the Yom Kippur War, seemed to threaten the economies of the Western industrialized world in an unprecedented way. The Watergate scandal and the subsequent resignation of President Richard Nixon under threat of impeachment had damaged the confidence of the nation in its government and had effectively undercut the foreign policy strategies with which President Nixon had been identified. Southeast Asia fell to Communist armies in 1975, and Soviet-backed regimes came to power in Angola and Mozambique. The Army, underfunded and unpopular, was hard pressed to fill its ranks with quality personnel without the stimulus of the draft. It was under these unpromising circumstances that the Army drew up a new charter for intelligence, which emerged as a result of the Intelligence Organization and Stationing Study (IOSS).

The disillusionment resulting from the nation's long involvement in Southeast Asia was slow to dissipate. Nevertheless, the Iranian hostage crisis, the Soviet invasion of Afghanistan, and continued instability in Central America gradually fostered a renewed interest in American security. Although the nation attempted to put the Vietnam experience behind it, there was no return to isolationism. From 1979 on, the country began to accelerate the buildup its defenses. By the mid-1980s the Army's morale and strength had been restored, a new generation of weapons for ground combat fielded, and the force structure increased. During this period the IOSS reforms, conceived in an environment of tight resources, continued to provide a viable architecture for Army Intelligence in a plentiful time for the Army and for intelligence operations in general.

Remaking Military Intelligence

The Intelligence Organization and Stationing Study originated in a 1974 memorandum from Secretary of the Army Howard Callaway to Army Chief of

Staff General Frederick Weyand. "We maintain considerable information which is of questionable value and seldom used," Callaway noted, and that "really makes me wonder about how much money we are wasting and raises serious questions as to the cost-effectiveness of our intelligence system."[1]

In addition, broader considerations made an overall assessment of Army Intelligence appropriate. Army Intelligence resources for the 1974–1978 time frame had already been reduced significantly by a program-budget decision of the secretary of defense in 1973. The Army inspector general had recently found grave deficiencies in the operations of the Army Security Agency. The dismantling of the U.S. Army Intelligence Command, which had just occurred, meant that the Army counterintelligence and human intelligence organization was in the process of evolution. At the tactical level, the STEADFAST reorganization had abolished the field army command, leaving without a mission the MI tactical units designed to support it. Finally, the Army in general realized that an overall appraisal of the intelligence structure was long overdue. Too many intelligence elements within the Army had been allowed to evolve apart from the development of the Army as a whole. It now seemed time to align Army Intelligence with the rest of the Army. The chief of staff entrusted the initial steps to a panel headed by Maj. Gen. Joseph J. Ursano.

After an exhaustive study of the structure and organization of Army Intelligence, the panel submitted its findings and recommendations in August 1975. The IOSS report was critical. It pointed out that the organization of the ACSI staff did not facilitate effective supervision of the Army's most crucial intelligence resources. The Directorate of Foreign Intelligence, ACSI's major contact point with the rest of the Army Staff and the other functional major Army commands (MACOMs), had only half the resources allotted to the staff elements supervising intelligence collection. Priorities within collection itself were even more skewed. Staff supervision of human intelligence took up a disproportionate amount of effort. The vital signals intelligence function was isolated and neglected.

The panel found intelligence production fragmented. Various aspects of production were being carried on by several ACSI elements as well as the Forces Command; other production elements operated under the Army Materiel Command and the Office of the Surgeon General. The disparate system fully satisfied only a portion of the Army's intelligence needs. Only a unified production center would, in the panel's judgment, alleviate the situation. Specific collection efforts also came under criticism.

The Ursano panel estimated that in the security field some 80 percent of the Army effort went into operations designed to counter the threat from foreign human intelligence organizations, and the remaining 20 percent was devoted to signal security. These were old and familiar functions, carried out respectively

---

1 IOSS, Aug 75, Exec Sum, p. 6.

by the U.S. Army Intelligence Agency and the Army Security Agency. But there was no effort directed against hostile imagery intelligence and no organization handling the total security picture and providing support to operations security (OPSEC). The panel concluded that as a result the allocation of security resources was wildly disproportionate to the existing threat.

The panel reserved some of its most stinging criticism for the Army Security Agency. The establishment of the National Security Agency/Central Security Service organization, it found, had essentially reduced ASA headquarters to just another bureaucratic layer. Lacking any operational responsibilities or a core of technical cryptologic experts, it was saddled with an immense span of control because of the closing of the various ASA theater headquarters. The Ursano board noted that field commanders could readily assume ASA's remaining support functions. Moreover, despite its best efforts, the agency was not meeting the Army's tactical requirements, since it could not field enough units to support the planned sixteen-division Active Army.

A succession of previous Army reviews—in all, eleven had been made since World War II—had upheld the validity of the Army Security Agency's traditional vertical command structure. The Ursano panel dissented vigorously. In the panel's opinion, the ASA pattern of organization had actually impeded the development of an efficient mechanism for carrying out intelligence and electronic warfare. The monopoly of signals intelligence and electronic warfare by an organization operating under compartmented secrecy had artificially kept signals intelligence out of the general intelligence flow and had largely excluded the rest of the Army from involvement in the vital electronic warfare field. At the same time, ASA's preoccupation with the cryptologic aspects of its mission had prevented it from keeping up with new trends in electronic warfare, despite the emphasis which the Army now had given to the latter function.

In the field, the IOSS report charged, the Army Security Agency's organizational and functional independence worked against the effective integration of all-source intelligence that was now necessary. It also imposed substantial administrative costs, since unit G–2s at tactical operations centers had to coordinate the intelligence flow produced by three separate elements: ASA, regular Military Intelligence units, and the special security officer dissemination system. Each of these elements had its own separate communications system and its own separate support system.

The Intelligence Organization and Stationing Study: Solutions

The Ursano panel recommended radical surgery to correct the perceived deficiencies of the Army Intelligence structure. Its complex prescription called for both centralization and decentralization. The heart of the suggested program, however, was dismantling the Army Security Agency. ASA's tactical units

should be resubordinated to field commanders and its training and research and development functions assigned to other major commands in conformity with the pattern which the McNamara reforms and the STEADFAST reorganization of 1973 established for the rest of the Army. The IOSS report offered three alternatives for realigning Army strategic and theater support intelligence assets. Under the proposal finally adopted, the Army Security Agency's headquarters and fixed field stations would become the core of a new major command. By adding the U.S. Army Intelligence Agency, those Military Intelligence groups engaged in a theater support role, and the various intelligence production elements to this base, the Army would create, for the first time, an integrated intelligence, security, and electronic warfare organization capable of fulfilling its national requirements.

At the tactical level, the proposals called for organizational decentralization and functional integration. With the dissolution of ASA's vertical command structure, ASA and MI field units could merge into a single system of unified intelligence and electronic warfare forces. In the committee's view, tactical Special Security Offices could become part of the units they supported. Army tactical commanders at the corps level and below would thus for the first time have substantially the same control over their intelligence assets as they did over the rest of the forces assigned to them. Signals intelligence would be merged into the all-source intelligence needed to meet tactical requirements.[2]

The recommendations raised a number of questions, one of which involved the issue of acceptability. The commanding general of the Army Security Agency, Maj. Gen. George Godding, rather predictably did not concur, not only because of the impending dismemberment and transformation of his organization, but also because of the proposed reorganization's possible effect on cryptology. On the whole, however, the Army's response was very positive. The new arrangements seemed to be designed to give the commander in the field what he wanted. The response from USAREUR, for instance, not only expressed support for the concept, but also demonstrated Army reservations about some of the features previously associated with intelligence work: "MI is fighting its way back to acceptance by the Army community. Stovepiping and restoring the 'spook' image must be avoided."[3] Under the IOSS concept, Army Intelligence would march in step with the rest of the Army, a prospect that pleased many.

One question which the Intelligence Organization and Stationing Study left unresolved was that of command. The ACSI suggested that control of the proposed new intelligence and security command be vested in himself. This arrangement would have given Army Intelligence an institutional structure strongly resembling that of World War II, when the G–2 had controlled the

3 IOSS, Aug 75, vol. 1, ch. 8, ann. B, p. 2.

Military Intelligence Service and after 1944 the strategic operations of the Army Signal Security Agency.

This proposal was rejected, however, and the new major command was allotted a commander of its own. The ACSI suggestion ran against the doctrine that staff and line functions should be separated, and it posed another problem. After the adverse publicity of the early 1970s, intelligence was still a sensitive field. At the time Army leadership believed that any merger of policy formulation and program management functions with operational capabilities would "deny the CSA [chief of staff of the Army] a check and balance mechanism believed necessary in today's environment of sensitivity to intelligence activities."[4]

Implementation of the IOSS proposals began in 1976. The Army realigned elements within OACSI, initiated staff planning for a new intelligence and security command, and fielded the first experimental intelligence and electronic warfare battalion. The U.S. Army Security Agency Training Center and School at Fort Devens, Massachusetts, was resubordinated to the U.S. Army Intelligence Center and School at Fort Huachuca, along with its two detachments at Goodfellow Air Force Base, Texas, and the Navy facility at Corry Station, Florida. This shift achieved the long-standing Army goal of centralizing all Military Intelligence training and further enhanced the importance of the Army Intelligence Center and School itself. The latter organization already had achieved the status of a general officer command after absorbing the Combat Developments Command Intelligence Agency and the Combat Surveillance and Electronic Warfare School. In 1983 the rank of the Army Intelligence Center and School commander was elevated to two stars after the commander received proponency over the Military Intelligence Branch and assumed the title of chief of Military Intelligence.[5]

In addition, the Special Security Group was radically reorganized, losing its operational role in communications and its tactical elements. By the end of 1976 tactical special security offices came under the control of ASA direct support units. Ironically, the Army Security Agency achieved the control over this organization, which it had sought for twenty years, just before its own demise. Concurrently, the Army restructured what remained of the Special Security Group along functional rather than regional lines through seven special security commands, each of which controlled subordinate offices servicing different major commands.[6] The culmination of the IOSS reorganization came on 1

[4] IOSS, Aug 75, vol. 1, ch. 8, p. 61.

[5] Saunders, "U.S. Army Intelligence Center and School." The transfer of MI Branch proponency to the commandant of the U.S. Army Intelligence Center and School took place as part of an Army-wide shift of this function from the Army Staff to the TRADOC schools. Proponency allowed the chief of Military Intelligence to initiate and coordinate actions in the areas of force structure, unit deployment and sustainment, and personnel acquisition, training, and distribution. It did not, however, give him control over individual career management.

[6] History of United States Army Special Security Group, n.d., p. 6, INSCOM History Office files.

January 1977, with the formation of the U.S. Army Intelligence and Security Command (INSCOM) at Arlington Hall Station, Virginia.

New Directions for Military Intelligence: INSCOM

The Army formed the new major command, INSCOM, by redesignating the U.S. Army Security Agency as the U.S. Army Intelligence and Security Command and reassigning the U.S. Army Intelligence Agency, as well as ACSI's and FORSCOM'S intelligence production units, to the new command.[7] At the same time, control of ASA's tactical units reverted to the supported commanders. The training, personnel, research and development, and materiel acquisition and administration functions which the Army Security Agency had carried out were assumed by other major commands and by elements of the Army Staff. INSCOM also assumed command of three Military Intelligence Groups located overseas: the 66th in Germany, the 470th in Panama, and the 500th in Japan. Previously, these units had been assigned respectively to USAREUR and Seventh Army, FORSCOM, and the U.S. Army Intelligence Agency. Despite the similarity of their designations, these groups varied widely in size and mission; moreover, theater commanders continued to exercise operational control over the units. On 1 October 1977, the former U.S. Army Intelligence Agency headquarters became part of INSCOM, and the command established a unified intelligence production element, the Intelligence and Threat Analysis Center, on 1 January 1978.

INSCOM provided the Army with a single instrument to conduct multidiscipline intelligence and security operations and electronic warfare at the level above corps and to produce finished intelligence tailored to the Army's needs. The new major command merged divergent intelligence disciplines and traditions in a novel way. Its creation marked the most radical realignment of Army Intelligence assets in a generation. Without fully realizing it, the Army had achieved not a "multidiscipline" organization, but an interdisciplinary approach to intelligence collection. The new command provided Army Intelligence with a framework within which the individual intelligence disciplines could cross-cue one another; the results of this collective effort would be greater than the sum of its parts.

Traditionally, the Army Security Agency had been the centerpiece of the Army Intelligence community in terms of personnel and resources. When the agency melded into INSCOM under the new realignment, it lost its vertical command structure, many of its functions, and thirty of its tactical units. As a result, Brig. Gen. (later Maj. Gen.) William I. Rolya, the former ASA commanding general who became INSCOM's first head, found himself heading an organization considerably smaller than its predecessor, although it had gained the U.S. Army Intelligence Agency, the theater Military Intelligence groups, and produc-

tion elements. However, the U.S. Army Intelligence and Security Command had at its disposal a wide array of diverse assets. Initially, these included eight fixed field stations inherited from ASA—three of them in the Far East, two in the continental United States, two in Germany, and one in Turkey. There were also the three intelligence groups overseas, transformed into multidisciplinary units by incorporating former ASA assets into the previously existing elements. A fourth, the 501st Military Intelligence Group, was soon organized in Korea. Because of Eighth Army's special requirements, the unit not only carried out a theater support mission, but also performed functions executed elsewhere by the Army's corps-level intelligence organizations.

In the continental United States, INSCOM received command over various single-discipline elements: the Intelligence and Threat Analysis Center; the CONUS MI Group, which furnished cryptologic personnel to the National Security Agency and controlled the two field stations in the United States; an expanded 902d Military Intelligence Group, which was assigned a combined counterintelligence and signal security support mission throughout the continental United States; the Central Security Facility, which maintained the counterintelligence records in the Intelligence Records Repository; and a number of other specialized subordinate units. Significantly, one function which the Central Security Facility previously performed—the adjudication of Military Intelligence–related and other sensitive clearances within the Army—shifted in October 1977 to a new Central Clearance Facility administered by the Military Personnel Center. This was done partially to further standardize the clearance process throughout the Army, secondarily to remove the process from Army Intelligence control, on the grounds that the investigative function should not be combined with the judicial.

With the U.S. Army Intelligence and Security Command in place, ACSI found it expedient to surrender control of most of the remaining operating functions to the new organization. Ever since the 1950s, the ACSI's operating responsibilities had waxed and waned cyclically as various incumbents transferred control of field operating agencies back and forth between OACSI and Fort Holabird. Now came another turn of the wheel. In 1978 INSCOM took over the Army's Russian Institute in Germany and in 1980 assumed command of the Special Security Group. A year later, OACSI discontinued its Inspector General's Office, since substantially all of its field activities had gone to INSCOM, and there was little in the field to inspect.

The U.S. Army Intelligence and Security Command faced certain problems when it started out. At first it was hampered by a shortage of resources. By the end of fiscal year 1978 only 10,400 people were assigned to the new command, debilitating shortages in key Military Intelligence specialties existed, and the command found itself unable to completely meet all the national collection requirements with which it had been tasked. However, the readiness situation improved steadily, as a new national consensus regarding the importance of

intelligence brought a greater infusion of resources. By 1985, 15,000 persons were assigned to INSCOM.[8]

The command's institutional and structural problems took longer to solve. INSCOM was designed to perform intelligence and security operations at the echelon above corps, but the precise structure of this echelon continued to be a matter of doctrinal dispute within the Army. The Army's traditional echelon above corps, the field army, had been discontinued in 1973 and replaced with a joint command system. INSCOM's broad responsibilities and the diverse nature of the units it commanded posed another problem. Proposals were made to simplify the command structure by creating additional subordinate headquarters overseas, as the Army Security Agency had done originally, but overseas headquarters elements proved expensive, and INSCOM finally abandoned this approach. Additionally, the command's exact role in electronic warfare remained undefined. Although INSCOM was the main proponent, its units were limited in this area.

The field of intelligence production also continued to present difficulties. The IOSS panel had originally recommended that all Army Intelligence production resources be brought together in a single location. However, Army leaders decided that the Army's scientific, technical, and medical intelligence production responsibilities would continue to be dispersed among three separate centers under the Army Materiel Command and the Office of the Surgeon General. It even proved impossible for INSCOM to collocate all elements of its own production center, the Intelligence and Threat Analysis Center. Although most of the center's resources were at Arlington Hall Station, it proved physically impracticable to move some of its major production functions from either the Washington Navy Yard or Fort Bragg, North Carolina.

How to impose a satisfactory organization on all Army intelligence production elements was resolved temporarily in 1985 by a more or less Solomonic decision. The Intelligence and Threat Analysis Center was removed from INSCOM and resubordinated to a new Army Intelligence Agency, a field operating agency of ACSI with headquarters in Northern Virginia. At the same time, the new agency was given command of the Army Missile and Space Intelligence Center and the Foreign Science and Technology Center. The Surgeon General's Medical Intelligence and Information Agency had become a joint service organization. Army intelligence production still remained geographically dispersed, but the situation was improved when elements of the Intelligence and Threat Analysis Center moved to the Washington Navy Yard. The new arrangement again made ACSI a major player in the field of intelligence operations, for the Army Intelligence Agency, with a personnel strength of 1,500, was as large as the Army's intelligence production organization before the creation of DIA.

---

[8] One of the few mentions of INSCOM in open sources can be found in Jeffrey Richelson, *The U.S. Intelligence Community* (Cambridge, Mass.: Ballinger Publishing Co., 1985), pp. 66–68.

Finally, INSCOM operations were impeded by physical limitations that split its headquarters elements between two Army posts forty miles apart. The physical facilities which INSCOM inherited from its predecessor organizations, ASA and USAINTA, simply were too limited. Attempts to find a suitable central headquarters location either at Fort Meade, Maryland, or at Vint Hill Farms, Virginia, repeatedly fell to political and fiscal constraints. However, the withdrawal of the large DIA presence from Arlington Hall in 1985 at last made it possible for planners to order that all headquarters elements be consolidated at that site during the following year. Nevertheless, a number of subordinate units at Fort Meade, including the Central Security Facility, remained behind, and Arlington Hall proved only a way station. In 1985 the Army finally decided that INSCOM's permanent headquarters would eventually be located at Fort Belvoir, Virginia. The command finally relocated in the summer of 1989.

Despite its initial growing pains, INSCOM provided a useful base on which the Army could build an expanded intelligence program once the long slide in defense spending was arrested. Human intelligence received fresh emphasis, as did the expansion of the command's cryptologic activities. In 1980 INSCOM established an Army presence at a joint service field station in Kunia, Hawaii. This was the first new Army field station set up outside the continental United States since the Vietnam War. Two years later, it organized another new field station in Panama from resources already in place. Later, the command fielded Army technical control and analysis elements to provide better cryptologic support to tactical Military Intelligence units.

A major new Military Intelligence unit based in the United States, the 513th Military Intelligence Group, was activated in 1982. The group would support possible operations of the Army component of Central Command (CENTCOM), the unified command created that year to deal with contingency situations in Southwest Asia. As initially configured, the group exercised command and control over three flexibly organized battalions: the 201st, 202d, and 203d Military Intelligence Battalions. Later, the 513th organized a TDA Military Intelligence battalion to deal with low-intensity conflict situations.

The group's 203d Military Intelligence Battalion at first was organized as a technical intelligence unit, indicating the Army's renewed interest in this sometimes neglected area. The battalion's main operating unit was the 11th Military Intelligence Company, the latest in a succession of company-size units that had stayed at Aberdeen Proving Ground, Maryland, since the 1960s. In 1978 this company had acquired the important additional mission of supporting the Army's Opposing Forces (OPFOR) training program. However, conflict soon developed between the technical intelligence battalion's mission of deploying overseas with its parent group in a contingency situation and its tasking to support the OPFOR program in the United States. A subsequent reorganization

reassigned the technical intelligence function to the Foreign Materiel Intelligence Group, a TDA unit directly subordinate to INSCOM headquarters, but the 513th regained the mission in 1989.[9]

By 1985 the U.S. Army Intelligence and Security Command was redefining its structure and practices along a variety of fronts. The resubordination of its production element to the Army Intelligence Agency allowed the command to focus most of its energies on its principal mission—managing the Army's strategic and theater-level collection resources. However, a reexamination of INSCOM's organization revealed that it was still carrying out functions of combat development and materiel development that in theory were supposed to have been transferred to TRADOC and the Army Materiel Command. Although INSCOM attempted to step out of these fields, the command's nucleus of resident experts made it difficult to abandon all its developmental efforts, since no other organization was prepared to address such requirements.

More definite resolutions were found in other areas, one of which was counterintelligence. As revelations of successful penetrations of America's most sensitive agencies by hostile intelligence services mounted, 1985 became the "Year of the Spy."[10] The Intelligence and Security Command moved to reconfigure its limited counterintelligence assets into more productive arrangements to meet the Army's needs. In the process, the command moved away from a concept of providing general operational security support to all Army elements in favor of a narrower focus on priority objectives, such as expanding polygraph examinations and technical services countermeasures and providing counterintelligence support to the Army's growing number of Special Access Programs (SAPs)—highly sensitive projects that required exceptional security measures.

In turn, this concern led to a reorganization of the command's main counterintelligence unit in the United States, the 902d Military Intelligence Group. Originally organized on geographic lines into three TDA battalions, the group's subordinate elements were restructured on a functional, rather than geographic, basis in 1985. At the same time, the group was given greater responsibility for handling counterespionage operations in the continental United States.

Change continued in 1986. Beginning that year, INSCOM's five multidiscipline intelligence groups were redesignated as brigades. This transition was intended to be more than cosmetic; the units would now be organized for possible warfighting, rather than having structures geared to national collection requirements in time of peace. A basic brigade was designed to consist of a headquarters and headquarters company, a numbered echelon above corps

---

9 The Foreign Materiel Intelligence Group was redesignated the Foreign Materiel Intelligence Battalion and resubordinated to the 513th Military Intelligence Brigade on 16 October 1989. In 1996 this TDA battalion was discontinued and the mission assumed by the provisional 203d MI Battalion.

10 Thomas B. Allen and Norman Polgar, *Merchants of Treason: America's Secrets for Sale* (New York: Delacorte Press, 1988), p. 2.

intelligence center for intelligence production, a signals intelligence battalion, an imagery analysis battalion, a counterintelligence battalion, an interrogation and exploitation battalion, and a collection element. Because of the diversity of intelligence requirements in the several theaters, however, the actual units allotted to each INSCOM brigade would differ. In the event of mobilization, INSCOM leaders planned to call up reserve component units as needed to bring the brigades to full strength. Additionally, the U.S. Army Intelligence Center and School drew up new TOEs that mandated the conversion of the command's flexible battalions into fixed elements.

Finally, INSCOM took action to redesignate some of its TDA units as numbered Military Intelligence brigades, battalions, and companies in the 700 series. Units redesignated included the Continental United States Military Intelligence Group and a number of field stations. This would provide units with designations more intelligible to the rest of the Army, and it would enhance the pride and esprit of their assigned soldiers. As a result of this step, existing command assets combined into three new Military Intelligence Brigades (the 701st, 703d, and 704th) and a number of new battalions in 1987.

The Combat Electronic Warfare and Intelligence Concept

The U.S. Army Intelligence and Security Command was only part of the new organizational design which the Intelligence Organization and Stationing Study imposed upon Army Intelligence. The IOSS also had brought about a major realignment of the Army's tactical intelligence assets in the field. These reforms drastically reshuffled the old command channels in the tactical arena. With the dissolution of the Army Security Agency's vertical command structure, all former ASA tactical elements were now under the command of the units they supported. At the same time, the Army formed new integrated combat electronic warfare and intelligence (CEWI) units to carry out functions previously performed by a variety of different organizations. This new type of Military Intelligence unit joined together Military Intelligence and former Army Security Agency assets.

Two separate institutional thrusts combined to create the ultimate CEWI structure. The first was a growing belief that under conditions of modern warfare it was absolutely essential that a combat division have its own organic intelligence capability. This concept marked a revolution in Army institutional thinking. The Army had reorganized the division force structure twice since the Korean War, creating the pentomic division in 1957 and replacing it with the ROAD division in 1962. Each time, its leaders had explicitly rejected the idea of making an intelligence unit organic to the division, partially because linguistic requirements would vary so greatly under different theater conditions. Until 1969 Army divisions received intelligence support, apart from signals intelligence, from attached Military Intelligence units. Although most of these detach-

ments subsequently had been expanded to full companies, such elements were still only temporary attachments to the division.

In the mid-1970s, after intensive study and testing, the Army reversed its stance and allotted each division an organic intelligence company. Army policy makers had finally concluded that the incorporation of permanent intelligence units into divisions would provide better peacetime training opportunities and would forestall the necessity of hastily assembling the requisite intelligence assets whenever a war broke out. Such units would also furnish a convenient locus from which to manage radar and ground sensor assets previously dispersed throughout the division. One underlying assumption was the growing importance of various technical collection mechanisms in relation to human intelligence sources on the future battlefield. This technology-driven approach complemented the newly developed process the Army termed "the Intelligence Preparation of the Battlefield," in which data on enemy, weather, and terrain would be plotted on map overlays to provide commanders with a graphic intelligence estimate.[11]

The second and more important element leading to the creation of CEWI units was the emphasis of IOSS on the need to integrate diverse intelligence disciplines in the field, both to enhance the support provided commanders and to reduce overhead. The end result of this process came when a TRADOC study group produced the first blueprint for a CEWI type of unit in early 1976. An experimental combat electronic warfare and intelligence battalion, the 522d Military Intelligence Battalion, was fielded later that same year at Fort Hood, Texas, and assigned to the 2d Armored Division. The successful activation of this prototype CEWI battalion meant that the TOE of the divisional intelligence company, which appeared the same year, was already obsolete. The Army's acceptance of the need for battalion-size units to support divisional intelligence requirements demonstrated how far the discipline had come since its World War I beginnings, when divisions had met their intelligence needs with staffs of four officers and a few enlisted men and militarized civilians serving as field clerks.

An agreed-upon TOE for an organic divisional CEWI battalion appeared in 1979. Significantly, the TOE for this new-model Military Intelligence unit was numbered in a different series from previous Military Intelligence and Army Security Agency tables of organization and equipment. The new organizational table provided for a headquarters and headquarters and operations company containing collection management, counterintelligence, and interrogation personnel, and included a platoon of helicopters configured for electronic missions.

---

[11] IPB: Intelligence Preparation of the Battlefield (Fort Huachuca, Ariz.: U.S. Army Intelligence Center and School, n.d.). The IPB process was potentially adaptable to automation. This seemed a necessity, since it was estimated in the 1970s that a corps commander in a European war scenario would have to track some 35,000 "movers, shooters, and emitters" in the adversary force. G. Kenneth Allard, *Command, Control, and the Common Defense* (New Haven: Yale University Press, 1990), p. 145.

It also called for three line companies that respectively carried out functional missions of collection and jamming, ground surveillance through radars and sensors, and service support. The new structure thus merged existing intelligence, signals intelligence, and electronic warfare assets available at division level and integrated them with divisional ground sensor and ground surveillance radar elements.[12] Planners also contemplated giving the unit a long-range reconnaissance patrol capability, an addition initially rejected but revived a decade later. Subsequently, the pattern of organization prescribed by the 1979 TOE was modified often in the field, as "company teams" containing elements from all disciplines were organized on an ad hoc basis to support the requirements of each of a division's three brigades.[13]

Although combat divisions continued to have separate reconnaissance battalions and were now allotted target acquisition batteries, the creation of the CEWI unit meant that the division's tactical operations center could draw on the resources of a single element to meet the bulk of its intelligence, security, and electronic warfare needs, rather than having to deal with fragmented elements scattered throughout the divisional structure. The CEWI battalion organization was intended to be strong enough to provide the diverse intelligence disciplines it contained with the necessary support. Since only a quarter of the CEWI battalion's strength consisted of highly trained intelligence specialists, it allowed maximum use of these scarce resources.[14]

The organization of the division-level CEWI battalion was only the beginning of a wholesale restructuring of Army Intelligence at the level of tactical support. Company-size CEWI units were formed to support separate brigades and armored cavalry regiments. The Army also replaced all its active component Military Intelligence battalions, air reconnaissance support, with "military intelligence battalions, aerial exploitation." These new units consisted of a headquarters and headquarters company, an imagery interpretation company, a combat intelligence company (aerial surveillance), and an electronic warfare aviation company (forward). When the battalion operated independently, an electronic warfare aviation company (rear) could be attached. The concept provided a suitable management framework for the Army's own aerial assets and integrated different types of mission aircraft into a single unit.[15]

13 Company Team Commander Responsibilities, 313th MI Bn (CEWI), 82d Airborne Div, Apr 84, copy in INSCOM History Office files.

14 Gordon, "CEWI Battalion," p. 27.

15 This change in force structure was in part dictated by the fact that relying on traditional Air Force photo-reconnaissance platforms in a high-intensity conflict no longer seemed a viable proposition. Army aerial assets could conduct various forms of electronic surveillance while flying in relative safety behind their own front lines. The discontinuance of MIBARS units in the Active Army meant that the Army would henceforth rely on INSCOM IMINT companies and on the reserve components to provide imagery interpreter support for Air Force tactical reconnaissance missions.

Initially the capstone of the new tactical support intelligence structure, the Military Intelligence group functioned at the corps level. The first of these units activated, the 504th Military Intelligence Group, went to support the III Corps at Fort Hood, Texas, in 1978.[16] In 1985, the 201st, 205th, 207th, 504th, and 525th Military Intelligence Groups assigned to support the five corps then operational in the Active Army were all upgraded to brigade status. Each Military Intelligence brigade consisted of a headquarters and headquarters detachment, an operations battalion, an aerial exploitation battalion, and an interrogation and exploitation battalion.

Military Intelligence in the Reserve Components

The integration and reorganization of the Army's intelligence elements were not confined to the Active Army, but also affected the reserve components. The end result of the process was to greatly expand the Military Intelligence presence in these components. While the 24th Military Intelligence Battalion continued as an aerial reconnaissance support unit, the three existing ASA battalions and the single field army type of Military Intelligence battalion in the Army Reserve were all converted to CEWI units, and four additional battalions were activated. Actual implementation of the program took some time. The first Army Reserve CEWI unit, the 138th Military Intelligence Battalion, was not activated until late 1983, and not until 1988 did the last remaining Army Security Agency battalion in the reserve phase out.

Initially, the Army had determined that all combat electronic warfare and intelligence battalions in the reserve structure would belong to the Army Reserve. The National Guard operated under state control in peacetime, and national policy makers had reservations about placing sensitive intelligence assets under state government control. Ultimately, the intelligence community decided that policy considerations did not preclude establishing such units in the National Guard, and the 629th Military Intelligence Battalion was organized in 1988 to service the intelligence and electronic warfare needs of the Maryland-Virginia National Guard's 29th Infantry Division. This issue did not arise in the case of non-CEWI types of National Guard military intelligence units, and aerial exploitation battalions appeared in the Georgia and Oregon National Guards in 1982.

One National Guard unit continued to provide unique support to Army-wide intelligence requirements. In 1980 the 142d Military Intelligence Battalion was organized in the Utah National Guard, replacing a similar company-size unit originally organized in 1960. This TDA battalion, a linguist unit, drew heavily from a pool of expertise provided by members of the Church of Jesus Christ of Latter Day Saints who had previously undergone language training to

[16] This unit was created by reorganizing and redesignating the 504th Army Security Agency Group, originally activated in 1974 to provide cryptologic support to FORSCOM.

carry out overseas missionary work. Battalion personnel on temporary duty repeatedly assisted the Regular Army in meeting its linguistic needs. The concept was so successful that in 1988 the battalion was converted to a TOE unit; a second similar battalion was organized in the Utah National Guard; and a TDA unit, the 300th Military Intelligence Brigade, was created to provide command and control. Later, the Army approved the organization of Guard linguist battalions in several other states.

Training continued to present difficulties for intelligence units both in the reserve components and in the Regular Army. Many intelligence specialties could not be exercised normally in hometown environments or even under garrison conditions. However, in 1978 the Intelligence and Security Command instituted the Readiness Training Program (REDTRAIN) to expose practitioners of intelligence disciplines throughout the Army to "enrichment" programs. REDTRAIN allowed both reservists and Regular Army soldiers to further their skills by participating in current operations. In practice, this was accomplished either by assigning personnel on temporary duty to units with an operational mission or by bringing the mission to the unit.

Military Intelligence in the 1980s

The 1980s were prosperous years for the Army, especially for its restructured intelligence component. The formation of INSCOM and the implementation of the CEWI concept not only affected intelligence operations throughout the Army, but also drew the Military Intelligence Branch firmly into the mainstream of the service. For the first time, most MI personnel were assigned to TOE units. By 1988 five MI brigades and no less than thirty MI battalions had been formed under the CEWI concept to support tactical units in the field, while another five TOE MI brigades and ten TOE single-function battalions carried out theater- and national-level support missions under INSCOM. Twenty-five thousand Military Intelligence specialists—over 15 percent of them female—were on active duty, backed up by another 8,700 in the reserve components. The active duty Military Intelligence component alone was as large as the entire Regular Army had been in 1885, when the Army first created a permanent intelligence organization. As retired Lt. Gen. James A. Williams, a former director of DIA, pointed out, the Army now had "the equivalent of two combat divisions in collection and analysis."[17]

There were still significant shortfalls in a number of areas. The proliferation of job opportunities presented by an information-based society made recruiting and retaining personnel in a number of intelligence specialties a pressing concern for what continued to be an all-volunteer force. The tactical-level force

---

17 Benjamin F. Schemmer, "Former DIA Director Urges That Four-Star Should Head All Military Intelligence," *Armed Forces Journal International*, Feb 88, p. 24.

structure had grown so large that some Army Intelligence professionals questioned whether it could be maintained indefinitely, given anticipated constraints on Army resources and the competing demands of the Army's echelon above corps intelligence structure. The lightning advance of technology, combined with convoluted contracting and procurement procedures and growing fiscal constraints, had left the Army saddled with equipment that fell far behind the state of the art in many intelligence disciplines. For much of its aerial work, Army Intelligence still depended upon the durable Mohawk, which despite its considerable virtues was now thirty years old. Almost thirty-five years after the inception of Project MICHIGAN, the Army was still struggling to field a satisfactory remotely piloted vehicle—a pilotless reconnaissance aircraft. Army tactical signals intelligence and electronic intelligence resources in the field were mounted on slow and overloaded carriers that could not keep up with the new generation of Army tanks and armored fighting vehicles. Moreover, as 1990 approached there were already signs that the greatest defense buildup since the Korean War was about to end, and this necessitated further changes in the organization of Army Intelligence.

In 1987, however, two significant developments seemed to confirm that the Army had at last accepted its Intelligence arm as an equal member in its family of branches. In May of that year the position of ACSI was upgraded to deputy chief of staff for intelligence (DCSINT), a change that ended the position of perceived organizational inferiority of the Army Intelligence staff post. Lt. Gen. Sidney T. Weinstein became the Army's first DCSINT. That same year, Army Intelligence became part of the regimental system that embodied the heritage of the U.S. Army. On 1 July 1987, the twenty-fifth anniversary of the establishment of intelligence as a Regular Army branch, all Army Intelligence personnel, military and civilian, became part of a single large regiment, the Military Intelligence Corps, headed by the commanding general, U.S. Army Intelligence Center and School. Although symbolic, the measure was significant. Maj. Gen. Julius Parker, the first chief of the Military Intelligence Corps, called the step "a recognition and celebration of our evolution from a plethora of diverse and separate intelligence agencies into the cohesive MI community we enjoy today. In short, it symbolizes the fact that Army Intelligence has truly arrived."[18]

Additional proofs that General Parker's statement was not overly optimistic were soon forthcoming. In 1987 the Army published a detailed Army Intelligence, Electronic Warfare, and Target Acquisition Plan (AIMP). The AIMP conceptualized the future structure of Army Intelligence as a "system of systems" and laid out a detailed and coherent road map of the measures needed to reshape the Army's intelligence organizations and technologies in ways that would satisfy future requirements. In 1989 INSCOM shifted its headquarters

---

18 Ltr, Chief, Military Intelligence, *Huachuca Scout (Military Intelligence Corps Activation Supplement)*, 25 Jun 87, p. 2.

from Arlington Hall Station to a site on the north post of Fort Belvoir, Virginia. INSCOM's new headquarters facility, the Nolan Building, was named in honor of Maj. Gen. Dennis E. Nolan, Pershing's G–2 in World War I.This was the first Army Intelligence headquarters ever designed specifically for its purpose. In 1990 the chief of Military Intelligence became commanding general of the U.S. Army Intelligence Center and Fort Huachuca. This step paved the way for the eventual closure of the Intelligence School at Fort Devens, Massachusetts, and the consolidation of almost all Military Intelligence training at Fort Huachuca. Meanwhile, the internal evolution of Military Intelligence within the Army was already being affected by outside events.

11

A Future of Uncertainties

The year 1989 was an "annus mirabilis," a time of wonders, in which the world geopolitical framework in place since the end of World War II was overturned. As military historian Michael Howard commented, "while the nations of Western Europe celebrated the bicentennial of the French Revolution, the nations of Eastern Europe reenacted it."[1] After so many years, the Iron Curtain finally parted, and with it the Berlin Wall and so many of the other symbolic and real barriers that had divided east from west. With tides of democracy sweeping through Eastern Europe, the Warsaw Pact was no longer relevant. The Soviet Union itself appeared in a new light—no longer the Great Bear of international politics, but an ideologically and economically bankrupt society showing ominous signs of fragmentation along ethnic and national lines. For all practical purposes, the looming threat of Soviet power that had gripped the attention of Western policy makers for so many years was suddenly gone.

Since 1989 these developments have dramatically restructured America's defense policy. Ever since the end of the Vietnam War, the U.S. Army had essentially staked its raison d'etre on countering a massive tank-led Warsaw Pact offensive against Western Europe. With this threat no longer viable, the nation's armed forces were slowly downsized and redeployed. The numbers governing the rate, scope, and exact nature of this process shifted with each new indication of communism's decline. In 1990 the Army implemented Project VANGUARD to bring about a controlled reduction of its strength in ways that would leave as much of its fighting forces intact as possible, a task to be accomplished initially through a radical trimming of headquarters elements.

However, just as the Soviet threat receded and pundits began to talk about the pleasant possibilities of a "peace dividend," a new array of international challenges appeared. In December 1989 American forces stormed Panama in Operation JUST CAUSE, overthrowing the regime of its narcotics-linked strong-

[1] Michael Howard, "The Springtime of Nations," *Foreign Affairs* 69, no. 1, p. 17.

man, General Manuel Noriega. Eight months later, crisis flared in the Middle East. An Iraqi invasion of the tiny emirate of Kuwait, threatening both the world's oil supply and the stability of a potential new world order, led to a massive American response. The United States deployed over 500,000 men and women to the Persian Gulf region—the largest buildup of troops since Vietnam—and then committed them to battle in Operation DESERT STORM, a lightning air and ground war that resulted in complete victory.

Despite these conflicting crosscurrents of events, planning for retrenchment of the force continued. Nevertheless, it was clear that the post–Cold War world would continue to hold unforeseen and unforeseeable perils. In the unstructured international environment created by the sudden collapse of the bipolar world order imposed by the Cold War, crises could—and did—take place in almost any region of the globe. The prospect of a smaller Army and a more diffused but wider menace would inevitably affect the institutional arrangements of Military Intelligence, since intelligence organizations are necessarily shaped by the threat as well as the force structure in place. In addition to preparing for contingency operations, Army Intelligence now had to monitor arms verification agreements, fight terrorism, maintain a vigilant watch against espionage, and assume a counter-drug mission in support of civilian authorities.

The challenges of JUST CAUSE and DESERT STORM—successive crises occurring half a world apart and in totally unrelated linguistic environments—had already made large demands on Military Intelligence and appeared to serve as a portent for the future. On the whole, the Army had met these demands successfully. INSCOM's 470th Military Intelligence Brigade and its attached 29th Military Intelligence Battalion had been in place in Panama when that crisis broke. INSCOM's 513th Military Intelligence Brigade, with a long-standing contingency mission to support the U.S. Army Central Command, had been at least partially positioned to meet Army intelligence requirements when deployment to the Persian Gulf began. Once brigade elements had moved to Saudi Arabia, the U.S. Army Intelligence and Security Command augmented the unit from its own assets around the globe. As the situation reached its climax, the brigade's echelon-above-corps intelligence center was expanded to a full operations battalion and placed in support of the G–2 of Central Command's Army component. Two corps CEWI brigades, the 504th and 525th MI brigades, and divisional CEWI units supported the intelligence effort in Southwest Asia with their own resources, and reserve component units and individual mobilization augmentees deployed to assist.

In this intelligence campaign, high technology at last came into its own. A variety of ground terminals received information provided by diverse national and theater intelligence systems, unmanned aerial vehicles—the new Army term for remotely controlled pilotless aircraft—were finally fielded to provide collection and targeting data, and the Army engaged in substantive electronic warfare

operations for the first time since electronic warfare had become an intelligence responsibility.[2]

In JUST CAUSE and DESERT STORM, however, the Army had been able to draw on the resources it had built up during the height of the Cold War. The future challenge for Army Intelligence would be to do more with less. Even as DESERT STORM came to an end, it was already evident that the smaller force structure envisaged for the future would necessarily lead to the inactivation of numerous intelligence battalions and brigades, as the divisions and corps to which they were assigned closed down. By 1995 the Army force structure had been reduced from eighteen divisions to just ten. The shrinkage of tactical assets was accompanied by a pullback of much of the Army from its forward-deployed posture. Presumably, this withdrawal would make INSCOM even more central to the Army's intelligence effort, since tactical intelligence units in the continental United States would not have direct access to their intelligence targets, and INSCOM alone had the necessary linkages to national systems to provide the Army with worldwide intelligence support.

However, the elimination of the Soviet threat and the consequent downsizing of the Army meant that INSCOM itself faced the greatest reorganization since its birth with the possibility of not even surviving as a major Army command. Flux was the order of the day. For a brief time, the command regained Army production functions, assuming command of the Army Intelligence Agency in 1991. The following year, however, AIA was disestablished and its subordinate production centers divided up between DIA and INSCOM, with DCSINT retaining operational control of the Intelligence and Threat Analysis Center and the Foreign Science and Technology Center, the two elements that remained with INSCOM. In turn, these two production elements were merged into a single National Ground Intelligence Center. The Special Security Group that had disseminated sensitive compartmented information since World War II was reorganized and most special security officers resubordinated to the major Army commands they supported, thus creating a much smaller Special Security organization to set policy and deal with private contractors. Eventually, the unit's mission was assumed by one of the battalions of the 902d MI Group.

This did not exhaust the list of changes. INSCOM's major field stations in Europe and Panama were discontinued and Army cryptologic organization radically restructured. INSCOM set up a Regional SIGINT Operations Center at Fort Gordon, Georgia, manned by personnel of the newly organized 702d MI Group. Since its 513th MI Brigade concurrently relocated to Fort Gordon, this allowed strategic and tactical assets to be combined. At the same time, the com-

[2] Details of Army Intelligence operations conducted during the DESERT SHIELD/DESERT STORM mission can be found in Brig. Gen. (P) John F. Stewart, Jr.'s pamphlet, Operation DESERT STORM: The Military Intelligence Story: A View From the G–2, 3d U.S. Army, April 1991.

mand assumed host responsibilities for new sites in Europe that would allow the Army to employ the most advanced communications technologies.

Institutional gains were accompanied by institutional losses. INSCOM's U.S. Army Russian Institute was resubordinated to the European Command. A Foreign Intelligence Command was organized at Fort Meade, Maryland, to provide better support to human intelligence (HUMINT) and counterintelligence units there, but this proved to have the life span of a mayfly: it was discontinued in less than a year as a result of the secretary of defense's decision to incorporate Army human intelligence elements into a Defense HUMINT Service.

As the Army itself restructured and pulled back from Europe and Panama, its leaders planned to merge INSCOM's five existing theater support brigades into two force projection brigades. The new units would operate in a split-based configuration and would have the capability to deploy tactically tailored force packages to meet any level of contingency requirement. Additionally, beginning in 1993 INSCOM provided personnel to augment corps-level production centers and (for a time) joint intelligence centers within the unified commands. INSCOM would no longer simply operate at echelons above corps, but would provide the Army with "seamless connectivity" between national-level agencies and the warfighters on the ground.

Finally, in 1994 the Army set up the Land Information Warfare Activity (LIWA) within INSCOM, operating under the staff supervision of the Department of the Army's deputy chief of staff for operations. This was inspired by the precedent offered by DESERT STORM, in which the centralized Iraqi command structure had been effectively befuddled by deception operations and decapitated by the electronic and physical destruction of its communications system. Still in the formative stage, the LIWA sought to bring together the techniques of electronic warfare, psychological warfare, deception operations, command and control targeting, and operational security to attack the information resources of the enemy while simultaneously defending those of our own armed forces. Once it became fully operational, the LIWA would offer the larger Army a place for "one-stop shopping" in these areas.[3]

Conclusion: The Shaping of Army Intelligence

Although the details of the future necessarily lay hidden, Military Intelligence's current trajectory provides clues as to its future organizational and mission directions.[4] At least five identifiable trends have helped shape the

[3] The "information warfare" concept reflected—or at least paralleled—the ideas of the influential futurologists Alvin and Heidi Toffler. See *War and Anti-War* (Boston: Little Brown, 1994), ch. 10, "The Knowledge Warriors."

[4] Of course, clues can be misleading. Distinguished military historian Russell F. Weigley has commented, "Almost all of the hints of prophecy into which the author was rashly drawn . . . proved wrong." *History of the United States Army, Enlarged Edition* (Bloomington: Indiana University Press, 1984), pp. 557–58.

post–World War II history of Army Intelligence: a steady devolution of functions to national and joint agencies; a redefinition of the Military Intelligence field to embrace new functions; an enhanced role for technology; a progressive growth both in the number and size of intelligence units and in the diversity of intelligence disciplines they incorporated; and finally, an increasing professionalism.

First of all, continuing pressures for greater service integration has had a major impact on the overall organization of Army Intelligence. As a result of these pressures, and over a period of time, the Army has transferred cryptologic, production, attache collection, and certain counterintelligence and human intelligence functions to national agencies. The creation of the Central Intelligence Agency in 1947 removed the Army from the fields of political and economic intelligence. This preceded the partial breakup of the Army Security Agency in 1949 to form the Armed Forces Security Agency (AFSA), the National Security Agency's predecessor. More reforms followed the revision of the National Defense Act in 1958, which removed the Army as an institution from the chain of national command and turned it into a mechanism for training, administering, and supplying land forces for the unified commands acting under the Joint Chiefs of Staff. The logic of this inevitably dictated the creation of the Defense Intelligence Agency (DIA) in 1961. As DIA grew it took over Army production functions as well as certain training and collection functions.

As the Army drew down during the last stages of the Vietnam conflict, there was another wave of consolidation. The Defense Mapping Agency absorbed Army topographic elements, the Central Security Service took over certain headquarters functions of the Army's cryptologic agency, and the Defense Investigative Service assumed the personnel background investigation function previously performed by Army counterintelligence. The first two integrations were done ostensibly to promote economy and efficiency, while the last eased the Army out of the domestic intelligence field that had left it open to charges of "spying on civilians."

As the Army once more planned to contract in the 1990s, these kinds of pressures on its Military Intelligence organization continued. If anything, the Department of Defense Reorganization Act of 1986 had placed a premium on joint operations. However, despite the steady trend toward integration, Army Intelligence has in fact shown a remarkable resiliency over the years. This is wholly consistent with laws of institutional behavior. Motivated recruits join the Army because they wish to wear green suits, not "purple" ones.[5] The Army most readily surrendered those intelligence functions peripheral to its central mission of warfighting.

---

[5] For an interesting discussion of the differing "personalities," identities, and behaviors of the different armed services, see Carl H. Builder, *The Masks of War: American Military Styles in Strategy and Analysis* (Baltimore: Johns Hopkins University Press, 1989), p. 39. Builder notes that "the unique service identities . . . are likely to persist for a very long time."

Before the creation of the Central Intelligence Agency, the Army had engaged in collection of political and economic intelligence for want of a better alternative. The high-level cryptologic mission turned over to the Armed Forces Security Agency had implications that went beyond the Army. It was also both exotic (most of the personnel who transferred to AFSA were highly specialized civilians) and a mission which naturally lent itself to a joint approach. Moreover, although the impetus behind the creation of AFSA had been to replace three service cryptologic organizations with one, the end result was the creation of four cryptologic organizations. The Army's determination to provide cryptologic support to its own commanders ensured that the Army Security Agency grew larger and more important after 1949 than it had been before. The National Security Agency later attempted unsuccessfully to integrate service management structures into a central security service.

The creation of the Defense Intelligence Agency presented Army Intelligence with a more formidable institutional challenge. Here, the Army and the other services pursued a strategy of more straightforward resistance, refusing to allow their intelligence components to be completely subsumed into the new organization. During the agency's formative period, Army officers posted to DIA found their assignments less than career enhancing. DIA was initially allowed to control only a single collection element, the attache system, and the Army reentered the field of intelligence production almost immediately. Even after thirty years, DIA had not achieved the dominant position in the general intelligence field that NSA had achieved in the cryptologic area.

In 1972 the Army gave up the bulk of its counterintelligence operations in the continental United States to the Defense Intelligence Service, when the latter agency was formed to execute the mission of conducting personnel background investigations for security clearances. This was a forced move, brought about by the fact that the Army had been brought deeply into the field of domestic intelligence during the troubled times of the Vietnam War. However, the transfer of functions, again, did not impact on the Army's wartime mission. Moreover, it could be looked upon as a blessing, since it removed the Army from an area which had been a political land mine since the earliest days of its own counterintelligence operations. The Army had been forcibly extracted from domestic intelligence operations twice before—in 1920, at the end of the Red Scare, and in 1943, following political displeasure at investigations of subversives that had touched upon the president's family. Three experiences of this kind were perhaps enough.

Finally, in 1995 DIA set up the Defense HUMINT Service (DHS), which absorbed all the strategic and theater-level human intelligence collection assets of the armed services. This forced merger was brought about by a post–Cold War drive for economy and efficiency that in many ways paralleled the Department of Defense–level realignments of the Vietnam drawdown. However, once more we could argue that the Army surrendered elements not central to its perceived main mission of warfighting.

A second trend evident during this period was the redefinition and expansion of the intelligence field. Over the years, Military Intelligence organizations absorbed various "special informational services." This process had begun immediately after World War II, when the Military Intelligence Division assumed administrative as well as operational control of the Army Security Agency. In turn, the logic of this realignment eventually made electronic warfare an intelligence responsibility. "Jamming" and collection operations were intimately related, and could not be conducted independently of one another. As a result, the Army Security Agency gained responsibility for communications electronic countermeasures in 1955. Simultaneously, it assumed the electronic intelligence (ELINT) mission from the Signal Corps. This too followed a certain logic: the agency now collected against the whole of the electronic spectrum instead of just a part. Continuing in the same pattern, ASA acquired the noncommunications electronic countermeasures mission from the Signal Corps in 1962.

The formation of combat electronic warfare and intelligence units as a result of the Intelligence Organization and Stationing Study brought additional collection services under the Military Intelligence umbrella. Intelligence units assimilated ground sensors and ground surveillance radars. Meanwhile, Army Intelligence had already taken to the sky. Army aviation had developed specialized reconnaissance aircraft in the late 1950s, and the Army Security Agency had developed its own air arm during the 1960s. In the late 1970s, both types of assets became part of an integrated Military Intelligence battalion, aerial exploitation.

In one area, however, the responsibilities of Military Intelligence contracted after World War II. This was the field of communications security. The Army Security Agency, as first set up, had responsibility for all aspects of military cryptology, including creating and distributing the Army's codes and cipher devices and monitoring the security of Army communications. The 1955 reorganization of the Army Security Agency resulted in the transfer of the first two of these functions to the Signal Corps. As the years went on, a tendency for Army Intelligence to edge away from security monitoring became pronounced; many saw the task as intrusive, unpopular, and not particularly effective. In the long run, as far as the Army was concerned, encryption of all message traffic could render security monitoring obsolete. Meanwhile, some aspects of communications security could now be passed back to the communicators. In 1988 INSCOM, which had inherited from ASA the mission of preparing the Army's Communications-Electronics Operating Instructions, decided that the function would more appropriately belong to the Army's new Directorate of Information Systems for Command, Control, Communications, and Computers. A little later, INSCOM transferred mission responsibility for the inspection of cryptofacilities and the tracking of communications violations to the Army's communicators.

Third, partially as a result of Intelligence's increasing dependence on the technical services, the advance of technology affected almost every intelligence discipline. The combined impact of the communications revolution and the

growth of automation had a profound effect upon intelligence collection, processing, and dissemination. To use only select examples, the development of infrared and radar imaging techniques revolutionized photographic intelligence and resulted in that discipline's transformation into imagery intelligence. The synergistic use of a variety of techniques to measure the distinct profiles displayed by an assortment of target "shooters, movers, and emitters" created the new intelligence discipline, measurement and signature intelligence (MASINT). Technology even promised—or threatened—to reverse the nature of the entire Army Intelligence process. Traditionally, information had passed from lower levels of command, in direct confrontation with the enemy, to higher levels for evaluation. In the Persian Gulf conflict of 1991, however, Army production elements based in the continental United States had used national intelligence acquisition systems to generate tactical intelligence that went down to the field.

Counterintelligence was also confronted with fresh challenges as a result of this trend. The Army faced a wider security threat as technological development created new vulnerabilities. Not only were the activities of hostile human agents now supplemented by electronic listening devices, but the radiations emitted by electronic media were vulnerable to detection, while the computers that supplied the masses of data on which the Army now relied could be infiltrated by "hackers" and menaced by computer "viruses."

Fourth, intelligence units in the field tended to grow both larger and more integrated. The Army emerged from World War II with a melange of single-discipline intelligence elements organized in no common pattern. They included counterintelligence detachments, ASA's signal service companies and detachments, and an assortment of teams and detachments that carried out various combat intelligence functions. Additionally, the Signal Corps had its own units conducting electronic intelligence and electronic warfare. The Korean War partially revolutionized this structure, as the Army fielded groups and battalions to collect combat intelligence and ASA created units of similar size to carry out military cryptologic functions in support of the tactical Army. In the latter part of the 1950s, counterintelligence and collection personnel were integrated into combat intelligence formations under the Military Intelligence Organization concept, although most counterintelligence personnel continued to serve in separate CIC groups. Roughly around the same time, various Signal Corps intelligence and electronic warfare units were folded into the Army Security Agency.

Following the Intelligence Organization and Stationing Study of 1975, the Army integrated all intelligence disciplines at both the tactical and strategic levels, creating CEWI units and the U.S. Army Intelligence and Security Command. For the first time, most Army Intelligence assets were contained in TOE units rather than under tables of distribution and allowances. By 1990 multidiscipline intelligence brigades had been fielded to support both corps and higher echelons of command.

The development of large intelligence units, combined with institutional pressures to reduce the operational role of the Army's intelligence staff, helped to move the center of gravity of intelligence work in the Army from the staff to the line. It also was one of the factors that helped make Army Intelligence more professional. One could argue logically that just as ordnance officers should command an ordnance unit, intelligence officers should command an intelligence unit. At first the Army Intelligence and Security Branch, as its title indicated, was something of an uneasy compromise, lumping together officers of diverse backgrounds and allegiances. The branch had no common training program, and the Army Security Agency, with its vertical command structure and its roots in the Signal Corps, remained a large, unassimilated segment of the Army Intelligence community. However, the Army made greater steps toward integration in 1967, when the Army Intelligence and Security Branch was redesignated as the Military Intelligence Branch and upgraded in status. The change was more than just a shift in nomenclature, since the common advanced schooling that went into effect at this time imposed a new homogeneity on the Military Intelligence field. Implementation of the IOSS recommendations brought the institutional structure of Army Intelligence into line with the single branch concept.

The professionalization of Army Intelligence, combined with the shift to an All-Volunteer Force in the early 1970s, led in turn to a greater emphasis on military values within the field. As long as intelligence organizations had been dominated by reserve officers, and depended on the stimulus of the draft for their manning, intelligence personnel had tended to identify with their specialties, rather than with the Army as a whole. The fact that so many of them were involved in specialized tasks with no immediate combat relationship only facilitated this ethos. While the mainstream of the peacetime Army focused on a training and readiness mission, Intelligence had (and continues to have) a viable peacetime mission. The bulk of ASA personnel, for example, carried out a strategic cryptologic mission at fixed installations, and most counterintelligence personnel operated in civilian clothes and lived on the civilian economy at a time when the rest of the Army was still in barracks and bachelor officers' quarters. When an applicant for the Counter Intelligence Corps asked his recruiters whether life in the CIC was anything like the Army, they replied, "Not very much." This approach has changed markedly.[6]

In short, we can argue that by 1990 Military Intelligence had become distinctly more military. Intelligence personnel—men and women, officer and enlisted—were soldiers first, specialists second. They trained regularly at Army skills and were held to Army standards of physical fitness. Separate management structures that tended to foster the idea that various groups of intelligence personnel were an elite corps apart from the larger Army had been dissolved:

[6] Author's recollection.

the Intelligence Corps was discontinued in 1966, and the Army Security Agency broke up ten years later. The grade structure of intelligence units mirrored that of the rest of the Army, unlike the situation in an earlier period, when 40 percent of a counterintelligence detachment's strength might consist of officers. The danger, of course, was that the process could be carried too far, and that the thrust to make everyone a potential warfighter might unduly divert energies from the proper performance of what remained a demanding real-world mission.[7]

Among other things, the new professionalism meant that Military Intelligence personnel could publicly identify with the traditions of the Army in ways that were not originally thought possible when intelligence work itself was identified, sometimes by its practitioners, as something appropriate only to the shadows. To give only one example, uniformed enlisted personnel assigned to Army Counter Intelligence Corps units during the 1950s wore a simple "U.S." as their collar insignia, officers bore the insignia of their carrier branch, and CIC units in the continental United States presented themselves to the public as "Army Research Groups." During the 1960s, however, Army Intelligence units boasted their own distinguishing unit insignia and their assigned personnel wore Military Intelligence brass. In the 1980s the MI groups of a previous period were redesignated as MI brigades, receiving their own shoulder sleeve insignia. This change would enhance troop esprit and morale by providing the units with more traditional military designations. Certain of INSCOM's TDA field stations and other TDA elements were also given new numerical unit designations. In part, the Army made the change to distinguish troop formations from the geographical locations at which they worked, but it also had the desirable side effect of assigning to these units designations that were more intelligible to the rest of the Army. In short, Military Intelligence identified itself with Army green, abandoning the cloak-and-dagger image of an earlier era. In more ways than one, the motto of the Military Intelligence Corps, "Always Out Front," reflected the new reality.

In 1987 the chief of Military Intelligence declared, "Army Intelligence has truly arrived," and in one sense he was correct. In another sense, however, Military Intelligence was still in transit, progressively redefining itself as the Army, the nation, and the international situation changed. Still, wherever the journey might lead it in the future, clearly Military Intelligence has come a long way from its modest beginning in 1885 as the Division of Military Information.

---

[7] As a visitor to an INSCOM counterintelligence element reported in 1989, "the six military personnel assigned . . . spend an inordinate amount of time detailed away from the office for charge of quarters details, training, physical training, and alerts, none of which is optional." He estimated that "the military personnel spend an average of 67% of their time away from the office." Memo, HQ INSCOM, IAOPS-CI-OC, 10 Oct 89, sub: Summary Report of Temporary Duty Travel to USAREUR.

Bibliography

For a number of reasons, it has seemed inappropriate to provide this volume with a full scholarly apparatus. Security conditions necessarily make the book's coverage of certain aspects of the Military Intelligence story a good deal less than definitive. Moreover, the book does not purport to be a completely original piece of research, since its first portion is based substantially upon material contained in two large previous studies: Bruce W. Bidwell's eight-part survey of the history of the Military Intelligence Division, Department of the Army, prepared for the U.S. Army Center of Military History in the 1950s, and a thirty-volume history of the Army Counter Intelligence Corps which the U.S. Army Intelligence Center compiled in 1959–1960. Initially, both works were fully classified, but now they have been largely declassified. Finally, the latter part of the book draws from a variety of Army files which still remain classified and, in some cases, compartmented; these files will not be accessible to researchers for the foreseeable future. As a result, we decided to provide footnotes only to cite direct quotations, provide additional commentary, and reference open-source publications applying to the subject. For the same reason, this bibliography lists only published, open-source material.

USCIB	U.S. Communications Intelligence Board
WAC	Womens' Army Corps
WDGS	War Department General Staff
YMCA	Young Men's Christian Association

Heraldic Items

Heraldic items for Army units include coats of arms, shoulder sleeve insignia, and distinctive unit insignia. Designed on the basis of a unit's official lineage and honors, they reflect each organization's history, traditions, ideals, mission, and accomplishments. Heraldic items also serve as identifying devices and contribute to unit cohesiveness and esprit de corps.

While the custom of bearing various symbols on shields, helmets, and flags existed in antiquity, heraldry was not introduced until the Middle Ages, when the increased use of armor made it difficult to distinguish friend from foe on the battlefield. Heraldic designs included mythological beasts, emblems commemorative of heroic deeds, and other identifying marks to which specific symbolism was ascribed. These heraldic devices were placed on a surcoat worn over the armor, from which the term "coat of arms" was derived. Gradually, a formal system of heraldry evolved, complete with rules for design, use, and display.

At the present time Army regiments and separate battalions are authorized coats of arms. A complete coat of arms consists of a shield, a crest, and a motto. The shield, the most important portion of the coat of arms, contains the field or ground on which the charges or symbols are placed. The crest was originally placed on the top of the helmet of the chief or leader to enable his followers to recognize him during battle. Today the crest is placed upon a wreath of six skeins or twists composed of the principal metal and primary color of the shield, alternately, in the order named. This wreath or torse represents the piece of cloth which the knight twisted around the top of his helmet and by means of which the actual crest was attached. Mottoes have been in use longer than coats of arms. Many of the older ones originated from war cries. Usually of an idealistic nature, they sometimes allude to a well-known event in the history of the unit.

The elements of the coat of arms are embroidered on the organizational flag (color), the central element of which is the American eagle. The shield of the coat of arms is on the eagle's breast, a scroll bearing the motto is held in his beak, and the crest is placed above his head. A crest to the coat of arms is authorized for Regular Army units that have war service or campaign credit.

Army National Guard units display the crest of the state or states in which they are located, and a special crest has been designed for all Army Reserve units.

The currently authorized embroidered shoulder sleeve insignia had their origin during World War I. They serve the same purpose as the corps symbols (badges) used during the Civil War and the War with Spain. Most corps badges were of simple design and could be cut from a single piece of cloth. These emblems, such as a four-leaf clover, a star, or a spearhead, were easily remembered and readily identified. Not only were they worn by soldiers on their headgear, they were also incorporated into the design of unit flags.

The first shoulder sleeve insignia is believed to have been worn by the men of the 81st Division during World War I. On their voyage to France they adopted as their insignia the figure of a wildcat, which they used as a distinctive marking for the division's equipment. Wear of this insignia was officially approved on 19 October 1918 by a telegram from the Adjutant General, American Expeditionary Forces, to the division commander. Insignia for other units of the American Expeditionary Forces were later authorized and designs officially approved. Designs varied greatly. Many had their origin in devices already in use for organizational and equipment markings. Others were based on monograms and geometric figures alluding to a unit's numerical designation. Symbols associated with traditions, geographical locations, and unit mission were also included in some designs.

Since World War I the authorization of shoulder sleeve insignia has expanded. Under the current system, separate brigades and higher echelons are authorized shoulder sleeve insignia for wear by soldiers assigned to the units. The insignia also appear on the organizations' distinguishing flags. Over time, the designs have become more elaborate and complex due to the increased number of authorized insignia and the availability of embroidery machinery for the production of various types of textile insignia. During the Vietnam era the policy governing the wear of subdued insignia on work uniforms was established.

Distinctive unit insignia, manufactured in metal and enamel and worn by all unit personnel, are authorized for separate battalions and higher echelons. The type of distinctive unit insignia currently in use was first authorized during the 1920s for regiments and certain other units. As in the case of shoulder sleeve insignia and coats of arms, authorization expanded as changes in the organization of the Army took place. The designs are based on symbols reflecting each unit's lineage, battle honors, traditions, and mission and usually incorporate the organization's motto. Distinctive unit insignia for most regiments and battalions include the same design elements as their coats of arms.

Today, as in the past, insignia displayed on flags and worn on uniforms are highly visible items of identification. These heraldic items serve to distinguish specific organizations and their members and are significant factors in establishing and maintaining unit esprit de corps.

LINEAGES AND HERALDIC DATA

MILITARY INTELLIGENCE CORPS

Heraldic Items

Coat of Arms

Shield: Azure, a key bend sinisterwise in saltire with a lightning flash argent, in fesspoint overall a sphinx or.

Crest: On a wreath of the colors, argent and azure, a torch or enflamed proper in front of two swords in saltire with hilts gold and blades of the first.

Motto: ALWAYS OUT FRONT.

Symbolism: Oriental blue and silver gray are the colors associated with military intelligence. The key, flash, and sphinx symbolize the three basic categories of intelligence: human, signal, and tactical.

The flaming torch between the crossed swords suggests the illumination as provided by intelligence upon the field of battle.

Distinctive Unit Insignia

The distinctive unit insignia is the shield and motto of the coat of arms.

HEADQUARTERS AND HEADQUARTERS DETACHMENT 66th MILITARY INTELLIGENCE BRIGADE

Heraldic Items

Shoulder Sleeve Insignia

Description: On a silver gray hexagon, one point up, with an oriental blue border, an oriental blue hexagon bearing a yellow sphinx superimposed by a silver gray dagger hilted black.

Symbolism: Oriental blue and silver gray, representing loyalty and determination, are the colors of the military intelligence branch. Yellow symbolizes excellence. The hexagon borders reflect the numerical designation of the brigade. The sphinx, a traditional military intelligence symbol, indicates observation, wisdom, and discreet silence. The unsheathed dagger reflects aggressive and protective requirements and the element of physical danger inherent in the mission of the unit.

Distinctive Unit Insignia

Description: A gold color metal and enamel device consisting of a hexagon composed of a checky of six black and white sections (one angle up), surmounted throughout by a smaller hexagon (flat side up) composed of a checky of nine sections of gold and oriental blue with the center square charged with a gold sphinx head, all above a gold scroll inscribed HONOR VALOR AND SECURITY in oriental blue letters.

Symbolism: The black and white sections symbolize enlightenment and knowledge both day and night around the world. The checky represents the unit's tactical and strategic capabilities in counterintelligence. The sphinx, a traditional intelligence symbol, indicates observation, wisdom, and discreet silence. The hexagon within a hexagon further distinguishes the numerical designation of the organization.

HEADQUARTERS
111th MILITARY INTELLIGENCE BRIGADE

Heraldic Items

Distinctive Unit Insignia

Description: A gold color metal and enamel device consisting of the major portion of a black and gold heraldic rose above and behind the head and wings of a gold eagle rising out of a gold disc charged throughout with a burst of red flames having eight tongues radiant to base and interspersed with seven five-pointed oriental blue stars, the disc enclosed by an oriental blue scroll inscribed with the words MISSION FIRST in gold.

Symbolism: The heraldic rose, alluding to the insignia of the military intelligence branch, is symbolic of the basic mission (to collect, check, and make available any information about a present or possible enemy), and its position at the top of the design is relative to the unit's motto. The phoenix (eagle) rising out of flames is symbolic of the former location of the unit, Atlanta, Georgia, and the seven states where the unit operated are represented by the ring of oriental blue stars.

HEADQUARTERS
112TH MILITARY INTELLIGENCE BRIGADE

HERALDIC ITEMS

DISTINCTIVE UNIT INSIGNIA

Description: A silver color metal and enamel device consisting of a yellow enameled demi-sun emitting five rays surmounted by a silver dagger, point up, beneath an oriental blue chevron bearing five silver stars, all within and below an arc segment of silver oak leaves and a red scroll inscribed with the motto STRENGTH THROUGH SECURITY in silver letters.

Symbolism: Oriental blue and silver gray are the colors traditionally associated with military intelligence. The sunburst further alludes to intelligence and also suggests the former location of the unit, the great Southwest. The yellow sunburst symbolizes the worth of reliable intelligence. The five rays of the sunburst allude to the five former regions of the unit and the chevron, a symbol for support, with the five stars, represents the five states which comprised its former area of operations. The ancient dagger signifies the dangers and silent covert nature of intelligence service. The oak leaves are symbolic of the strong and enduring resolution of the members of the unit, and the motto portrays the goal of a successful intelligence organization.

HEADQUARTERS AND HEADQUARTERS DETACHMENT 201st MILITARY INTELLIGENCE BRIGADE

Heraldic Items

Shoulder Sleeve Insignia

Description: On a shield divided from upper left to lower right, silver gray above oriental blue with a yellow border, a sword between two flashes all yellow.

Symbolism: Oriental blue and silver gray are the military intelligence branch colors. The two parts symbolize the responsibility for acquisition and processing of tactical and strategic intelligence. The sword symbolizes the aggressiveness and physical danger inherent in military intelligence operations.The lightning bolts refer to the electronic warfare capabilities of the unit and the commander's need for accurate and ready intelligence from all sources.

Distinctive Unit Insignia

Description: A silver color metal and enamel device consisting of an oriental blue disc bearing a silver polestar encircled at top and sides by a black scroll inscribed WITH COURAGE AND VISION in silver letters, and in base three alternate wavy bars of oriental blue and silver superimposed by a silver mountain peak supporting a griffin segreant grasping a sword and a lightning flash, all gold.

Symbolism: Oriental blue and silver gray are the colors associated with military intelligence. Black denotes secrecy. The oriental blue disc superimposed by the silver polestar symbolizes the world and the far-reaching capabilities of the unit. The oriental blue and silver wavy bars allude to World War II campaign participation in the Pacific. The mountain peak is representative of Korean War campaigns. The griffin, having the keen eyesight of an eagle and the strength and courage of a lion, indicates the attributes of military intelligence and also alludes to the motto. The lightning flash is indicative of communications, electronic warfare capabilities, and the origin of the brigade as a signal unit. The sword reflects the fighting aspect and suggests the unit's aggressiveness and the physical danger inherent in military intelligence operations.

HEADQUARTERS AND HEADQUARTERS DETACHMENT 205th MILITARY INTELLIGENCE BRIGADE

Heraldic Items

Shoulder Sleeve Insignia

Description: On an oriental blue shield a white fleur-de-lis centered in front of two crossed silver gray lightning bolts.

Symbolism: Oriental blue and silver gray are the colors associated with military intelligence units. The crossed lightning bolts refer to the convergence of all types of intelligence from all sources, enabling commanders to "see the battlefield." The fleur-de-lis alludes to the unit's original activation in France.

Distinctive Unit Insignia

Description: A gold color metal and enamel device consisting of an oriental blue fleur-de-lis bearing in gold a dagger, point down, between a lightning flash and a propeller blade all convergent in base on a silver gray background enclosed at the bottom by a gold wreath of rice tied in red and at the top by an oriental blue scroll inscribed VANGUARD OF VIGILANCE in gold letters.

Symbolism: Oriental blue and silver gray are the colors traditionally associated with the military intelligence branch. The oriental blue fleur-de-lis refers to the unit's World War II service in Europe. Campaign participation in Vietnam is symbolized by the gold and red wreath of rice. The lightning flash represents signals intelligence and electronic warfare; the dagger represents human intelligence; the airplane propeller represents airborne imagery intelligence. The slanting of these symbols of the intelligence disciplines employed by the unit toward the fulcrum of the fleur-de-lis represents the convergence of intelligence from all sources to enable commanders to "see the battlefield."

HEADQUARTERS AND HEADQUARTERS DETACHMENT 207th MILITARY INTELLIGENCE BRIGADE

Heraldic Items

Shoulder Sleeve Insignia

Description: On an oriental blue disc a silver gray key and lightning bolt crossed slightly above center, with the key's ward at the lower left and the lightning bolt's point to the right, centered below is a dagger, point up, with silver gray blade and black hilt; all within a narrow red outline of a seven-petaled stylized rose.

Symbolism: Oriental blue and silver gray are associated with military intelligence. Red derives from the predominant color of the VII Corps shoulder sleeve insignia and black represents the unknown. The key and lightning bolt represent electronic warfare and security and also signify the numeral two of the unit's designation. The stylized seven-petaled rose has its origin in the more traditional compass, dagger, and rose associated with the military intelligence branch and also represents the numeral seven of the unit's designation as well as the number of the corps it supported. The circular shape of the insignia also refers to the zero of the unit's designation. The dagger denotes the counterintelligence function of the unit.

Distinctive Unit Insignia

Description: A gold color metal enamel device consisting of an oriental blue five-petaled heraldic rose and centered vertically thereon a gold lightning bolt surmounted at the bottom by a horizontal gold key, surmounting the lightning bolt at center a white horse's head between two white wings, each with seven feathers. Attached to the bottom of the device a scroll of three parts inscribed with the words SEE STRIKE KNOW in black letters.

Symbolism: Oriental blue is one of the colors associated with the military intelligence branch. The heraldic rose, a part of the military intelligence insignia, indicates the brigade's association with that branch. The winged horse (Pegasus) with seven feathers on each wing signifies aerial vigilance in support of the VII Corps. The key denotes the unlocking of the enemy's secrets.

The lightning bolt represents the unit's electronic warfare capability and its ability to transmit information rapidly.

HEADQUARTERS AND HEADQUARTERS COMPANY 319th MILITARY INTELLIGENCE BRIGADE

Heraldic Items

Shoulder Sleeve Insignia

Description: On a rectangle arched at top and bottom with a silver gray border, divided beveled from upper right to lower left black above oriental blue, in upper left an oriental blue polestar pierced silver gray.

Symbolism: Oriental blue and silver gray are the colors traditionally associated with military intelligence units. Blue also alludes to the Pacific and the unit's area of operations. Black and blue suggest day and night vigilance. The polestar simulates satellite intelligence collection and communications. The jagged division of the background is reminiscent of a lightning bolt, symbolizing speed, accuracy, and electronic information and systems.

Distinctive Unit Insignia

Description: A silver color metal and enamel device consisting of a silver sunburst within an oriental blue oval (with axis vertical) inscribed EYES OF THE PACIFIC in silver letters, overall a diagonal red lightning bolt from lower left to upper right superimposed by a silver knight's helmet crested with a griffin's head in shades of light brown.

Symbolism: Oriental blue and silver gray are the colors traditionally associated with military intelligence units. The griffin, a mythical beast, with keen eyesight and acute hearing, symbolizes constant vigilance. The helmet with the visor closed connotes covert capabilities as well as military preparedness. The sunburst symbolizes knowledge and truth; the lightning bolt underscores electronic communications, speed, and accuracy.

HEADQUARTERS AND HEADQUARTERS DETACHMENT 470th MILITARY INTELLIGENCE BRIGADE

Heraldic Items

Shoulder Sleeve Insignia

Description: On a silver gray rectangle arched at top and bottom with a black border, a vertical oriental blue stripe and overall a black griffin's head.

Symbolism: Oriental blue and silver gray are the colors traditionally associated with military intelligence units. The three sections of the background refer to the three types of intelligence: human, signals, imagery. The blue stripe bordered by two gray stripes suggests the Panama Canal and refers to collecting and funneling information. It also alludes to the unit's location. The griffin, a mythological creature of vigilance and strength, a guardian of gold, symbolizes the unit's mission. Black represents the secrecy of the operations.

Distinctive Unit Insignia

Description: A silver color metal and enamel device consisting of an erect silver key, double-warded in base, the bow of seven radiating rays and surmounting overall an oriental blue torch with a red flame. Encircling the device in base, the ends terminating at the opposite lower corners of the flame, an oriental blue scroll bearing the inscription TRUTH SECURITY LOYALTY in silver letters.

Symbolism: Oriental blue and silver gray are the colors used for military intelligence. The key, a symbol of authority, secrecy, and wardenship, refers to the basic mission of the organization. The double wards allude to intelligence and counterintelligence and the seven rays of the bow, a reference to the numeral seven, symbolize revealing light, security, and wisdom. The torch represents guidance. Blue represents truth, and red, zeal and valor.

HEADQUARTERS AND HEADQUARTERS DETACHMENT 500th MILITARY INTELLIGENCE BRIGADE (Pacific Vanguard)

Heraldic Items

Shoulder Sleeve Insignia

Description: An oriental blue rectangle arched at top and bottom with a silver gray border bearing a crossed yellow lightning flash and sword surmounted by an oriental blue globe gridlined and outlined silver gray, and overall a yellow torch with red flame.

Symbolism: Oriental blue and silver gray are traditionally associated with the military intelligence branch. The sword signifies vigilance, the lightning flash alludes to electronic communications and speed, the globe symbolizes worldwide service, and the torch and flame signify knowledge.

Distinctive Unit Insignia

Description: A gold color metal and enamel device consisting of an oriental blue conical shape with apex at base bearing a white radiant sun behind a white snowcapped black mountain peak, overall a gold palm tree eradicated, surmounted by a scarlet and ultramarine blue taeguk, and in base a gold Siamese headdress all between two gold bamboo trees with shoots arched, all enclosed at the top with a gold scroll inscribed SCIENTIA POTENTIA EST (KNOWLEDGE IS STRENGTH) in scarlet letters.

Symbolism: Oriental blue is one of the colors used by Army intelligence units. Service in Japan is commemorated by the silhouette of Mount Fuji, while the palm tree denotes service in Hawaii. This unit had intelligence responsibility for several areas: the Republic of Korea, indicated by the red and blue taeguk; Taiwan, represented by the white sun from the Republic of China flag; the Republic of Vietnam, indicated by the bamboo trees; and Thailand, denoted by the Siamese headdress.

HEADQUARTERS AND HEADQUARTERS COMPANY 501st MILITARY INTELLIGENCE BRIGADE

Heraldic Items

Shoulder Sleeve Insignia

Description: On a vertical rectangle arched convexly at top and bottom divided vertically silver gray and oriental blue all within a yellow border, a double-warded inverted yellow key between two yellow lightning flashes issuing from upper left and right corners and conjoining the shaft of the key just above the double ward.

Symbolism: Oriental blue and silver gray are the colors associated with military intelligence and also refer to the constant day and night vigilance mission of the unit. The key is symbolic of authority and control and alludes to security. The lightning flashes are symbolic of worldwide electronic communications and the double-warded key conjoined with the two lightning flashes symbolizes military intelligence and security united.

Distinctive Unit Insignia

Description: A silver color metal and enamel device consisting of a silver color rectangle bounded on either side by a vertical white sword at left and a vertical black sword at right, point up, and enclosed at the top and bottom by two arched oriental blue scrolls passing over the ends of the swords and inscribed IN UNITATE (IN UNITY) on the top scroll and ET VIGILIA (AND VILIGANCE) on the bottom scroll in silver letters. On the rectangle a red oriental dragon, his body curved from left to right with tail at top and head below, grasping in his right claw a blue lightning bolt crossed over a blue double-warded key grasped in his left claw.

Symbolism: Oriental blue and silver gray are the branch colors of military intelligence. The red dragon represents the Orient and the lineage of the organization. The lightning bolt signifies worldwide electronic communications and the key symbolizes security and control; crossed in saltire, they represent strength and symbolize Army Security Agency and military intelligence units. The swords are adapted from the military intelligence branch insignia. Their colors, white and black, signify day and night and the continuous mission of the unit.

HEADQUARTERS AND HEADQUARTERS DETACHMENT 504th MILITARY INTELLIGENCE BRIGADE

Heraldic Items

Shoulder Sleeve Insignia

Description: On an oriental blue shield with a yellow border a silver gray winged lightning flash with wings elevated, the flash topped with a silver gray demi-fleur-de-lis.

Symbolism: Oriental blue and silver gray are the colors associated with the military intelligence branch. The wings suggest loftiness or the advantage obtained from clear observation. The lightning flash alludes to the unit's ability to respond accurately and quickly in support of the commander's needs for intelligence from all sources. The demi-fleur-de-lis is a symbol both of intelligence and of the brigade's roots in the campaigns of Northern France, Rhineland, and Central Europe. Yellow signifies excellence and achievement.

Distinctive Unit Insignia

Description: A gold color metal and enamel device consisting of a vertical red enamel winged lightning flash with wings elevated, tipped with a demi-fleur-de-lis, all within a continuous blue scroll arched at top and base and passing behind the wings and demi-fleur-de-lis at the sides and top and inscribed SEMPER PRAEPARATUS (ALWAYS YOU ARE PREPARED) in gold letters and all areas enclosed by the wings and scroll are checky of gold and silver gray.

Symbolism: Oriental blue and silver gray are the colors used for the military intelligence branch. Wings connote loftiness, a vantage point for visual observation. The lightning flash and checky area represent technological capabilities, symbolize vigilant leadership, celerity, and communications, and allude to the unit's concern with control over hostile communications and security of friendly communications. The demi-fleur-de-lis, lightning flash, wings, and checky area also refer to the unit's origin as the 137th Signal Radio Intelligence Company, Aviation. The demi-fleur-de-lis denotes participation in European campaigns during World War II, while the color scarlet alludes to the Meritorious Unit Commendation (Army) Streamer awarded the unit.

HEADQUARTERS AND HEADQUARTERS COMPANY 513th MILITARY INTELLIGENCE BRIGADE (Vigilant Knights)

HERALDIC ITEMS

SHOULDER SLEEVE INSIGNIA

Description: On a vertical rectangle arched at the top and bottom, a field divided quarterly silver gray and oriental blue and thereon a yellow lightning bolt issuing from upper left and a white sword point up in saltire surmounted by a white front-facing helmet detailed silver gray; all within a yellow border.

Symbolism: Oriental blue and silver gray are the military intelligence branch colors. The quartered field symbolizes the four primary intelligence functions: collection, analysis, production, and dissemination of intelligence information. The lightning bolt refers to the worldwide capabilities and the electronic warfare functions of the unit. The sword symbolizes the aggressiveness, protection, and physical danger inherent in military intelligence operations. The helmet alludes to the origins of the unit at Camp King in Oberursel, Germany. The helmet's front-facing position suggests alertness and vigilance and the closed faceplate the anonymity and aggressiveness of covert collection.

DISTINCTIVE UNIT INSIGNIA

Description: A gold color metal and enamel device consisting of a gold semicircular scroll bearing the words PER VIGILANTIAM SCIENTIA (KNOWLEDGE THROUGH VIGILANCE) in teal blue letters and containing upright between two green laurel branches a gold helmet facing front with teal blue rivet holes around the neck and a teal blue grill opening, the throat encircled by a collar of checkered white and black edged gold and atop the helmet a gold three-pointed coronet, the center point in teal blue.

Symbolism: The Teutonic helmet with crown is an allusion to Camp King in Oberursel, Germany, and its front-facing position suggests alertness and vigilance. The laurel branches on either side are

symbolic of honor and achievement. In the collar the colors black and white denote the two types of intelligence collection provided by the unit and the repetition of the pattern indicates the dissemination of intelligence information.

HERALDIC ITEMS

SHOULDER SLEEVE INSIGNIA

Description: On a rectangle arched at the bottom with a yellow border, below a yellow and black checkered chief consisting of two rows of five squares each, a field divided from upper left to lower right with silver gray above oriental blue separated by a yellow lightning flash with point at lower right.

Symbolism: Oriental blue and silver gray are the colors traditionally associated with military intelligence. The lightning flash refers to the communication and electronic warfare functions of the unit. The checkered area alludes to the overt and covert aspects of the military intelligence mission, with the black and yellow colors referring to constant vigilance day and night.

TAB

Description: Immediately above and touching the shoulder sleeve insignia, a black arc tab containing the inscription AIRBORNE in yellow letters.

DISTINCTIVE UNIT INSIGNIA.

Description: A gold color metal and enamel device consisting of a black equilateral triangle charged with a gold lion rampant, in base two rows of alternating squares gold and oriental blue all above a voluted gold scroll inscribed FAST FACTUAL FAITHFUL in black letters.

Symbolism: The gold lion rampant on a black background was taken from the coat of arms of Heidelberg in Germany, where the 525th Interrogation Team was activated in 1946. The triangular shape alludes to the deltas in Vietnam and symbolizes the unit's service in that country. The triangle and lion with the checkered rows allude to tenacity, flexibility, and secrecy and represent the combined intelligence programs of the organization.

HERALDIC ITEMS

DISTINCTIVE UNIT INSIGNIA

Description: A gold color metal and enamel device consisting of a white expanded horizontal scroll surmounted vertically by a gold quill in front of a gold demi-sun emitting eight rays; all encircled by an oriental blue scroll with the upper area surmounted by the points of the rays and in base the inscription TRUTH CONQUERS in gold letters.

Symbolism: Oriental blue is one of the colors associated with military intelligence. The quill and scroll allude to the reporting mission of intelligence. The sun, a symbol of enlightenment, with the radiating rays, symbolizes the illumination of dark areas and defense against subversion and espionage. The eight rays further refer to the eight states in the jurisdictional area of the group.

HERALDIC ITEMS

DISTINCTIVE UNIT INSIGNIA

Description: A gold color metal and enamel device consisting of an ellipse divided quarterly oriental blue and black, overall a vertical gold quillon dagger point up with white blade and six-sectioned red grip extending over the ellipse at the top and base.

Symbolism: Oriental blue is one of the colors associated with military intelligence. Black connotes secrecy and the covert methods sometimes used in accomplishing the unit's mission. The four segments comprising the ellipse refer to the four phases of the intelligence cycle. The dagger signifies the aggressiveness and determination required for successful achievement in performance of intelligence operations. Red denotes martial fortitude and the six sections of the dagger's grip refer to the initials LIDMAC (Loyalty, Integrity, Discretion, Morals, and Character). In addition, the vertical thrust of the dagger, the ellipse, and the nine areas of the weapon (blade, guard, six-sectioned grip, and pommel) allude to the numerical designation of the group.

HERALDIC ITEMS

DISTINCTIVE UNIT INSIGNIA

Description: A gold color metal and enamel device consisting of an oriental blue disc within a scarlet military belt buckled and edged with gold and inscribed in gold letters VIGIL PROMPTUSQUE (WATCHFUL AND READY); issuing from the inner edge of the belt downward over the oriental blue disc a gold demi-sun emitting rays; surmounted by a representation of the Washington Monument in the District of Columbia, white shaded silver gray, the monument issuing from the lower inner edge of the belt and extending between the two words of the motto beyond the top outer edge.

Symbolism: Oriental blue and silver gray are military intelligence branch colors. The sun and rays are taken from the shoulder sleeve insignia of the former United States Army Intelligence Command. They stand for light and knowledge and indicate that the group served under that organization. The belt refers to the encircling band of security provided by military intelligence and denotes the military nature of the group. The Washington Monument alludes to the District of Columbia, the place where the unit was activated in 1946.

HEADQUARTERS AND HEADQUARTERS DETACHMENT 259th MILITARY INTELLIGENCE GROUP

HERALDIC ITEMS

DISTINCTIVE UNIT INSIGNIA

Description: A silver color metal and enamel device consisting of a silver ring containing a disc divided into quarters alternately from upper left of silver gray and black enamel centered in front of two oriental blue griffins seated back to back all upon a horizontal silver platform, the griffins each holding in a claw at chest level the upper fold of a silver scroll curving downward in three folds, the small fold centered below the platform and the scroll inscribed in black letters with the motto WATCHFUL AND VIGILANT, one word on each fold; the free ends draped below each end of the platform.

Symbolism: Oriental blue and silver gray are the colors used for military intelligence. The griffin, a mythological creature of exceeding alertness and acute hearing, represents qualities necessary to the military intelligence mission. The scroll held up in his claws alludes to the assimilation of military intelligence data and the disc at center, quartered in light and dark colors representing night and day, suggests the importance of constant vigilance. The silver circle refers to the state of Ohio, the unit's original home area.

DISTINCTIVE UNIT INSIGNIA

Description: A gold color metal and enamel device consisting of an octagon, issuing from the top a white enamel wedge shape between two black enamel areas each surmounted with a gold sea lion facing outward, and extending in base over an oriental blue enamel area charged in the center with a gold Philippine sunburst, all above a gold scroll of three sections inscribed in sequence SECURITY TRUTH ALLIANCE in scarlet letters.

Symbolism: The sea lions allude to the unit's New Guinea and Luzon campaigns in the Pacific theater during World War II. The Philippine sunburst symbolizes the organization's Philippine Presidential Unit Citation. The octagon refers to the number eight, which in numerology stands for perfect intelligence. The colors black and white symbolize day and night vigilance, while gold, the color of the farseeing sun, which appears bringing light out of an inscrutable darkness only to disappear again into darkness, stands for intuition. Oriental blue is one of the colors used for intelligence and security.

Symbolism: The sun rays allude to the Philippine Presidential Unit Citation and to the unit's World War II service in New Guinea and Luzon. The knight, a chess piece shaped like a horse's head, symbolizes the group's ability to make strategic moves while checking any hostile infiltration and advancement. The color red is used to symbolize courage, zeal, and awareness and with the alternating gold squares refers to the unit's counterintelligence mission. Oriental blue is one of the colors used by military intelligence.

1st MILITARY INTELLIGENCE BATTALION (The Flying Eye Battalion)

HERALDIC ITEMS

COAT OF ARMS

Shield: Azure, issuant from base a lightning flash bendwise terminating in a dexter hand fesswise supporting an annulet winged to chief all or, within the annulet a human eye proper.

Crest: On a wreath of the colors, or and azure, a bundle of five arrows crossed with a hook-bladed machete in bend sinister, the arrows point down with shafts of the first barbed and flighted gules, the machete with handle to base azure all banded in center with a ribbon gold bearing three narrow stripes fesswise scarlet, all in front of a bank of clouds proper.

Motto: INFORMARE LABORAMUS (WE LABOR TO INFORM).

Symbolism: Teal blue and yellow are the colors formerly used for air reconnaissance support battalions. The annulet, symbolic of a camera lens, refers to the aerial photo interpretation mission in the unit's history. The wings allude to flight; the eye represents observation. The lightning flash alludes to the former signal element in the unit's composition and the hand commemorates the unit's mission of support.

The battalion's awards for Vietnam service, for which it received the Presidential Unit Citation (Air Force) and five Meritorious Unit Commendations (Army), are represented in the crest. The mak, or hook-bladed machete used to clear fields in Vietnam, signifies the battalion's keen reconnaissance performance, and, together with the clouds alluding to the Air Force, refers to the Presidential Unit Citation (Air Force); blue is the color of the award streamer. The five arrows, with points down signifying penetration from the air, represent five Meritorious Unit Commendations (Army), with arrowheads and feathers in scarlet, the color of the award streamers. The yellow band with scarlet stripes, suggested by the national flag of the Republic of Vietnam, also alludes to the unit's achievements in collecting aerial reconnaissance information.

DISTINCTIVE UNIT INSIGNIA

The distinctive unit insignia is the shield and motto of the coat of arms.

COAT OF ARMS

Shield: Per chevron abased azure and argent, a chief dancetty of two enhanced of the last the apexes surmounted by two roundels of the first counterchanged and in base a sphinx rampant sable armed gules.

Crest: None approved.

Motto: OCULI CULTUS SECRETI (THE EYES OF INTELLIGENCE).

Symbolism: The colors, white and teal blue, symbolize the battalion's former status as an unassigned-to-branch unit. The battalion's numerical designation and mission are suggested by the two roundels or lenses directing their gaze downward. The sphinx is representative of the intelligence mission. Black alludes to the coat of arms of the old Rhineland district of Pfalz in Germany, where the unit was activated.

DISTINCTIVE UNIT INSIGNIA

The distinctive unit insignia is the shield and motto of the coat of arms.

3d MILITARY INTELLIGENCE BATTALION

HERALDIC ITEMS

COAT OF ARMS

Shield: Per bend azure and checky or and gules in chief a chess piece with a griffin's head argent.

Crest: On a wreath of the colors, or and azure, a Vietnamese sunburst of the first surmounted by a bamboo cross pierced at center proper.

Motto: WINGED VIGILANCE.

Symbolism: The colors oriental blue and silver gray are used to represent military intelligence and scarlet and gold to symbolize military strength and operational excellence. The griffin, traditionally a creature of vision, alertness, and intelligence, is shown as a chess piece adjacent to a chessboard, suggesting the type of operation, requiring ingenuity and intellect, which the battalion is called upon to carry out. The squares on the chessboard represent the many engagements in which the unit participated in Vietnam.

The sunburst, taken from the Hien Nhan gate to the Imperial City in Hue, represents Vietnam and has three principal flames, suggesting the Meritorious Unit Commendations (Army) awarded to the organization. The bamboo cross stands for the Republic of Vietnam Cross of Gallantry with Palm awarded to the unit.

DISTINCTIVE UNIT INSIGNIA

The distinctive unit insignia is the shield and motto of the coat of arms.

LINEAGE AND HONORS

14th MILITARY INTELLIGENCE BATTALION

HERALDIC ITEMS

COAT OF ARMS

Shield: Per bend dove-tailed argent and azure, two whelk shells counterchanged.

Crest: None approved.

Motto: SUPPORT BY INTELLIGENCE.

Symbolism: The two shells and the dove-tailed partition line stand for the three general functions of a military intelligence unit: collecting, processing, and disseminating information. The whelk shells, which receive and transmit sound waves and vibrations, refer to the collection and dissemination of information; the fitting together of the two parts of the shield, by means of the dove-tailed line, refers to the process of interpreting and collating separate pieces of information to form an integrated whole. Oriental blue and silver gray are the colors used for military intelligence. Counterchanging the colors of the shells alludes to the counterintelligence function of the unit.

DISTINCTIVE UNIT INSIGNIA

The distinctive unit insignia is the shield and motto of the coat of arms.

15th MILITARY INTELLIGENCE BATTALION

HERALDIC ITEMS

COAT OF ARMS

Shield: Azure, above a base rayonné argent, a winged sphinx couchant of the last and in chief two plates partially superimposed fesswise the conjoined area sable.

Crest: None approved.

Motto: VIGILANTIA AD FINEM (VIGILANCE TO THE END).

Symbolism: Oriental blue and silver gray are the colors used for military intelligence. The winged sphinx, all-seeing and continually watchful, refers to the battalion's air reconnaissance support mission and also connotes the unit's motto. The overlapping discs simulate camera lenses and allude to the stereoscopic capabilities provided by the organization in its performance of reproduction, identification, and packaging of aerial imagery. The flames are indicative of heat sensory devices, wisdom, and zeal.

DISTINCTIVE UNIT INSIGNIA

The distinctive unit insignia is the shield and motto of the coat of arms.

101st MILITARY INTELLIGENCE BATTALION

HERALDIC ITEMS

COAT OF ARMS

Shield: Checky azure and argent in front of a sword and lightning flash in saltire a double-warded key palewise argent, on a chief invected of the like a sunburst throughout tenné.

Crest: None approved.

Motto: TRUST VIGILANCE LOYALTY.

Symbolism: Oriental blue and silver gray are the colors traditionally associated with military intelligence. The invected chief is an allusion to clouds and the atmosphere, the main field of operations for a combat electronic warfare intelligence unit. The sunburst, a symbol of Helios, the Greek sun god, is a further reference to the atmosphere. The sunburst may also denote a compass rose and the multi-directional facets of the unit's radio functions. The checky background alludes to a chessboard and symbolizes strategy and intelligence. The sword refers to the unit's military ability, the lightning flash to speed and communications, and the key to intelligence and security.

DISTINCTIVE UNIT INSIGNIA

The distinctive unit insignia is the shield and motto of the coat of arms.

102d MILITARY INTELLIGENCE BATTALION

HERALDIC ITEMS

COAT OF ARMS

Shield: Per fess dancetty azure and sable, a chief invected argent, and overall a sword bend sinisterwise point to base gules surmounted by a lightning flash issuant from dexter chief bendwise overall or.

Crest: None approved.

Motto: KNOWLEDGE FOR BATTLE.

Symbolism: Silver gray and oriental blue are the colors used for military intelligence units. The divisions of the shield are symbolic of weather and terrain, with the scarlet sword representing the enemy. The unit's deployment overseas is symbolized by the wavy blue section and the black area in base refers to the steep, mountainous terrain of Korea, where elements of the battalion served during the Korean War. The lightning flash signifies the seeking, gathering, and dissemination of information relative to the areas of weather, terrain, and the enemy and further denotes the constant vigilance which is inherent in the mission of military intelligence.

DISTINCTIVE UNIT INSIGNIA

The distinctive unit insignia is the shield and motto of the coat of arms.

103d MILITARY INTELLIGENCE BATTALION

Heraldic Items

Coat of Arms

Shield: Per bend azure and quarterly gules and or, on a bend engrailed argent a lightning bolt of the second and in sinister chief a wyvern's head of the fourth.

Crest: None approved.

Motto: TOP OF THE ROCK.

Symbolism: Oriental blue and silver gray are the colors associated with military intelligence units. The wyvern's head has been adapted from the device of the 3d Infantry Division, which this battalion supports. The wyvern is a heraldic creature known as a fearless guardian and thus symbolizes a major role of the intelligence mission. The lightning bolt on the engrailed bend alludes to the unit's special interest in communications of hostile and friendly forces as well as communications throughout the battalion. The scarlet and yellow quarters refer to the arms of Wurzburg in Germany, the battalion's place of activation.

Distinctive Unit Insignia

The distinctive unit insignia is the shield and motto of the coat of arms.

105th MILITARY INTELLIGENCE BATTALION (Owls)

HERALDIC ITEMS

COAT OF ARMS

Shield: Azure, a pile to honor point argent bearing a lozenge throughout gules charged with an owl's head couped or, all above a sword and key in saltire with blade and ward to chief of the second between two lightning flashes palewise of the fourth.

Crest: None approved.

Motto: BOLD VIGIL.

Symbolism: Silver gray and oriental blue are the colors traditionally associated with military intelligence. The sword and key in the saltirewise position represent support and symbolize military leadership. The lightning flashes refer to the speed and power of electronic communications. The owl is symbolic of wisdom and watchfulness and the red diamond shape alludes to the unit's support of the 5th Infantry Division. The two lightning flashes further refer to World War II and the war in Vietnam, in which elements of the battalion served.

DISTINCTIVE UNIT INSIGNIA

The distinctive unit insignia is the shield and motto of the coat of arms.

106th MILITARY INTELLIGENCE BATTALION

HERALDIC ITEMS

COAT OF ARMS

Shield: Per chevron enhanced sable and argent, a mascle gules interlaced by a flash bendwise and a flash bend sinisterwise azure, between four evergreen trees in pale two and two, and two evergreen trees in fess vert.

Crest: None approved.

Motto: THE NORTHERN WATCH.

Symbolism: The chevronwise division of the background together with the evergreen trees forms the illusion of a snow-covered mountain against the night sky and refers to the unit's service in Alaska as well as its around-the-clock mission and responsibilities. Black represents the covert and white is for truth. Oriental blue is one of the colors associated with military intelligence and red is symbolic of courage. The two flashes intertwined with the mascle emphasize the complexity and interrelated nature of military intelligence work. They allude to electronic capabilities, speed, and a strong defense and also represent the Gordian knot of mythology. The evergreens symbolize security and need for constant alertness; their number (six) alludes to the 6th Infantry Division.

DISTINCTIVE UNIT INSIGNIA

The distinctive unit insignia is the shield and motto of the coat of arms.

107th MILITARY INTELLIGENCE BATTALION

HERALDIC ITEMS

COAT OF ARMS

Shield: Per fess enhanced azure and ermine the silhouette of a bayonet fesswise argent charged with a lightning flash gules and in base a fret throughout of the first.

Crest: None approved.

Motto: THROUGH KNOWLEDGE VICTORY.

Symbolism: Oriental blue and silver gray (white) are the colors traditionally associated with military intelligence units. The ermine background is a heraldic fur and alludes to a cloak symbolizing a "cloak of secrecy" and the covert activities of an intelligence organization. The fret is composed of interlaced parts showing the complexity and interconnections of intelligence information. It resembles a puzzle to be solved by finding the proper key or part, an allusion to the military intelligence mission. The bayonet signifies readiness and response. The lightning flash symbolizes the radio communications and electronics employed to make the unit prepared and effective.

DISTINCTIVE UNIT INSIGNIA

The distinctive unit insignia is the shield and motto of the coat of arms.

108th MILITARY INTELLIGENCE BATTALION

HERALDIC ITEMS

COAT OF ARMS

Shield: Azure, two swords crossed argent hilts to base gules, above a globe of the second gridlined of the field; on a chief sable and between two silver mullets a lightning bolt palewise or terminating upon the center of the globe.

Crest: None approved.

Motto: VICTORY THRU VIGILANCE.

Symbolism: Oriental blue and silver gray (white) are the colors associated with military intelligence. The crossed swords in the colors red and white represent the unit's military readiness and support mission. The bolt of lightning alludes to the unit's technology and to the swift and accurate use of information to thwart enemy plans. The stars and globe suggest the organization's areas of operation in search of intelligence and counterintelligence.

109th MILITARY INTELLIGENCE BATTALION

HERALDIC ITEMS

COAT OF ARMS

Shield: Sable, between two flanches checky argent and azure a sun in splendor in chief and in base a decrescent or, overall palewise a lightning flash gules.

Crest: None approved.

Motto: SEEK AND DISRUPT.

Symbolism: Silver gray and oriental blue are the colors of military intelligence. The checkered arrangement reflects the multifaceted intelligence and electronic warfare capabilities of the battalion. The black center field suggests secrecy and symbolizes tactical operations security. The sun and moon symbols and two hemispheres denote round-the-clock tactical and global deployment capabilities. The red flash is a symbol of the offensive combat capability of electronic warfare as well as the long range electronic surveillance characteristics of the battalion.

126th MILITARY INTELLIGENCE BATTALION

Heraldic Items

Coat of Arms

Shield: Celeste a griffin rampant argent grasping a double-warded key with a lightning bolt shaft gules, wards to chief of the second and the bow consisting of a heraldic rose of the like and azure seeded or and slipped vert.

Crest: That for the regiments and separate battalions of the Army Reserve: On a wreath of the colors, argent and celeste, the Lexington Minuteman proper. The statue of the Minuteman, Capt. John Parker (H. H. Kitson, sculptor), stands on the Common in Lexington, Massachusetts.

Motto: VIGILANCE AND STRENGTH.

Symbolism: Oriental blue and silver gray are the colors traditionally associated with military intelligence. The griffin combines the keen eyesight and mobility of the eagle with the courage and prowess of the lion. He has acute hearing and is alert and watchful; he also epitomizes the unit's motto. The shaft of the key consists of a lightning bolt to highlight the electronic nature of the unit's mission; the bow is formed by a heraldic rose, adapted from the military intelligence branch insignia, and referring to the sub rosa functions of the unit. The key, used both to secure and unlock, underscores military intelligence as essential to total preparedness.

Distinctive Unit Insignia

The distinctive unit insignia is the shield and motto of the coat of arms.

Lineage and Honors

AR

Lineage (inactive)

Constituted 16 September 1987 in the Army Reserve as the 126th Military Intelligence Battalion and activated with Headquarters at East Windsor, Connecticut. Inactivated 15 September 1993 at East Windsor, Connecticut.

Campaign Participation Credit

None.

None.

128th MILITARY INTELLIGENCE BATTALION

Heraldic Items

Coat of Arms

Shield: Azure, a demi-griffin grasping a key, the wards upward and outward forming a keystone or; on a chief checky argent and sable, a sword and lightning flash saltirewise of the second.

Crest: That for the regiments and separate battalions of the Army Reserve: On a wreath of the colors, or and azure, the Lexington Minuteman proper. The statue of the Minuteman, Capt. John Parker (H. H. Kitson, sculptor), stands on the Common in Lexington, Massachusetts.

Motto: KEYSTONE TO VICTORY.

Symbolism: Oriental blue is one of the colors associated with the military intelligence branch. The demi-griffin stands for courage, intelligence, and vigilance and holds a key as the symbol of secrecy and security. The wards of the key form a keystone recalling the battalion's motto, its home state of Pennsylvania, and the unit's affiliation with the 28th Infantry Division. The checky chief, recalling the insignia of the 99th United States Army Reserve Command, suggests strategy, while its colors, black and white, refer to night and day operations. The sword represents military preparedness; the lightning flash suggests speed and electronic capabilities. Gold stands for excellence.

Distinctive Unit Insignia

The distinctive unit insignia is a modification of the shield and motto of the coat of arms.

134th MILITARY INTELLIGENCE BATTALION

HERALDIC ITEMS

COAT OF ARMS

Shield: Or, a griffin's head erased sable grasping in his beak a lightning bolt gules, a bordure quarterly azure and argent.

Crest: That for the regiments and separate battalions of the Army Reserve: On a wreath of the colors, or and sable, the Lexington Minuteman proper. The statue of the Minuteman, Capt. John Parker (H. H. Kitson, sculptor), stands on the Common in Lexington, Massachusetts.

Motto: GATHER INTERPRET INFORM.

Symbolism: Oriental blue and silver gray are the colors traditionally associated with military intelligence units. Blue conveys loyalty; red is indicative of action, bravery, and courage. Gold reflects excellence, achievement, and high ideals. The griffin combines the strength and courage of a lion with the vigilance and awareness of an eagle, reflecting the mission of the organization. The lightning bolt alludes to the speed and accuracy with which the unit's mission is carried out and recalls its motto.

DISTINCTIVE UNIT INSIGNIA

The distinctive unit insignia is the shield and motto of the coat of arms.

135th MILITARY INTELLIGENCE BATTALION

Heraldic Items

Coat of Arms

Shield: Azure a lightning flash issuant from dexter chief bendwise or, overall a fess argent bearing a bar invected sable.

Crest: That for the regiments and separate battalions of the Army Reserve: On a wreath of the colors, or and azure, the Lexington Minuteman proper. The statue of the Minuteman, Capt. John Parker (H. H. Kitson, sculptor), stands on the Common in Lexington, Massachusetts.

Motto: PIERCING THE FOG OF WAR.

Symbolism: The colors oriental blue and silver gray are traditionally associated with military intelligence units. The lightning flash is symbolic of speed in accumulating accurate information necessary to achieve total military preparedness. The stylized clouds allude to the unit's capabilities and goals to strive twenty-four hours a day to pierce enemy intelligence lines effectively and provide the information necessary for total preparedness.

Distinctive Unit Insignia

The distinctive unit insignia is the shield and motto of the coat of arms.

140th MILITARY INTELLIGENCE BATTALION

Heraldic Items

Coat of Arms

Shield: Azure within an orle argent, in base a pyramid of the like and in chief a sun in splendor issuing to base five lightning flashes or and charged with a globe of the like gridlined of the first.

Crest: That for the regiments and separate battalions of the Army Reserve: On a wreath of the colors, argent and azure, the Lexington Minuteman proper. The statue of the Minuteman, Capt. John Parker (H. H. Kitson, sculptor), stands on the Common in Lexington, Massachusetts.

Motto: SEMPER VIGIL (ALWAYS WATCHFUL).

Symbolism: Oriental blue and silver gray (white) are the colors associated with military intelligence. The sun represents the Greek god Helios, who, according to mythology, could bring all secrets to light; surrounding a globe, it represents the unit's worldwide military intelligence mission. The lightning flashes suggest electronic warfare and communication capabilities. The sun and lightning flashes are gold and allude to California, the "Golden State," the unit's home area. The pyramid personifies longevity and strength.

Distinctive Unit Insignia

The distinctive unit insignia is the shield and motto of the coat of arms.

141st MILITARY INTELLIGENCE BATTALION

Heraldic Items

Coat of Arms

Shield: Azure a compass rose or charged with a sword sable, grip gules surmounted by a globe argent, gridlined or bearing a lamp of knowledge of the like enflamed gules.

Crest: That for the regiments and separate battalions of the Utah Army National Guard: On a wreath of the colors, or and azure, a beehive beset with seven bees all proper.

Motto: STRENGTH THROUGH KNOWLEDGE.

Symbolism: Oriental blue and silver gray are the colors traditionally associated with military intelligence. The shield represents the unit's constant protection of the country, while the globe symbolizes its worldwide mission. The gold lamp of knowledge reflects the unit's efforts to gain knowledge to be ready and prepared to keep world peace. The black sword exemplifies its vigilance, loyalty, and readiness to defend freedom, liberty, and country. The rays of light, adapted from the military intelligence emblem, allude to a compass and symbolize the unit's readiness to respond wherever needed.

Distinctive Unit Insignia

The distinctive unit insignia is a modification of the shield and motto of the coat of arms.

203d MILITARY INTELLIGENCE BATTALION

HERALDIC ITEMS

DISTINCTIVE UNIT INSIGNIA

Description: A silver color metal and enamel device consisting of a silver gear bearing a black helmet with silver details, face forward, all centered upon a blue disc with silver grid lines encircled by a silver scroll inscribed TECHNICIANS FOR VICTORY in red letters and in base two sprigs of green laurel.

Symbolism: Oriental blue and silver gray are the colors traditionally associated with military intelligence units. The gridlined sphere represents the unit's worldwide mission and the gear refers to the technical aspect of its responsibilities. The helmet is adapted from the device of the 513th Military Intelligence Group, alluding to the unit's original assignment and symbolizing covert vigilance and preparedness. The laurel, a traditional symbol of achievement, exemplifies the motto.

FLAG DEVICE

The flag device is the same as the distinctive unit insignia.

204th MILITARY INTELLIGENCE BATTALION

Heraldic Items

Coat of Arms

Shield: Azure, a double-warded key palewise with an arched lightning flash on either side connecting the ward and bow and each flash enclosing a fleur-de-lis argent and on the bow an ermine spot.

Crest: On a wreath of the colors, argent and azure, a dragon sejant with wings elevated and addorsed gules armed and langued of the second spattered with seventeen mullets and grasping in his dexter claw three lightning flashes or.

Motto: SILENTLY WE DEFEND.

Symbolism: Oriental blue is one of the colors associated with military intelligence, and a key is emblematic of authority and security. The double ward and flashes represent the unit's concern for both overt and covert security communications. The flashes also denote celerity in operation procedures and allude to the unit's signal lineage. Initially designated as the 3118th Signal Service Battalion, the unit's participation in the Northern France, Rhineland, and Central Europe campaigns during World War II is represented by the fleurs-de-lis and ermine spot. The design has been adapted from the badge of a predecessor unit, the 502d Army Security Agency Battalion.

The dragon, a mythical beast renowned as a vigilant guardian and defender, symbolizes the heritage, mission, and ideals of the unit. The red dragon alludes to the Meritorious Unit Commendation (Army) and service of elements of the battalion in Vietnam. Red emphasizes the unit's courage, determination, and valor. The stars denote military preparedness and excellence in endeavors. Service during World War II in Northern France, Rhineland, and Central Europe is represented by the three lightning flashes.

Distinctive Unit Insignia

The distinctive unit insignia is an adaptation of the shield and motto of the coat of arms.

205th MILITARY INTELLIGENCE BATTALION

Heraldic Items

Coat of Arms

Shield: Azure, on pale argent a torch sable enflamed gules superimposed by a sword argent hilt or grip garnished gules, between two quills palewise argent.

Crest: On a wreath of the colors, argent and azure, a lightning flash palewise gules rising from a wreath of palm proper, overall an oriental dragon passant or armed gules and garnished azure.

Motto: PACIFIC VIGILANCE.

Symbolism: Oriental blue and silver gray are the colors traditionally associated with military intelligence units. Blue conveys devotion and loyalty, red is indicative of courage and zeal, while white portrays integrity. Gold reflects excellence, achievement, and high ideals; black reflects covert capabilities. The quills symbolize the unit's analytical functions; the torch signifies guidance, leadership, and knowledge. The sword is symbolic of military preparedness.

The lightning flash indicates speed and accuracy and alludes to the battalion's heritage and association with the Signal Corps. It is red to indicate the Meritorious Unit Commendation (Army) received by the unit during World War II. The palm fronds stand for victory, while the oriental dragon personifies vigilance and preparedness. They suggest the Pacific area and reflect the unit's motto.

Distinctive Unit Insignia

The distinctive unit insignia is the shield and motto of the coat of arms.

Meritorious Unit Commendation (Army), Streamer embroidered ARLINGTON HALL STATION 1945 (9420th Technical Service Unit, Headquarters and Detachments, 2d Signal Service Battalion, cited; GO 2, Office of the Chief Signal Officer, Army Service Forces, 1 May 1945)

206th MILITARY INTELLIGENCE BATTALION

HERALDIC ITEMS

COAT OF ARMS

Shield: Per chevron enarched reversed sable and celeste, nine rays radiating from honor point argent; in base a lion's head erased argent charged with two bars gules.

Crest: None approved.

Motto: COLLECTION FOR DEFENSE.

Symbolism: The white concentric rays represent light or knowledge gathered to a central point; they refer to the battalion's mission of collecting strategic information. The white and scarlet lion on the blue background is taken from the coat of arms of Hesse in Germany, where the unit was activated. The head of the lion is used because it is a symbol of intelligence and reason. The color of the background, oriental blue, also refers to military intelligence.

DISTINCTIVE UNIT INSIGNIA

The distinctive unit insignia consists of elements of the coat of arms.

224th MILITARY INTELLIGENCE BATTALION

HERALDIC ITEMS

COAT OF ARMS

Shield: Quarterly azure and argent a griffin sejant or grasping two flashes saltirewise gules.

Crest: None approved.

Motto: VIGILANCE ABOVE.

Symbolism: Oriental blue and silver gray are the colors associated with the military intelligence branch. The crosswise arrangement of the background is a reference to the Republic of Vietnam Cross of Gallantry with Palm awarded to the unit for service in Vietnam. The griffin is a heraldic creature combining the strength and courage of a lion with the vigilance and awareness of an eagle; as such, it is well suited to represent the ideals and capabilities of an intelligence unit. Its wings refer to the airborne mission, and the flashes it grasps denote the electronic data collection mission of the unit.

302d MILITARY INTELLIGENCE BATTALION

Heraldic Items

Coat of Arms

Shield: Per fess abased argent and azure, in chief a red fox's mask proper charged on the forehead with a billet fesswise sable, and in base a key palewise between two stylized lightning flashes of the first.

Crest: On a wreath of the colors, argent and azure, a fleur-de-lis barry of ten of the second and first, the outer petals serrated, the inner charged with a bayonet or point up, and on the crosspiece of the fleur-de-lis a bar couped tenné with two barrulets argent.

Motto: LOYALTY, VIGILANCE, PRIDE.

Symbolism: The colors, white and teal blue, are symbolic of the battalion's former status as an unassigned-to-branch unit. The battalion's war service as a signal unit is shown by the colors of the fox's mask and background, while the intelligence functions of the unit are represented by the black censor's stamp. The key is for the unit's first campaign (Normandy) in World War II and also alludes to signal and intelligence functions. The stylized lightning flashes symbolize radio reconnaissance.

The fleur-de-lis represents campaign participation in Europe. The outer petals of the fleur-de-lis, suggestive of electronic flashes, reflect the unit's service in communication reconnaissance. The bar on the crosspiece is divided into five segments representing participation in five campaigns in Europe during World War II. The bayonet suggests the Army's offensive spirit and reflects the unit's association with United States Army, Europe.

Distinctive Unit Insignia

The distinctive unit insignia is the shield and motto of the coat of arms.

HERALDIC ITEMS

COAT OF ARMS

Shield: Or, three piles, one in chief and two conjoined in base azure bearing in chief an edelweiss argent seeded of the field and issuing from base two beacons of the last enflamed tenné and gold.

Crest: On a wreath of the colors, or and azure, in front of a stylized wreath of rice or, four flashes saltirewise gules.

Motto: PRIMI NOSCERE (FIRST TO KNOW).

Symbolism: Oriental blue and silver gray are the colors associated with military intelligence. The blue piles represent the mountains of Central Europe and Korea, where the battalion's predecessor units served. The edelweiss, a small white flower prized by European mountaineers, refers to the unit's service in Central Europe. The two beacons refer to Korea's ancient and effective system of communications, which was accomplished by means of beacon fires on mountain tops, and also refer to the battalion's two unit decorations for service in Korea.

The colors red and yellow are traditionally associated with Vietnam, as is the rice wreath, a symbol of excellence and achievement. The red flashes refer to the Meritorious Unit Commendations (Army) earned while serving in Vietnam and also represent accuracy and speed.

DISTINCTIVE UNIT INSIGNIA

The distinctive unit insignia is the shield and motto of the coat of arms.

304th MILITARY INTELLIGENCE BATTALION

HERALDIC ITEMS

COAT OF ARMS

Shield: Azure, a voided isosceles triangle point up sable enclosing a vine leaf or and surmounted in chief by a lozenge fesswise argent bearing a Korean taeguk all between two lightning flashes, points up gules, fimbriated or.

Crest: On a wreath of the colors, or and azure, a demi-griffin of the last armed and langued gules grasping in dexter claw a dagger or, all within a laurel wreath of the like.

Motto: HONOR VIGILANCE DUTY.

Symbolism: The diamond and taeguk simulate an eye, and the lightning flashes connote technology; together they represent the vigilance, celerity, and communication of Army Security Agency units. They also allude to the lineage and service of the organization in World War II and the Korean War. The vine leaf refers to the Rhine province and denotes the unit's participation in the Rhineland campaign. The taeguk represents Korea, where the unit participated in six campaigns. It is also used to symbolize the award of the Meritorious Unit Commendation (Army) Streamer inscribed KOREA. Black is used on the triangle to connote iron and refers to the Republic of Korea Presidential Unit Citation Streamer with the inscription IRON TRIANGLE.

Oriental blue represents the military intelligence branch. The griffin, a traditional symbol of intelligence, resourcefulness, and courage, emphasizes the qualities required of battalion personnel and recalls the European theater of operations. Its claws and tongue are scarlet, denoting courage and sacrifice. It holds a dagger, a reference to the dangers of covert activities and a symbol of preparedness. The wreath refers to all honors and achievements associated with the unit during its history. Gold signifies excellence.

DISTINCTIVE UNIT INSIGNIA

The distinctive unit insignia consists of elements of the coat of arms.

305th MILITARY INTELLIGENCE BATTALION

Heraldic Items

Coat of Arms

Shield: Azure, a saltire argent charged with pyrotechnic projectors of the first, overall a mullet of four points tenné fimbriated of the second.

Crest: On a wreath of the colors, argent and azure, issuant from the battlements of a tower proper a fleur-de-lis or between two griffin heads respectant gules beaked or.

Motto: AD ARCANA TUTANDA (TO KEEP OFFICIAL SECRETS SAFE).

Symbolism: Teal blue and white are the colors associated with former Army Security Agency battalions. The pyrotechnic projectors allude to the signal and reconnaissance missions of the unit. The four-pointed star refers to four World War II campaigns and also symbolizes intelligence, reconnaissance, communications, and signal, all vital functions of the battalion. The color orange further alludes to its signal function. The saltire is symbolic of the southern states that made up the Third Army area, the former location of the battalion.

The tower symbolizes a strong defense and military preparedness. The griffins, personifying vigilance, stand prepared to meet all threats. Red denotes courage and zeal. The tower and fleur-de-lis commemorate the unit's World War II service in Europe.

Distinctive Unit Insignia

The distinctive unit insignia is the shield and motto of the coat of arms.

306th MILITARY INTELLIGENCE BATTALION

HERALDIC ITEMS

COAT OF ARMS

Shield: Azure, a volcano abased argent surmounted by a pellet charged with a mullet of the second; in chief a lightning flash fesswise tenné fimbriated of the second.

Crest: On a wreath of the colors, argent and azure, a demi-griffin gules holding in its dexter claw a sword with blade in the form of a lightning flash or all in front of a wreath of palm fronds proper.

Motto: NEMO VIGILANTIOR (NO ONE MORE WATCHFUL).

Symbolism: Teal blue and white are the colors formerly used for Army Security Agency battalions. The volcano symbolizes the area in the Pacific where the unit served. The black sphere charged with a white mullet alludes to the coat of arms of Captain Cook, who discovered New Caledonia, the island on which the unit was activated. The lightning flash refers to the mission of the unit and the orange color represents its former status as a signal company.

The griffin, symbol of courage, strength, and vigilance, represents the intelligence mission of the battalion. The unit's origin as a signal company is recalled by the lightning flash sword blade, which also denotes speed of response and action. The palm wreath refers to the unit's service in the Pacific during World War II. Red signifies courage and recalls the award of the Meritorious Unit Commendation (Army). Gold stands for excellence.

307th MILITARY INTELLIGENCE BATTALION

Heraldic Items

Coat of Arms

Shield: Tierced in pairle reversed argent, azure, and gules, on the first and second an eagle's head erased counterchanged, and on the third, a key palewise, the ward to base, between two electronic flashes, one in bend and the other in bendsinister of the first.

Crest: On a wreath of the colors, argent and azure, in front of a wreath of laurel or an equilateral triangle point up with the points barbed gules and charged with a Philippine sun of the third.

Motto: ELECTRONIC FIREPOWER.

Symbolism: The eagles, known for swiftness, stamina, and keen vision, together with the key and electronic flashes symbolize eternal vigilance and security. All allude to the basic mission of the organization. In addition, the eagles' heads, adapted from the civic arms of the cities of Frankfurt am Main and Ludwigsburg in Germany, refer to former stations of the battalion.

The crest symbolizes unit awards received by elements of the battalion. The wreath of laurel refers to the eight Meritorious Unit Commendations (Army) for service in the Pacific during World War II, in Korea, and in Vietnam, and to the Republic of Vietnam Cross of Gallantry with Palm. The triangle and sun symbolize the Philippine Presidential Unit Citation.

312th MILITARY INTELLIGENCE BATTALION

HERALDIC ITEMS

COAT OF ARMS

Shield: Argent, on a taeguk proper an enflamed torch palewise in front of two lightning flashes saltirewise of the first, on a chief wavy azure a chess knight argent.

Crest: None approved.

Motto: SEMPER VERITAS (ALWAYS THE TRUTH).

Symbolism: Oriental blue and silver gray (white) are the colors traditionally associated with military intelligence. The wavy partition alludes to service in the Pacific during World War II; the taeguk to service in Korea. The crossed flashes refer to the unit's origin as signal and its present combat electronic warfare and intelligence function. The torch is a symbol of truth and reflects the motto and the mission of the unit. The chess knight, a piece that can move covertly, further symbolizes the military intelligence mission.

DISTINCTIVE UNIT INSIGNIA

The distinctive unit insignia is the shield and motto of the coat of arms.

LINEAGE AND HONORS

313th MILITARY INTELLIGENCE BATTALION (Snow Owl)

HERALDIC ITEMS

COAT OF ARMS

Shield: Azure, a fess checky argent and tenné, overall a mullet of six points of the second.

Crest: On a wreath of the colors, argent and azure, a dragon passant gules garnished or in front of a mount vert impaled with twelve bamboo spikes proper, the dragon's tail interlaced with the spikes.

Motto: SAVOIR C'EST POUVOIR (KNOWLEDGE IS POWER).

Symbolism: Oriental blue and silver gray (white) allude to military intelligence. The colors orange and white refer to the organization's former affiliation with the Signal Corps, and the points of the mullet allude to the unit's decorations for World War II and Vietnam.

The dragon, symbolic of alertness and readiness, denotes the unit's service as an Army Security Agency battalion in Vietnam. The mount refers to the lush terrain of that country and the spikes to the number of campaigns in which the unit participated.

DISTINCTIVE UNIT INSIGNIA

The distinctive unit insignia is the shield and motto of the coat of arms.

314th MILITARY INTELLIGENCE BATTALION

HERALDIC ITEMS

COAT OF ARMS

Shield: Argent, within a cross quarter-pierced azure the device from the flag of Okinawa proper; on a chief wavy sable a dagger and a key wards up saltirewise of the first.

Crest: That for the regiments and separate battalions of the Army Reserve: On a wreath of the colors, argent and azure, the Lexington Minuteman proper. The statue of the Minuteman, Capt. John Parker (H. H. Kitson, sculptor), stands on the Common in Lexington, Massachusetts.

Motto: SAPIENTIA ET VERITAS (WISDOM AND TRUTH).

Symbolism: Oriental blue and silver gray (white) are the colors traditionally associated with military intelligence. The red and white Okinawa symbol represents the unit's service in the Pacific. The blue and white squares simulate a chessboard and allude to strategy in gathering intelligence information. Black implies covert operations, while the silver key and sword refer to securing information for military activities. Black and white also signify day and night operations.

DISTINCTIVE UNIT INSIGNIA

The distinctive unit insignia is the shield and motto of the coat of arms.

326th MILITARY INTELLIGENCE BATTALION

HERALDIC ITEMS

COAT OF ARMS

Shield: Per fess or and checky sable and argent on a pile in point party per fess azure and of the first an eagle's head couped of the third langued gules.

Crest: None approved.

Motto: FROM INTELLIGENCE ACTION.

Symbolism: Oriental blue is one of the colors used for military intelligence units. The eagle's head with piercing eye representing vigilance, keenness of vision, and swiftness of purpose symbolizes the attributes inherent in the basic mission of the organization. The checkered area alludes to secrecy and compartmentalized information and, together with the inverted triangle formed from the heraldic pile, is indicative of the penetrative methods in the gathering of intelligence.

DISTINCTIVE UNIT INSIGNIA

The distinctive unit insignia is the shield and the motto of the coat of arms.

LINEAGE AND HONORS

RA
LINEAGE (active)

Constituted 24 November 1967 in the Army Reserve as the 826th Military Intelligence Battalion. Activated 31 January 1968 with Headquarters at Hartford, Connecticut. Location of Headquarters changed 11 October 1969 to Cromwell, Connecticut. (Company C ordered into active military service 24 March 1970 at Fort Hamilton, New York; released from active military service 26 March 1970 and reverted to reserve status.) (Organic elements inactivated 16 September 1980.) Location of Headquarters and Headquarters Company changed 1 September 1981 to East Windsor, Connecticut. Headquarters and Headquarters Company inactivated 15 September 1987 at East Windsor, Connecticut.

Battalion redesignated 1 November 1994 as the 326th Military Intelligence Battalion; concurrently withdrawn from the Army Reserve and allotted to the Regular Army. Headquarters transferred 1 December 1994 to the United States Army Training and Doctrine Command and activated at Fort Huachuca, Arizona.

337th MILITARY INTELLIGENCE BATTALION

HERALDIC ITEMS

COAT OF ARMS

Shield: Argent, four flashes issuant from dexter chief, sinister chief, dexter base, and sinister base convergent in fess point azure, a dagger point up proper, blade and pommel argent, grip gules, guard and garnish or winged sable.

Crest: That for the regiments and separate battalions of the Army Reserve: On a wreath of the colors, argent and azure, the Lexington Minuteman proper. The statue of the Minuteman, Capt. John Parker (H. H. Kitson, sculptor), stands on the Common in Lexington, Massachusetts.

Motto: COLLECT EXPLOIT INFORM.

Symbolism: Oriental blue is one of the colors associated with military intelligence units. The flashes, alluding to speed and electronics, converge, emphasizing the collection and assimilation of information from all sources. They underscore the electronic warfare and signals intelligence capabilities of the unit. The winged dagger symbolizes the intelligence role in total military preparedness while characterizing the diverse mission and functions of the battalion.

DISTINCTIVE UNIT INSIGNIA

The distinctive unit insignia is the shield and motto of the coat of arms.

HERALDIC ITEMS

COAT OF ARMS

Shield: Argent, an oval sphere azure gridlined of the field, overall a key wards up palewise of the last superimposed by a sphinx's head or garnished sable; on a chief embattled sable two flashes saltirewise gules.

Crest: That for the regiments and separate battalions of the Army Reserve: On a wreath of the colors, argent and azure, the Lexington Minuteman proper. The statue of the Minuteman, Capt. John Parker (H. H. Kitson, sculptor), stands on the Common in Lexington, Massachusetts.

Motto: INVENI ET USURPA (FIND AND EXPLOIT).

Symbolism: Oriental blue is one of the colors associated with military intelligence. The embattled division of the shield signifies defense and military preparedness, while black and white suggest night and day capabilities. The globe denotes the far-reaching scope of the unit's mission. The key symbolizes security; the sphinx alludes to vigilance and strength. The red flashes indicate speed and action while representing electronic communications and technology.

HERALDIC ITEMS

COAT OF ARMS

Shield: Argent on a saltire celeste a key ward up bendwise sinister surmounted by two pikes bendwise or.

Crest: None approved.

Motto: SILENT SENTINEL.

Symbolism: Oriental blue and silver gray are the colors used for military intelligence. The key, symbol for security and secrecy, and the pikes, weapons used by sentries in the Middle Ages, symbolize the basic mission of the organization.

DISTINCTIVE UNIT INSIGNIA

Description: A gold color metal and enamel device consisting of a gold key, ward slanted upward to right behind the shafts of two pikes; all encircled by a continuous oval-shaped scroll passing through the bow of the key, behind the pike heads, keyward and over the pike staffs and bearing the inscription in black letters SILENT SENTINEL.

Symbolism: The key, symbol for security and secrecy, and the pikes, weapons used by sentries in the Middle Ages, symbolize the basic mission of the organization. The shape of the bow of the key and the two pikes further simulates the numerical designation of the organization.

Redesignated 1 July 1956 as the 301st Army Security Agency Battalion. Inactivated 15 October 1957 in Korea. Headquarters and Headquarters Company activated 15 December 1965 at Fort Bragg, North Carolina. Inactivated 18 June 1971 at Fort Bragg, North Carolina. (Companies A and B redesignated 1 November 1975 as the 356th and 329th Army Security Agency Companies—hereafter separate lineages.)

Headquarters and Headquarters Company, 301st Army Security Agency Battalion, redesignated 16 September 1980 as Headquarters, Headquarters and Operations Company, 501st Military Intelligence Battalion, assigned to the 1st Armored Division, and activated in Germany (202d Army Security Agency Company [see ANNEX 1] concurrently reorganized and redesignated as Company A; 501st Military Intelligence Detachment [see ANNEX 2] redesignated as Company B and activated).

ANNEX 1

Constituted 15 July 1967 in the Regular Army as the 202d Army Security Agency Company and activated at Fort Hood, Texas. Inactivated 19 April 1971 at Fort Hood, Texas. Activated 1 July 1974 in Germany.

ANNEX 2

Organized 26 August 1943 in Algeria as the 2678th Headquarters Company, Counter Intelligence Corps (Provisional). Disbanded 26 April 1944 and personnel transferred to the 6779th Counter Intelligence Corps Detachment (Provisional). Disbanded 18 August 1944 and personnel transferred to the 501st Counter Intelligence Corps Detachment (constituted 12 July 1944 in the Army of the United States). Disbanded 26 June 1945 in Italy.

Reconstituted 6 April 1951 in the Regular Army as the 501st Counter Intelligence Corps Detachment. Activated 11 May 1951 at Fort Holabird, Maryland. Reorganized and redesignated 25 January 1958 as the 501st Military Intelligence Detachment. Inactivated 31 March 1971 at Fort Hood, Texas.

501st MILITARY INTELLIGENCE BATTALION (Electronic Horsemen)

HERALDIC ITEMS

COAT OF ARMS

Shield: Quarterly azure and vert, in bend a lightning flash point to base gules fimbriated or and in bend sinister a cavalry saber point to chief of the like.

Crest: On a wreath of the colors, or and azure, in front of a torii gate gules a horse's head erased sable langued of the third interlaced with two lightning flashes, the one behind bendwise and one in front bend sinisterwise of the first.

Motto: OUT FRONT.

Symbolism: Blue and green refer to the air and ground assets of the battalion and further allude to the close relationship with infantry (blue) and armor (green) units of the division. The red and yellow flash connotes the prominent role of electronic signals intelligence in modern warfare. The cavalry saber, flash, and quartered field collectively suggest the blending of the traditional with the latest modern developments in intelligence, reconnaissance, security, and electronic warfare capabilities within the military intelligence battalion.

The black horse's head, suggested by the arms of the province of Naples, refers to the participation of an element of the battalion in Italian campaigns of World War II. The torii gate alludes to the battalion's service in Korea and the flashes connote awards of the Meritorious Unit Commendation (Army) and the Republic of Korea Presidential Unit Citation.

DISTINCTIVE UNIT INSIGNIA

The distinctive unit insignia is the shield and motto of the coat of arms.

502d MILITARY INTELLIGENCE BATTALION

HERALDIC ITEMS

COAT OF ARMS

Shield: Argent, on a pale azure between two beacon fires in base of the second enflamed or, in chief a beacon fire of the first enflamed of the third.

Crest: On a wreath of the colors, argent and azure, issuing from a wreath of laurel or with a Korean taeguk at center proper, a griffin's head of the third langued gules.

Motto: FREEDOM BY VIGILANCE.

Symbolism: Oriental blue is one of the colors used for military intelligence units. The three beacon fires, representing Korea's ancient system of sending messages, allude to the three campaigns in which the unit served in the Korean War. The gold of the flames commemorates unit decorations received by the battalion.

The griffin is a symbol of vigilance, the essential attribute for effective intelligence work. The taeguk represents the Republic of Korea Presidential Unit Citation, and the wreath refers to the Meritorious Unit Commendation (Army) awarded to the battalion for service in Korea. Gold is used to represent excellence and achievements of the unit.

DISTINCTIVE UNIT INSIGNIA

The distinctive unit insignia is the shield and motto of the coat of arms.

511th MILITARY INTELLIGENCE BATTALION

HERALDIC ITEMS

COAT OF ARMS

Shield: Azure, a Korean taeguk proper and issuant therefrom to chief three lightning bolts argent.

Crest: On a wreath of the colors, argent and azure, two griffins' heads addorsed and erased, that to dexter argent and that to sinister of the second both beaked and eyed or and langued gules.

Motto: PROUD AND READY.

Symbolism: Oriental blue and silver gray are the colors associated with the military intelligence branch. The lightning bolts refer to the importance of speed, electronics, and communications to all intelligence activities and represent the unit's participation in three campaigns in the Korean War and its multifaceted intelligence mission. The taeguk denotes the award of the Republic of Korea Presidential Unit Citation to the organization.

The griffin is a heraldic symbol of alertness and vigilance; the prominent eyes and ears suggest the role played by intelligence forces in support of the Army's mission. The contrasting colors and back-to-back position signify the round-the-clock and worldwide scope of the intelligence and security functions.

DISTINCTIVE UNIT INSIGNIA

The distinctive unit insignia is an adaptation of the shield, crest, and motto of the coat of arms.

Heraldic Items

Coat of Arms

Shield: Or, in base a sphinx facing to dexter couchant azure detailed of the first in front of an open book of the last, fimbriated of the second, its upper edge at fess point in front of a globe overall of the like, gridlined of the field.

Crest: On a wreath of the colors, or and azure, a garb of rice of the first in front of a triangle gules conjoined at the tip with a torii sable.

Motto: STRENGTH THRU INTELLIGENCE.

Symbolism: Teal blue and yellow are the colors formerly used for Army intelligence organizations. The sphinx also symbolizes Army intelligence. Resting against the terrestrial globe is an open book, representing the knowledge made available through mastery of the languages of the world. The globe itself indicates the worldwide scope of the battalion's activities.

Red is the color for action, and the triangle, simulating a Vietnamese sun hat, alludes to service in Vietnam. The torii refers to Korea, where an element of the organization participated in seven campaigns. The rice stalks represent the unit decorations awarded during both wars.

522d MILITARY INTELLIGENCE BATTALION

HERALDIC ITEMS

COAT OF ARMS

Shield: Azure, on a bend engrailed plain cottised between a winged sphinx couchant argent and a taeguk gules and azure fimbriated of the second, a lightning flash gules.

Crest: None approved.

Motto: THE EQUALIZERS.

Symbolism: Oriental blue and silver gray are the colors used for military intelligence. The winged sphinx is symbolic of all-seeing and eternal vigilance, and the taeguk refers to the unit's Korean War service. The electronic warfare intelligence capability of the organization is represented by the engrailed bend, and the lightning flash is indicative of speed in communication and intelligence gathering.

DISTINCTIVE UNIT INSIGNIA

The distinctive unit insignia is the shield and motto of the coat of arms.

LINEAGE AND HONORS

RA

LINEAGE (inactive)

Organized 1 September 1950 at Fort Bragg, North Carolina, as the 522d Military Intelligence Service Detachment. (Constituted 20 September 1950 in the Regular Army.) Inactivated 28 December 1951 in Korea.

Redesignated 23 June 1954 as Headquarters and Headquarters Company, 522d Military Intelligence Battalion (Companies A and B concurrently constituted). Battalion activated 27 July 1954 in Germany. Inactivated 15 August 1958 in Germany. Assigned 21 December 1976 to the 2d Armored Division and activated at Fort Hood, Texas. (373d Army Security Agency Company [see ANNEX 1] consolidated 16 October 1979 with Company A; 502d Military Intelligence Company [see ANNEX 2] concurrently consolidated with Company B.) Inactivated 15 April 1991 at Fort Hood, Texas. Activated 16 December 1992 at Fort Polk, Louisiana. Inactivated 15 January 1996 at Fort Hood, Texas.

ANNEX 1

Constituted 11 May 1962 in the Regular Army as Company B, 303d Army Security Agency Battalion. Activated 25 June 1962 at Fort Benning, Georgia. Reorganized and redesignated 15 October 1966 as the 373d Army Security Agency Company.

ANNEX 2

Constituted 21 June 1944 in the Army of the United States as the 520th Counter Intelligence Corps Detachment. Activated 1 July 1944 at Camp Campbell, Kentucky. Allotted 17 December 1948 to the Regular Army.

Reorganized and redesignated 25 January 1958 as the 502d Military Intelligence Detachment. Consolidated 28 December 1961 with the 502d Counter Intelligence Corps Detachment (see ANNEX 3) and consolidated unit designated as the 502d Military Intelligence Detachment. Reorganized and redesignated 8 January 1971 as the 502d Military Intelligence Company.

ANNEX 3

Constituted 12 July 1944 in the Army of the United States as the 502d Counter Intelligence Corps Detachment. Activated 16 August 1944 in France with personnel from provisional Counter Intelligence Corps detachment attached to the 2d Armored Division. Inactivated 14 October 1946 in Germany. Activated 10 May 1947 on Guam. Inactivated 14 March 1950 on Guam.

524th MILITARY INTELLIGENCE BATTALION

Heraldic Items

Coat of Arms

Shield: Azure two chevronels fretty argent charged with eighteen pellets all within a bordure of the second.

Crest: On a wreath of the colors, argent and azure, a garb of rice or charged at base with a taeguk proper; overall a bayonet palewise, point up, blade sable and hilt argent all tied with a ribbon gules.

Motto: SILENT VIGILANCE.

Symbolism: Oriental blue and silver gray are the colors associated with military intelligence. The interlocking chevronels suggest the gathering of information from many sources processed through the unit and distributed throughout the Army, as represented by the border. The black pellets suggest the unit's ability to interpret various data and to form assessments of military situations. Eighteen refers to the number of campaigns in which the unit participated in Korea and Vietnam.

The bayonet alludes to the unit's participation in campaigns in Vietnam and Korea, represented by the garb of rice and taeguk. The black blade refers to secrecy and the unit's intelligence function. The red band of the garb refers to the Meritorious Unit Commendation (Army) awarded the unit for service in Vietnam.

Distinctive Unit Insignia

The distinctive unit insignia is the shield and motto of the coat of arms.

527th MILITARY INTELLIGENCE BATTALION

HERALDIC ITEMS

COAT OF ARMS

Shield: Gyronny of eight argent and sable, a pale gules voided throughout argent, surmounted by a globe azure gridlined argent, overall two swords saltirewise also argent.

Crest: None approved.

Motto: STRIVE FOR EXCELLENCE.

Symbolism: The shield, divided into dark and light sections, suggests the ever-changing methods of counterintelligence functions and the day/night vigilance of intelligence gathering. The red and white allude to the coat of arms of Kaiserslautern in Germany, where the unit has been stationed. The globe alludes to the overseas origin and duty of the unit and resembles a grid, which suggests the sifting of information through the unit to support Army goals. The crossed swords symbolize offensive and defensive counterintelligence and the defense of Europe.

DISTINCTIVE UNIT INSIGNIA

Description: A silver color metal and enamel device consisting of two silver swords in saltire, pommels to base, the lateral and base areas between the swords of black enamel and the upper area of red enamel; surmounting the swords a blue disc divided by five horizontal and vertical silver lines bearing at center a black square, point up, with a silver dot; issuing from the disc three rays to the lateral and base areas and a broad arrowhead extending beyond the top all silver; on a silver scroll issuing from under the blades and the pommels, the inscription STRIVE FOR EXCELLENCE in black enamel.

Symbolism: The square and dot simulate an observation apparatus, the disc represents a globe, and the divisions symbolize a network. The arrowhead connotes martial readiness, while the rays symbolize all facets of sound, light, and vibratory systems. All represent the collection, processing, and dissemination of information functions of a military intelligence unit. The swords refer to defensive and offensive counterintelligence methods. The white arrowhead dividing the red area suggests the coat of arms of Kaiserslautern in Germany, symbolizing service there.

Lineage and Honors

RA

Lineage (active)

Constituted 18 April 1946 in the Army of the United States as the 527th Interrogation Team. Activated 1 May 1946 in Germany. Inactivated 31 October 1946 in Germany. Redesignated 6 February 1948 as the 527th Headquarters Intelligence Detachment. Activated 21 February 1948 at Fort Bragg, North Carolina. Allotted 5 May 1949 to the Regular Army. Reorganized and redesignated 23 May 1949 as Headquarters, 527th Military Intelligence Platoon. Reorganized and redesignated 4 August 1949 as the 527th Military Intelligence Service Platoon. Reorganized and redesignated 14 November 1951 as the 527th Military Intelligence Service Company. Reorganized and redesignated 31 December 1953 as the 527th Military Intelligence Company. Inactivated 25 January 1958 at Fort Hood, Texas. Activated 1 June 1962 in Germany.

Reorganized and redesignated 1 July 1972 as Headquarters and Headquarters Company, 527th Military Intelligence Battalion. (Organic elements constituted 1 October 1982 and activated in Germany.)

532d MILITARY INTELLIGENCE BATTALION

HERALDIC ITEMS

COAT OF ARMS

Shield: Checky azure and or a horse rampant sable fimbriated of the second.

Crest: None approved.

Motto: NOSCE HOSTEM (KNOW YOUR ENEMY).

Symbolism: Teal blue and yellow are the colors formerly used for military intelligence battalions. The black horse alludes to Stuttgart in Germany, the unit's place of activation. The horse and checky field combined, symbolic of a chessboard, refer to the strategic and tactical functions of an intelligence unit.

DISTINCTIVE UNIT INSIGNIA

The distinctive unit insignia is the shield and motto of the coat of arms.

533d MILITARY INTELLIGENCE BATTALION

HERALDIC ITEMS

COAT OF ARMS

Shield: Per fess argent and azure two lightning flashes saltirewise counterchanged, in chief two eagles' heads conjoined erased sable and overall in pale a double-warded key, wards to base of the first.

Crest: None approved.

Motto: VIGILANCE WITH PRIDE.

Symbolism: Oriental blue and silver gray (white) are the colors traditionally associated with military intelligence. The crossed lightning flashes connote the battalion's mission as a combat electronic warfare intelligence unit. The key is a symbol of knowledge and security. The double-headed eagle symbolizes watchfulness and vigilance and alludes to the unit's former areas of service, Austria and Germany.

DISTINCTIVE UNIT INSIGNIA

The distinctive unit insignia is the shield and motto of the coat of arms.

542d MILITARY INTELLIGENCE BATTALION

HERALDIC ITEMS

COAT OF ARMS

Shield: Sable, a sword and lightning flash saltirewise surmounted by a stylized chess piece with a griffin's head or, within a bordure compony argent and azure.

Crest: That for the regiments and separate battalions of the Army Reserve: On a wreath of the colors, argent and sable, the Lexington Minuteman proper. The statue of the Minuteman, Capt. John Parker (H. H. Kitson, sculptor), stands on the Common in Lexington, Massachusetts.

Motto: THE EYES OF THE BATTLE.

Symbolism: Oriental blue and silver gray (white) are the colors traditionally associated with military intelligence units. Black denotes solidity while suggesting clandestine capabilities. Gold alludes to excellence and achievement. The sword and flash represent military preparedness and speed. The border and chess piece suggest strategy and countermeasure tactics. The griffin symbolizes vigilance with its keen eyesight and acute hearing.

DISTINCTIVE UNIT INSIGNIA

The distinctive unit insignia is a modification of the shield and motto of the coat of arms.

LINEAGE AND HONORS

AR

LINEAGE (active)

Constituted 16 September 1987 in the Army Reserve as the 242d Military Intelligence Battalion and activated with Headquarters at Staten Island, New York. Inactivated 15 September 1993 at Staten Island, New York.

Redesignated 16 September 1993 as the 542d Military Intelligence Battalion and activated with Headquarters at East Windsor, Connecticut.

CAMPAIGN PARTICIPATION CREDIT

None.

DECORATIONS

None.

549th MILITARY INTELLIGENCE BATTALION

HERALDIC ITEMS

COAT OF ARMS

Shield: Azure, a globe argent gridlined sable, overall a lightning flash issuing from dexter chief or in saltire with a sword gules in bend sinister, all within a border of the second.

Crest: That for the regiments and separate battalions of the Army Reserve: On a wreath of the colors, argent and azure, the Lexington Minuteman proper. The statue of the Minuteman, Capt. John Parker (H. H. Kitson, sculptor), stands on the Common in Lexington, Massachusetts.

Motto: MODERN WARFARE.

Symbolism: The global aspect of the mission performed by the military intelligence branch is represented by the longitude and latitude lines of the world. The lightning flash is symbolic of the electronic warfare nature of military intelligence. The sword represents the aggressive nature and dangerous missions accomplished by military intelligence personnel. The border suggests containment and alludes to intelligence gathering and its use in defense strategy.

DISTINCTIVE UNIT INSIGNIA

The distinctive unit insignia is the shield and motto of the coat of arms.

550th MILITARY INTELLIGENCE BATTALION

Heraldic Items

Coat of Arms

Shield: Argent, a lightning bolt bendwise point to base azure, all within a bordure quarterly gules and of the first.

Crest: That for the regiments and separate battalions of the Army Reserve: On a wreath of the colors, argent and azure, the Lexington Minuteman proper. The statue of the Minuteman, Capt. John Parker (H. H. Kitson, sculptor), stands on the Common in Lexington, Massachusetts.

Motto: BLUE LIGHTNING.

Symbolism: Oriental blue and silver gray are the military intelligence colors. Blue also alludes to the battalion's affiliation with the 50th Armored (Jersey Blues) Division. The colors red and white were suggested by the shoulder sleeve insignia of the 78th Division (Training), to which the battalion was attached. The lightning bolt relates to the battalion's signal security and electronic warfare mission. The quartered border signifies military strategy.

Distinctive Unit Insignia

The distinctive unit insignia is the shield and motto of the coat of arms.

629th MILITARY INTELLIGENCE BATTALION

HERALDIC ITEMS

COAT OF ARMS

Shield: Per chevron paly of six argent and azure a bend counterchanged, and of the first in base a panther's face proper grasping two lightning flashes conjoined chevronwise of the second.

Crest: That for the regiments and separate battalions of the Maryland Army National Guard: On a wreath of the colors, argent and azure, a cross bottony per cross quarterly gules and argent.

Motto: STALK THE PREY.

Symbolism: Oriental blue is one of the colors associated with military intelligence. The upper half of the shield alludes to the state flag of Maryland and identifies the home area of the battalion. The panther embodies the nickname of the unit, "Prowler," and is a predator celebrated for its stealth and patience on the hunt. It is an appropriate symbol for a tactical level intelligence unit. The lightning flashes refer to speed of operation and the dominant role of combat electronic warfare on the battlefield.

DISTINCTIVE UNIT INSIGNIA

The distinctive unit insignia is the shield and motto of the coat of arms.

LINEAGE AND HONORS

ARNG

LINEAGE (Maryland)

Organized and federally recognized 3 May 1988 in the Maryland Army National Guard as the 629th Military Intelligence Battalion, an element of the 29th Infantry Division, with Headquarters at Greenbelt. Location of Headquarters changed 1 April 1994 to Laurel.

Home Station: Laurel.

Glossary of Lineage Terms

ACTIVATE. To transfer a constituted Regular Army or Army Reserve unit from the inactive to the active rolls of the United States Army. The unit is usually stationed at a specific location and assigned personnel and equipment at this time; however, a unit may be active at zero strength—that is, without personnel or equipment.

ALLOT. To allocate a unit to one of the components of the United States Army. The present components are the Regular Army (RA), the Army National Guard (ARNG), and the Army Reserve (AR), formerly known as the Organized Reserves and the Organized Reserve Corps. During World War II units were also allotted to the Army of the United States. An Army National Guard unit is usually further allotted to a particular state or group of states. A unit may be withdrawn from any component except the Army National Guard and allotted to another; the new allotment, however, does not change the history, lineage, and honors of the unit.

ASSIGN. To make a unit part of a larger organization and place it under that organization's command and control until it is relieved from the assignment. As a rule, only assignments to divisions and separate combined arms brigades are shown in unit lineages.

CONSOLIDATE. To merge two or more units into a single unit. The unit may retain the designation of one of the former units or it may have a new designation, but it inherits the history, lineage, and honors of all of the former units. Active as well as inactive units may be consolidated.

CONSTITUTE. To place the designation of a new unit on the official rolls of the United States Army.

CONVERT. To transfer a unit from one branch of the Army to another—for example, from signal to military intelligence. Such a change always requires a redesignation; however, there is no break in the historical continuity of the unit. Active as well as inactive units may be converted, but if the unit is active, it must also be reorganized under a new table of organization and equipment (TOE).

DESIGNATION. The official title of a unit, consisting usually of a number, a branch or function, and a command echelon. Additional descriptive terms may appear in parentheses, but such parenthetical identifications are not part of the unit's official designation.

DISBAND. To remove the designation of a Regular Army or Army Reserve unit from the official rolls of the United States Army. If the unit is active, it must also be inactivated. Disbandment is intended to be permanent and irreversible, except in extraordinary circumstances.

ELEMENT. A unit that is assigned to or is part of a larger organization.

FEDERALLY RECOGNIZE. To accept an Army National Guard unit into the force structure of the United States Army after the unit has been inspected by a federal representative and found to be properly stationed, organized, and equipped in accordance with Army requirements.

INACTIVATE. To place a Regular Army or Army Reserve unit that is not currently needed in the force structure in an inoperative status without assigned personnel or equipment for a limited period of time. The unit is transferred to the inactive rolls of the United States Army, but it can be activated again whenever needed. Upon reactivation, the unit retains its former history, lineage, and honors.

ORDER INTO ACTIVE FEDERAL SERVICE. To place an Army National Guard unit on full-time active duty under the control of the United States government. The unit remains in federal service until released by the federal government, at which time it reverts to the control of its home state or states.

ORDER INTO ACTIVE MILITARY SERVICE. To place an Army Reserve unit on full-time active duty, usually during a war or a crisis. After completing its active duty, the unit may be inactivated or it may be released from active military service, reverting to reserve status. This term does not apply to Army Reserve units on annual active duty for training.

ORGANIC ELEMENT. A unit that is an integral part of a larger organization—for example, a lettered company of a battalion.

ORGANIZE. To assign personnel and equipment to a unit and make it operative—that is, capable of performing its mission. For Army National Guard units, this term is used instead of ACTIVATE. (See above.)

RECONSTITUTE. To restore to the official rolls of the United States Army a unit that has been disbanded or one whose federal recognition has been withdrawn. The reconstituted unit may have a new designation, but it retains its former history, lineage, and honors.

REDESIGNATE. To change a unit's official title. Active as well as inactive units may be redesignated, but personnel and equipment of an active unit are not changed unless the unit is reorganized at the same time. Redesignation is a change of title only; the unit's history, lineage, and honors remain the same.

REORGANIZE. To change the structure of a unit in accordance with a new table of organization and equipment (TOE) within the same branch of the Army.

SPECIAL DESIGNATION. An official unit nickname. There are two types of special designations—a traditional designation (one that a unit has used continuously for the last thirty years or more) and a distinctive designation (one that a unit has used for less than thirty years or one with which a unit wishes to be associated). The special designation, if any, appears in parentheses after the unit's official designation.

WITHDRAW FEDERAL RECOGNITION. To remove the designation of an Army National Guard unit from the official rolls of the United States Army. Federal recognition is withdrawn when the unit no longer meets Army requirements or is no longer needed in the force structure.

Foreword

This book is part of the Army historical community's commemoration of the fiftieth anniversary of World War II. American victory in that conflict was brought about not only by the valor of our fighting men and the immensity of our productive capacity, but also by the availability of superb military intelligence. Much of this intelligence came from the ability of our armed forces to intercept and decipher the most secret communications of their adversaries. For many years security considerations prevented any public mention of these successes in the official histories. Now much of the story can be told. To preserve the memory of the Army's role in this intelligence war, the U.S. Army Center of Military History has joined with the History Office, U. S. Army Intelligence and Security Command (INSCOM), to publish this collection of documents on Army signals intelligence in World War II. INSCOM carries on the heritage of the Army's World War II Signal Security Agency, which by breaking the Japanese diplomatic ciphers and military codes helped speed the way of our forces to victory.

The book is intended both for an Army audience and for the general public—including those World War II veterans who participated in the signals intelligence war and who for so many years were constrained to keep their contributions secret. The security barriers have now been lifted, and the Army is proud to acknowledge those contributions.

Preface

The Army's contributions to the success of the American communications intelligence—COMINT—effort in World War II are not widely known. This volume represents a modest attempt to close this information gap. The core of the book consists of World War II–era documents generated by various cryptologic organizations of the U.S. Army. Originally, most of these documents were highly classified. As a result of initiatives undertaken in the 1970s, they have now been released to the National Archives and Records Administration in the form of Special Research Histories after declassification by the National Security Agency. The documents included necessarily represent only a small fraction of the material that is now in the public domain. It is hoped that the publication of this book will help to alert the public to the existence of this relatively unexplored mass of historical documentation. Although these materials are being increasingly used by professional historians, only two collections of these documents have yet been published. In 1977, the Department of Defense released a multivolume compilation entitled *The "Magic" Background of Pearl Harbor*; more recently, Dr. Ronald Spector has edited *Listening to the Enemy: Key Documents on the Role of Communications Intelligence in the War with Japan*. We can assure the reader that the present volume does not exhaust the possibilities of further exploiting this largely untapped source.

The documents themselves consist for the most part of official histories and government memoranda. For the sake of variety, we have also included one highly unofficial history and examples of intelligence reports and intercepted messages. Some of the documents have been rather heavily sanitized before release, as is indicated by the [text withheld] notations liberally sprinkled through them. It should be pointed out that the declassification/sanitization process went on for a number of years (and is still continuing), and that guidelines as to the releasability of material have changed during this period. As a result, the careful reader will note certain inconsistencies. The editors of this volume have made no attempt to reverse any of the original declassification decisions. They have, however, not hesitated to abridge documents that were overly long or treated subjects repetitively. The editors have also chosen to eliminate those portions of documents that had been so

heavily sanitized as to render them less than intelligible. Those who are curious about what we may have omitted may check the original documents at the National Archives and Records Administration. It should be noted that most typographic mistakes in the originals have been retained.

No book comes into existence without some type of collaborative process going on, and this one is no exception. We would like to begin by thanking Col. James H. P. Kelsey, Deputy Chief of Staff, Operations, U.S. Army Intelligence and Security Command, for the unfailing support he has provided to the History Office in all of its projects. The manuscript itself was prepared and proofread by Ms. Diane L. Hamm, the History Office writer-editor. John Elsberg of the U.S. Army Center of Military History did much to enhance the final product through astute editing and wise counsel. John Greenwood, Chief of the Center of Military History's Field and International Division, made arrangements for an earlier version of the introductory essay to be presented at the 1990 Army Historians Conference. John Birmingham designed and formatted the final product, working closely with the authors and the editorial staff. Finally, we would be remiss if we did not thank the numerous declassification specialists at the National Security Agency whose dedicated work made the publication of this book ultimately possible.

U.S. ARMY
SIGNALS INTELLIGENCE
IN WORLD WAR II

CHAPTER I

U.S. Army Signals Intelligence in World War II: An Overview

by John P. Finnegan

The United States Army entered World War II with an effective, functioning organization for the production of communications intelligence—COMINT. This was the Signal Intelligence Service (SIS) of the Army Signal Corps. The SIS had been formed in 1930 to consolidate all Army cryptologic functions under the Signal Corps. It was a unified organization responsible for producing the Army's own codes and cipher devices and for attempting to decrypt the communications of America's potential adversaries. Previously, the cryptanalytic function had been carried out by the War Department's Military Intelligence Division through a clandestine element based in New York, headed by Herbert O. Yardley, and funded with State Department support. However, this had been discontinued in 1929, partially as a result of Secretary of State Henry L. Stimson's conviction that "Gentlemen do not read each other's mail."[1]

The SIS was an organization shaped by its first chief, the legendary William F. Friedman. Friedman, who had previously served as the Signal Corps' code and cipher consultant, quickly recruited a small but extremely talented civilian staff. Even after a military officer was placed in charge of the SIS in 1935, Friedman continued to exercise a wide influence. During the period before World War II, the SIS published a series of influential studies on cryptology and pioneered the development of machine ciphers of unparalleled sophistication and security to safeguard Army communications. It also implemented training courses to educate reserve officers in cryptology, thus setting up a limited mobilization base for wartime expan-

sion. Another accomplishment was the establishment of a network of radio intercept stations, something which the Army had never attempted in peacetime; Yardley's earlier cryptanalytic efforts had depended on the cooperation of friendly cable companies to provide the raw material. [2]

The greatest prewar accomplishment of SIS, however, was its success in deciphering the machine cipher used by the Japanese Foreign Office for its most secret messages. Through purely cryptanalytic methods, the SIS was able to build an analog of this machine and read Japanese dispatches as quickly as the intended recipients. As a result, the Army became privy to the thought processes that guided Japanese diplomacy. The secret breakthrough was shared with SIS's Navy counterpart, OP–20–G, and later with the British. Otherwise, it was closely held. Decrypts of enciphered Japanese messages, code-named MAGIC, were passed on to a tightly restricted group of individuals in the War and Navy Departments and further disseminated to top policymakers (the Secretaries of War, Navy, and State, the President's military adviser, and the President himself). [3]

Unfortunately, MAGIC could not ward off Pearl Harbor. The high-level communications of the Japanese Foreign Office did not carry the details of Japanese military planning. Consular traffic that did contain military intelligence indicators traveled in less secure systems, but it could not be translated in a timely fashion because of other priorities. Moreover, the very secrecy with which MAGIC was handled impaired its utility. A few upper-level officials received tantalizing snippets of information from critical messages, but the material itself was never subject to detailed exploitation and analysis over the long haul. As Friedman would later put it, "each message represented only a single frame, so to speak, in a long motion picture film." [4] But no one had ever been in a position to watch the whole movie.

The shock of the Pearl Harbor attack immediately led to the adoption of a more systematic approach to handling diplomatic intercepts. A first step was taken when the Secretary of War, Henry L. Stimson, directed that a Special Section be formed within the Military Intelligence Division's Far Eastern Section. (The head of the Far Eastern Section had previously functioned as the sole conduit of MAGIC.) Following an outside study conducted at Stimson's direction by a Chicago attorney, Alfred McCormack, the section was expanded to the status of a Special Branch within the Military Intelligence Service that was created as the operating arm of the Military Intelligence Division in March 1942. The Special Branch was headed by Col. (later Brig. Gen.) Carter Clarke; McCormack himself accepted a

colonel's commission and became Clarke's deputy. This organizational innovation for the first time allowed sufficient numbers of analysts access to COMINT in ways that would allow them to use it in its entirety to build up an intelligence picture. [5]

Meanwhile, the Signal Intelligence Service was conducting a rapid expansion. In March 1942 the Military Intelligence Division (MID) recommended to the Chief Signal Officer that SIS move from its existing quarters in the Munitions Building in downtown Washington to new quarters that would provide greater security. MID also suggested that primary monitoring stations be established, one on each coast. At the time, the seven small existing stations manned by the 2d Signal Service Company—the SIS collection unit—were not well positioned for wartime needs; the station nearest to the scene of action, Fort McKinley in the Philippines, had already been overrun by the Japanese Army. [6]

Under wartime conditions, these steps were taken with alacrity. In June 1942 the first Army elements took possession of Arlington Hall, a former women's junior college just outside Washington. That same month, personnel from the 2d Signal Service Battalion (as the intercept arm of the SIS was now designated) began operations at Vint Hill Farms in Warrenton, Virginia, which had been selected as the site for Monitoring Station Number 1. A second major field station was soon set up at Two Rock Ranch near Petaluma, California. In the meantime, SIS itself was redesignated. The term "Signal Intelligence" was thought to be too provocative; SIS first became the Signal Security Division, then the Signal Security Service; and achieved its final wartime designation as the Signal Security Agency (SSA) in the summer of 1943. [7]

The Signal Corps' cryptologic organization recruited a largely civilian work force and began a process of rapid expansion. The original buildings at Arlington Hall were quickly outgrown. In the winter of 1942 and the spring of 1943, two large temporary buildings were hastily constructed at Arlington Hall to handle the overflow. Meanwhile, the agency moved in new directions even as it grew. In the spring of 1942 liaison with the British introduced it to the new and promising art of traffic analysis, through which intelligence could be derived from the externals of a message even if the message itself could not be decrypted. In June 1942 the agency was given exclusive responsibility for exploiting foreign diplomatic communications, a mission previously shared with the Navy. It also dispatched a small detachment to Australia and sent one of Friedman's top cryptologists, Col.

Abraham Sinkov, to command it. This would become the American nucleus of a completely independent COMINT effort conducted in support of General Douglas MacArthur's Southwest Pacific Area by Central Bureau Brisbane, a combined U.S.-Australian operation headed by Brig. Gen. Spencer Akin, MacArthur's signal officer and a former chief of SIS. [8]

However, there were still large deficiencies in the Army's COMINT effort. The effort remained fragmented with intelligence production and collection in separate compartments. The Special Branch of the Military Intelligence Service, responsible for COMINT evaluation, had no association with the cryptanalysts at Arlington Hall. The latter group worked for the Signal Corps, which itself was only one component of the Army Service Forces. As a result, McCormack commented, a situation existed in which the Military Intelligence Service was "simply taking in what the Signal Corps catches and turns in, leaving with the Signal Corps the responsibility for determining how much it will catch and turn in, and from what sources."[9] And the Signal Security Agency itself did not monopolize COMINT collection, since tactical signals intelligence units in the field worked for the supported commanders, not SSA. [10]

Moreover, the Army's COMINT effort was hampered by a severe shortage of personnel throughout the whole system. This created bottlenecks within the Special Branch and the Signal Security Agency. Part of the problem resulted from military regulations. The Secretary of War had decreed that no officer under 28 years old could be in Washington after 31 January 1942. Additionally, the Army was reluctant to offer direct commissions to qualified civilians. The Civil Service Commission was equally obstructive. McCormack noted rather sourly that it seemed "unable to distinguish an intelligence organization from an office that routes and stamps papers, and therefore forces on us an organization chart that calls for quotas of morons and semimorons. . . ." The Signal Security Agency, with much larger personnel requirements, was even more vulnerable to such practices, and it was hampered by the low priority given to it as a component of Army Service Forces. Paradoxically, the importance of its work, which might have been used to justify a higher personnel priority, was too secret to divulge. [11]

Even more frustrating was the slow progress made by SSA in actually breaking any military codes. As previously noted, Japanese cryptosystems worked on principles entirely different from those used in Japanese diplomatic communications. The Japanese Army used bulky reenciphered codes, not a cipher machine. Cryptanalytic continuity was lacking. The Navy had

been able to monitor traffic produced by Japanese naval exercises in the 1930s, but the Army had never encountered Japanese military nets until Bataan. As a result, SSA analysts at Arlington Hall were not able to make an entry into a single Japanese Army system until April 1943, when SSA and MacArthur's Central Bureau Brisbane made an almost simultaneous breakthrough. The first usable intelligence was not derived from exploitation of this Japanese Water Transport code until June 1943. [12]

The Army was equally frustrated in its attempt to work on German military systems. In April 1942, SSA had suggested to the British that it be allowed to work on the Enigma cipher machine used in high-level communications of the German armed forces. It was generally understood that the Government Code and Cypher School (the main British cryptanalytic center at Bletchley Park) had achieved some success in this field. However, the British rebuffed the Army's efforts either to secure Enigma decrypts or to work on the Enigma problem. This studied lack of cooperation—justified by the British on grounds of security and economy of effort—became even more grating when the Army became aware that the British were willing to share high-level COMINT with the U.S. Navy to meet the operational needs of fighting the U-boat war. [13]

Finally, America's first exposure to actual land combat in the Tunisia campaign that followed Operation TORCH revealed major deficiencies in the structure of the Army's tactical signals intelligence organization. When the Army entered World War II, it was envisaged that only two types of tactical COMINT units would be needed: radio intelligence platoons organic to the divisional signal companies and signal radio intelligence companies assigned on a basis of one per field army. Since it was assumed that analysis and translation would be accomplished by small radio intelligence staffs at theater or field army level, as had been the case in World War I, no analytic personnel were included in these units. [14]

The test of combat quickly demonstrated the unsuitability of this structure. The divisional platoons, in exposed positions near the front, were in too great a danger of being overrun to practice effectively their specialty; the signal radio intelligence companies, as organized, were too large and unwieldy to be used to support a corps, which had no dedicated communications intelligence support but which seemed to be the level of command most in need of it. Central processing proved to be impracticable, and the staffs at army level were too limited to handle the volume of exploitable COMINT. At the same time, the communications practices of the European

members of the Axis (but not the Japanese) presented large volumes of material sent in clear or in low-level codes susceptible to timely forward exploitation. The Army was initially forced to turn to the British to bolster its units with analytic personnel. Later, a numbered theater intelligence service, the 849th Signal Intelligence Service, was formed to support American COMINT units in the North African Theater of Operations. [15]

In short, the Army's successes in the COMINT field up to the midpoint of the war were limited. Its continuing triumphs in the field of diplomatic communications had not been matched by corresponding success against the military systems in use by its major adversaries. The Army's COMINT effort had been hampered by its own organizational deficiencies and lack of priorities. The Army had been rebuffed by the British in its attempt to obtain access to German COMINT; it had been largely baffled by the Japanese military systems. Commenting on the situation in early January 1944, McCormack concluded morosely that "except for whatever the Navy has been able to do, we have achieved no corresponding victory over the Japanese. To date, in the field of radio intelligence, we have met largely with failure." [16]

McCormack's dissatisfaction at the beginning of 1944 was understandable. A resistive personnel system had created bottlenecks within both Arlington Hall and the Special Branch. Arlington Hall's initial breakthrough against Japanese codes in the summer of 1943 had created "a critical need for at least 2,000 [additional] persons. . .", but it had taken six months to begin "the lengthy and difficult job of recruiting such personnel. . . ." In the meantime, 200,000 unread Japanese messages had piled up. [17]

But McCormack drew too dark a picture. Already the situation was becoming brighter. Mid-1943 had been a watershed in the Army's final successful exploitation of communications intelligence. Two major developments took place at this time. The first was Arlington Hall's success in breaking and exploiting the Japanese Water Transport codes. This proved to be a springboard for the exploitation of other Japanese military systems. The Signal Security Agency, now steadily expanding, was able to throw masses of personnel and batteries of IBM machines against the Japanese military cryptosystems. The capture of codes by troops in the field enhanced the ongoing efforts of cryptanalysts. Soon after McCormack's pessimistic evaluation, Arlington Hall had thus mastered the main Japanese Army code, a breakthrough that produced a wealth of intelligence. [18]

The second development was of equal importance. In mid-1943 the

British finally decided to take the United States Army into their confidence and reveal the full story of their success against the Enigma and other high-grade German systems. This was accomplished by a liaison visit to London by a joint Special Branch–SSA team: McCormack, Friedman, and Lt. Col. Telford Taylor of the Special Branch. All barriers to free exchange suddenly fell. American cryptanalysts were allowed to work at Bletchley Park, a Special Branch liaison officer in London supervised the dispatch of pertinent traffic to MID in Washington, and Arlington Hall was given a share of research on the Enigma problem. In turn, the United States agreed to adopt and implement stringent British security practices on the transmission of COMINT to the field. [19]

The new availability of COMINT from both American and British sources created for the first time the problem of dissemination to the field. The problem was solved by the creation of a system of Special Security Officers (SSOs) along the pattern already established by the British. The SSOs would serve as representatives of Special Branch to the major American commands in the field, functioning as transmitters, guardians, and interpreters of ULTRA, as high-level COMINT was now called. The first three SSOs were sent to the Pacific in December 1943. Shortly thereafter, the British agreed to allow American SSOs to support the American commanders in the European and North African–Mediterranean–Middle East Theaters. (Previously, the British Special Liaison Unit system had handled all such dissemination of COMINT.) A subsequent decision to release ULTRA down to the field army and numbered air force level resulted in an even greater expansion of the Special Security Officer system. By August 1944 the SSO system had been allotted 172 officers and 65 enlisted communications personnel. [20]

The new importance and availability of COMINT led to changes in the organizational structure that produced it. By mid-1944 Special Branch was as large as all other branches in the Military Intelligence Service's Intelligence Group combined. But this created a situation in which a large portion of the War Department's intelligence organization labored blindfolded, producing estimates without access to what was now the Army's single most important intelligence source. This was an obviously less than desirable situation, and it led to a reorganization of MID and its operating arm. Rather awkwardly, this took place just at the time of the Normandy invasion. Special Branch, as such, was broken up; its members dispersed through the rest of the Military Intelligence Service. (A smaller Special

Branch entity continued to supervise dissemination of COMINT to the field.) [21]

A few months later, the artificial barriers that had separated collectors of COMINT from evaluators also fell. The fact that the Signal Security Agency was just a small part of the Signal Corps had disturbed War Department intelligence officers ever since 1942. By 1944 the SSA had become the Military Intelligence Division's most important single source, furnishing it with 70 percent of its diplomatic intelligence and 80 percent of its information on the Japanese military. This made the existing situation even more unsatisfactory. In August 1944 Assistant Secretary of War John J. McCloy wrote pointedly to Lt. Gen. Joseph McNarney, the Army Deputy Chief of Staff, that "I do not believe it is good practice to have the MIS by general directive and the establishment of general policies to attempt to create a workable intelligence organization in the low echelons of Army Service Forces as they are now attempting to do."[22] The Signal Corps clung tenaciously to SSA, but in the end it was forced to back down. On 15 December 1944, the Military Intelligence Division was given operational control over the Signal Security Agency, leaving the Chief Signal Officer responsible only for the agency's administration. [23]

Meanwhile, SSA continued to expand. By the summer of 1944 5,100 civilians and 2,000 military personnel were on duty at Arlington Hall. The intercept facilities of the 2d Signal Service Battalion, SSA's collection arm, were also built up. In the spring of 1944 new fixed stations were established at New Delhi, India; Asmara, Eritrea; Fairbanks and Amchitka, Alaska; and Fort Shafter, Hawaii. In the fall the steady advance of American forces allowed another field station to be established on the island of Guam. The battalion also took over "listening posts" at Bellmore, New York, and Resada, California, that had been previously operated by the Office of Strategic Services (OSS). The OSS had used the facilities to track Axis propaganda broadcasts; SSA converted them to security monitoring stations. [24]

At the tactical level Army signals intelligence was strengthened by the creation of new types of units. As previously noted, the Army's experience in conducting the COMINT war in North Africa and later in the Mediterranean had demonstrated deficiencies in the existing organization of field assets. Divisional signal radio platoons had proven unsatisfactory; the existing signal radio intelligence companies were cumbersome and could function effectively only when supplemented by analytic and linguist personnel from a theater-level signal intelligence service. The War Department's initial reaction had been to move radio intelligence platoons

up to the corps signal battalion. However, this measure only jammed a small number of intelligence personnel into a larger unit performing an unrelated function, resulting in obvious security and operational disadvantages. In the northern European theater, a happier solution was found. Small signal service companies, numbered in a sequence beginning with 3250, were formed from existing resources in theater to provide COMINT support to each corps. These units contained their own analytical personnel. The large signal radio intelligence companies continued to operate at army, army group, and theater level. [25]

In the Far East, because of the nature of the target and the tactical circumstances, the structure of the Army's tactical signals intelligence organization followed a different pattern. The Japanese target array offered little opportunity for local exploitation, and large Army formations were not fielded until the Philippine campaign of late 1944. Consequently, the four signal radio intelligence companies in the Southwest Pacific Area operated as collection arms for MacArthur's Central Bureau Brisbane rather than supporting the army commanders. In the Pacific Ocean Area two signal radio intelligence companies worked in similar fashion on high-level codes for Arlington Hall. [26]

In addition, the Army Air Forces (AAF) created its own specialized intercept units to carry out a mission previously performed by signals intelligence units of the ground Army. In 1944 the AAF organized radio squadrons, mobile, to support each numbered air force. These large, battalion-size units, which included AAF intelligence analysts, were capable of operating in separate detachments and conducting intercept against both continuous-wave (Morse) and voice transmissions. [27]

By 1945, then, the Army had largely perfected its structure for collecting, evaluating, and disseminating communications intelligence. In this field, however, the Army never acted as an autonomous player. MIS and SSA were partners in a vast combined effort in which responsibilities were largely divided along theater and target lines, with the British focusing on the German problem, and the Americans on the Japanese. However, the U.S. Army was deeply involved in all theaters: American SSOs furnished intelligence derived by Bletchley Park to the American commanders they supported in Europe, and Army personnel were at three of the four great Allied production centers. The Army controlled Arlington Hall; Central Bureau Brisbane continued as a combined U.S.-Australian effort; and the Army had a foothold at Bletchley Park. Only the Wireless Experimental

Center at Bombay, India, remained a purely British operation. [28]

Despite these steady improvements, the Army's COMINT arrangements were still less than satisfactory in three areas. SSA was still under the administrative control of the Chief Signal Officer, and this took its toll on any claim for resources. The fact that Col. Preston W. Corderman, who commanded 10,000 men and women in his dual capacity as chief of SSA and commander of the 2d Signal Service Battalion, did not receive a brigadier general's star until June 1945 reveals something of the dimensions of the problem. [29]

Second, the Army's strategic and tactical signals intelligence assets were still not coordinated properly. Tactical COMINT units were trained by Army Ground Forces, not SSA, and they functioned under the direction of theater and numbered air force commanders, not SSA, despite the fact that this division of labor did not reflect the reality that the communications intelligence process was a seamless web. As one contemporary evaluation put it, "radio intelligence operations, their availability for interception, the cryptographic systems used, and the usefulness of the results derived therefrom, all have no relation to the considerations which are determinative in assigning command responsibility for combat operations against enemy forces." [30]

Finally, cooperation between Army and Navy COMINT operations had been slow to arrive, despite the fact that OP–20–G, the Navy equivalent of SSA, was headquartered in another requisitioned junior college just a few miles away from Arlington Hall. An Army-Navy Communications Intelligence Coordinating Committee (ANCICC) had been set up in early 1944, but had not been able to effect coordination all that well. The Navy had different uses for COMINT than the Army, and its security practices were more stringent. Navy hesitancy at sharing naval COMINT had been so great that McCormack at one time had toyed with the idea of terminating all cooperation between the two services. In February 1945, however, the two service chiefs (Army Chief of Staff General George C. Marshall and Navy Commander in Chief and Chief of Naval Operations Admiral Ernest W. King) had agreed to set up a high-level Army-Navy Communications Intelligence Board to finally coordinate a joint effort. [31]

The new head of MID, Maj. Gen. Clayton Bissell, took this Navy initiative as an opportunity to resolve what he perceived as the remaining difficulties of Army signals intelligence organization. He protested that "the Army cannot participate on an inter-service project of this sort as long as its

own signal intelligence activities remain as decentralized as they now are." [32]

This bureaucratic ploy spurred the War Department to thoughts of reorganization. After consulting theater commanders in the Far East, the Army created a single unified signals intelligence organization on 15 September 1945. The Army Security Agency established that day was to control "all signals intelligence and security establishments, units, and personnel" and to function under direct control of the Military Intelligence Division. The U.S. Army thus attained the integrated COMINT organization its intelligence chiefs had so long desired—thirteen days after the world war that had called it into being had finally come to an end. [33]

CHAPTER II

The Road to Pearl Harbor

These documents trace the evolution of U.S. Army signals intelligence in the period prior to United States involvement in World War II. SRH 29, A Brief History of the Signal Intelligence Service, was written by William F. Friedman, the organization's first head. It sketches the beginnings of Army signals intelligence in World War I, provides an unflattering account of Herbert O. Yardley's Black Chamber organization, the legendary cryptanalytic unit secretly funded by the State and War Departments, and goes on to explain the reasons for transferring the function from Military Intelligence to the Signal Corps in 1929. SRH 134, Expansion of the Signal Intelligence Service, was also written by Friedman. It charts the growing pains of this organization after 1930, and discusses how the efforts of Friedman and his team resulted in the breaking of the Japanese diplomatic machine cipher, codenamed PURPLE.

The actual intercept of communications was performed by specially trained Signal Corps personnel. After 1938, these were brought together in a unique unit, the 2d Signal Service Company. The establishment of this unit is documented in an excerpt from SRH 135, History of the Second Signal Service Battalion, 1939-45.

The success of the SIS in breaking PURPLE was shared with the Navy's corresponding cryptologic unit, OP-20-G, but was otherwise closely held. The intelligence product obtained from decrypted Japanese diplomatic communications was assigned the codename MAGIC and disseminated to only a small group of top officials. One of the most important messages contained in Japanese diplomatic traffic is reproduced from *The Magic Background of Pearl Harbor, Volume IV, Appendix* (Washington, D.C.: Department of Defense, 1977), p. A-89. However, the stringent security measures surrounding MAGIC impaired effective and sustained evalu-

ation of the material. The excerpt from SRH 115, U.S. Army Investigations Into the Handling of Certain Communications Prior to the Attack on Pearl Harbor, 1944-1945, shows the impact of this policy of tight compartmentation on the War Department military intelligence organization.

From SRH 029. *William F. Friedman, the first head of the Signals Intelligence Service, was America's foremost cryptologist. Born in Czarist Russia to Jewish parents, Friedman was brought to the United States by his family as a very young child. He was originally trained as a geneticist, but his energies were soon diverted to the exotic field of cryptology when he was hired by the eccentric philanthropist George Fabyan to work at Fabyan's private "think-tank"—Riverbank Laboratories at Geneva, Illinois. Fabyan had a theory that Shakespeare's plays had actually been written by Sir Francis Bacon, and that this could be proved by deciphering a hidden cipher that Bacon had scattered throughout the plays. Fabyan was wrong—as Friedman convincingly demonstrated many years later, no such cipher existed—but his enthusiasms led Friedman on to a brilliant career. In 1942, Friedman wrote this succinct account of the origins of the Army's World War II signals intelligence organization. As can be seen from the text, his bitterness against his great colleague and rival, Herbert O. Yardley, continued to run deep.*

A BRIEF HISTORY OF THE SIGNAL INTELLIGENCE SERVICE

1. Prior to June 1917 no department of the Government conducted cryptanalytic activities whatsoever. From June 1916 to about May 1918 a considerable amount of work along these lines was conducted purely as a patriotic enterprise at his own expense by Mr. George Fabyan, whose Riverbank Laboratories at Geneva, Illinois, organized a small group of fairly well-trained cryptanalysts to work upon such codes and ciphers as were forwarded by the War, Navy, State, and Justice Departments. The undersigned directed the cryptanalytic operations and training at the Riverbank Laboratories from the time of the inception of this work until its close thereat in 1919, except for a period of a year when he was 1st Lieut., MID, serving at GHQ-AEF in the German code solving section.

2. In June 1917 the cryptanalytic activities of the War Department were initiated by Colonel Van Deman, G-2, with the commissioning of H.O. Yardley as 1st Lieut., MID. Yardley, who had been a telegrapher at the State Department and had

taken some interest in cryptography, was given two civilian employees to assist him. The work grew rapidly and by the autumn of 1917 the increased staff was organized as a section designated as MI-8, which was subdivided into 6 subsections with duties as indicated very briefly below:

(1) Code and cipher solution subsection. - This subsection was what would now be called the cryptanalytic subsection. It was the largest of the subsections of MI-8 and performed the cryptanalytic work not only for the War Department *but also for all other Government departments, including Navy, State, Justice, and the two censorships—Cable and Postal, which were then separate organizations.*

(2) Code and cipher compilation subsection. - Despite the fact that under Army regulations the compilation and revision of codes was a function of the Chief Signal Officer, compilation activities under the Signal Corps were apparently in a moribund state. Information having been received that the Germans possessed copies of the War Department Telegraph Code, MI-8 deemed it advisable to establish a code compilation subsection, and that subsection produced several codes such as Military Intelligence Codes No. 5 and No. 9, small pocket codes for secret agents, and the like.

(3) Training subsection. - In addition to training its own personnel MI-8 trained the majority of the personnel sent overseas for cryptanalytic duties with field forces, both AEF and Siberia.

(4) Secret inks subsection. - A laboratory was established for the preparation of invisible inks for use by our own agents. It also examined letters for secret ink writing and an average of over 2000 letters per week were examined for the military and postal censorship from July 1, 1918 to February 1, 1919.

(5) Shorthand subsection. - This subsection was organized to handle texts in various shorthand systems, especially German, which had to be deciphered.

(6) Communications subsection. - This was established in MI-8 for handling messages to and from military attaches and intelligence officers serving abroad. In a period of 9 months it sent and received about 25,000 such messages, practically all in code.

3. At the height of its development, which was reached in November 1918, MI-8 was, for those days, a rather large unit, consisting of 18 officers, 24 civilian cryptographers and cryptanalysts, and 109 typists and stenographers. The time had come for the establishment of a definite policy for the future. Now, the guiding heads of Military Intelligence at that time fully recognized the high importance and value of the services rendered by the cryptanalytic bureau, because they had been in positions where the products of the daily activity of the bureau came directly to notice and they could not fail to note the influence and bearing which the work had, not only upon the military and naval but also upon the diplomatic, political, and economic phases of the conduct of the war. They therefore had *practical* experience in the matter and could bring the weight of their position of influence and their actual experience to bear upon those in charge of the purse strings, with the

result that they were able to obtain funds sufficient to keep a fairly large organization intact for a year or two. An annual appropriation of $100,000 was recommended in a G-2 study dated May 16, 1919 [text withheld] to be used as follows:

Rent, light, and heat		$3,900
Reference books		100
Personnel:	Chief	6,000
	10 code and cipher experts @ $3,000 each	30,000
	15 code and cipher experts @ $2,000 each	30,000
	25 clerks @ $1,200 each	30,000
	Total	$100,000

The item for "rent, light, and heat" is explainable when it is noted that the bureau was to be moved from Washington with a view to hiding its existence. Of the $100,000 recommended, the State Department was to provide $40,000 and $60,000 was to be provided for expenditure by the A.C. of S, G-2 on "confidential memoranda" against funds pertaining to "Contingency Military Intelligence Division"—that is, by vouchers not subject to review by the Comptroller General. The paper containing the recommendations made by the A.C. of S, G-2 to the Chief of Staff was "OK-ed" and initialled by Acting Secretary of State Polk on May 17, 1919, and on May 19 it was approved by the Secretary of War over the signature of General March, Chief of Staff. The plan was put into effect, the bureau was installed in a private house at 22 East 38th Street, New York City, and all personnel together with existing records were moved thereto.

4. It is important to note that at that time no provision whatsoever was made for radio intercept as a source of raw material for cryptanalysis. A few words on this subject may not be amiss. Radio intercept of fixed station material in the U.S. by the Army during our active participation in the last war was rather fragmentary. The work was, of course, a responsibility of the Signal Corps, but radio communications could hardly compete with cable and wire communications as a source of raw material because not only did the large governments use cable in preference to radio, but also radio as a means of communication between widely separated fixed stations was then in its infancy. The Signal Corps did, however, have what was called "mobile tractor" units stationed on the southern border, [text withheld] and in late 1918 one large intercept station was established at Houlton, Maine, for the purpose of copying trans-Atlantic radio. The large intercept stations maintained by the Signal Corps in the AEF did furnish a large quantity of diplomatic traffic which was forwarded as raw material to G-2 in Washington, but as soon as the war was over all these sources of intercept material were abandoned. [text withheld]

* * *

This was, of course, true to a certain extent but was not by any means the whole truth. At any rate by 1929 the flow of messages furnished G-2 had dwindled to a mere trickle. In about the year 1926 the intercept stations of the Coast Guard submitted to me informally a few radio intercepts of what appeared to be Japanese code messages, but these were only sporadic occasional intercepts of transmissions in the Far East. They were usually fragmentary and afforded very poor material. Such as they were, however, these occasional messages were turned over to G-2. There were, therefore, clear indications that if a serious attempt were made to obtain this material better copy could be obtained. However, no pressure was brought on the Signal Corps to set up a regular intercept service, and aside from a few relatively weak efforts to establish an intercept station in the Philippine Department there was no real intercept service until after 1929, when responsibility for cryptanalysis was transferred from G-2 to the Signal Corps. How this came to pass will soon be detailed.

5. As indicated Par. 3 above, the $100,000 appropriation set up in 1919 took care of the bureau for the FY 1920, that is from July 1, 1919 to June 30, 1920, but when in June 1920 it came time to set up the budget for FY 1921, the purse strings were already beginning to be pulled tighter. Many of the "old-timers" in G-2 had gone to other assignments; those remaining and the newcomers in G-2 apparently had neither the background nor the influence to press the matter. The appropriation was at once cut in half, that is, to $50,000, of which the State Department share still continued to be $40,000. The theory was, evidently, that since the work done by the bureau was primarily, if not solely, for and of interest to the State Department, all or nearly all of the funds should be provided by that department. The War Department overlooked some very important points in the situation—points which will be brought up and emphasized later in this summary. In order not to break the continuity of the history at this point, it will be stated merely that year by year the funds provided for the maintenance and operation of the bureau became more and more constricted until by the autumn of 1929 the following tabulation, based upon a letter dated July 17, 1929 from Major O.S. Albright, G-2 to the Chief Signal Officer (General Gibbs), shows how the bureau had been permitted to deteriorate:

Rent		$3,000
Books, postage, travel, transportation, misc.		2,370
Personnel:	1 Chief (Yardley)	7,500
	1 Code and cipher expert	3,660
	1 translator (Jap)	3,750
	1 secretary	1,800
	1 clerk-typist	1,600
	1 clerk-typist	1,320
	Total	$25,000

In the foregoing total appropriation of $25,000 the State Department furnished $15,000, the War Department $10,000. The activities of the bureau had by this time become so reduced that it was sending in only occasional translations of a few Japanese [text withheld] diplomatic messages. No research whatsoever was conducted in cryptanalysis; there were no training activities, no intercept, no code compilation, no secret ink work. The personnel consisted of six persons all told and 37 1/2% of the total payroll went to one man, who had little interest other than to continue as long as possible to maintain himself in the sinecure into which he had been permitted to establish himself.

6. In the summer of 1929 Major O.S. Albright, Signal Corps, had been assigned to G-2 to serve on the Staff of the A.C. of S., G-2 to supervise and coordinate such of the cryptographic and cryptanalytic activities of the War Department as remained. After a careful study of the situation and an appraisal of how the existing cryptanalytic bureau was and was not serving the functions for which it had been intended, Major Albright came to the conclusion that the entire picture was wrong. He felt that the product ("bulletin") which the bureau was turning out every few days was indeed of primary interest for its own sake to the State Department and while the War Department had only a secondary interest in the "bulletin" for the information it gave, the primary interest of the War Department in cryptanalytic studies in peace time was that it was intended to provide a means for training of personnel for *immediate* war-time effectiveness. Major Albright found that not only was there very little if any training being conducted but also that all the persons in the bureau, except for one clerk receiving the least pay, were "getting along in years"—their potential usefulness for possible war time service practically nil. Moreover, the bureau was now hidden away in a public office building in New York (under cover of the "Code Compilation Company" for alleged purposes of security) and far away from *direct* supervision of anybody connected with the War Department or of G-2, so that nobody knew what was going on, how the office was administered, etc. Yardley devoted most of his time to two or three private enterprises (commercial code compilation, real estate brokerage, consultant in code matters to commercial firms) and he was having a "field day" at Government expense. There were, in addition, several other weighty factors which motivated Major Albright in preparing a G-2 study [text withheld] recommending that the bureau be taken out of G-2 and its functions transferred to the Signal Corps, chief among which was the desirability, if not necessity, of placing *all* cryptographic and cryptanalytic work of the War Deparment under one agency, rather than distributing it among three (The Adjutant General, for printing, storage, issue, and accounting of codes; The Chief Signal Officer, for compiling codes and ciphers; Military Intelligence for solution of codes and ciphers). A memorandum on the same subject was prepared by Lieut. Col. W.K. Wilson of the War Plans and Training Section of G-2, and is also attached hereto [text withheld] The reasons given in Major Albright's study and in Col. Wilson's memorandum were apparent-

ly deemed valid by the Chief of Staff, for Major Albright's recommendations were approved in April 1929 and steps were soon initiated by G-2 and the Chief Signal Officer to put them into effect. The recommendations carried with them merely the wording of a changes to be made in AR 105-5, specifying the duties of the Chief Signal Officer, these duties being enlarged to include the printing, storage, distribution, and accounting of codes and "in time of war the interception of enemy radio and wire traffic, the goniometric location of enemy radio stations, the solution of intercepted enemy code and cipher messages, and laboratory arrangements for the employment and detection of secret inks."

7. However, before anything could be done actually to transfer the activity a new and very disturbing factor entered into the picture. In March 1929 a new administration took office, in which Mr. Stimson became Secretary of State. For a few weeks no "bulletins" from the cryptanalytic bureau in New York were given him, the intention being to "go slow" until he had become sufficiently well oriented in the duties of his office to warrant bringing to his attention the highly secret activities engaged in by War and State Departments by means of funds provided in large part by the latter Department. Early in May 1929, however, the time was deemed ripe for this measure, but it was with some trepidation that a few translations of Japanese code messages were placed on Mr. Stimson's desk. His reaction was violent and his action drastic. Upon learning how the material was obtained, he characterized the activity as being highly unethical and declared that it would cease *immediately*, so far as the State Department was concerned. To put teeth into his decision he gave instructions that the necessary funds of the State Department would be withdrawn *at once*. It was only after considerable pressure by the A. C. of S., G-2 that he was dissuaded from this course, which might have had serious consequences by suddenly throwing out of employment the six people concerned, at a time of severe economic depression. For these workers had only special training in a field wholely useless to commercial, industrial, shipping or banking firms, or to other government departments, or to educational institutions. An arrangement was therefore made to close the office immediately so far as active work was concerned but to keep the personnel on the payroll for the time necessary to wind up affairs, and get the files in shape ready to turn over to the Signal Corps. This took a couple of months, and at the end of June 1929 the employees were given three months' pay *in advance* in a lump sum, to tide them over the period in which they might be jobless. Since they had been paid out of "confidential funds" they had no civil service status and no retirement benefits; moreover, they were ineligible for transfer to other Government positions. The danger was, of course, that their dissatisfaction with what must have appeared to them as highhanded, arbitrary action on the part of a new official, and that their helplessness in the serious personal situation created for them by his drastic action might lead them to indiscretions which might prove most embarrassing to the Government and have serious consequences upon national defense. It turned out that whatever their private feelings, all the dis-

charged personnel, except the chief beneficiary of the old regime, remained loyal and did the best they could to find jobs.

8. In October 1929 I was sent to New York to take over the boxed up records and files and to oversee their transportation to Washington. The cryptanalytic activities, research, and training now being under the Chief Signal Officer, steps were taken to reorganize the bureau and its work. The funds available were, of course, very slim—only what remained of the War Department's contribution of $10,000 for the FY 1930 was available, because the remainder of the State Department's share of $15,000, as indicated above, had already been withdrawn by the State Department. An offer of employment was made to Mrs. Wilson, the Japanese expert with Yardley, but she was unable to accept, since it involved moving to Washington and she had a husband and child in New York. Another employee, Mr. Victor Weisskopf, had a business in New York and refused to move to Washington. The female clerical employees were deemed unsuitable for our purposes and, moreover, having no Civil Service status they could not be taken on by transfer. An offer of temporary employment was made to Yardley but he refused the tender. Instead, he proceeded secretly to prepare a book which first appeared in the form of articles in the the Saturday Evening Post and which in much expanded form later appeared under the title *The American Black Chamber*. The book and articles were highly sensational and made damaging disclosures concerning the most secret activities ever conducted by the Government. Before the appearance of the articles and book, however, he had taken certain steps to protect himself from possible prosecution for his disclosures, among which was to resign his commission as major in the Military Intelligence Reserve. Of course, had the authorities understood the real purpose of his resignation they might have prevented it so as to retain some hold on him. But being in ignorance of the real motives and deeming it just an act of pique, the resignation was accepted. The unfortunate consequences attendant upon the publication of the book need no elaboration herein. Suffice it to say that [text withheld] our precarious relations with Japan were brought to a boiling point when about 30,000 copies of the Japanese translation of *The American Black Chamber* were sold in Tokyo in a period of less than a month (perhaps the book was subsidized by the Japanese Government itself). The bad odor into which all cryptanalysts and cryptanalytic activities fell, as a result of the difficulties which the publicity given the matter by Yardley's disclosures occasioned high government officials, had a bad effect upon the attempted reorganization of the cryptanalytic bureau by the Chief Signal Officer. *Funds were hard to get*, and State Department support was lacking, if not in the other direction altogether. The most serious consequences of Yardley's disclosures, however, came 10 years later and their effects can hardly be estimated. I refer here to the jolt which his book gave the Japanese cryptographers, leading them out of their blissful ignorance and causing them to develop really complex methods which are now giving us many difficulties. The same is true probably as regards the German and Italian cryptographers—their

education has been entirely at Uncle Sam's expense and the final consequences of Yardley's work can not yet be foreseen. They may well turn out to be disastrous.

9. However, the Chief Signal Officer proceeded, energetically as possible under the circumstances, to carry out the mission assigned him. The code and cipher solving section was placed under the War Plans and Training Division since the compilation section was already there. A rather detailed directive which was prepared by G-2 and approved by the Secretary of War (Exhibit 4), became the guiding plan of the reorganized service, which was now named the Signal Intelligence Service. Its personnel consisting of myself and one or two clerks soon was augmented by a half dozen more employees. Training literature and courses were prepared and put into good usage at once. A great deal was done in expanding our cryptographic work also, by preparing reserve editions of existing codes, compiling new codes and ciphers, developing cipher apparatus, and so on. Cryptanalytic work was put on a firm basis of research and training, with emphasis on the latter, *for there* existed no intercept service and the raw material could not be obtained [text withheld] Hence an intercept service now was organized and grew very slowly. All phases of signal intelligence were unified under one service and taken under study and action. Moreover, cooperation with the Navy in the work was also initiated. How the activity has expanded since then requires no comment at this time. However, a few words about relations with the Navy are pertinent.

10. Cryptanalytic activities in our Navy Department were practically non-existent until after the close of the last war, during which, as was noted above, whatever problems they had in cryptanalysis were referred to MI-8. But in 1921 the Navy, recognizing the important role which cryptanalysis was bound to play in the future, began building up a large unit in the Navy Department, with echelons afloat. Whereas the Army placed emphasis upon civilian training, the Navy placed emphasis upon officer training; and for each dollar the Army was able to obtain for cryptanalytic and cryptographic work the Navy was able to obtain three to five dollars, until by 1939, as far as concerned numbers of officers and civilian personnel engaged in these activities, amount of equipment on hand, and funds available for research, the Navy had considerably outstripped the Army. However, it may be said, with some justifiable pride perhaps, that while they were ahead of us in quantity we were ahead in quality, for all the important developments in both the cryptographic and cryptanalytic fields must be credited to Army personnel. At first, cooperation between the two services was intermittent and at times very indifferent—the usual mutual suspicions and jealousies pervaded our relationships. But, happily, for the past three to five years cooperation has been much more wholehearted, with the result that it may now be said without reserve that, as regards their cryptographic and cryptanalytic activities, cooperation between the Army and Navy is so close as to be the same as though they were under one head. This, of course, is as it should be and must be in order to gain the desired result from such activities.

11. It would be of utmost value to the winning of this war if the Government were now in a position to read the codes and ciphers of all the foreign powers whose actions and probable intentions are of interest and importance in our prosecution of the war. *It could have been in this fortunate position had it given to cryptanalytic studies the attention which it deserves during peace time and had provided funds for their continuity on a scale sufficient for the purpose for which they are intended.* The matter can be summarized very succinctly in this statement: Actual or physical warfare is intermittent, but mental, that is, cryptanalytic warfare is continuous. . . .

* * *

June 29, 1942

William F. Friedman,
Head Cryptanalyst.

From SRH 134. *This official history, written by Friedman in 1945, traces the history of the SIS from its modest beginnings through its triumph in decrypting the Japanese diplomatic machine cipher system. It should be noted that Friedman had no doubt that the activities in which the Signal Intelligence Service was engaged were quite illegal.*

EXPANSION OF THE SIGNAL INTELLIGENCE SERVICE FROM 1930 TO 7 DECEMBER 1941

As a result of War Department General Staff action it was directed by the Secretary of War, on 5 April 1929, "That the Signal Corps be charged with the duties pertaining to the solution of enemy codes and ciphers and the detection of secret inks in War, in addition to those duties with which they are now charged pertaining to the compilation of codes and ciphers required by the Army and to the interception of enemy radio and wire traffic in war."

* * *

. . .the Signal Intelligence Service was to be organized primarily on the basis of *training for war*, rather than for active operation for enemy interception and solution of the communications of foreign governments or armies. However, it was also

stated that if information of present or immediate value to G-2 should be intercepted and solved, such information would be acceptable to G-2, but it was to be clearly recognized and regarded as a by-product of the training work, and not as the fruit of the functioning of the Signal Intelligence Service in peacetime.

But in addition to this foregoing reason for the emphasis on training, there was another important reason. Because of the rigidity of our laws regarding interception of communications, the activities of the Signal Intelligence Service had to partake of the nature of a clandestine activity, since it was illegal to intercept messages, and the penalties for divulging even the existence of a message were severe. The law did not exempt anyone from its penalties, and therefore, the War Department and all the people connected with the work of interception and solution of the communications of foreign governments realized the necessity for keeping the activity secret. By emphasizing the training aspects of its activities, it was thought that the illegal nature of some of the work of the Signal Intelligence Service (interception and solution of foreign communications) could be more easily defended if word of these activities should "leak out." The foregoing reason for secrecy was, of course, to be added to another important reason for keeping the activity secret - namely, the requirement to keep from foreign governments the extent of our success with their communications, and even the fact that we were successful in reading any of such communications. Under such circumstances, therefore, it was only to be expected that the normal channels for obtaining of funds for such an activity would be made somewhat difficult and they were. Up to this time, it must be understood, the War Department support for the solution activities came from Military Intelligence Division Contingent Funds, which are not subject to review by the Controller General.

For one reason or another, none of the six persons who had been working in the old MI-8 Section when the Chief Signal Officer took over the solution activities from G-2 could be added to the staff of the Signal Intelligence Service, which then consisted of one cryptanalyst, (P-5, $4,600) and one clerk-typist (CAF-3, $1,620). A whole new organization had therefore to be built-up with the very scanty funds ($6,666.68) that remained from the original War Department contribution of $10,000 for the rest of the fiscal year 1930. Therefore, to begin with, the real establishment of a permanent Signal Intelligence Service had to await the availability, to the Chief Signal Officer, of funds specifically for the purpose; and then, of course, the long period of training required to produce cryptographic and cryptanalytic skill was another factor that resulted in what may appear to be a rather slow development, in addition to the usual lack of funds.

However, the hiring of new personnel did not have to await the availability of funds, for until the Chief Signal Officer was able to include in his own estimates the specific funds necessary for the support of the Signal Intelligence Service, he could draw by allotment upon the funds available to the Assistant Chief of Staff, G-2. These, however, amounted to only $10,000 per annum. The sum of $6,666.68

was allotted by the Assistant Chief of Staff, G-2, to the Chief Signal Officer for the payment of personnel engaged in code and cipher work on 16 December 1929 for the balance of the fiscal year 1929.

On 4 January 1930 the Secretary of War was requested by the Chief Signal Officer to authorize the employment of four junior cryptanalysts (P-1, $2,000 per annum). Since the G-2 funds ($10,000 per annum) were available to the Chief Signal Officer the FY 1930 and 1931, this request was approved quite promptly; three persons were obtained from Civil Service rosters of eligibles in scientific pursuits (junior mathematicians, etc.) and appointed. An additional person was obtained by Schedule "A" or excepted appointment for the position of Japanese translator (SP-5, $1,800 per annum) because no Civil Service roster of eligibles was available for selection. On 2 September 1930 an additional person (SP-5, $1,800 per annum) was appointed, making the original staff of the Signal Intelligence Service a total of seven persons by the end of 1930. Except for one or two changes in personnel and the addition of one or two clerk-typists, the technical staff was not augmented until July 1938. In 1936 and 1937 a cryptanalyst was sent to each of the Panama Canal and Hawaiian Departments to work as advanced echelons of the Signal Intelligence Service, and these two persons' positions were filled by two additional candidates selected from Civil Service rosters. However, by the end of 1938 both cryptanalysts who had been sent to overseas stations were back in Washington, for the experiment was not a success, and we badly needed them here. What could one lone cryptanalyst do in Panama or Hawaii?

The years 1931 to 1936 were particularly trying ones - promotions were out of the question, and further expansion was greatly handicapped by the program of economy imposed upon the War Department during the depression. Several examples may be cited to illustrate our attempts to expand the Signal Intelligence Service over the years 1931-1938 and the more or less fruitless results thereof.

On 14 October 1931 the Chief Signal Officer requested approval of a project to include four additional positions in the Signal Intelligence Service, involving an increase of $7,240 in his estimates for salaries for the fiscal year 1934. As inclosures, the Chief Signal Officer submitted schedules showing the number of people engaged in Signal Intelligence work in fiscal years 1928-1931 and projecting the numbers estimated by 1934. The request for the four additional positions was "not favorably considered at this time" by the Adjutant General. The reason given was the necessity for holding estimates to a minimum for the fiscal years 1934: "It is not contemplated outhorizing new projects unless current or prospective funds are available."

Again in 1932 an attempt was made to attain urgently needed personnel, with no favorable results. It was stated that the need for expanding the code production program was urgent. In addition to the code compilation duties of the section, there were those of conducting research in solution as well as certain administrative duties in connection with correspondence courses, reserve officer

instructional training courses, and the regular administrative activities concerned in the use, distribution and improvement in code and cipher communication by the Army, the development of cipher apparatus, methods of secret intercommunication between the Army and Navy, the development of radio intercept and radio direction-finding methods, work in secret inks, etc. The assistance of G-2 was sought at the time, since it was thought that in view of the interest registered in the work of the Signal Intelligence Section on the part of the Assistant Chief of Staff, G-2, and the Chief of Staff, it would be the psychological moment to take the matter up once more in the hope that means might be found to add to the personnel of the section, and thus enable it to carry on in an effective manner. Whether or not the support of the Assistant Chief of Staff, G-2, was obtained, the available record does not disclose; however, even if this support was forthcoming, the attempt remained fruitless.

In 1936, the Chief of the Signal Intelligence Service recommended that the time had come to organize the Signal Intelligence activities if the Chief Signal Officer upon a more extensive basis, "in order that personnel for efficient operation may be available when the situation will require their services." It was also considered essential to provice opportunities for advancement for the personnel already employed, in order that a restricted field might be attractive to them. Otherwise, the Signal Intelligence Service would "become merely a training ground for other departments."

A five-year expansion program was recommended, which would increase the total personnel to 21 by 1942, with a total budget of $54,660.

Various obstacles impeded the immediate approval of this plan. In the first place, in order to be able to keep our trained personnel, long-overdue promotions were very necessary; but any proposal for an increase in the salaries of the personnel in the Signal Intelligence Service was held to be objectionable.

(For several years, owing principally to measures of economy imposed by the President and Congress, it had not been possible to provide administrative promotions for any Signal Corps employees. In addition, the President had directed that no promotions were to be included in the 1937 budget.)

A second obstacle was that the personnel and equipment assigned to the Signal Intelligence Service fully occupied its available space, and because of the critical shortage of office and storage space in the District of Columbia, no additional space was likely to be secured for the expansion of that organization. It was suggested that additions to the existing force would overcrowd the area and be detrimental to health and comfort as well as impair the performance of their duties.

This request for personnel was not approved and the four additional positions had to be deleted from the estimates. One of the contributory factors which brought about this deletion was the lack of support from representatives of G-2. Assurance had been obtained from G-2 on advance that it would cooperate in

defense of the item, but its representatives "failed to appear at the hearing when held." Note the following extract from a very interesting memorandum dated 18 February 1936, to the Chief Signal Officer, again requesting an increase in personnel for the Signal Intelligence Service:

> "9. Under the date of March 20, 1935, the Chief Signal Officer requested authority to present in connection with the 1937 estimates, a requirement for two (2) assistant cryptographic clerks at $1,620 per annum, and two (2) junior cryptanalysts at $2,000 per annum. The War Department approved the inclusion of this additional personnel in the Signal Corps estimates. The limiting figure, designated by the War Department under date of August 5, 1935, for Project #1, "Personnel", of the Signal Corps estimates to be submitted to the Bureau of the Budget, was reduced to such a point as to necessitate the deletion of these four positions from fiscal year 1937 estimates. One of the contributory factors in the necessity for this deletion was, no doubt, the lack of support by representatives from the Assistant Chief of Staff, G-2, whose assurance of cooperation in defense of this attempt had been obtained in advance, but who failed to appear at the hearing when held."

At that time it was the opinion of Major W. S. Rumbough, Officer in Charge of the War Plans and Training Division, of which the Signal Intelligence Section was a part, that such "a serious shortage of trained personnel exists in the Signal Intelligence Service," that it could not "fully perform its peace-time mission."If this shortage should "be allowed to continue, no Signal Intelligence Service worthy of the name will be available during the early phase of an emergency when the most valuable results should be expected from this agency."

The memorandum of 18 February 1936 recommended that if funds in the amount of $7,240 accrue by savings, under Project #1, fiscal year 1937, that these savings be used for the employment of two Assistant cryptographic clerks at $1,620, and two junior cryptanalysts at $2,000, to be obtained and trained in this office as soon as possible; alternatively, that if no such savings can be foreseen, funds be diverted from other projects and allocated to Project #1, fiscal year 1937, for the foregoing purpose. But, as already noted, the attempt was fruitless.

It may be stated that about this same time, in May 1936, whereas the Signal Intelligence Service had a total of some seven or eight people, the Navy had some forty, and even the small unit at the United States Coast Guard had seven people. [text withheld] All attempts to increase the complement of seven people comprising the staff of the Signal Intelligence Service were more or less fruitless

until the fiscal year 1938, when four more positions were finally authorized. No doubt one of the factors which led to the final approval of the repeated requests for expansion was the recognition on the part of the high authorities of the War Department of the importance of the work being done. A program of code compilation was being vigorously pursued under severe handicaps; new codes and ciphers were being prepared, printed and placed in storage with two, and sometimes three or more editions in reserve to meet all contingencies. (It is necessary to note that in 1933 the duties formerly assigned to the Adjutant General in connection with the printing, distribution, and accounting for codes, were transferred to the Chief Signal Officer,) thus integrating all cryptographic work in the Army within one organization—the Signal Intelligence Service under the Chief Signal Officer.)

Very important progress in research and development of new cryptographic apparatus and devices was being made; and a high-speed, electrical, cryptographic machine of highest security had been invented and developed by our chief cryptanalyst—this machine being far in advance of anything that had hitherto been known. Moreover, this machine was going into practical usage for secret intercommunication among War Department and the Commanders of overseas departments. An intercept service was being organised to provide the raw material for the cryptanalytic training activities, the first station to be established being that at Fort Monmouth, New Jersey, with additional stations being contemplated in the overseas departments. On the cryptanalytic side much progress had already been made, and by 1934 the training program had reached the stage where actual solutions of current Japanese diplomatic messages were being achieved daily. It is, however, a commentary on the peculiar situation which existed to state that so fearful was the Chief Signal Officer that news of the "illegal" activities of the Signal Intelligence Service might leak out, that these solutions were not issued as "bulletins" or distributed to anybody. Occasionally, one would be shown to the Chief Signal Officer, and it is possible that he would show a translation to the Assistant Chief of Staff, G-2, but it is doubtful if dissemination went any farther than that. When important visitors from the War Department were brought by the Chief Signal Officer to the quarters occupied by the Signal Intelligence Service for inspection or other official business, it was important to emphasize that such solution work as was being accomplished was only a by-product and part of the training being conducted, and that no use was made of the product. It was not until 2 March 1935 that "publication" of the bulletin was started, and G-2 began receiving on a more or less regular schedule the translations of Japanese diplomatic messages resulting from the "training." What distribution or dissemination G-2 made is, of course, not known to me, except by indirect evidence.

It was not until 1939 that any considerable increase in funds for the Signal Intelligence Service was provided, as is shown by the following letter:

September 27 1939

"SUBJECT: Signal Intelligence Service
"TO: The Chief Signal Officer

"1. You are authorized to employ the following designated additional civilian personnel from October 1, 1939, at the annual salaries indicated.

1 Principal Cryptanalyst @ $5,600.	$5,600
2 Associate Cryptanalysts @ $3,200	6,400
2 Research Analysts @ $3,200	6,400
2 Assistant Cryptanalysts @ $2,600	5,200
2 Junior Cryptanalysts @ $2,000	4,000
2 Cryptanalytic Aides @ $1,800	3,600
4 Principal Translators @ $2,300	9,200
1 Principal Clerk @ $2,300	2,300
1 Principal Stenographer @ $1,800	1,800
3 Cryptographic Clerks @ $1,800	5,400
1 Senior Tabulating MachineOperator @ $1,800	1,800
3 Assistant CryptographicClerk @ $1,620	4,860
2 Tabulating Machine Operators @ 1,620	3,240

"2. It is desired that you establish and operate a monitoring station at Fort Hunt, Virginia, and purchase such of the following listed equipment as may be necessary and procurable within the funds allotted:

10 Radio Sets, SCR 243 (or equivalent) @$260	$2,600
29 Radio Sets, SCR 244 (or equivalent) @$195	5,655
18 Recorders, BC 17 @ $1,300	23,400
12 Recording Equipment Tape @ $2,000	24,000
9 Diversity Antennae @ $3,000	27,000
14 Diversity Receiving Equipment @ $1,400	19,600
TOTAL	$102,255

"3. The authorized strength of the Second Signal Service Company is increased by the addition of the following listed personnel. The authorized strengths of Signal units from which these men are transferred are reduced by the corresponding grades and specialist ratings. The allotment of enlisted men to the Signal Corps is increased by twenty-six privates (grade 7). No increase in grades above grade 7 or in specialist ratings will be made until such time as additional grades and ratings become available (probably Nov. 8, 1939).

1 Master Sergeant
1 Technical Sergeant
1 Staff Sergeant
1 Private lst Class, spec. 1st class
6 Private lst Class, spec. 2d class

6 Private lst Class, spec. 3d class
6 Private lst Class, spec. 4th class
4 Private lst Class, spec. 5th class

"4. It is desired that you submit the name of and other pertinent data concerning a Regular Army Officer to be assigned as assistant to the officer in charge, Signal Intelligence Service, and the names of and other pertinent data concerning nine Reserve Officers for active duty under the provisions of the Thomason Act.

"5. Funds in the amount of $41,050 from the Administrative Reserve Signal Service of the Army and in the amount of $50,000 from the reserve now in an unallotted status, subject only to direction of the Secretary of War, will be released to you for the salaries of these civilian employees, for the purchase of additional equipment, and for the expenses incident to operation of the Signal Intelligence Service. The balance necessary for the purchase of equipment will not be available for obligation until the total deficiency of $175,405, required for the expansion of the Signal Intelligence Service has been covered by Congressional appropriations.

"6. You will make necessary arrangements in collaboration with A.C. of S. G-2 to obtain Civil Service exemptions required.

"By Order of the Secretary of War:

/s/ WILLIAM W. DICK
Adjutant General"

The total number of additional personnel for the Signal Intelligence Service in Washington authorized by the foregoing letter was twenty-six; with the original staff of nineteen people, the Signal Intelligence Service staff was to be forty-five persons. Steps were immediately taken to hire the new personel, have them cleared, and to start them in training - a rather lengthy process. Special dispensation had to be obtained from the Civil Service Commission to hire these trainees outside the Civil Service regulations, because no rosters of eligibles in cryptographic or cryptanalytic work existed. In order to obtain the support necessary for such an unusual procedure the Secretary of War requested approval by the President on 26 October 1939 to have the Civil Service regulations suspended so as to permit the employment by the Signal Intelligence Service of not more than twenty-six persons on a temporary basis until 30 June 1940. Through the intervention of the White House, the approval requested was obtained.

The unfavourable way in which the war in Europe was progressing so far as concerned Britain, led to desires to expand the Signal Intelligence Service even more, and as fast as possible. The urgency for cryptographic production to meet the needs of a large United States Army in case the United States became a belligerent was apparent; the output of the cryptanalytic staff was impressive enough to G-2 to warrant further increase of that staff. By September 1940 the Signal Intelligence Service, without the help of any other staff, had succeeded in a most momentous

achievement. [text withheld] - the solution of the Japanese diplomatic machine designated by them as the "B Machine" and by us as the "Purple." Texts of highest strategic and diplomatic import were being furnished G-2 daily, the value of which was recognized by the Assistant Chief of Staff, G-2, the Chief of Staff, the Secretary of War, and the President. The conduct of our difficult negotiations with the Japanese in regard to the situation in the Pacific was no doubt being guided from day to day by means of the solutions furnished the War Department, the State Department, and the President.

On 16 October 1940 the Chief Signal Officer requested of the Assistant Chief of Staff, G-2, authorization for two further expansions of the Signal Intelligence Service, one of which, to begin 1 January 1941, would involve appointment of forty-eight additional civilian employees at annual salaries totaling $85,580, half of which ($42,790) would have to be provided during the fiscal year 1941, then already in progress. No funds for this purpose were available to the Chief Signal Officer, but this expansion was approved by the Acting Assistant Chief of Staff, G-2, with the concurrence of the Assistant Chief of Staff, War Plans Division, on the very next day.

The second request, made on 16 October 1940, was for expansion involving employment of forty-two other employees, who were to begin work on 1 July 1941. This plan was approved in principle by Brigadier General Sherman Miles, Assistant Chief of Staff, G-2, on 17 October 1940, but its carrying out was postponed until the time for the preparation of the budget for fiscal year 1942. The paragraph is of interest:

> "3. The complete expansion of the Signal Intelligence Service to place it on a wartime basis beginning July 1, 1941, as recommended in paragraph 1c and inclosure of the basic letter, is not essential at the present time. The recommendation, however, is for funds to enable this expansion to be begun on July 1, 1941. The uncertainty of the future and the necessity in any contemplated expansion of this service to make provision for a time lag incident to selection and training of new personnel make it necessary to provide for an increase in personnel far in advance. It is recommended, therefore, that funds be made available in the fiscal year 1942 budget to provide for total expansion of the Signal Intelligence Service. If conditions develop prior to 1 July 1941, which make this additional expansion unnecessary, the funds need not be expended."

The letter from the Chief Signal Officer to the Assistant Chief of Staff, G-2, on 16 October 1940, contemplated an expanded Signal Intelligence Service for fiscal year 1942 amounting to 127 persons. The pressure of events was such that the full program must have been approved, for on 7 December 1941, instead of having only eighty-five people, as would have been the case had only the first increment been approved, the strength of the Signal Intelligence Service was as follows:

	Washington	Field	Total
Officers	44	1	45
Warrant Officers	-	-	-
Enlisted	28	149	177
Civilian	109	-	109
Total	181	150	331

The staff was organised as shown in the accompanying chart, with the following sections and personnel:

	Officers	Civilian	Total
Administrative	2	2	4
Personnel	2	6	8
Cryptanalytic			
Japanese	10	24	34
German	1	15	16
Cryptographic	16	10	26
Laboratory	4	-	4
Communications	5	2	7
Tabulating (IBM)	1	15	16
"Trainees" in classes	-	22	22
Total	44	109	153

. . .The nineteen people in professional grades also include Japanese translators; only a few expert cryptanalysts were therefore on hand among those nineteen.

The necessity for producing codes and ciphers has already been mentioned and the staff of 26 persons was hardly adequate for the large volume of work to be done. The production of our electric cipher machines (Sigaba) was under way and there were multitudinous details to be dealt with in that project above: the preparation of instructional manuals for the maintenance and operation of the machine, the elaboration of keying arrangements; the elaboration of what shall go into spare parts kits, etc. Also, the plans for the production of Converter M-209 were under way— a very large project in itself. Besides all this, keys and control tapes for the electric Converter M134A had to be prepared on a current basis, to maintain security of current communications; strips and key lists for the widely distributed Strip Cipher Device M-138A had to be prepared in large quantities; constant liaison with the Navy Cryptographic Division, for the production and distribution of cryptographic material for joint communication required much time, etc. Also, plans for the production of an automatic teletype encipherment system invented by Signal Intelligence Service personnel were being brought to fruition.

The ever-expanding requirements of traffic for the cryptanalytic staff meant expansion in the facilities and personnel of the Second Signal Service Company. Seven monitor stations were in operation by 7 December 1941:

1 - Fort Hancock, New Jersey
2 - Fort Scott, Presidio of San Francisco
3 - Fort Sam Houston, Texas
4 - Post of Corozal, Panama Canal Department
5 - Fort Shafter, T. H.
6 - Fort McKinley, P. I.
7 - Fort Hunt, Virginia

Also, of course, a good portion of our traffic came from the United States Navy, which had a large station at Bainbridge Island, Washington, and another at Bar Harbor, Maine. The mere recording and indexing of the large volume of messages constituted a task of no small proportions.

Hence, even with the large expansion of the Signal Intelligence Service there was much more to do than hands to do with. Consider what was done in the field of solving and translating Japanese diplomatic messages alone. By a special agreement between the Chief Signal Officer and the Director of Naval Communications, all work on Japanese diplomatic traffic was divided up between the Army and Navy on the basis that Army would process all messages of even date (cryptologic), Navy, all of odd date - with full exchange of technical data and results. Thus, in collaboration with the Navy and with a total of only 34 persons, the Signal Intelligence Service was attempting to decode, decipher, and translate its half of the traffic for which the Japanese must themselves have had several hundred persons, and the Japanese, of course, did not have to translate the material, a job which was quite difficult for us because of linguistic difficulties and paucity of qualified translators. Moreover, the Japanese had the necessary keys; we had to solve them, and in many cases solution had to await the accumulation of traffic - it could not always be done with a single message, so that occasion delays in solution were inevitable from the very nature of the systems involved. Also, another factor had to be taken into account: the time required to forward the intercept traffic to Washington. Lacking facilities and personnel to prepare all the traffic, encipher it, and transmit it to Washington, some of it had to await shipment by air mail, and this factor alone occasioned delays. As has been aptly said by General Miles: "The astonishing thing, gentlemen, is not that these messages were delayed, but that they were able to do it at all. It was a marvelous piece of work."

WILLIAM F. FRIEDMAN
Director of Communications Research

Prepared on
4 December 1945

From SRH 135. *Army success in signals intelligence operations prior to World War II was dependent not only on the core of skilled cryptanalysts at SIS headquarters, but on the men who manned what we now call the "front end" of the system: the Signal Corps intercept operators. The Army's Chief Signal Officer, Major General Joseph O. Mauborgne, describes the Army's existing intercept organization and suggests a way to improve it in this 1938 letter. The 2d Signal Service Company he proposed was activated on 1 January 1939.*

WAR DEPARTMENT
Office of the Chief Signal Officer
Washington

OCSigO-320.3-RID September 2, 1938

SUBJECT: Signal Intelligence
TO: The Adjutant General

1. The Signal Intelligence Service in Washington depends for the material with which it works, upon Signal Intelligence Detachments in Hawaii, Panama, Ninth Corps Area and Eighth Corps Area. These signal intelligence detachments are parts of the Signal Service Companies located in the same corps area or department. There has been ordered set up as part of the Tenth Signal Service Company in the Philippine Department, a signal intelligence detachment of 10 men. In addition, so important has the War Department considered the work of the Signal Intelligence Service, it has been thought essential to detach 17 men from the Provisional Radio Intelligence Company at Fort Monmouth, New Jersey, and have this detachment act as a signal intelligence detachment. This last is done even at the risk of crippling the important tactical activities of the Provisional Radio Intelligence Company (to be designated as the 1st Radio Intelligence Company as of November 1, 1938).

2. Whereas the results achieved by the Signal Intelligence Service in Washington are treated with utmost in care and secrecy, equal measures of secrecy are not taken with the personnel of the signal intelligence detachments in the field. The personnel of the signal intelligence detachments cannot long be unaware of the nature of the work in which they are engaged and the ultimate secrecy of the system as a whole depends just as much upon them as upon the personnel in Washington. At present the choice of signal intelligence detachment personnel is left to the corps area and department signal officers and there is no doubt that they exercise every possible precaution. However, in the present form of organization much is entirely out of their hands and beyond the control of the Chief Signal Officer. For example, a skilled member of the signal intelligence detachment in Hawaii is returned to the mainland. Unless he is in Grade 4 or above he is reduced

to the grade of private and returned for haphazard assignment by the normal process. Even if he is eventually reassigned to a signal intelligence detachment on the mainland, he must begin afresh in the grade of private and work himself up. Knowledge of this actuates many to separate from the service; every such man separated from the service carries with him a fairly accurate knowledge of the work upon which the Signal Intelligence Service is embarked and he constitutes just one more threat to the secrecy of the work. He is a far greater threat when separated from the service since he is no longer under military surveillance.

3. The haphazard movement of the enlisted personnel engaged in signal intelligence work also makes their training more difficult and lessens the effectiveness of the Signal Intelligence Service. The useful member of the signal intelligence detachment must be first of all an excellent radio operator and beyond that must acquire skill and experience peculiar ro signal intelligence work: the acquisition of this skill and experience requires from six months to a year under competent instruction. At present, it is not possible to surely retain trained men: indeed it is not even possible to surely retain competent instructing personnel.

4. The remedy to this situation is a signal service company, detachments of which are stationed in the various corps areas and departments as required. The personnel could then be transferred from detachment to detachment without loss of grade or rating and control over the personnel would be increased. To minimize the number of highly skilled personnel separating from the service, the grades and ratings of the company should be considerably higher on the average than is normal in the Army. After many years of experience, the Navy Department adopted just the form of organization here recommended. Obviously, the ideal cannot be achieved by mere statement. However, a great step forward in the secrecy of signal intelligence work and in the training of signal intelligence enlisted personnel can be taken by organizing the several signal intelligence detachments into a signal service company. This can be done without request for any additional men, grades, rating, housing, transportation or equipment.

5. It is therefore recommended that there be organized the 2d Signal Service Company. The personnel necessary are to be obtained by withdrawing from the various service companies the signal intelligence detachments of which are now part of them and by a temporary decrease in the 1st Radio Intelligence Company. (It is proposed not to alter the Tables of Organization of the Radio Intelligence Company, but merely to leave vacant such grades and ratings as are taken to make up the 2nd Signal Service Company: when increases in signal intelligence personnel are granted the Radio Intelligence Company will be permitted to regain its table of organization strength.) Inclosure No. 1, Table of Organization of the 2nd Signal Service Company, shows the strength, grades and ratings of the proposed company. Inclosure No. 2 shows the men, grades and ratings taken from the various companies in order to constitute the Signal Intelligence Company. It will be seen that the organization of the Signal Intelligence Company requires no addition-

al men, grades or ratings from outside the Signal Corps itself. The matter of housing will not be concerned since the detachments are already housed. No additional transportation or equipment will be required because of the organization of the company. The company will be commanded by the officer in charge of the Signal Intelligence Detachment at Fort Monmouth. Detachments of the company will be stationed in the various corps areas and departments just as they are now: they will be attached to the local organization for rations and quarters (the same organizations with which they are now rationed and quartered): their work will be supervised by the corps area or department signal officer concerned, except in the case of the detachment now at Fort Monmouth which will be supervised by the commanding officer of the company.

6. It is intended that the 2d Signal Service Company shall function under general instructions issued by the Chief Signal Officer. Plans for its expansion in time of war and its use in war will be recommended by the Chief Signal Officer for inclusion in the several colored war plans, and the mobilization plan.

/s/ J.O. MAUBORGNE
/t/ J.O. MAUBORGNE
Major General
Chief Signal Officer of the Army

From *The "Magic" Background of Pearl Harbor, Volume IV, Appendix* (Washington, D.C.: Department of Defense, 1977), p. A-89.

The Japanese government dispatched this diplomatic communication to its envoys in Washington, Special Envoy Saburo Kurusu and Ambassador Admiral Kichisaburo Nomura, on 22 November 1941. It was intercepted and translated by the Army's Signal Intelligence Service on the same day. In the aftermath of Pearl Harbor, its language took on a new ominousness.

FROM: Tokyo
TO: Washington
November 22, 1941 (Urgent)
#812

To both your Ambassadors.

It is awfully hard for us to consider changing the date we set in my #736a. You should know this, however, I know you are working hard. Stick to your fixed policy and do your very best. Spare no efforts and try to bring about the solution we desire. There are reasons beyond your ability to guess why we wanted to settle Japanese-American relations by the 25th, but if within the next three or four days

you can finish your conversations with the Americans; if the signing can be completed by the 29th (let me write it out for you—twenty-ninth); if the pertinent notes can be exchanged, if we can get an understanding with Great Britain and the Netherlands; and in short if everything can be finished, we have decided to wait until that date. This time we mean it, that the deadline absolutely cannot be changed. After that things are automatically going to happen. Please take this into your careful consideration and work harder than you ever have before. This, for the present, is for the information of you two Ambassadors alone.

* * *

Trans. 11/22/41 (S)

ARMY 6710 25138

From SRH 115. *This excerpt from hearings held by the Army on the roots of the intelligence failure that led to Pearl Harbor demonstrates all too vividly the feeble resources of the Military Intelligence Division on the eve of war. It also shows how tightly "Magic" was held: Brigadier General Hayes W. Kroner, the head of MID's Intelligence Branch in 1941, was unaware of its existence. This is the transcript of an interview of Kroner conducted in September 1944 by Colonel Carter W. Clarke, Deputy Chief of the Military Intelligence Service. The General Miles mentioned in the text was the hapless Brigadier General Sherman A. Miles, Assistant Chief of Staff, G-2, at the time of the Pearl Harbor attack. "Minxler," whom Kroner describes as the individual who furnished mysterious source materials to one of Kroner's subordinates, was actually Colonel Rex A. Minckler, Chief of the Signal Intelligence Service at the time.*

Place: Room 2C637 Pentagon Building, Washington, D.C.
Date: 13 September 1944
Time: 1430 - 1510

Present: Brigadier General Hayes A. Kroner
Colonel Carter W. Clarke
Lt. Col. E.W. Gibson

Brigadier General Hayes A. Kroner, having been sworn and warned of his rights by Colonel Carter W. Clarke, gave the following sworn testimony:

Col. Clarke: Will you state your name, rank and station.

Gen. Kroner: Hayes A. Kroner, Brigadier General. Station Rio de Janeiro,

Military Attache.

Col. Clarke: When did you first come on duty in G-2, Department General Staff?

Gen. Kroner: About the first of March 1941.

Col. Clarke: What were your duties at that time?

Gen. Kroner: I was assigned to the British Empire Section of the Intelligence Branch, G-2 but before taking up those duties I was sent to England for a period of observation of the war. I returned from England early in June, about the middle of June 1941, and took up my duties of Chief of the British Empire Section, G-2 at that time.

Col. Clarke: How long did you continue on that duty?

Gen. Kroner: Approximately one month.

Col. Clarke: And then what did you do?

Gen. Kroner: About the middle of July I was informed by the retiring Chief of the Intelligence Branch, Col. C. H. Mason, that he was leaving G-2 and that he had been instructed to turn the Branch over to me as next senior officer. I immediately took over charge of the Branch and for the next several months was acting in charge and later on I was appointed Chief of the Branch. To the best of my memory it was about September 17 that an order was issued by the Executive Officer, G-2 appointing me as the Chief of the Intelligence Branch, which position I held until sometime in the month of December, when General Lee became Acting Assistant Chief of Staff, G-2 and I was then verbally relieved from Chief of Intelligence Branch and made Deputy to General Lee.

Col. Clarke: What did the Intelligence Branch consist of principally?

Gen. Kroner: I found the Intelligence Branch, in July '41, to consist of a very small Administrative Section and of several geographic sections and an Air Section. The Administrative Section was in process of transition. Because of the impact of the war and more information coming into G-2, there was a greater need for proper handling and dissemination of that information. The only geographic section of G-2 which appeared to be expanding at that time was the Latin American Section. By the 10th of October—referring here to the official chart on record—the Intelligence Branch consisted of a headquarters or the Administrative Section, Contact Section, Situation Section, Dissemination Section, and the Air and geographic sections composed of the following: Air Section, British Empire Section, Western European Section, Central European Section, Eastern European Section, Southern European Section, Far East Section, and the Latin American Section. The several

European sections had been set up to deal with the increased information coming in from the European war and, together with the British Empire Section, it was considered adequate to handle the war in Europe. The Latin American Section was expanding for obvious reasons of hemisphere defense. The Far Eastern Section at this time had not undergone any material change, so far as I can remember, for several months. This organization, with a few changes, continued during my tenure of office as Chief of the Branch....

Col. Clarke: I understand you to say then that you were Chief of the Intelligence Group from about July through Pearl Harbor, December 7?

Gen. Kroner: Yes.

Col. Clarke: During that time was there any recommendation made—first let me ask you this—who was the Chief of the Far Eastern Section?

Gen. Kroner: Col. R. S. Bratton.

Col. Clarke: During that time was there any recommendation made to you as Chief of the Group for any increase in personnel or expansion of its intelligence gathering activities?

Gen. Kroner: Not any to give me any trouble - there was some minor increase of a clerk or two and perhaps one officer, I don't remember, but nothing in the line of expansion as I have referred to in the European Section. I would say this further, that one of their Far East experts.Col. Pettigrew, was taken from the Far Eastern Section at the time to assist in the reorganization of the Headquarters dissemination, so that I had very close to me at that time an experienced Far East officer on my staff.

Col. Clarke: Who was that?

Gen. Kroner: Pettigrew. It was, I think, worthy of note just here that Col. Betts, who was the Chief of the Situation subsection, whom I called my G-2-G-3 officer on my own staff, Col. Pettigrew being so-called G-1-G-4 officer, together with my own experience in the Far East, that with Col. Bratton it was a fairly good team of Far East trained officers at the head of the Intelligence Group.

Col. Clarke: Was there any action taken by the Chief of the Far Eastern Group that would lead you to think that any difficulties or hostilities were expected in the Orient that would affect the United States?

Gen. Kroner: None specifically as to direct threat in regard to time or date or place. Japanese possible lines of action were often discussed, as you might expect among officers as closely allied as the ones I mentioned above with Far East training and influence. I left the evaluation of information pertaining to the Far

East and its interpretation initially to Col. Bratton, and in that over-all sense to Col. Betts.

Col. Clarke: What was your chief source of information with regard to the Far East?

Gen. Kroner: Military Attache reports and translations of books and journals which were received from various sources, so far as I was aware.

Col. Clarke: You had no secret intelligence service?

Gen. Kroner: No.

Col. Clarke: Was any attempt made to create any during the time that you were in charge?

Gen. Kroner: Yes. I remember the time—I don't remember exactly—but I remember an instance which was partially fulfilled, I believe, that a former Far East trained officer, who I think was retired and living in California, Captain or Major W. C. Clear, was brought into G-2 and given secret briefing by Gen. Miles, to the best of my knowledge, and sent out to the Far East, I think to Singapore, in order to initiate some secret intelligence, of which I have no detailed knowledge.

* * *

Col. Clarke: Did you have access to a source of information which we know as Top Secret or the British known as Most Secret?

Gen. Kroner: Meaning communications information?

Col. Clarke: Signal intelligence.

Gen. Kroner: No, none whatever.

Col. Clarke: You mean you didn't get it or your Branch didn't get it?

Gen. Kroner: I personally as Chief of the Branch did not get it. I was aware that something, which later I found out to be of this nature, existed, but I was given to understand, particularly by Col. Bratton and Col. Pettigrew, who sometimes handled the matter for Col. Bratton, that he received information from Col. Minxler, whom I knew to be in the Signal Corps, which perhaps had to do with Japanese troop movements, which he by long custom and by General Miles special desire, was to handle himself directly with Gen. Miles.

Col. Clarke: Then you don't know what Col. Bratton did with this stuff other than give it to Gen. Miles?

Gen. Kroner: No official information. I frequently remember seeing him leave his office with several parcels under his arm and be gone for some hours, but I felt it was my duty to follow the established procedure which was apparently pleasing to my chief, and I didn't question

the procedure.

Col. Clarke: During the time that you were Chief of the Intelligence Group you never had access or never saw any of this material yourself? When did you first see it?

Gen. Kroner: I only saw the material, which later I learned was called material, when I used to receive it from Minkler's hands when Bratton was absent, and lock it up in my safe and give it to Bratton without sorting it out. In other words, I understood, without any specific orders from Gen. Miles, that he wished it handled that way and therefore I did not violate that procedure.

Col. Clarke: Do you know if any estimates were written in the Far East Section based on this material or any prognostications, forecasts, or predic tions?

Gen. Kroner: I do not.

Col. Clarke: If any had been made you would have seen them, wouldn't you, as the Chief?

Gen. Kroner: I think so because estimates were accustomed to being made, not only at regular intervals, but also special estimates from time to time would be made, the Far Eastern part of which was always prepared initially in the Far East, held by Col. Bratton or under his direction brought into Col. Betts, who revised it and fitted it in with information from other geographic sections. I assumed that the Chief of the Far Eastern Section used all the information at his disposal to make a complete estimate and as accurate an estimate as possible.

Col. Clarke: Did there exist anything like a central evaluating section where all information came in and was there melted into one estimate or report or summary?

Gen. Kroner: No. There was a trend toward that at the end of the year but we didn't get anywhere with it. It was just in the planning stage.

* * *

Col. Clarke: I would like to ask you one more question. In any estimate from the time you took over the Intelligence Group up to and including Pearl Harbor, was there ever any prediction or forecast made of a possible attack on Pearl Harbor?

Gen. Kroner: None to my knowledge. I have in mind the last estimate that was made before Pearl Harbor, which was an estimate covering a future period from December 1 to sometime in 1942.

Lt. Col. Gibson: Did you consider it a capability of the Japanese to successfully attack Pearl Harbor with bombers?

Gen. Kroner: No. The matter was discussed -

Col. Clarke: Did you identify this document?

Gen. Kroner: Yes. I identified it - this is the document to which I referred - IB 159, November 29, 1941. This particular estimate was considered by the whole division, not only the Intelligence Group but by General Miles himself, as perhaps the most important we had ever gotten out. That importance lay not in so much the danger that we saw from Japan, although danger in that field was pretty thorough ly discussed, but primarily because Gen. Miles wished to focus War Department thought on the defeat that could be administered to the Nazi powers. In the preparation of the estimate each geographic section in the Intelligence Branch prepared its part. Colonel - now Brigadier General - Thomas J. Betts put the several estimates together and did what we called "polish them up." He and I discussed the lines of action and the capabilities of all the warring powers and especially of each potential enemy to the U.S.A., and I took them to Gen. Miles where they were finally altered to suit him or approved. This particular estimate does not include in the lines of action open to Japan, an attack on Pearl Harbor, and I remember that so distinctly because when the word came through the radio on that fateful Sunday, December 7, that Japan had attacked Pearl Harbor, I was sitting in my office in the Munitions Building reading from this paper the Japanese capabilities. Therefore from my point of view, I feel that Japan's potential capability against Pearl Harbor was left from this estimate because neither Col. Betts nor I had any information which would lead us to believe that they were capable of or planned to do so.

Col. Clarke: I would like to ask one final question again just to reiterate the fact that you personally had no knowledge of what Col. Bratton did with this most secret material or to whom he showed it?

Gen. Kroner: That is correct, except to Gen. Miles.

Col. Clarke: And you don't know what Miles did with it.

CHAPTER III

Accepting the Challenge

The technical success of American cryptanalysts could not prevent the Pearl Harbor debacle: the intercepted Japanese diplomatic communications had not contained the details of Japanese military planning. In the aftermath of Pearl Harbor, American policymakers realized that some better way had to be found to produce finished intelligence from COMINT intercepts. Secretary of War Henry L. Stimson called upon the services of the distinguished Chicago lawyer Alfred W. McCormack to solve the problem. McCormack recommended the establishment of a Special Branch within the Military Intelligence Service to handle highly sensitive signals intelligence. This proposal was adopted, and McCormack was commissioned as a colonel and became deputy head of the new organization. McCormack tells the story of the inception of the Special Branch in SRH 116, Origin, Functions and Problems of the Special Branch. The excerpt from SRH 141, Papers from the Personal Files of Alfred McCormack, Colonel AUS, Special Branch, G-2, Military Intelligence Division, War Department, Volume II, details some of the problems surrounding the effort.

From SRH 116. *Writing in 1943 to his superior, Colonel Carter W. Clarke, the Chief of Special Branch, Colonel Alfred McCormack describes the organization they both had helped to shape.*

ORIGIN, FUNCTIONS AND PROBLEMS
OF
THE SPECIAL BRANCH, M.I.S.

April 15, 1943.

MEMORANDUM FOR COLONEL CARTER W. CLARKE:

Subject: Origin, Functions and Problems of the Special Branch, M.I.S.

Following our recent discussions, I am putting down in this memorandum what seem to be the important facts relating to the Special Branch, in the hope of clarifying the problems now confronting us.

A. *Responsibilities of War Department for Intelligence Derived from Cryptanalysis.*

The outstanding feature of "black chamber" activities in the United States is that they are performed almost exclusively by the armed services and that the great bulk of the work is done by the Army. The F.B.I. and the Coast Guard operate in certain limited fields. The Navy confines itself exclusively to naval traffic. The Army is responsible not only for military and M/A traffic but for the large residual field that is loosely called "diplomatic," which includes the great bulk of the important traffic over commercial, official and semi-official radio networks throughout the world.

[text withheld] From the standpoint of the Army the present U.S. arrangements are the most desirable, especially in time of war. The Army is not dependent upon the State Department, [text withheld] for its information about all the complicated cross-currents of political and economic diplomacy and for the enormous amount of intelligence that is found in foreign official messages. On the contrary, the State Department is dependent upon the Army, which now controls the sources and determines the order of priority in which those sources will be exploited.

The continuation of Army-Navy control over such sources is important for the immediate necessities of war, and it is at least equally important for the long-range future. The availablility of important intelligence from cryptanalytic sources, during the critical 18 months prior to December 7, 1941, was due solely to the fact that the Army and the Navy, in the face of difficulties and even legal prohibitions, were able to maintain skeleton organizations in this field, in preparation for the day when they would be vital to the national defense. The armed services are the safest repositories of cryptanalytic material and activities, since they can operate with greater

secrecy and with a longer-range viewpoint than can the political agencies of the Government. The chances of continued cryptanalytic progress after the war are believed to be better if control of the field remains in the armed services than if the non-military fields are taken over by a civilian agency.

However, control involves responsibilities, and in case of the diplomatic traffic it involves specific commitments to the President and to the State Department to get as much usable intelligence as possible out of the material.

B. *Handling of Intercept Intelligence Prior to the War.*

When this country declared war, both the intercept work and the cryptanalytic work in the diplomatic field were divided between the Army and the Navy, though actually most of the work was being done by the Army. The combined intercept and cryptanalytic facilities of the Army and Navy had produced some 7,000 decrypted and translated messages in the 6 months before Pearl Harbor, or an average of about 300 per week, of which only 1,561 were considered of enough significance to be filed for future reference. The responsibility for bringing important messages to the attention of the Secretary of War and the top officers of the Army was vested in the Chief of the Far Eastern Section, M.I.S. O.N.I. served the President, the Secretary of the Navy and the top officers of the Navy.

In M.I.S. the material was handled as follows: Each day's batch of messages was examined by the Chief of the Far Eastern Section. Those not considered important were put aside for burning. Those that were thought important were circulated to the Secretary of War, the Chief of Staff, the Assistant Chief of Staff, Op.D., and the Assistant Chief of Staff, G-2. One copy of each circulated item was put into a locked file; the other copies were burned after they had been returned by the readers. No personnel were assigned to a continuous study of the material; hence very little could be done to put any of it together in connected form. The Chief of the Far Eastern Section, M.I.S., having as such a full-time job and limited personnel, could do no more with the messages than carry the important facts in his head.

C. *Decision of the Secretary of War Concerning Exploitation of Cryptanalytic Field.*

When the sudden attack on Pearl Harbor occurred, it became apparent that the event had been clearly foreshadowed in the Japanese traffic of 1941. The Secretary of War, and no doubt others, than concluded that the traffic had not been given sufficiently close attention, and that some agency should be set up to deal with cryptanalytic intelligence in a more thorough-going fashion than previously had been thought necessary. The Secretary decided that the job ought to be undertaken by a lawyer having a special type of competence and training, such as may be acquired in the handling and presentation of large cases involving complicated facts.

After consulting with the Assistant Secretary, Mr. McCloy, about possible candidates, the Secretary authorized Mr. McCloy to offer this assignment to me, my experience over a number of years having been along the indicated lines. The mat-

ter was put up to me early in January, 1942, and after some discussion I agreed to undertake the job, resigned from my law firm, and took office as a Special Assistant to the Secretary on January 19, 1942.

On that day I received my instructions from Mr. Stimson. Briefly, they were that I was to study the problem and determine what had to be done in order to expand the cryptanalytic operations to meet the requirements of war, and to make sure that all possible useful intelligence was derived from the cryptanalytic material. Both the Secretary and Mr. McCloy emphasized the need for close and continuous study of intelligence derived from cryptanalytic activities and of piecing such intelligence together in connected form.

For two months I studied the back materials, investigated production facilities, had numerous conferences with Mr. McCloy, General Lee and others interested, and made recommendations as to what should be done and how the work should be handled. The details are no longer of any importance. Everyone agreed that there was a very large job to be done.

D. *Organization of M.I.S. Section to Handle Intercepts.*

Shortly after I started work, there was set up in the Far Eastern Branch of M.I.S. a section which was to follow and report upon the cryptanalytic material. It soon became apparent that there were at least two fundamental differences of opinion between the officer chosen to head that section and myself.

First, I disagreed with the notion that any reserve officer, or any civilian who had been graduated from college, was qualified to handle cryptanalytic intelligence. It seemed to me that the job could be done effectively only by persons with very special qualifications; that the most careful selection of personnel was necessary, and that only individuals of first-rate ability and suitable training should be taken into the work.

Second, I disagreed with the method that was adopted for reporting the intercept material, which was to take what looked interesting and to pass it along in paraphrased form, without any attempt either to check or evaluate the information or to supplement it by collateral intelligence. It seemed to me that the Secretary, the Chief of Staff and the others to whom reports were made were entitled to have every item carefully checked, evaluated and supplemented by all possible sources of intelligence, and that their time should not be wasted in reading odd and unchecked bits of information not related to attendant circumstances and given their proper value. Further, it appeared to me that the daily reporting of current messages was only one part of the job; and that the real job was to dig into the material, study it in the light of outside information, follow up leads that it gave, and bring out of it the intelligence that did not appear on the surface.

E. *Organization of Special Branch.*

My investigations of the intercept and cryptanalytic problems brought me in contact with you, and we had many discussions on the subject and some discussions with General Strong. His thinking was along the same lines as ours and he

approved of our conclusions. The upshot was that the M.I.S. section in charge of cryptanalytic activities was made the Special Branch, with you as its Chief. We moved into common quarters and worked together, your staff (part of M.I.S.) and my staff (part of the Secretary's office) being made into a single working unit as fully as if they were all part of the same agency. You concentrated on pushing the expansion of the intercept facilities, on setting up a workable system of priorities, and on the many technical problems that were encountered. You were fully familiar with those problems and had arrived at the same conclusions that I was reaching, with respect to the necessity for a great expansion of the intercept facilities and for an attack on the cryptanalytic problems on a much broader basis. You were largely instrumental in inducing the Signal Corps to embark upon the program that it is now carrying to completion, involving the acquisition and development of Arlington Hall, the location at Vint Hill of one of the largest intercept stations in the world, the expansion of facilities at Two Rocks, California, and elsewhere, and a personnel program reasonably adapted to requirements of a war-time job.

Meanwhile, I concentrated on recruiting a suitable staff and on the problems involved in getting intelligence out of the intercepts and devising methods of checking, evaluating and reporting it and of keeping track of it by suitable files and indexes. General Strong and you felt that it was desirable for me to go into the Army, and I was commissioned in June. Thereafter the Special Branch absorbed the staff that the Secretary's office had assigned to me.

F. *Work of the Special Branch.*

* * *

It seems fair to say that we have a good organization of people well above the average level of competence, who work full steam and on the whole have given a good account of themselves. Our so-called "Magic Summary" appears to be accepted as a satisfactory job of reporting. At the Navy's request a copy now goes to the Secretary of the Navy, and at the State Department's request copies now go to the Secretary of State and to the Assistant Secretary of State who follows cryptanalytic intelligence.

A great deal of our work does not get into the "Magic Summary." I think we probably do more work in deciding what to exclude from the Summary than we do on items that are put into it. We try to avoid reporting more details, and we consider that those to whom we report should not be bothered by material which, if properly checked and studied, would be found to be of no value.

A lot of our work, from the reporting angle, consists in feeding information to the M.I.S. geographical sections, to other agencies of the Department, and to outside agencies. We employ one officer full-time in verifying Order of Battle information and reporting such information to the O/B sections and the Air Branch of M.I.S. When security considerations permit, we pass on economic information to

the B.E.W. We are constantly called upon for information by those in the State Department who have access to our material, and we employ one officer full time in serving the State Department and getting necessary information from them. We prepare periodical reports on South American information for the Coordinator of Inter-American Affairs. When information is of a sort that the Assistant Chief of Staff, G-2, should bring to the attention of other agencies, such as the O.S.S. or the O.W.I., we prepare reports or paraphrases for his signature.

The whole body of intelligence which flows out of intercept material, into the various sources that have been mentioned, adds up to a considerable amount. This memorandum will not attempt to evaluate it, as compared with other sources of intelligence, but it may be worth while to mention a number of examples of important intelligence material, with which the readers of the "Magic Summary" will be familiar:

a. Practically the only good information about the relations between Japan and Russia has come from the intercept material. Much of it has not been obvious on the face of the material, but has required a great deal of study and collateral research in order to piece it together. (At a time when almost everyone expected Japan to attack Russia, and when M.I.S. went on record as predicting such an attack at an early date, we had concluded from the intercept material that Japan had no intention of attacking Russia, but wanted to keep out of war with Russia at all costs.)

b. The best information about the attitude and intentions [text withheld] following the African invasion, came from that source.

c. That source has also yielded, in addition to considerable information not otherwise obtainable about Japan, the most accurate and dependable information about the relations between the Japanese Government and its Axis partners and about trade between Axis Europe and the Far East. [text withheld]

Many other examples of lesser importance, but of the same general type, might be given.

It would take a lot of space to give a good picture of what might be called the "detail intelligence" that we get, of its present value and of the future value that it may have as it gradually builds up facts. Perhaps the picture can best be given by the following illustrations:

The nature of the materials bearing on the Far East is such that the most astute person, even if an expert on the Far East and possessed of a photographic memory, would derive few connected impressions—and very little usable information—from merely reading the messages from day to day. They must be pieced together by the most painstaking and laborious process, involving collateral investigation, often of minute points. The work is very difficult, but the rewards in the way of intelligence are substantial. For example:

As you know, we are in possession today of enough information about Japanese shipping to and from Indo-China and Thailand so that we have a pretty

clear picture of the movement of supplies on those runs and of the problems that Japan is encountering in getting raw materials out of those areas and keeping them supplied with the minimum of essential imports. Our information has been put together from an infinite number of scraps of fact. As you recall, the material on this subject was not at first very promising. It looked hopeless to make any connected sense out of the garbled texts, incomprehensible ship names, abbreviations and alphabetical designations, and the inconsistent tonnage figures, loading reports and ship schedules, especially because in many cases the key messages had not been intercepted.

Finally, however, by struggling with the S.S.D. translators, doing research on Japanese merchant vessels, gradually identifying ship names, eliminating duplications of cargo information, checking ship tonnages and schedules and, in general, applying what might be called high class detective methods, we built up a picture that is clear and substantially complete in its principal parts. Having built up that picture, it is now possible for us to follow the pertinent messages from week to week and to understand what they mean. Had the job not been done, the current messages would be largely incomprehensible.

Since Japanese shipping has been selected as an illustration of the piecing together of incomprehensible bits of intelligence into a connected whole, it is interesting to note that we arrived at several conclusions about Japanese shipping which made it necessary to change previously accepted figures. For instance, we established that the Japanese have been employing at least 450,000 tons of merchant shipping in the South Pacific, whereas the J.I.C., apparently with the approval of the Navy, recently published a study which showed that only 300,000 tons of shipping were employed in moving goods to and from that area. We brought our findings to the attention of O.N.I., whose people first explained them away. A few days ago, however, we were advised informally by O.N.I. that they now agree with our findings and that, while they do not want to revise their published figures at present, they will make the corrections when they next issue a report.

This little story has a pertinent moral. Until we gave them the above and certain other findings on Japanese merchant shipping, the O.N.I. people were polite and cooperative, but they stopped short of giving us their own secret information. But, when we brought them to our office and explained what we were trying to do and how far we had progressed, they offered to put at our disposal all their own information on the same subject. Since that time, which was last fall, they have prepared for our special use and delivered to us each morning a summary of all information received on the previous day about merchant shipping in the Far East, from sources other than our own material.

From this daily report, pieced together with our other material, we are building up a wealth of evidence on the movements of Japanese vessels and cargoes. We have hopes that the time is not far distant when we will have the whole picture of Japanese shipping and water-borne trade reconstructed to a point where its main

outlines will be clear and many if not most of the important details will be known.

The above is given as a sample of the work that we are trying to do; and while this memorandum is not intended as an analysis of S.S.D. traffic, present or potential, it may be worth while to carry the story just a little further:

Japanese shipping is only one of the important subjects on which the intercepts are gradually building up connected and definitive information, not obtainable from any other source. Referring only to the Far East, it is our hope that over the next year, if the same kind of material keeps coming in and if sufficiently painstaking work is done on it, we will have the Far Eastern picture—except perhaps for the East Indies—pretty well reconstructed in its economic and political aspects and be able to make increasingly accurate diagnoses of Japanese capabilities, difficulties and plans.

The story of the Dutch East Indies is buried, we think, in the water transportation traffic of the Japanese Army. The cryptanalysts at Arlington Hall think they have solved the cryptographic system in which this traffic is sent and that in 1, 2 or 3 months they will have built up code values to a point where the traffic will be completely readable. If that should prove to be true, then the East Indies will be opened up from the intelligence standpoint and the geographical coverage of the Far East will be complete.

G. *Increase in Volume of S.S.D. Material.*

Meanwhile, coverage is being extended, new systems are being solved and translation and processing facilities are being built up. [text withheld] In the 6 months before Pearl Harbor almost all the traffic produced was Japanese, with a scattering of German [text withheld] messages. A large volume from many sources is now handled, and language coverage has increased [text withheld]

The recent solutions of the German Key Word Code and the Japanese M/A Code represented substantial progress in cryptanalytic work; and the expected solution of at least one of the highest grade Japanese military ciphers—and possibly of the whole Japanese military system—will, if it occurs, be an event of major importance from the intelligence angle.

Intercept coverage has been extended by the development of 3 large fixed monitoring stations, giving approximately global coverage for what is broadly described as "diplomatic" traffic, and by field radio intelligence companies. Not only do the new stations permit more intercept facilities to be used, but the better antenna installations and better equipment make it possible to listen to circuits at times when previously they could not be heard. For example, until completion of a recent installation at Vint Hill, the Berlin [text withheld] circuit could be listened to for an average of perhaps one or two hours per day. Now it is estimated that the good listening hours have increased to 8 to 10 hours per day, and possibly more. When the Fairbanks station—the only one that can listen to traffic between Tokyo and [text withheld] —gets new antennas, as it will when the spring weather comes, the amount of traffic intercepted from those circuits should increase from a mere

driblet to a substantial volume.

During the month of March we received 4,500 deciphered messages from Arlington Hall. This was still only a fraction of the available material, as may be shown very readily by the figures for the messages [text withheld] during March.

	Total
Japanese Army and weather traffic	91,596
Other traffic	22,489
	114,085

The bottleneck—by reason of which this Branch received only 4,500 messages from Arlington Hall in March, as compared with our 22,000 (excluding Japanese military) [text withheld] lies in the processing and translating facilities of Arlington Hall, which are largely a problem of civilian personnel. They had 105 civilians on December 7, 1941; they had 1,754 on February 1, 1943 (the last date when we obtained exact figures). They now have over 2,300 and their T/O calls for 3,683 by June 30, 1943. It is estimated that—apart from the problem of Japanese military tarffic—the volume of S.S.D. material coming into the Special Branch will at least double by the end of June. It will continue to increase as the successive bottlenecks are eliminated. More traffic will be intercepted; more will be decoded; more will be translated. Leaving out of account the Japanese Army traffic, the total volume could easily increase four-fold by the end of the year.

This increase of material emphasizes our manpower problem. But the problem exists independently of the question of volume,and the factors involved in long-term planning are much more important than merely the question of handling a certain number of intelligence items per day.

H. *Basic Factors in the Problem of Cryptanalytic Intelligence.*

Certain considerations that are fundamental to our problems may be mentioned:

a. An effective intelligence agency—especially one that must deal with such difficult material as decrypted intercepts—cannot be built up by writing a T/O and filling the places with what personnel happens to be available. To do the work well, a man must have not only a broad education and background of information, but must have more than his share of astuteness, skepticism and desire to solve puzzling problems; and he must have a capacity for laborious detail work that very few people have. As you know, we have had 2 cases of men who proved incapable of doing our work, though both of them had had fairly successful careers in civil life. Not only were they able to produce nothing by their own efforts, but they used up so much time of others working in the office, and made so many mistakes that it took time to correct, that we found our net efficiency increased by taking them entirely off the work and inventing jobs to keep them busy until they could be assigned elsewhere.

b. One principal reason why exceptionally qualified personnel are required in the intelligence agency that deals with cryptanalytic material is that such an agency cannot afford to make mistakes, because it tends to become a focal point in intelligence activities. There are several reasons for this:

(1) Intelligence from intercepts, where the material is first-hand and of dependable origin, is the most reliable information and frequently the first to arrive. Hence it is looked to as a primary source of high-grade intelligence.

(2) Much of the intercept material consists of odd pieces of information and sometimes no more than a clue, which can be understood or followed up only in the light of information that must be obtained from other sources. Hence the processors of intercept intelligence tend to draw into themselves—and must draw into themselves to be effective—the intelligence output of other agencies. This they must put together with what they have; and if their own information is good they are likely to come out with more accurate and better evaluated information than is elsewhere available. We see this constantly in comparing our information on various topics with information put out by the B.E.W., O.S.S., J.I.C. and other agencies.

(3) Because they must constantly seek information from outside sources, those who deal with intercept intelligence have an opportunity to learn what the good sources of information are on a wide variety of subjects. In view of the multiplicity of intelligence agencies and would-be intelligence agencies in Washington, the large amount of duplication of work, and the penchant of certain agencies to bring forth a stream of classified reports that are inaccurate and, in many instances, not much more than irresponsible guesswork, this is a very important point. (For instance, though the Joint Intelligence Committee is among the least of the sinners in this respect, I think it fair to say that its Weekly Summaries in the past two months have contained a number of inaccuracies and some positively erroneous or misleading information, which this Branch, at least, would never have put out under any circumstances.)

c. The guiding consideration in the internal arrangements of the organization that handles cryptanalytic material, and in its methods of dealing with outside persons and agencies, is the consideration of security. One lapse of security is all that is necessary to dry up a radio intercept source. Therefore, both on the officer level and below, only persons of the greatest good sense and discretion should be employed on this work. This consideration is basic, since intercept information involves a different kind of secrecy than does most other classified information. It will make no difference a year from now how much the enemy knows about our present troop dispositions, about the present whereabouts of our naval forces or about other similar facts that now are closely guarded secrets. But it will make a lot of difference one year from now—and possibly many years from now—whether the enemy has learned that in April 1942 we were reading his most secret codes. Not present secrecy, not merely secrecy until the battle is over, but perma-

nent secrecy of this operation is what we should strive for. That may be too much to hope for in a democracy; but if it is possible to attain or approach it we should try to do so.

d. An essential job of the Special Branch, which must be done if it is to produce this maximum usable intelligence, is to establish intercept priorities, keep them constantly in tune with intelligence requirements and see to it that those who operate the intercept stations shall understand and follow them. Only a small fraction of the world's radio traffic can be listened to, with the facilities that are at hand or obtainable. To deal with the priority problem there must be a continuous appraisal of materials coming from the various circuits, of the probable intelligence value of what might come from other circuits and of the week to week necessities from an intelligence angle. The whole question is infinitely complicated and time-consuming, as witness the fact that you and Col. Taylor and I spent many days on the last priority directive. But it is an absolutely essential job to be done. With Col. Taylor going to London we will have to find some other man to spend a good part of his time on the intercept priority problem.

e. Another essential job is to establish cryptanalytic priorities and keep track of cryptanalytic projects. Cryptanalysts are scarce and their time must be used to best advantage. This requires a degree of liaison that we have not yet been able to realize, from lack of man-power. This problem, moreover, is closely interwoven with the intercept priority problem. If you are to put the cryptanalysts on a new project when they have finished the one that they are now working on, you must devote a part of your intercept facilities to the building up of a large volume of traffic in the as yet unreadable code, so that when the time comes to tackle it the cryptanalysts may have enough materials to do the job.

f. Still another essential function of the Special Branch is to supply the cryptanalysts with leads and clues, and with intelligence in general. The art of cryptography has outstripped cryptanalysis, to a point where high level codes and ciphers are no longer broken by cryptanalytic methods alone, even though modern machinery is capable of almost miraculous performance in the analysis and synthesis of cryptographs. Today it is collateral intelligence which solves high-grade cryptographic systems. While that intelligence can come from a number of sources, in the nature of things the best source is the intelligence organization that struggles day by day with the cryptanalytic output and is familiar with what the cryptanalysts are trying to do and what their needs are. From the long term standpoint the Special Branch's function as a feeder of intelligence to Arlington Hall is hardly less important than its function of getting intelligence out of what Arlington Hall produces. We have done a lot of work along this line; but we would be doing a great deal more if we had more help.

g. The experience of the Special Branch has proved that astute people working on the special materials have opportunities to furnish intelligence that leads directly to the solution of codes. Lt. Littlefield, for example, is directly

responsible for the recent solution of the cryptographic system used by the Germans in communicating from Berlin to agents in South Africa. From his study of other intercept material he came to the conclusion that a certain class of unreadable radio traffic was being beamed to South Africa, although the intercept people, including those of the Coast Guard, were positive that it was being beamed to South America. He insisted on this position, and informed the cryptanalysts what he thought the messages might deal with; and they applied probable meanings to the messages that they had. The solution of the code followed very quickly, and the contents of the messages proved that Lt. Littlefield's guesses had been correct.

h. Intercept coverage and cryptanalytic work has one very important purpose that is sometimes lost sight of, in addition to the job of getting intelligence out of the messages. That purpose might be described as protective monitoring. This has many phases, of which the following are illustrations:

(1) We get from S.S.D. a large volume of samplings of [text withheld] traffic, some of which has to do with ship movements, deliveries of airplanes and munitions, assignments of military personnel, placing of orders in the United States, and other subjects having military aspects. Almost none of this material is ever reported by us. Nevertheless we follow it very closely, in order to make sure that it does not become a source of valuable information to the enemy... [text withheld] It is our practice to check each item of information to determine whether it is one that the enemy could not get from other sources, whether, if it is, the information is of importance and, if it is important, whether the degree of importance warrants taking some action. Generally our conclusions have been negative; but in one or two instances General Strong's attention has been called to such a problem and he has alerted those dealing with [text withheld] to the dangers involved in giving certain information and in doing business in such manner as to require too much use of the radio.

(2) Another aspect of "protective monitoring" is to keep on the alert for any evidence that the enemy is reading our own codes or the codes of other nations. Since everybody appreciates that codes will be changed or abandoned if the users discover that other countries are reading them—and since, therefore, everybody tries to be very careful about transmitting information from intercept sources—the most meticuluous "detective work" is required in dealing with this problem.

* * *

(3) Still another aspect of this subject is to keep track of the enemy's sources of information and to keep posted about what he knows. Prior to the landings in North Africa, attention was directed to all available traffic that might reveal the enemy's knowledge, and it was examined with great care with that in mind. The cutting down of Axis code communications by Chile and later by Argentina was brought about by our State Department because they knew from

intercepts what kind of information the enemy was getting, knew how much pressure on the two countries was justified by the facts, and knew, finally, what ace they had in the hole in case they should be forced to use it. The location by [text withheld] intercept activities, of enemy agents who were sending valuable information to Berlin and Rome, has enabled them to deal with the problem in some instances in a different way, viz., by buying up the agents and getting control over the Axis source. There are several places in the world today where the problems of Axis communications are a live and important issue.

i. U.S. operations in the field of cryptanalytic intelligence are relatively limited. For various reasons, including the piety of the State Department and the fact that our Army was starved for funds prior to the war, we entered the war with relatively little experience in cryptanalytic matters, and with even less experience in dealing with intelligence from intercept sources. This is certainly true as compared with the British, and we have reason to suppose that the Germans—and to suspect that the Russians—were also far ahead of us. While we have made progress, we have a long way to go. Large as it is, our S.S.D. operation is on a much smaller scale than the various comparable operations of the British. This is also true of the intelligence side of the picture; and so long as it remains true, we will continue to be at a disadvantage

* * *

m. There is one aspect of our relations with the British in intelligence matters that has struck me very forcefully. Our intelligence agencies in Washington appear to spend a lot of their time keeping information secret from one another, in competing for credit and in beating one another into print. All of them have some liaison or other with the British intelligence agencies; and for some reason they are freer in giving information to the British than to one another. The British do not keep their information in water-tight compartments, nor do their various agencies seem to care who gets the credit. They are so set up that their intelligence is put together and evaluated; and the job is done promptly. This gives them a great advantage over us in intelligence matters.

n. We have had enough to do with the British to have discovered that there is a considerable amount of intelligence which they withhold from us, not especially by design, but because we do not ask for it. Sometimes it is not asked for because nobody knows it exists. Recently, for example, we have discovered that certain intercept information about Continental Europe, which does not flow regularly into any American channels, is available to us at the Embassy, merely because we deal with cryptanalytic material and have established a certain amount of confidence in our judgement and discretion. If Major Heneman, who has pursued this contact, were not encumbered with a large burden of other work, and could spend half his time at the Embassy, I am confident that he could bring into the United

States channels of intelligence a substantial amount of valuable information that either does not get into those channels at present or gets into them too late to be of the greatest value.

o. A fairly important problem that we have—one that will grow with the volume of traffic—is the problem of increasing the proportion of Arlington Hall intercepts which are at least scanned for their intelligence content. The problem exists in all languages covered, but it is particularly acute in the Japanese. Because of the shortage of cryptanalysts and translators, not all decipherable messages can be deciphered, and not all that are deciphered can be translated. There is a scanning and selecting process at both the cryptanalytic and the translation stages. This is done by the cryptanalysts and translators themselves; and on the whole they do a good job. However, to insure that no useful intelligence is missed, the organization handling the intelligence should participate in the process of selection and should continually educate the cryptanalysts and translators in the week to week intelligence needs. This is done in the British Black Chamber organization, and it is done in the Navy organization. We have assigned Capt. Ervin as liaison with Arlington Hall, and he will be able to do this to some extent. However, there are so many liaison requirements that an additional officer will have to be provided before long, if we want to be sure that the work is done thoroughly. In addition, there is a specific need for a man familiar with the Japanese language, to deal with Japanese translators. We have such a man, Dr. Creel, who because he is also a Chinese scholar can help the translators on one of their most difficult problems, which is to identify Chinese names from their Japanese Kana versions. He has already helped them a great deal. But, until we get some additional personnel, he cannot take much time away from the day to day job of handling Far Eastern material.

p. The WT/I field, and the relations of the Special Branch and Arlington Hall's work in this field, are matters that are now under study, and I mention the subject only for the record.WT/I—the derivation of intelligence from radio traffic by all means short of cryptanalysis- [text withheld] It has, of course, numerous applications in the field; and it is of special importance to the Navy. Arlington Hall has been experimenting with Japanese Army traffic from the WT/I angle; and the prospects for deriving intelligence from it look promising. But the development of this work, to judge from what I have seen of it thus far, is going to require a close liaison with the military intelligence and, from our standpoint, the full time of at least one man....

I. *Personnel Situation of the Special Branch—Officers and Civilians.*

In the foregoing somewhat discursive remarks, which by no means cover the whole subject, I have tried to show that our problems have many sides, that the field of cryptanalytic intelligence is important, and that there are great opportunities in this field if we are prepared to seize them.

Whether or not the objectives that we have in mind are sound, I think the problems at least are of some real importance to the country. The adage that knowledge

is power is nowhere truer than in the field of international relations, especially during a war and in preparation for peace. We are gaining knowledge and experience in many parts of the world, some of it rather expensively; but we still have a lot to learn. In the field of intercept intelligence we have at hand, in my opinion, one of the greatest potential sources of information; but we are not making the most of it. We need to raise our sights.

The above statement of our problems may indicate why the present manpower of the Special Branch is not adequate to do the job that we want to do. A quick picture of our manpower (excluding you and myself) may be given as follows:

Total officers	30
Civilians comparable to officers	9
	39
Deductions must be taken for:	
Officers who work in the Cryptographic Security Section and Radio Communications Section (transferred from C.I.G.) who have nothing to do with S.S.D. material	5
Officers who do purely administrative work, which is very heavy because of security requirements and the large volume of paper work that passes over your desk	3
Officers about to be transferred to Ground Forces (2) and to London (1)	3
Mr. Bingham, who has enlisted and is about to be inducted in the Army	1
	12
Balance	27
To get the net working forces on the intelligence job, certain additional deductions of men on special assignments must be taken, as follows:	
Major McKee (Order of Battle specialist)	
Capt. Berle (Liaison with the State Dept.)	
Capt. Calfee (Only technically assigned to the Branch, doing most of his work for AIS. . . .)	
Capt. Ervin (in training at Arlington Hall, to be a liaison officer with	

that organization)	
Mr. Randolph (about to commence training at Arlington Hall, to work on WT/I material)	
Lt. McCluney (temporarily spending full time on personnel work)	
Lt. Wilkinson (just relieved as Security Officer and engaged in training his successor)	7
Present net working force on intelligence material	20

According to their work and the parts of these 20 men are assigned as follows, the world that they keep track of:

Editing "Magic Summary" and studies	3
Reading and routing collateral intelligence material from regular sources	1
Biographical Section	2
Far East	6
Near East	1
Eastern Europe	1
Central and Western Europe	3
Southern Europe and Africa	2
Latin America	1
	20

Considering the volume of material that we have to handle and the job that we are trying to do on it, the figures above speak for themselves.

* * *

Alfred McCormack,
Colonel, G.S.C.

From SRH 141-2. *In a moment of discouragement about the Army's relative lack of success in exploiting Japanese military (as opposed to diplomatic) communications, McCormack wrote this memorandum to his immediate superior. Like a great many of his memoranda, it dealt with personnel. The B Branch of MIS, mentioned in the correspondence, handled Japanese military decrypts; A Branch handled diplomatic materials; C Branch, the German intercepts provided by the British. Ironically enough, at the time he wrote, SSA and Special Branch were on the verge of a definitive breakthrough in deriving intelligence from Japanese Army messages.*

3 Jan 44.

MEMORANDUM FOR COLONEL CLARKE:

Subject: Personnel Problem of B
Section, Special Branch.

1. This attempts to state the problem of getting intelligence out of the Japanese Army material, specifically from the standpoint of personnel requirements.

2. The United States entered the war completely unprepared to deal with Japanese Army cryptography; we were not then reading, and had never seriously attempted to read, any high-level Japanese Army cipher system. (For that matter we had never tried to read the German military systems either).

3. The first break into a high level Japanese system occurred some time in March or April 43, when the Wireless Experimental Center at New Delhi got into the [text withheld] water transport) system. By that time enough was known about the high level systems of the Japanese Army to permit a decision as to the order in which they should be worked on and the division of the work among the 4 large cryptanalytic units (Arlington Hall, the GC&CS in England, the WEC in India and the Central Bureau at Brisbane). Arlington Hall by agreement was made the directing center of Japanese Army cryptanalytic activities; and in dividing up the work it assumed the primary burden of the bookbreaking job on [text withheld]

4. As of April there was no American experience in intelligence work on Japanese high level decodes. In a study written up in that month we expressed confidence in the ability of the Special Branch to handle the material that was expected to flow in after a couple of months, though we did say that a transfer of personnel from other work would be required, and that our other work would be impaired, unless personnel could be recruited promptly and trained.

5. Not until the middle of June did we get approval for additional personnel. By that time our work had expanded far beyond the new allotment of 20 officers; we were given additional jobs to do, faster than new personnel could be recruited; and we were not able to put adequate personnel on the JA work.

6. Having no experience to guide us, both Arlington Hall and ourselves had under-estimated the difficulties that the Japanese systems would present; specifically (it now seems to me), both had underestimated the amount of intelligence and research work that would have to be done in order to build up the water transport codebook and get intelligence out of the messages. Both organizations, therefore, were unprepared for the job that this material presented.

7. By June, it was clear that, in order to capitalize on the opportunities presented by [text withheld] and other systems then in process of solution, Arlington Hall would have to increase its personnel by a minimum of 2,000 people. Studies designed to present the problem to the appropriate authorities were commenced. By August a request for the necessary personnel, accompanied by a T/O and manning tables, had been submitted. It appeared on the face of the study that a critical situation existed. Nevertheless, 4 months passed without effective action being taken; and only within the last few days has Arlington Hall received the authority necessary to commence recruiting.

8. In other words, 6 months after a critical need for at least 2,000 persons was obvious to anyone familiar with the problem, the lengthy and difficult job of recruiting such personnel is just being started.

9. Meanwhile, upwards of 200,000 Japanese Army messages (in [text withheld] and other partially solved systems) have piled up on the shelves at Arlington Hall, unread. These messages would be readable if the necessary personnel were available. Most of them will never be read, because the priority of current traffic, the increase of readable current material at a rate faster than the recruitment of personnel, and the sheer necessity of moving forward from one period of a system to another, in order to preserve cryptographic continuity, will make it impossible ever to allocate personnel to decipher and translate any substantial portion of these messages.

10. How much priceless intelligence is locked up in these unexploited and unexploitable messages is anybody's guess. It is anybody's guess, also, how much information of operational importance has been lost, because when the opportunity came along we were not ready for it.

* * *

77. One thing is sure. If every limitation of personnel allotments were removed, and the Special Branch were allowed to recruit (as the British GC&CS do) qualified personnel from wherever they might be found (officers, enlisted men and women and civilians), it would still be impossible, even within the next year, to find and train the number of qualified persons necessary to keep up with the ever-increasing opportunities which the Japanese Army traffic will probably present.

78. The writer would sum up the situation presented by the Japanese Army traffic as follows:

a. In our exploitation of this field we are far behind where we should be, or where we might have been had the job been seen in its true proportions and been given the necessary priorities in manpower and facilities.

b. We have arrived, nevertheless, at a point where an opportunity is presented to increase our Japanese intelligence a thousandfold.

c. If we act vigorously, giving this job the kind of priority that the British have given their work on German "E," we have the chance of getting into Japanese Army cryptography so deeply that we can never be dislodged from it by changes in systems or by devices employed by the enemy.

d. If we act vigorously, at the very least we can open up sources of intelligence that will certainly be of great importance, and might even be of decisive importance, in the Pacific war.

e. Except for the matter of I.B.M. machines at Arlington Hall, the problem reduces itself almost wholly to one of obtaining qualified personnel, when they are needed and not 6 months later.

f. If we go on the way we have gone to date, we shall continue to miss opportunity after opportunity, and at the end we shall have paid for the lost opportunities in lives and wasted resources.

79. The foregoing appears to confirm the opinion that you have expressed, that Arlington Hall's increase of personnel should be raised from 2,000 to 5,000, amd that it should be allowed to go forward to recruit 5,000 qualified persons as promptly as possible. When the Wireless Experimental Center in India, with a much more limited mission, already employs 5,000 personnel and is moving to increase that number as rapidly as personnel can be found, an increase of at least 5,000 persons for Arlington Hall would seem to be indicated.

80. An increase of personnel for B Section of the Special Branch from 55 to 280 officers and from 22 to 120 enlisted women or equivalent personnel is a drop in the bucket alongside of the Arlington Hall requirements. It is, moreover, no over-estimate of the requirements, if the British organization is to be taken as a model. Hut 3 at B.P., an intelligence section dealing with high-level German traffic solely from the current operational standpoint, had 328 persons working in May; and this is exclusive of administrative personnel. In the two principal sections dealing with the longer-term aspects of German military traffic there were 257 persons and 179 persons (again exclusive of administrative personnel), or a total in the 3 operations of 764 persons. This total is exclusive of a Tabulating Section of 239 persons, and takes no account of personnel on the intelligence side of the operation at the War Office and the Air Ministry. The Special Branch must perform not only the functions performed at B.P. but a number of those performed by the Service Ministries in London.

81. This situation is a challenge to the War Department to tackle a new kind of job, one not easy to understand and not easy to fit into a familiar pattern of organization, and one that requires considerable imagination and a particular type of personnel.

82. It is also an intellectual challenge to the United States Command. The victory of the British over the Germans in the radio intelligence field is a great intellectual victory of one leader and one people over another. The Germans have been outwitted at every turn; their most secret military communications are read every day; their most elaborate security precautions count for nothing. Why were the British able to get to the "Scharnhorst" and sink her? Simply because they were able to arrange their tactical dispositions and deception measures in the light of knowledge, derived from reading messages in what the Germans still consider an unbreakable cipher, of the vessel's precise mission, the nature of its escort and the exact time when the battle convoy was going to leave Lopphovet.

83. Except for whatever our Navy has been able to do, we have achieved no corresponding victory over the Japanese. To date, in the field of radio intelligence, we have met largely with failure.

84. The chances for victory, however, lie before us; the only question is whether we have the vision to see them and the imagination and energy necessary to seize them.

Alfred McCormack, Colonel, General Staff
Deputy Chief, Special Branch, MID

CHAPTER IV

Training the Force

The very large signals intelligence effort mounted by the U.S. Army in World War II demanded masses of trained personnel. For most of World War II, officer and enlisted cryptologic personnel were trained at Vint Hill Farms in Warrenton, Virginia, which was also the site of the Signal Security Agency's Monitoring Station Number 1. The "Official Story" of officer training is contained in the excerpt from SRH 358, History of the Training Division, Signal Security Agency. A more informal account of the human side of the training process as it affected enlisted ranks can be found in the "Third Battle of Manassas," an unpublished manuscript prepared by some of the trainees.

From SRH 358. *An excerpt from the History of Training Division, Signal Security Agency, discusses the training of cryptologic officers at Vint Hill Farms Station during World War II. Indicative of the fact that the Agency (and the Army) reflected all too well the prejudices of the time is the fact that all officers selected not only had to be mentally and physically fit, but also "of the white race."*

CHAPTER IV

HISTORY OF SCHOOLING OF COMMISSIONED OFFICERS IN THE VINT HILL FARMS SCHOOL VINT HILL FARMS STATION WARRENTON, VIRGINIA, 17 March 1941 to 1 January 1945

* * *

10 March 1942 to 5 October 1942

On 10 March 1942, the training of commissioned officers was initiated in the Cryptographic Division, Fort Monmouth, New Jersey. The Cryptographic Division was then a part of and under the supervision of the Enlisted Men's Department, Signal Corps School, Fort Monmouth, New Jersey, and had been organized primarily to train enlisted men in cryptanalytics and linguistics. The training of commissioned officers was initiated primarily because of the need in various Signal Corps and Army Air Forces units and installations for personnel qualified as Message Center Officers, Cryptographic, MOS 0224. It was certain that emphasis in such training should be placed on cryptography and, therefore, that a school organized to teach cryptanalysis would apparently not be the proper place to give such instruction. However, the Cryptographic Division was the only Signal Corps school then existent which could not only teach the operational phases of War Department systems but could also demonstrate to the students by cryptanalytic methods, their weaknesses and thus emphasize to them their responsibility for the security of such systems.

On 10 March 1942, a group of seventeen officers, assigned to the Signal Corps, were placed in such training and fifteen were graduated after a period of approximately ten weeks. All of the group graduated were transferred to the Army Air Forces for cryptographic security duties. Additional officers were assigned for training from both the Signal Corps and the Army Air Forces from that date until 5 October 1942, so that the average number graduated per month during that period amounted to ten, of which approximately 50 per cent were assigned to duty with the Army Air Forces and the remainder to duty with the Signal Corps.

Since the commissioned training during this period dealt with relatively small classes, only two commissioned instructors were needed and these were provided from officers assigned to the Staff and Faculty, Signal Corps School. The instructors were required to be trained as Cryptanalytic Officers, General, MOS 9600, with special additional training in the operation and analysis of War Department systems.

All commissioned students were required to have an AGCT grade of 130 or better, an analytical mind, and preferably a college education. All had to be cleared under the provisions of classified AGO letters pertaining to the clearance of personnel for cryptographic duties. Due to the fact that almost all position vacancies were in overseas units or installations, composed of or operated by white troops, all officers had to be of the white race and physically qualified for overseas service.

The problems encountered in this phase of the training conducted by the Cryptographic Division were relatively few and based primarily on the difficulty in obtaining current and pertinent instructional material and on the difficulties created in the scheduling of training on classified material by reason of the delays incurred in obtaining cryptographic clearances. As the student body increased, the further problem of finding adequate classroom space was created. No additional space was available at Fort Monmouth, and as a consequence, the school was placed on a two shift basis.

No reports have been received criticizing the adequacy of the training given commissioned officers during this period, but it can be properly acknowledged that by reason of the speed-up created by the demands for trained officers, the training was at best weak because the theoretical and technical phases had to be emphasized at the expense of practical application, and as in most types of school training given to commissioned officers, little or no opportunity was allowed to them to gain experience in the administration and handling of troops.

Enlisted overhead for the Cryptographic Division during this period were assigned to the Second Signal Service Company, Washington, D.C. and on detached service with the 15th Signal Service Regiment, Fort Monmouth, N.J.

5 October 1942 to date

During the summer of 1942, negotiations were initiated to determine the feasibility of moving the Cryptographic Division to some location near Washington, D.C. This was deemed advisable in order that closer liaison could be obtained with the Signal Security Agency, so that more current cryptanalytic information could be obtained, and so that more physical space would be available for both commissioned and enlisted training.

On 5 October 1942, pursuant to authority contained in paragraph 2, S.O. #272, Hq. Fort Monmouth, N. J., dated 4 October 1942, all overhead and student person-

nel then assigned for duty to the Cryptographic Division were transferred from Fort Monmouth to Vint Hill Farms Station, Warrenton, Virginia, a Class IV installation. At Vint Hill Farms Station, the name of the school was changed to the Signal Corps Cryptographic School. The transfer of the school, although well intended, was unfortunate at the time, due to the fact that Vint Hill Farms Station was then only in the initial stages of construction and certainly not, at that time, a proper place for the operation of a special service school. Due to the size of the student body and the initial lack of classroom facilities, it was necessary, until all of the present school buildings were completed in April of 1943, to operate the school on two shifts, which necessarily resulted in cutting down the effectiveness of the instruction given. However, once the physical facilities were completed they were entirely adequate except in rare cases when it has been necessary to turn down unanticipated training demands.

During the remaining part of 1942 and during 1943, the courses of instruction given to commissioned officers were increased to qualify officers in the following military occupational specialties:

Message Center Officer, Cryptographic	MOS 0224
Cryptanalytic Officer, General	MOS 9600
Cryptanalytic Officer, Translator	MOS 9604
Cryptanalytic Officer, Traffic Analyst	MOS 9605

In January of 1944, a section was added to the school to instruct officers (as well as enlisted men) in the installation, maintenance and repair of cryptographic equipment and to qualify officers with the following military occupational specialty:

Cryptographic Equipment Maintenance & Repair Officer MOS 9600.

In May 1944, pursuant to directive of the Chief Signal Officer, instruction of Message Center Officers, Cryptographic, MOS 0224, was made the responsibility of the Eastern Signal Corps School, Fort Monmouth, N. J., and was discontinued by the Signal Corps Cryptographic School.

In June 1944, it was recommended by the Chief Signal Officer and approved by the Commanding General, ASF, that the school henceforth be known as the Vint Hill Farms School.

During the period under discussion, all commissioned overhead for the school have been assigned to and furnished by the Signal Security Agency, and all enlisted overhead have been assigned to and furnished by Detachment, Second Signal Service Battalion, Vint Hill Farms Station. No Table of Organization has been created for this purpose, but commissioned grades and enlisted grades and ratings have been allotted, such allotment being related directly to the training demands and thus increasing and decreasing as the training demands increased or decreased. This has resulted in a desirable flexibility of overhead and has proven entirely adequate to serve the training demands of the school. All overhead, though being furnished by the organizations indicated, have with few exceptions been graduates of the Vint Hill Farms School. All commissioned overhead with few exceptions have

been either enlisted students or overhead in the Vint Hill Farms School prior to their being commissioned.

The primary problems in all the courses given by the Vint Hill Farms School have been to provide sufficient personnel to meet theater demands and to keep the courses current in a constantly changing field. The first of these two problems is an unsolved one. Although it is believed that sufficient commissioned personnel have been trained to met theater demands prior to this date, it has been primarily a result of fortunate assignment of officers to the courses given. At no time has adequate information been forthcoming from higher headquarters on which a reasonably accurate estimate of future training demands could be based. When it is considered that all of the courses given by the Vint Hill Farms School must differ in the fundamentals thereof, dependent upon the theater in which the student is to be assigned, the problem in making a reasonably accurate estimate is self-evident, but by the same token, it is also self-evident that a bad guess would result in an excess of officers being trained for one theater and an insufficient number trained for another. The problem of keeping the courses current has been met by constant and close liaison with Signal Security Agency and by requesting through the Signal Security Agency, reports from the theaters pertaining to the adequacy or inadequacy of the training being given.

The methods of instruction have varied with the different courses. Originally, when adequate time was available, emphasis was placed on individual study. However, as demands for commissioned personnel increased, it was necessary to speed up the courses. Lectures, demonstrations and individual and team solution have been the principal methods of instruction used in cryptanalytic and traffic analytic courses. Lectures and independent study have been the principal methods of instruction used in language subjects. Lectures, demonstrations, independent study and coach-and-pupil-method have been the principal methods of instruction used in the cryptographic equipment maintenance courses.

Adequate commissioned student personnel have been available for training and with the exception of those officers on detached service from their units, all student officers have been assigned to the OSCRP, Advanced Radio Communications School, Arlington Hall Station, Virginia and placed by such organization on temporary duty at the Vint Hill Farms School. The mental qualifications and educational background of all officers sent to the Vint Hill Farms School for training have been adequate. In general, they have been required to have an AGCT grade in Groups I or II if college graduates, and in Group I if high school graduates. Also, all officers were required to possess analytical ability. With few exceptions, drop-outs have been caused by the lack of analytical ability, an ability which cannot be readily pre-determined but will reveal or fail to reveal itself only during the course of instruction.

With the exception of the normal field and technical manuals used for general military training, all training has been based on special texts, documents, devices,

charts, mock-ups, etc., prepared either by Signal Security Agency or by the instructional overhead of the school. This situation has been necessitated by the fact that almost all technical instruction is of highly classified nature and that it is not intended that information pertinent thereto be available to the army at large.

* * *

The present organizational status of the Vint Hill Farms School is that it is a special service school operated under the direction of the Chief Signal Officer for training personnel of the army in cryptanalytic, traffic analytic and cryptographic equipment maintenance subjects. The Commanding Officer, Vint Hill Farms Station is also Commandant of the Vint Hill Farms School. The Director of Training of Vint Hill Farms Station is directly in charge of training in the school. The school receives technical information and aid from the Signal Security Agency, and the Commandant of the school is responsible to the Chief Signal Officer, through the Commanding Officer, Signal Security Agency, for the adequacy of the training conducted.

* * *

From *The Third Battle of Manassas. This highly unofficial history of the training of Army enlisted signals intelligence specialists conveys a good sense of the flavor of training camp life in World War II. Lambros D. Callimahos, the "flute-playing, Esperanto-speaking, Egyptian-born Greek" lieutenant mentioned in the text, went on to a distinguished professional career in the National Security Agency. In an introduction he wrote to the original manuscript, Callimahos commented that "Sometimes it is a bit catty, sometimes biting in its remarks; nevertheless this history is a lot more honest than other histories I have read labeled 'official'."*

THE THIRD BATTLE OF MANASSAS

* * *

THEY FELL OUT IN FRONT OF THE ORDERLY ROOM

At eight o'clock on the morning of 5 October 1942, approximately 250 speculative enlisted men and three officers, each with a baloney-as-usual box lunch, assembled along the Jersey Central siding in Fort Monmouth, N.J. A coach train backed in from the direction of Eatontown and stopped with the baggage car near

the general site of the mountainous pile of foot lockers and barracks bags. A detail consisting of about fifty strong "volunteers" was picked to stow the mountain on the train. This done, the men got aboard under the guidance of Lts. J. T. Guernsey, W. P. Bundy, and R. L. Markland and waved goodbye to about thirty fellow students who were left behind, some to pack up the school supplies for forwarding, others to carry the school banner to OCS. During the entire embarkation procedure, the Post Band played familiar airs and cheered the School on to new adventures—or were they just celebrating the departure of the "geniuses" who, in some companies, drew no KP or detail?

The destination of the movement was, except to knowing few, only a subject for rumor. Stories were current of Arlington Hall and other comfortable places in or near Washington; another version had it that the future home of the school would be an old estate in Virginia with a mansion house....After traveling over the rails of most of the lines in the east and south for about ten hours and finally ending up behind a Southern Railway locomotive with a bright green shell around the boiler, the men and officers arrived in Warrenton, Virginia, where they were met by a diverse collection of trucks and conveyances and most of the Warrenton populace.

* * *

The trip from Warrenton to the new home was, for some, a sightseeing tour; for those jammed into the front of the trucks, it was a period of slow suffocation inside raincoats. It had rained most of the afternoon and was still drizzling. The sight that greeted the men upon arrival was one of mud and desolation; and the grim discovery that straddle trenches served for latrines dropped the "campustry" majors to even lower depths. Morning brought a more cheerful outlook, because the sun was bright and the leaves were green. When it was realized that eating or washing required, for most men, a trip across the post, the cheerfulness evaporated again.

Although, at the time, few people knew it, Company "B" already existed on paper and included the "Schoolboys," 25 "linguists" of questionable proficiency, and three untutored non-coms, "Lil Abner" Hodges, "Louie" Fragassi, and "Repulsive" Ahearn. These diamonds-in-the-rough were somewhat doubtful as to how to handle the "new fellers" who were "pretty much like ordinary people—smart, but kinda mad". Lt. Nixdorff, he of the long chin, was company commander, in a remote sort of way. The "first sergeant"....had a pat solution for every difficulty: "You'll have to make your own provisions for that." When Lt. Marion became Company Commander a month later, nobody knew the difference.

Company administration was strictly a hit or miss affair. Paper work consisted of a detail roster that included everybody. There was only one copy of this and Jones, who had it, could never be found. As a consequence, the efforts of Hodges and Co. to control goofing off were largely nullified. Reveille, also handled by Li'l Abner, was an indeterminate proceeding. It was held under blackout conditions

where "Barrack so-and-so all presnnnneraccounted FOR!!! was a mere formality—except that Ahearn's report from the one-holer generally agreed with the facts.

The Orderly Room was a clapboard shack at the main gate that looked like a tool shed (and was). With the detail situation very much out of control, a clerk was needed to get out additional lists of names. A private named Griffin, who was more at home with a typewriter than a shovel, volunteered, and genuine administration got a definite, if modest, start. A week or so later, the Orderly Room moved to a leaking tent behind Barracks 10, which at the time was only a pile of prefabrication in the rain. When it was at last put together (at a cost rumored to be $3,030 without steps and screens), the company headquarters moved inside and Lt. Guernsey took over as CO. In less than a month, a telephone had been installed and the Company had established communication with the rest of the Post, proving that the Signal Corps could do the job if the customers would just be patient. The tent became a telephone booth outside of which long lines of patrons formed at odd hours of the night and morning.

Shortly afterwards, a group of officers and "non-com material"...left to start "C" Company (later Hq. and Hq. Co.), whose original function was basic training for an assortment of illiterates, ex-convicts, gittar players and spare parts who had shipped in when nobody was looking. Hodges' bunch moved over, too.

In those days the immediate ambition of every student was to get in one day a week of school. The company was growing: classes were filled and were run in shifts. Life was mostly detail—chopping trees, digging post holes, laying sidewalks, and cleaning the (outdoor) latrines. Life centered around those woodsy chapels: while the dry and shining bowls in the regular latrines remained unblemished, men from "B" and "C" companies shared a common interest in an incredible twenty-holer on the corner across from Barracks 1. There they would meditate amid the fragrance, the "C" men eating candy or munching an orange, the "B" men reading Tristan and Isolde or a volume of T. S. Elliot. . . .

Having been specially selected at processing centers because of superior mental and educational qualifications, the men were put to work at digging and moving logs. One count showed forty three years of college in one ditch (8 EM); the postholes were likewise "educated." Products of the lumbering activities were classified into (a) logs, (b) branches, (c) trimmings. On odd days the log poles and brush would be moved to one side of the area "to make way" for further developments; on even days they would be moved back again "to make way" for still other developments. This went on until all concerned ran out of developments. It was then decided to burn the brush piles and carry out the logs. Those who goofed off got a week's KP—which was in many ways a relief. . . .

During this rugged period while construction was still in progress, casualties were not uncommon. The uncharted maze of trenches, later used as ditches in which to lay sewer and water pipes, probably taking the largest toll. Somehow there seemed to be very little cooperation between the engineers digging the

trenches and throwing up the breast works and the other combatants on night operations. While on a special mission one warm October night, Afflerbach, clad in GI undies, walked into a thirteen foot ditch but relaxed (or was relaxed) enough to suffer nothing worse than mortification. On the other hand, the same ditch was responsible for a wrenched leg and three broken ribs from two other victims that same night. . . .After that, extreme caution was observed by the personnel of the Company; anything that looked like a ditch was avoided, and the dim morning hours found dozens of men gingerly stepping over the shadows of trees.

Social life on the Post was somewhat suppressed by the lack of facilities. Over in "A" area there was a barracks that had been converted into a day room, mail room, library, special services office and PX. The latter consisted of a twelve-foot counter and three shelves, mostly empty; besides, it was nearly a mile away. Dinner invitation extended by the Warrenton folk (that was before the native money-grabbers made a mockery of "Southern hospitality") generally had to be declined: eleven miles each way was a long walk, even for the Signal Corps. When Sgt. Parker tried to organize an orchestra, the response to first call consisted of five trombonists and two xylophone players. It was several months before a combination with the customary assortment of instruments could be gotten together.

* * *

When Griffin was away or ill, Owens took reveille with an intonation that added to the Owens legend. In Hodges' day, the vocal side of reveille had been nothing more exciting than a succession of strange noises in a Kentucky twang. When Griffin came along, he enlivened the proceedings with a haughty "reh-PORHT!!" and a battery of announcements and involved instructions proclaimed in his best theatrical manner. Against this professional competion, Owens staked his bid for fame on an unmelodious "RE-E-E-E-E-E-E—-PORT" delivered in a droning monotone. With the Griffin-Owens team running things, the men could depend on a reveille in harmony with the dizzy events of the later hours.

About this time, Lt. Volm, deciding that it was time for recreation and beautification, began the Area Cleanup Project. Lt. Kunzman became sidewalk engineer and used for his theory of construction "straight logs, only straight logs." This meant that logs would be toted in for the walk one day and out the next—for longer and straighter ones. Again big brush piles burned in the middle of the "stadium." Lts. Guernsey and Vultee would stand about the huge fires warming their hands (?), saying "more branches on this side," and, "more twigs over there. . . . let's get a move on."

Danny Volm was a skillful "improviser." When the sidewalks needed gravel and it was not forthcoming from the engineers, he would stroll up to the main gate, and, as the trucks approached with gravel for the Colonel's walks, would swing aboard and holler, "Down this way" and bring them to the company area. In this

manner several hundred tons of shale were obtained for a 220 yard race track that ran around the area between the barracks and divided Goldbrick Park in half. It was boycotted by everybody: Afflerbach tried to use it, but recognized the disadvantages of ostracism in time. Later it was removed, as painfully as it had been built.

The Day Room began to shape up under Volm technique. Huge slabs of masonite for the new white barracks in "C" company disappeared, only to reappear on the walls of the day-room, neatly squared off with lathes gathered in the same manner. . . .

Inspections were frequent. On Saturdays the inspection party followed a transposed route among the barracks in an attempt to catch the boys warming their hands around the stoves instead of standing by their bunks. . . .This "hit-em-where-they-ain't looking" strategy worked occasionally, particulary in Barracks 1 (the goat: Kilgore). Captain Guernsey was a no-haircut gigger, especially when the barber shortage was acute. Homer Baker got it for "dust in ear"—lint from an OD towel, it was. Lt. Vultee specialized in upper bunk gigs where you could get an eye-level view of the wrinkles in the bottom sheet. Lt. Kunzman who usually inspected with him, however, specialized in lower bunk "gigs" which were more in line with his qualifications. . . .Lt. Volm liked to look for food which he ate (except Biern's beer-cheese), leaving a gig slip in gratitude. At foot-locker inspections, the barracks leader was required to wriggle around in the airspace above the ceiling vents in a nothing-up-here-but-us-chickens act. All kinds of junk were discovered: radios, a crate of oranges, satchels, volumes of poetry in limp leather, and Wilhelmy's six-month file of the New York Times. (This practice was ended when somebody fell through the ceiling). Epps was caught with an axe in his footlocker; Jurgens had silverware in his overcoat; Oppenheimer had an aspirin under his bed.

Cold days also bred disease. One after the other, barracks came down with measles or allied bugs that led to bigger quarantines. Finally the whole Post was put in a quarantine based on the following principles:

1. That men living off the Post were immune.
2. That the germs distinguished between enlisted and commissioned personnel.
3. That the men ceased to be carriers every third day but became dangerous again on the fourth (the issuance of passes on Mon.-Thu.-Sun., etc., was based on this principle).
4. That short periods of immunity occurred in a scheduled manner (this permitted operation of the PX on a shift basis).
5. That contact was dangerous in training activities but harmless while on detail.

* * *

ADMINSTRATION FOR ALL CONCERNED

It wasn't until three or four days after our arrival at Vint Hill that the administration overhead took up duties in the barn in the now "B" Company area....Lt. Guernsey opened his office in the rear east room of the barn. Of course, the school had to have a phone so immediately one was supplied (a crank-type affair). There was a trunk line—to one place, Post Headquarters in the big house—but to get there it went across the floor of the office, down the hall and over the fields. If you had business with other than Sgts. Enright and Jones you had to go for a hike. After all, it was only a little less than a mile over to the orderly room at the present site of the main gate. Besides, if it was Lt. Nixdorff you were looking for, he wasn't there!!

One of the big jobs which had to be done again was the roster of EM in school who were eligible to be T/5s. Of course, we had made a roster before we left Ft. Monmouth; what happened to that nobody knew. Anyway, on October 27th the post-hole diggers got their rank. By that time, it was time to move and the school set up headquarters in the telephone building, except that Reproduction, Supply and Plans & Training stayed in the (unheated and dimly lighted) attic of the barn. Those were the days of easy ratings. Radio personnel were changing stripes as frequently as they changed underwear. Then it was learned that all the overhead were to become at least T/5s, so up to AHS went a list of men recommended for promotion. Everybody was put on the list but SNAFU—only about one-half of the men recommended were promoted.

There was a gnashing of teeth and much weeping and wailing—and no chaplain to issue TS slips. (Sgt. Bruce "I have a few ah-nowns-ments, fel-lows" Parker acted as a sort of chaplain, but he was busy most of the time figuring out schedules for the "Green Dragon"—a converted auto trailer which linked the camp with the outside world.) It took almost two weeks to arrange to have the other EM in overhead promoted to T/4; after that, there was rank all over the place.

During the latter part of November the office of the school was moved across the post to the present school supply building. Three space heaters (the regular quota for heating buildings in the Sunny South) were installed. It was hard at first for the Warrenton Commandos—Lt. Guernsey, Sgt. Kane, and Sgt. Hawes—to adjust themselves to the vagaries of the temperature in this new office. After they stood around the stove for two hours, the icicles would melt and they could slowly work back to their desks and get administration underway. By noon the building would be so hot to stand, while the atmosphere would be blue from the smoking of the stoves and the Commandos.

* * *

...Sunday classes were scheduled on alternate week-ends for all personnel from 0800 to 1645 during January through April 1943. Target practice with a knife was furnished by Lt. Mann in the main office, the target being the then present calendar month. However, instruction was not of the best for he couldn't hit the target as often as the students.

In the early part of April it was decided to have post headquarters and the school together. And for the fifth time the administrative staff was packing up and bossing a bemused bunch of men who were wandering through the bushes with typewriters, file drawers and in-baskets. Now though, it was clear that progress had been made: for the first time, the school headquarters looked like an office and was uncluttered with dirty stencils, crates, mess tables and student officers.

* * *

...the desk in front of Afflerbach is not occupied but it is reserved. Perplexed student officers spend days at this desk filling out multitudes of forms, screaming they had already filled them out at Arlington. After the first day they become hoarse, the second day they give their occupations for the last five years in answer to an inquiry about their grandparents' dates of birth, and on the third day they are veteran student officers. Lt. Callimahos is over in the other corner but is heard from all the time. His byline: "Don't you know how to report to an officer????". . . .

It was during this period that the output of memorandums reached its peak. Although Capt. Guernsey and Lt. Vultee were only four feet apart, they found it necessary to carry on communications by indirect discourse. The Lt. would jot down notes to be typed by Sgt. Doering who would route them through Sgts. Jurgens and Kane up to the Captain, each Sgt. retaining a copy for file. Memos for general distribution were written by the officers, including Lt. Callimahos, and were sent down to Reproduction for ditto-ing, while over in the corner Sgt. Kane kept up an envious grumble about the days back in Monmouth when he put out all the notices.

When the paper shortage began to be felt, economy was effected by substituting buckslips for individual copies. As the practice grew, magazines, bulletins, and other printed matter came to be circulated by this means, "FYI" and "Note and initial below." Eighty-page copies of Tactical and Technical Trends would be sent out to thirty-odd people in six different buildings "to be returned promptly." Instead, they would disappear. Sgt. Doering, who used to be a statistician, got out the calculator and some probability tables and estimated that buck-slips issued in May could not, the way things were, be expected back before the middle of November. Runners were sent out to find the missing buck slips, but no luck. The device of including breezy comment (e.g. "Pages will not be dog-eared") was tried, without success. Finally, Lt. Vultee blasted out with his famous memo on "Bucking of Buck Slips" in which negligent "buckees" were charged with retarding the war

effort and were warned that "such impedition will not be tolerated." Everybody reached for his dictionary and awaited the next dispatch. . . .

* * *

. . .as Rosh Hashana approached. . . .Almost the entire student body exhibited religious fervor and a sudden desire to attend services. For this, of course, a three-day pass was necessary.

Equinoctially, these "Passover passes" (the term applied to both Passover and Yom Kippur) brought on righteous indignation in some quarters because "They get off at Christmas or New Year's, too, and that ain't fair!" The other quarters said "Yes" and went on pass anyway. . . .

. . .the Room 31 gang. . . .had started a map in the second stall of the latrine down the hall from the office, a map which included some of the prominent personalities of the period. Irritated (no doubt, by the misuse of government property), Owens issued a notice to "all EM" warning them that "anyone found guilty of writing on, marking or in any way maliciously defacing any wall, partition or other part of the school buildings will be subject to severe disciplinary action."

Though the map grew and grew, Owens couldn't catch anybody. As its reputation spread, visitors from other buildings and even the Company came over to see the newest "terrain features."

Captain Guernsey regularly passed by the officers' stall in order to keep abreast of developments. . . .

* * *

The Legal Department moved in shortly afterwards and immediately took over. . . .They seemed to regard the school headquarters as intruders. Business was brisk. One day somebody who said he was a representative of Armour & Co. called up and insisted that Lt. Pratt had some chickens for sale at his farm. The "Legal Eagle" explained that this was an army post, that, anyway, we were using all the chickens we could handle. . . .

* * *

The Chief Clerk has also always had a secondary function—that of a combination John Anthony—Ma Perkins—medicine man for the soul. At least once a day he received a wailing visitor with a long story of a check that had to be cashed, a telephone call for a life-or-death matter, bonds that had to be bought, or "I want to see Lt. Kunssssman." The EM long ago learned that the simple story is not always the best. There was. . .the lads who felt all right in the morning but now were a little sick, and would like to go to the dispensary, please—passing the PX on the way, of course. Then there were the delinquents sweating out an interview with the Captain

or the Executive Officer and who stood around for fifteen minutes to a half an hour, gazing aimlessly at the ceiling and getting out of people's way while maintaining a pre-execution look of "No, I won't take an eye bandage." And there were the potential OCS men who had been told to report to the Chief Clerk about their applications. They marched down the halls, silently counting cadence; executed a smart column left; and, coming to attention at the Chief Clerk's desk, they were ready to reel off the general orders, the position of the soldier, or a fifty word essay on "Why I want to be an Officer." When they were asked merely to sign their name three times, their relief was so evident they'd have let out a scream (if they hadn't been OCS men).

In addition, the Chief Clerk is often kept quite busy with a security problem peculiar only to School Section "A." Room 36, adjacent to his desk, is the secret classrooms of all secret classrooms, and the subjects taught there are verboten to all outsiders. Unfortunately, the human voice carries; and when Lt. Pratt lectures, the windows rattle in the Big House a half mile away. This keeps the Chief Clerk busy with phone calls from the main gate, as the guards are quite interested in his course, and frequently request repeats on certain paragraphs they missed while checking trucks out of camp. . . .

* * *

EDUCATION IN DARKEST VIRGINIA

* * *

Just at chow time Thursday evening, October 8th, three large commercial vans pulled in to camp with all the worldly possessions of the school that had been left at Monmouth. In addition to the stationer's supplies and personal materials of the students, they had all the furniture, twelve tons of IBM paper, the IBM machines and a three-ton safe. The draft-dodging that went on that night when a detail was needed to unload has never been equalled by any of the "Zoot Suit Clan." The materials were for the most part put in the left of the barn, and the overflow in the firehouse. By eleven PM everything was unloaded but the safe, which was strictly an "Everybody-boss-nobody-do-anything" job. The situation finally got to the point where Lt. Bundy and Lt. Markland gave up and Afflerbach first laid claim to an SSN for safe moving.

Sometime during the following week, school was started with two four hour shifts in the left of the barn, two small rooms on the ground floor, and a barracks. During the formative period of the school most of the overhead either drew their materials and continued their studies or were busy pushing details preparing the buildings. Sgt. Frick did neither but instead went to Washington every night and came in just in time for noon chow. . . .

As soon as lights were available for evening study, a night study hall, optional

to all students, was instituted. The roster for the supervision of the hall was arranged so that one so-called senior instructor and one junior were on each night. This probably became as confused as the army has ever known, with such arrangements as the following prevailing. One night Sgt. Netherton was the person who actually served, but he was doing it for Bailey, who was supposed to have done it for Hurst, who was supposed to replace Afflerbach, who had originally been scheduled for that night. . . .

By November the school quarters had been moved to what later became HQ Company's mess hall. The heating arrangement in the mess hall was poor enough with the best of attention, but to make matters worse, Cpl. Symmes was put in charge of building the fires.

A less apt person for the job could not have been found in all the school. For instance: one cold Sunday, Symmes was the only person in Barracks 1, and though his bunk was next to the stove, he let the fire go out and went to the latrine to finish his usual Sunday bundle of letters.

* * *

In the company by this time things had become well enough organized to attempt a fire drill and gave the twelve Assistant Fire Marshals some practice. Everything went very smoothly until Lt. Mann noticed that Sgt. Bailey had allowed his quarantine men to fall out with the rest of the company and proceeded to inform Bailey that he was in error. To this he received the philosophical reply, "Sir, fire recognizes neither race, creed, or color." This little episode may have been the beginning of the Lt. Mann-Sgt. Bailey feud which lasted for the duration of Bailey's stay at Vint Hill.

On December 13 school was moved to "E" Bldg. No. 1, the first time on the Manassas front that decent quarters were available. There now was allocated one officer instructor to each room in addition to the NCO in charge of the room, and in this arrangement, it seemed that Lt. Mann and Sgt. Bailey were just naturally a team (either by accident or design). Their feud continued, and in addition a race sprung up between them over the progress made. Bailey never was very cooperative in his suggestions to Lt. Mann (Bailey was more advanced) and one time he nearly laughed himself into hysterics after looking over Lt. Mann's problem, glancing out the window as if viewing the weather prospects, making a few pointed observations with a knowing inflection, and watching Lt. Mann swallow the bait and madly try to follow the "clue" which was entirely false. Sgt. Bailey went racing down the hall fairly shouting, "Boy, did I foul Mann up! He'll be there the rest of the winter."

* * *

In the spring of '43, the going about camp really got tough, with mud about a foot deep every turn one took. By this time the mess hall was open (Christmas dinner was the first meal served in it), and the school shift was the conventional A shift from 0645 to 1245; B shift from 1380 to 1900. The first shift was marched to and from school by T/Sgt Van Cleaf, on detached service from the Air Force somewhere out in Washington State, and the second shift by Sgt. Afflerbach. Every morning there was the problem of finding a route to school that involved no swimming to cross the road in front of the E buildings. This problem and the routes finally chosen confused Van Cleaf who missed the turn, went out the main gate, marched down the road (all of this in total darkness), and arrived at school twenty minutes late. Afflerbach, having the noonday sun to maneuver by, did nothing worse than lose a few people when they slipped off the foot bridge over the mud in front of "E" Bldg. 2.

With the coming of spring came a great influx of students and the need for more instructors. As a breaking-in course, the embryonic professors were first given the test of showing their ability with the students in Room 31....No one ever was complete master of Room 31, because the Schwartz boys, Duke (of latrine map fame), and Smitty (Lou) were just invincible. Many are the times that their stories have held up before Capt. Guerney's questioning, though everyone knew they had been in Warrenton long before noon that Saturday. Tarpley and Hodge, rather than face Room 31, chose to become warrant officers and take part in the invasion of Sicily.

During this phase of the campaign, military training was strictly a hit or miss afair supposed to take place during the shift that the men were not in school. What with the large number of men on detail and the "goof off's." very few were out at any one formation. To counteract the rise in goofing off, Griffin and Afflerbach cooked up a surprise roll call one morning and found that the absentees just about balanced the presentees. Before the inevitable three days KP, the boys admitted that they had been (1) in the barracks, (2) in the bushes, (3) in the PX, (4) in "A" Company asleep and unnoticed because of "A" Company's 24-hour schedule.

In May 1943, enough buildings became available to discontinue the two shift basis and also to crack the tradition of the thirteen day week. The training program now was held in the afternoon as the finish of a day and utilized the Kunzman Memorial Obstacle course, the Nason grape vine hang-on-or-get-wet-course, and Sgt. Neuwoehner's tick-infested "creep and crawl" course.

After the demise of Ephron, Clark, Latham, Lehr and Schier, Gramann and Chapman, with Sgt. Nelson as boss, took over the paper grading department and worked madly trying to make at least thirty new problems per day in addition to going over hundreds of papers. With 147 square feet of map behind them, this "General Staff" was masterminded by the excitable, fluet-playing, Esperanto-speaking, Egyptian-born Greek, Lt. Callimahos who simultaneously prepared problems, practiced Morse Code, worked on inventions, played chess, and listened

in on other sections' conversation. Despite a sharp intellect, the Lt. had a gullible streak that was exploited by his buddies whenever the situation was ripe (as it usually was)....

The rest of the summer of 1943 was quiet. Gus Uhl went to Canada just long enough to get a service ribbon and then returned; Corry set a new beer record in the 130 pound class and added acrobatics performed on the railing around the PX; Palmer's room of cripples were all either declared fit or sent home to find jobs, thus freeing him for active duty; and Lamke (Bks. 13 all present or accounted FOO-URP!") was quietly bitching away in the library, able assisted by Oscar Briggs. Bershas and Wiggin transferred their efforts from the language field, probably to fill the gap left when Oppenheimer went to the Southwest Pacific.

* * *

Besides other school equipment, a complete staff of able officers was around at all times. Some made the complete cycle of student, instructor, company executive officer, and back to student...."Big" Bundy and Lt. "Little" Bundy conspired together with some message center problems that seemed to be always planned for the coldest and most uncomfortable day of the month; and although they've been gone for nearly two years, there still stands on the main gate road the buggy little shack they immortalized as "THQ"—a monument to their work.

Autumn of 1943 brought big things and a lot of new instructors. Jungle Jim Metcalf took on instructorial duties above and beyondthe call of malaria control; Elgin and Braswell were salvaged from the Room 31 gang; and the Atamian-Marburger combine was the result of random selection. The "quickie" course came bouncing off the press (really from the pens of Lt. Callimahos and Gerlach) and the first experiment at force feeding was under way. Very few chokings or strangulations were reported.

At the first anniversary at Vint Hill approached, plans were made for a celebration of those who had made the initial trek and were still hanging around. The dinner was held at the Robert E. Lee, one of several outposts of Greek civilization in Warrenton, on the evening of October 5, 1943. Seventeen of the twenty eligibles enjoyed the spaghetti dinner and then returned to Room 318 for coffee (and bourbon, with poker). Sgt. Krueger and Owens, as usual, financed the game and finished by paying off Cpl. Bill Hewitt's wedding expenses. Bill Doering demonstrated a journalistic flair by writing his first full length novel, "Your Life at Vint Hill," . . .a memorial which gave rise to the Old Bastards Club.

* * *

By May, the school had dwindled to the point where each instructor had his own student; many of the Warrenton Commandos saw fit not to plant a garden; and

everyone was trying to get in a couple of extra courses that would help hold stripes. Came the "bust" in ASTP, and then the horde. Every available room (School Section "B" was even declared bankrupt) and spot was utilized for classes, with "The Dome" Rosskopf having the misfortune to draw the Salt Mines (Supply Building) where the tar on the roof melted and spattered freely. He finally got a helper in Les Olin, but Olin decided if he could stand tar he could stand another substance and went to OCS. . . .

On July 4th, (ah, what a day for fireworks!) the first class of WACs came to School Section "A," and what a change in the EM!! Students no longer had to be reminded to shave, and it is said that the sale of Kreml quadrupled at the PX. The one sad note in the coming of the WACs, other than the loss of one perfectly good latrine by the EM, was that, after many long hours of planning and master-minding, Afflerbach was at the last moment informed that a more stable and experienced man would be required to master the co-eds and that Sgt. Nelson would fit exactly (as long as his didn't find out).

The WAC occupation can be divided roughly (or perhaps gently) into three periods: (1) the Nelson or pioneering period; (2) the Ramsey-Snyder or achievement period; and (3) the Palmer or decadent period. During the first of these, the personnel of the group exhibited a timidity, seriousness, and lack of humor for which Nelson claimed credit but which probably reflected the newness of their situation; for although the natives looked upon them with interest and curiosity, they treated them with formality and restraint. During this period of plain living and high thinking, the first personalities to emerge and take definite shape (uh huh!!) were those of Mary Jane, the heroine, and Sue the siren. The classroom held an odor variously interpreted as (a) Chanel Number 7 and Tabu, and (b) GI soap and honest sweat. Toward the end of the period a feud with the guards resulted in a marching formation that was practically all road guides.

During the second period the group became more self-assured, both in their work and in their social relations. During breaks they mingled with the male students, who began to accept them, and their fears regarding the apparent abnormality of the male behavior were quelled as the sheep's clothing gradually disappeared. As the girls attacked their work with more confidence, Summerhalter and Morris became adept at substituting charm for achievement. McMann showed a certain athletic prowess while werstling during breaks, and sedate M/Sgt. Filipczak was occasionally moved to execute trapeze antics on the railing outside the door near the classroom.

There is no positive proof that Sgt. Palmer's presence caused the period of decadence, but it is unfortunately true that many of the brighter flourishes occurred during his brief regime. The trouble was that AR's and SSAR's (School Section "A" Regulations) had never envisaged the entry of females into the school, so that many of the little incidents had to pass unregulated. For example, what could be done when Ginny Blakemore began to put up her hair during class, or when

Summerhalter showed up with curlers in her hair? Both continued working, so not even the crime of loafing could be pinned on them. And the cigarette holders nearly a foot long —- strictly not GI, but apparently not contrary to the rules.

Bell got closer to the borderline when she impaled a marshmallow on a pencil, then toasted it over a match, but she was ahead of the rest of the class and had earned the right to an eccentricity or two. Sgt. Palmer felt that much of the trouble was really the fault of Sgt. Nelson, for everything he (Palmer) did was wither approved by a chorus of "That's just what Sgt. Nelson said", or disapproved by the accusing reminder that "Sgt. Nelson never spoke to us like that." The story had a happy ending, though, for on his birthday the girls sang "Happy Birthday, Sgt. Palmer", and have him some cigarettes, candy, and aspirin—the latter to remember them by, they said.

As the second year staggered to a close, the Old Bastards held a second meeting, again putting out a memorial of the occasion. . . .Although both Bastards and bourbon were scarcer, the party demonstrated that the aging members had lost none of the capacity for celebration. They wondered if they (or anyone) would be around for a Third Anniversary. It didn't seem likely, but then as Lt. Neuwoehner used to say, "We'll never touch Palau and Halmahera!"

* * *

CHAPTER V

Cracking the Codes

The principal Army cryptanalytic center in World War II was located on the grounds of a former women's junior college at Arlington Hall Station in Arlington, Virginia. The main school building housed the headquarters of the Signal Intelligence Service (later redesignated as the Signal Security Agency); operational personnel worked in two large and unlovely temporary buildings run up in ninety days in 1942 and 1943. By the time the war came to an end, 5,000 civilians and 2,000 military personnel were working around the clock to decrypt Japanese military, diplomatic, and other messages. The excerpt from SRH 349, Achievements of the Signal Security Agency in World War II, gives some details of their accomplishments. A message reproduced from SRH 280, An Exhibit of the Important Types of Intelligence Recovered through Reading Japanese Cryptograms, demonstrates that solution of Japanese codes and ciphers could even produce important intelligence dividends on the war in Europe.

Other Army cryptanalysts were located at Bletchley Park, the headquarters of the Government Code and Cypher School (the British signals intelligence organization); with field units; and at General Douglas MacArthur's Central Bureau, an Allied cryptologic unit originally headquartered in Brisbane, Australia. A short history of Central Bureau can be found in the excerpt from A Brief History of the G-2 Section, GHQ, SWPA and Affiliated Units: Introduction to the Intelligence Series (General Headquarters, Far East Command, Military Intelligence Section, General Staff), pp. 66-69.

From SRH 349. *Beginning in 1942, the Signal Intelligence Service was repeatedly reorganized and redesignated, finally becoming the Signal Security Agency, a designation which obscured its major mission.*

THE ACHIEVEMENTS OF THE SIGNAL SECURITY AGENCY IN WORLD WAR II

I. BUILDING THE ORGANIZATION

The Signal Security Agency (SSA) owed its existence in World War II to the basic fact that valuable information may be derived by intercepting communications and reducing them to intelligible form. This fact has two aspects: efforts must be made to protect our own communications against examination by the enemy, while at the same time steps must be taken to derive as much information as possible from enemy communications. The SSA had primary responsibility for both these phases.

* * *

In spite of greatly limited funds, the SIS was able in the years prior to World War II to lay securely the foundations upon which wartime expansion of the SSA was built. . . .

Activity of the SIS consisted of continuation of existing code production projects; establishment of a training program by which a small group of expert civilian cryptanalysts was produced, and another small group of officers, both Regular and Reserve, were trained in the varied phases of signal intelligence; development of intercept facilities to provide material for the cryptanalysts; and, toward the end of the period, the reestablishment, as a practical operation, of solution of current diplomatic traffic. In addition, time was found to do much planning for war and to carry on research and development in cryptographic and cryptanalytic techniques. All of this work was done by a very small staff: Only seven persons from 1930 to 1936—by the outbreak of the War in Europe there were only nineteen.

Thereafter, a series of expansions resulted in the following strength on the day of the Pearl Harbor Attack:

Category	In Washington	In the Field	Total
Officers	44	1	45
Warrant Officers	0	0	0
Enlisted Men	28	149	177
Civilians	109	0	109
Total	181	150	331

Actual operating strength was somewhat less, since 22 of the civilians were still undergoing training and had as yet made no contribution to the work. A comparison of these figures with the strength of V-J Day (14 August 1945) will show the tremendous proportions reached by the wartime expansions:

Category	In Arlington	In the Field	Total
Officers	661	116	777
Warrant Officers	4	11	15
Enlisted Men	565	2139	2704
Enlisted Women	957	257	1214
Civilians	5661	0	5661
Total	7848	2523	10,371

These figures do not include, of course, the more than 17,000 officers and enlisted personnel engaged in signal intelligence activities under overseas theater commanders, nor do they give any adequate indication of the turnover of personnel in the Military District of Washington: by the end of the War more than 18,000 numbered badges had been issued to all categories of personnel at Arlington Hall (headquarters of the SSA) alone. To recruit such a staff and to maintain it despite the many influences which tended to dissipate and to lower strength were tasks requiring strenuous efforts.

The recruitment program was faced not only by obstacles which also beset other wartime agencies, such as the manpower shortage and the need for speed, but also by many problems peculiar to the SSA, most of the activities of which had no counterpart outside the Government from which to draw personnel. Many of its operations required persons of the highest intelligence, possessed of rare skills not easily definable, often demanding, as in the case of the language experts, years of study to produce proficiency. Messages in more than [text withheld] languages had to be translated, yet in only a few instances were competent linguists easily obtainable. This problem was most acute in the case of Japanese, both because a knowledge of Japanese is rare in this country and because the volume of material to be translated was so great [text withheld] The only recourse was to train personnel from the very beginning: ultimately, for example, 428 Japanese translators were trained in this way. The same method proved to be the only solution for supplying competent cryptanalysts: both by the use of training manuals in military cryptography and cryptanalysis and by apprentice training in operating units, the small number of competent cryptanalysts available in 1941 was gradually expanded, but the supply was never equal to the demand.

Moreover, the SSA was called upon to train large numbers of personnel for ultimate assignment to overseas units maintained by theater commanders. This training was given not only in formal courses designed to produce officers and men qualified in the various cryptographic and cryptanalytic specialties but also by

participation in the day-to-day activity of operating units. Much was done also to coordinate training of signal intelligence and radio intelligence units being trained elsewhere in order to keep them abreast of the latest technical developments. In this connection it will be well to digress long enough to point out the trend exhibited during the War of breaking down the centralized authority of the SSA by setting up independent signal intelligence units under theater commanders. Such a change was motivated no doubt by a feeling that it would be necessary to maintain signal intelligence units close to military operations. Yet the experience of the War showed that modern electrical communications are so speedy that distance is no longer a factor that need be considered. Examples will be cited. . .of messages transmitted many thousands of miles, promptly read and translated, and sent back to the proper commander in time for action.

Morale problems were particularly acute, for in addition to those encountered by other wartime agencies, involving living conditions, health, fatigue, and the like, the SSA had a number peculiar to itself. Chief among these was the mixed character of the personnel. Officers, enlisted personnel, and civilians worked side by side, and in each of these groups there were both men and women. A small unit composed of personnel from several of these groups might contain people having varying degrees of prestige and receiving different pay and privileges, yet performing exactly the same type of service. . . .Moreover, there seemed to be no correlation between a category of personnel on the one hand and competence and achievement on the other. Brilliant work was done by individuals in all categories. Had it been possible to operate the SSA entirely with military personnel, or entirely with civilians, some friction might have been avoided, but an SSA made up only of military, or only of civilians, would have lost immeasurably the contributions of the other group. As it was, military personnel had to be stationed with the SSA for both operational and training purposes while having civilian employees made it possible to use the services of many not qualified for military duty.

Another factor not particularly conducive to the maintenance of high morale was the necessity of maintaining complete silence concerning every phase of one's work. Moreover, many of the operations involved nothing but drudgery and considerations of security prevented the individual employee in many cases from getting a clear understanding of how his or her work contributed to the war effort.

Continuous efforts were made to maintain morale at a high level by bettering conditions of work and furnishing employees with aid in the solution of their personal problems. While the rate of separations of civilian employees (4 per cent a month) seemed high, it was found to be actually lower than that of other comparable wartime agencies in Washington. Indeed, giving due consideration to the inherent difficulties, morale in the SSA was really high.

Early in the War space in the Munitions Building, where the SIS had been located from its founding, grew so crowded that larger quarters had to be secured elsewhere. At first it was expected that the SIS would be housed in the Pentagon,

then nearing completion, but before such a move was effected, plans were laid for moving the SIS to a site of its own, preferably outside Washington. The SIS would thus have room for expansion, be relatively better protected from the danger of enemy bombing, and could maintain its security with greater ease if not forced to share a building with other War Department agencies.

The site ultimately chosen after examination of several possibilities was the premises of Arlington Hall Junior College in Arlington, Virginia. This location was close enough to the Pentagon, was not too far from the Eastern Primary Monitoring Station then being planned at Vint Hill Farms, near Warrenton, and in addition made possible the utilization of the housing facilities in the Washington area for quarters for personnel and dependents.

The property was acquired by court action for $650,000, with $40,000 additional for furnishings, and the War Department assumed possession on 14 June 1942. Arlington Hall Station was established as a Class IV installation under the Chief Signal Officer on 25 June 1942. Immediately units of the SIS began to move into the former school building, now the Headquarters Building, Arlington Hall Station, and by 24 August 1942 all of the SIS was at Arlington Hall, the move having consumated without interruption of operations.

Construction began almost immediately on projects designed to convert certain of the existing buildings to military purposes, and by September the program of new construction was in full swing. Besides many smaller buildings, two very large semi-permanent buildings were erected for operations. The first was completed in less than three months time; the second, erected in winter months, took a little longer, but after May 1943 all operating units were housed in the two operations buildings. Other construction provided barracks and mess halls for enlisted personnel, a station dispensary, theater, post exchange, and other service buildings; a motor pool, a fire house and warehouses. The final construction was completed by 1944: while many units have had to work in crowded conditions, adequate space was supplied for all operations. One of the important ancillary structures was a cafeteria, completed early in 1943 and enlarged in 1944, which ultimately provided service around the clock. . . .

The Post was made secure by establishment of a guard detachment and the erection of a double steel fence provided with an alarm system. Another fence was erected around each operations building entrance to which was limited to authorized personnel. Distinctive badges were issued to all categories of personnel and had to be worn at all times. . . .Access to the Post was forbidden to visitors except on official business, and efforts were constantly maintained to indoctrinate all personnel in the necessity of maintaining the physical and operational security of the Agency.

The SIS had been prior to the War a field service under the Chief Signal Officer. Though located physically in Washington, it was not a part of the Office of the Chief Signal Officer but was administered at first through its War Plans and

Training Division and later through its Operations Branch. With the coming of war, however, reorganizations were made by the Chief Signal Officer which resulted in a series of changes of name. The old name of Signal Intelligence Service (SIS), which had existed since 1930, was abandoned for Signal Intelligence Division (SID), and in rapid succession, this became the Signal Security Branch (SSB), the Signal Security Service (SSS), and, finally, on 1 July 1943, the Signal Security Agency (SSA), a name which remained unchanged until the cessation of hostilities. After the organization of the Army Communications Service within the Office of the Chief Signal Officer, the SIS-SSA, by whatever name it was called, was always a part of the Army Communications Service.

The need for enlisted personnel was met by increasing the strength of the Second Signal Service Battalion. This Battalion had been created as a company on 1 January 1939 to supply personnel for the various intercept stations then in existence. Later it furnished a convenient military unit to which enlisted personnel employed in the Military District of Washington and elsewhere for other types of signal intelligence activity could be assigned. In November 1942 the post of Commanding Officer of the Battalion was united with that of the Commanding Officer, Signal Security Agency: in this way it was possible to effect unified control of all SSA enlisted personnel wherever stationed. The Battalion had detachments not only at Arlington Hall Station but all over the world wherever it became desirable to conduct any intercept activity. The Battalion did not, of course, include signal intelligence personnel directly under the control of theater commanders. While the Battalion embodied many unorthodox features—its maximum strength, for example, surpassed 5,000 officers and men and at the end of the War it was commanded by a Brigadier General—it effectively solved the problem of how to administer the amazingly complex activities performed by enlisted personnel working for the SSA.

* * *

It has already been noted that the SSA was administratively and functionally a part of the Signal Corps, but G-2 exercised staff supervision and control. While channels were erected whereby G-2 could exercise this control without at every step going through the Office of the Chief Signal Officer, nevertheless the SSA was primarily a Signal Corps agency, its personnel were Signal Corps employees, and for purposes of supply it relied on Signal Corps facilities.

Since it was increasingly felt by G-2 that the SSA was the most important source of intelligence, even closer control was required and therefore, on 10 December 1944, there came a change. The SSA was removed from the Signal Corps for operational control, which was now assumed by G-2, but administrative control was still retained by the Signal Corps. This cleavage of control was by no means clearcut and sharply defined: the line of division was not straight, since the

organization was pragmatic rather than theoretical, but in the main the differentiation thereafter was operational control exercised by G-2, administrative control maintained by the Signal Corps.

Divided control, such as this was, however, proved far from satisfactory in practice and was ended on 15 September 1945 by transfer of administrative control also to G-2, with the change of name from Signal Security Agency to Army Security Agency (ASA). This had the effect of associating the organization more closely with G-2, the user of one of the two chief products, but it will necessitate that in the future liaison be constantly maintained with the Signal Corps so that not only an adequate supply of trained personnel may be available for the communications side of its activity but also the increasingly closer relationship between signal intelligence and signal security may be maintained by the closest cooperation. Moreover, it also resulted in once more consolidating all responsibility for signal intelligence and signal security in a single organization, since the units formerly under the control of theater commanders were now made a part of the ASA.

As will be abundantly clear from specific references in the two following chapters, the SSA had the incalculable advantage of collaboration with the corresponding units of the United States Navy (OP-20-G and OP-20-K). Liaison with the Navy had long been in progress before the War but throughout the conflict it constantly increased in both the cryptographic and cryptanalytic fields. For some years before the War the Army and the Navy had been collaborating [text withheld] but the Office of Naval Communications, being pressed for personnel and facilities needed by units at work on enemy traffic [text withheld] asked the SIS to take over more and more work. . . .Early in the next year the first SIS mission was sent to England to establish the basis for liaison and in the summer the SIS and GCCS first exchanged permanent liaison officers, a relationship ever since maintained. Special missions have, however, also been sent and received from time to time. Intercommunications by radio, cable, and mail, have constantly maintained. Frequent agreements have been made to avoid unnecessary duplication of effort: the chief of these was reached in 1943 whereby the British assumed primary responsibility for signal intelligence operations for the War in Europe, the SSA, for those for the War in the Pacific, though neither Agency abandoned work in the field of the other's responsibility. This exchange of information has been broadest in cryptanalytic activity: considerations of security have limited cooperation in cryptographic compilation and development to work on systems used in combined British and American operations. . . . [text withheld]

The SSA provided trained personnel for and collaborated with U.S. Army Signal Intelligence Services in all theaters: Mediterrean Theater of Operations, European Theater of Operations, Southwest Pacific Area, China-Burma-India Theater, Central Pacific Area, etc. Collaboration between the SSA and the Central Bureau, Brisbane (CBB), began with the founding of the latter organization by joint action of the Royal Australian Army and the United States Army in the spring

of 1942. As will be later seen, this cooperative effort was maintained by constant intercommunication, particularly in the case of the Japanese Army cryptanalytic problem.

* * *

II. THE PRODUCTION OF INFORMATION

Modern intelligence services are able to derive information useful for military purposes from many sources but the most fruitful and most authentic is the enemy's message traffic and the communication system over which it is transmitted. Indeed, though messages differ in value, experience has proved that there are no messages, no matter how insignificant in content, which have potentially no intelligence value. Therefore, the cryptanalytic attack had to be made not only upon the purely military traffic transmitted by enemy forces but also upon diplomatic, commercial, and private messages as well. Even plain-text messages could not be neglected, but the largest part of the intercepted traffic was, of course, in cryptographic form and required cryptanalytic treatment before it could be read.

While some of the techniques used by the SSA were not strictly cryptanalytic in character, e.g. traffic analysis, secret ink solution, and exploitation of telephonic communications, the production of information involved, in general, the following steps:

a. Interception of traffic in large volume;
b. Traffic analysis of intercepted messages;
c. Solution of the cryptographic systems used;
d. Decryptographing of messages sent in solved or partially solved systems;
e. Translation of such texts as were in foreign languages, and
f. Publication of the texts in a form useful to the Military Intelligence Service.

* * *

A. INTERCEPTION

No cryptanalytic attack upon the communications of a foreign government can hope to be successful unless an adequate supply of intercepted material is available for study; nor can proper measures for safeguarding our own communications be taken without constant monitoring of the traffic sent out by American stations. It therefore became necessary to establish facilities for the interception of radio traffic in large volume.

Prior to the war there were seven fixed intercept stations located as follows:

No. 1 Fort Hancock, New Jersey
No. 2 Presidio of San Francisco, California
No. 3 Fort Sam Houston, Texas
No. 4 Corozal, Panama Canal Zone
No. 5 Fort Shafter, Territory of Hawaii
No. 6 Fort McKinley, Philippine Islands
No. 7 Fort Hunt, Virginia

Constant efforts during the War expanded these facilities greatly. In the end there were eleven fixed stations, many of which were far larger than any operating in 1941. These eleven, which were found sufficient to supply the necessary volume of traffic, were distributed as follows:

No. 1Vint Hill Farms, Warrenton,Virginia
No. 2Two Rock Ranch, Petaluma, California
No. 3 Indian Creek Station, Miami Beach, Florida
No. 4 [text withheld]
No. 5 Fort Shafter, Territory of Hawaii
No. 6 Amchitka, Aleutian Islands
No. 7 Fairbanks, Alaska
No. 8 [text withheld]
No. 9 Bellmore, Long Island
No. 10 Tarzana, California
No. 11 Guam

The three largest stations (at Vint Hill, Two Rock, and Fort Shafter) were equipped with elaborate arrays of high-directivity antennas for all-round coverage. These stations had been located so as to make easy the electrical forwarding of the intercepted traffic to Arlington Hall and the largest portion possible of intercept missions was assigned to them. The supplementary stations, particularly those at [text withheld] Amchitka, Fairbanks, and [text withheld] were located so as to intercept signals which could not be copied at the larger stations, and in general they had antenna systems beamed at specific targets of sectors. The stations at Bellmore and Tarzana were assigned the task of monitoring United States traffic for security purposes. Considerable assistance was rendered to the intercept facilities of the SSA, particularly in the period before the SSA's own intercept facilities were fully developed, by radio intelligence companies stationed on the West Coast and in the Pacific Area.

Among the new items of equipment developed during the War for use at intercept stations were "multicouplers," which allow the signal from one antenna to be coupled to several receivers; a "Hellschreiber Facsimile Recorder," for copying signals of this German system; and a "Time Delay Device," which accomplished a delay of from three to ten seconds between the time a signal is received and the time it is necessary to copy it, making it possible to start a recorder to take down the entire transmission for later transcription.

Intercept activity was coordinated and controlled by staff units at Arlington Hall which supplied the stations with technical advice. Speedy transmission from the intercept stations was effected chiefly by special teletype lines, which came more and more to take precedence over other means such as cable and air mail. From four teletype lines in operation on 7 December 1941, the number of such lines grew until on V-J Day there were forty-six. The amount of money paid for monthly rental of land-line teletype facilities alone reached in August 1945 the large sum of $58,918.02 but this figure does not include the cost of radio-teletype facilities, paid for by the Army Communications Service, for which no data are available to the SSA. Average monthly volume also constantly grew:

December 1943 279,034 messages
February 1943 46,865 messages
July 1945 381,590 messages
August 1945 289,802 messages

Arrangements were also made for obtaining traffic from radio intelligence units operating in theaters of war; from the Navy; from the several offices of the Chief Cable Censor; [text withheld]

B. TRAFFIC ANALYSIS

Traffic analysis, a procedure which first arose from attempts to reconstruct enemy communications networks and their characteristics with the aim of improving intercept facilities, became highly useful also for two other purposes: (1) Through study of the external features of the messages as distinct from the text itself, together with direction finding, by which it is possible to locate the site of unknown radio stations, traffic analysts were able to provide cryptanalysts with much useful information not otherwise obtainable; (2) Statistical study of the fluctuations in the volume of traffic passing in each circuit, and inferences drawn therefrom, became an important source of military intelligence. Traffic analysis can be carried on, of course, independently of successful cryptanalysis: useful information can be derived by traffic analysis even before a message is readable, but when the two techniques are combined, each is aided by the other.

While traffic analysis had been used to a limited extent in World War I, the British were the first to develop the science extensively in World War II. The beginnings of traffic analysis in the SIS date from April 1942. A mission was sent to England to gather information and upon its return it was possible to set up traffic analysis as an integral part of the SIS. As a result of this mission, efforts of the SSA in traffic analysis were to be concentrated on traffic in the Pacific theater, leaving to GCCS the primary responsibility for that in the European, a logical arrangement arising from geographical considerations.

The initial problem in traffic analysis for the SSA was the solution of the code numbers used to indicate message center place names occurring in Japanese mili-

tary messages, and the first success was achieved in September 1942. By the following June nearly all of the twelve main systems had been reconstructed, permitting accurate location and mapping of radio stations and circuits. Four distinct major military networks were identified, those used by the Imperial GHQ in Tokyo, the Southern Field Force, the Water Transport organization, and the Army Air Force. The adequacy of the techniques used was proved when, on 1 April 1944, the Japanese introduced a completely new place-name code which was almost wholly solved within a month, about half of the names being identified within 48 hours. Technical assistance given the intercept stations was responsible, at least in part, for the rapid increase in volume of Japanese military intercepts.

Contributions of traffic analysis to military intelligence began with the location of military message centers attached to unit headquarters. The identification of nets and unit organization revealed troop locations and chains of command, thus giving highly important information concerning the Japanese Order of Battle. Traffic flow analysis—the study of variations in traffic volume and patterns of station activity—gave indications of impending enemy activity. Convoys were detected and followed merely by studying the changes in the pattern of communications in the Water Transport code between various seaports along the route. Analogous studies of patterns in Air Force and Army Administrative codes led to detection of aircraft and troop movements. Analysis of communications between field units and their home depots indicated the location of almost all divisions south of Manchuria. The movement of a unit in the field could be detected from its home depot traffic, or through readdressed messages, or by messages addressed to the unit code name in lieu of a specific message-center location. Finally insight into the general content of diverse classes of messages, gained through traffic analysis, aided in establishing priorities in handling the thousands of messages received daily. Though publication of daily and weekly traffic analysis bulletins began in September 1942, the greatest emphasis on the intelligence aspect of traffic analysis came in late 1944 and 1945. Where deceptive measures are not employed, traffic analysis can yield a very large amount of fairly reliable intelligence; where deception is effectively practiced, deductions from traffic analysis must be used with extreme care. Since, however, there was currently no evidence that the Japanese engaged in deceptive communication measures (a fact which was confirmed after V-J Day), valuable results from traffic analysis were frequently obtained.

C. CRYPTANALYSIS

Cryptanalytic procedures are never stereotyped and permit no easy description. . . . [text withheld] Too much emphasis cannot be placed upon the need for cryptanalytic continuity. . . . [text withheld] It is characteristic of most cryptographers that they tend to introduce new cryptographic features and elements in a conservative manner. Thus, a new system will frequently not represent a radical departure

from its predecessor but will, rather, be merely a refinement and improvement of what went before.

Since this is likely to be so, the cryptanalyst who can start his study of a new system with a good acquaintance with the cryptographic character of the one just made obsolete, and of others used concurrently by the same government, will be at a great advantage. The basic factor underlying all successful cryptanalysis, however, is constant watchfulness for significant details which may provide an entry: one or another of the operations mentioned above may reveal the nature of the system but the surest method is statistical analysis.

In World War I and for many years thereafter, such statistical analysis was dependent upon hand methods alone. The cryptanalyst or his clerical assistants were forced to make frequency counts or other statistical tabulations of the units or text (letters or digits), taken either singly or in groups, by hand. Not only did the process involve an immense amount of drudgery but it was also easily subject to serious error. The eye had to keep the place in a meaningless text while the hand made the necessary indications on the charts. Naturally, the work, to be dependable, had to be painstakingly accurate: the result was that it was time-consuming.

Even under the conditions of World War I, when the volume of intercepted traffic was relatively low, this was already a problem of most serious proportions. As a consequence, steps were taken during the period of peace to find adequate solutions to the problem. The most significant trend in cryptanalytic research and development during World War II has been, in fact, the extent to which machinery has been used to speed up hand methods and also to perform operations which, because of their magnitude, could never have been attempted without such apparatus.

A very large measure of the success of the SSA in cryptanalysis must be attributed directly to this fact. The enormous increase in the volume of intercepted traffic would alone have made hand methods wholly inadequate to accomplish the task set us in this War. Fortunately, none of the enemy nations seems to have realized the possibility of developing such machinery and the necessity of protecting their cryptographic systems against attack by such means, or if they did, as was true in the case of the Germans, the realization was not too clear and insufficient emphasis was placed upon the development of mechanical and electrical analytical equipment. The SSA, on the other hand, has had to keep constantly in mind, while developing cryptographic systems for our own use. . . , the possibility that other nations might also make, during the war or later, similar advances in machine cryptanalytic techniques and to prepare against that contingency. Thus, any new development in cryptanalytic techniques has the immediate effect of causing a converse development in cryptographic techniques, and vice versa. This is the fundamental reason why all research and development in both fields must be carried on within a single organization. [text withheld] Several types of machinery have been used. The first of these is standard tabulating machinery, including machines available on the open market as well as machinery of the same general type modified or

developed expressly for the SSA. The method involves the recording of data on a card in which holes are punched by means of a key-punch machine and the processing of decks of such cards by a number of other machines. [text withheld] While few, if any, cryptanalytic units have failed to make extensive use of these machines, by far the greatest employment of them has been in the solution of the Japanese Army systems. Indeed, the solution and processing of any significant quantity of the hundreds of thousands of messages in those systems would have been impossible without these machines. An indication of the growth of the use of tabulating machines of this type by the SSA in the fact that whereas only 13 machines and 21 operators were at work at the outbreak of the War, 407 machines had been installed at the peak in April-May 1945, involving a total of 1275 persons as operators and supervisors. The monthly rental for these machines reached a peak in June 1945 of $60,982.

In addition to standard and specialized tabulating machinery, another important category of machines was that generally referred to as Rapid Analytical Machinery (RAM). Machines of this category usually employ vacuum tubes, relays, electronic circuits, and photoelectrical principles. A number of different types, designed within the SSA for specific operations, were developed and constructed by the SSA itself or in cooperation with several contractors, and set up at Arlington Hall Station. One cryptanalytic machine, costing almost a million dollars, was basically homologous to an automatic telephone exchange capable of serving a city of about 18,000 subscribers, and the SSA had two such machines. These two machines were capable of performing operations which, if done by hand methods, would have required over 200,000 people. A second cryptanalytic machine, specifically designed to perform a certain type of test by means of electrical relays, served as the equivalent of 6,000 cryptanalysts; and an improved machine of the same general nature, but using vacuum tubes and electronic principles rather than relays, is now almost completed. It is expected to operate at least 500 times faster than the relay type and can be estimated to be equivalent to having 3,000,000 people at work. In the development and construction of these highly specialized cryptanalytic machines the SSA expended several million dollars, but it could hardly have operated without them.

D. SOLUTIONS

Cryptographic systems have grown in complexity very greatly since World War I, and in a brief report such as this it is impossible to give more than an inkling of the length to which many foreign governments have gone in improving their methods. Larger and more scientifically constructed codes were introduced; complex radio procedures and superencipherment systems were added; and intricate cipher machines were developed. By the year 1939, when the outbreak of war in Europe caused the first substantial expansion of the SIS since 1930, cryptanalyt-

ical attack was being centered in accordance with directives from G-2 [text withheld] . . .all systems thus far studied were entirely diplomatic in character; indeed, little traffic of other categories was then being intercepted. Work proceeded along these lines, effecting solutions which will be discussed in greater detail a little later, but so far as cryptanalysis is concerned, this was the situation existing on the day of the Pearl Harbor attack. [text withheld]

(1) Japanese Diplomatic and Military Attache Traffic. The first diplomatic systems to receive attention in the SIS were the Japanese, and from 1933 to 1941 eleven such systems were studied and solved. For the most part they were not greatly advanced in cryptography from those solved before 1930, but in two machine ciphers, the earlier of which had appeared by 1932, the Japanese demonstrated that they had read with profit *The American Black Chamber*, in which Herbert O. Yardley, formerly an officer of the Military Intelligence Division, indiscreetly revealed to the world American successes in solving foreign cryptographic systems.

The machine ciphers presented cryptanalytic problems of greater difficulty, involving not only the reconstruction of a complicated machine but also thereafter the day-to-day recovery of a great number of keys. The second of these machines, introduced in 1938, was much more complex than the first and required almost two years of concentrated study to solve: its solution by the SSA, unassisted by any other cryptanalytic organization, represented an achievement of first magnitude and importance. It is now known that the German organizations attempted the feat and failed, [text withheld] The remarkable feature of this solution was that a machine capable of deciphering the Japanese messages was reconstructed wholly by analysis: the SSA has never seen one of the Japanese machines. The importance of this solution can hardly be over-estimated.

General Marshall, in his now famous first letter to Governor Dewey dated 25 September 1944, and disclosed in the Joint Congressional Hearing in the Pearl Harbor disaster, stated that "our main basic of information regarding Hitler's intentions in Europe is obtained from Baron Oshima's messages from Berlin reporting his interviews with Hitler and other officials to the Japanese Government.". . .

In addition to this machine, which remained in current use until the end of the War because knowledge of its solution was fortunately kept secret during the War, the Japanese also began to use for diplomatic purposes a variety of other high-security systems based on intricate cryptographic principles. [text withheld] The result was that the best efforts of a large staff of the ablest experts working continuously on this problem were necessary to solve the diplomatic and military attache systems. Solution was, even so, effected in nearly all cases, providing a very large volume of translated messages giving significant information as to the intentions of the Japanese, conditions in the Far East, and also of conditions in Europe. Indeed, it has been said that the Japanese military attaches were the best secret agents of the United Nations on conditions inside occupied Europe.

The value of the intercepted Japanese diplomatic and military attache traffic for intelligence purposes can best be illustrated by representative translations, but of the many thousands of messages which appeared in the SSA Bulletin, only a few can be chosen for inclusion in a brief report such as this. . . .

a. Berlin to Tokyo, . . .translated 4 December 1943, sent in the [text withheld] (military attache system). . . .The full text, too long for reproduction here, is a report of a visit made in the fall of 1943 by a subordinate of Baron Oshima to the German western fortifications. The military information contained in this message was of incalculable advantage to the planning of the invasion of France. . . .

b. Berlin (Oshima) to Tokyo, . . .translated 12 August 1944, sent in the [text withheld] (diplomatic) system. This message. . .has been described by officers in MIS as "worth all the expenses of maintaining the SSA." The text describes conversations with the head of the Todt organization, Albert Speer, in which the latter revealed to the Japanese, and, thus to us, highly important information concerning the production of munitions in Germany. . . .

c. Hanoi to Tokyo, . . .translated 1 February 1945, sent in the [text withheld] (diplomatic) system. This message is important because it reveals that the Japanese were interested in obtaining uranium. . . .

d. Moscow (Sato) to Tokyo, . . .translated 30 July 1945, sent in the [text withheld] (diplomatic) systems. This three-part message, the translation of which was available to President Truman during the Potsdam Conference, reveals the activity of Sato, Japanese Ambassador to Moscow, at the time of the conference. . . .It will have been noted that while two of these four messages were translated within two days after they were transmitted, another took about ten days and the fourth nearly a month for translation. Delays of this kind may be attributed to a number of factors. [text withheld] Secondly, a sharp rise in the volume of intercepts may create a backlog of unprocessed messages which may take several days to eliminate. Thirdly, there is the question of translation: in the case of Japanese texts, for example, in spite of the great efforts made to train competent Japanese translators there never were enough of these to keep up at all times with the production of the cryptanalysts. To prevent highly important messages containing information demanding immediate action by MIS from being laid aside until the information was too late to be useful, a policy was adopted of scanning the messages as they became readable in order to sort them according to the degree of urgency. In spite of these difficulties, however, it frequently happened that messages were intercepted, decoded, translated, and placed in the hands of MIS before their addressees might be presumed to have read them. A conspicuous instance of this kind was the famous message by which the Japanese transmitted through the Swiss Government their intention to accept the surrender terms. The fact that the Japanese had accepted the Allied terms was known in the MIS several hours before the Swiss Minister was able to give the message to the State Department.

(2) Japanese Army and Air Force Traffic. The following paragraph is quoted

from a communique which appeared in The New York Times on 4 September 1943: Wewak: Our strongly escorted medium bombers attacked an enemy convoy of five cargo ships and two destroyers which arrived during the night with reinforcements and supplies for the enemy garrison. Coming in at masthead height, our bombers scored direct hits with 1,000-pound bombs on three freight transports, each of 7,000 tons, sinking them. In addition, one of the escorting warships and a 1,000-ton cargo ship sustained direct hits and were left ablaze. Numerous small harbor craft were destroyed by strafing. Intense anti-aircraft barrages were encountered and barrage balloons from ship and shore were employed in an endeavor to halt our low-level attacks. Thirty-five fighters flown in from the rear bases to protect the convoy were intercepted in the air. Twelve of these were downed with eight others probably destroyed and five damaged. Three of our bombers and one fighter were lost.

Note that in the entire communique there is no explanation of the method by which the American commander in the New Guinea area learned of the presence of the convoy at Wewak: the impression is given, as indeed was intended, that the good fortune of the bombing mission in finding the convoy solely was the result of chance. Yet this was not so. A message had been intercepted and read by the SSA (on 20 August, nearly two weeks ahead of time) which foretold to the Japanese at Wewak the arrival there of the the convoy on the first or second: . . . .The message in its English form was forwarded speedily to MIS and thence by radio to the proper commander for his use. This instance is, of course, only one of many which could be adduced to show how in an age of radio communications the necessity of forwarding an intercepted text thousands of miles to a control agency for decipherment and its return when made readable causes little more delay than would have taken place had the cryptanalysts been at work at the points of interception.

In order to prevent the Japanese commander at Wewak from suspecting the truth, precautions were taken, in accordance with rigid regulations, to provide an additional source of the information which he would naturally suppose to be the only one, namely, reconnaissance planes were sent over Wewak. On many occasions, in fact, American commanders were in possession of valuable information provided by the SSA which they could not use because to do so would have run the risk of revealing to the Japanese the fact that their secret communications were being read by us. The ability to continue reading the traffic as a whole was often a military objective of greater importance than that involved in the successful completion of a specific mission.

The bombing of the convoy at Wewak, as just described, is a good example of the effect of the translation of an isolated message—only the third part of a three-part message had been translated in time—but many messages, which individually are less striking, when taken together and coordinated by MIS, permit the accomplishment of even more spectacular results. The following paragraph is taken from a memorandum prepared by an officer in MIS (27 March 1945):

Use of Ultra (= SSA) Information for Attack on Japanese Troop Convoy

1. Information received. ULTRA traffic on and shortly after 2 April 1944 revealed Japanese plans to send a large convoy, designated as the "TAKE" Convoy, to Halmahera and New Guinea. The convoy, consisting of nine merchant vessels and about twelve escorts, sailed from Shanghai for the south in the latter part of April, carrying 12,874 troops of the 32nd Division, about 8,170 troops of the 35th Division, with equipment and other military supplies. Messages furnished the identity of the ships and full details about the troops and cargo loaded on each ship. Traffic analysis disclosed the approximate date the convoy was scheduled to leave Shanghai for Manila and provided current information on the convoy's approximate position on its trip from Shanghai to Manila. Before the departure from Manila on 1 May, messages revealed the following information:

a. scheduled noon positions for each day from 2 May to 9 May;

b. an outline of an alternate route to be followed only on receipt of special instructions;

c. a plan to divide the convoy into two groups on 7 May to a point N of Halmahera, one part (presumably the 35th Division ships) scheduled to go on to Manckwari, and the other part presumably (32nd Division ships)scheduled to go on to Wasile on Halmahera.

2. Action taken. Information on the composition, loadings, movements of the TAKE Convoy was forwarded to the appropriate field commands, as it became available.

3. Operational results. On 26 April the convoy was attacked by submarine at a point 30 m. W of Laoag (NW Luzon) and one ship was sunk. On 6 May the convoy was again attacked by submarine 100 m. NW of Menado and three additional ships were sunk. About 4,000 troops together with ordnance and other supplies were lost as a result of those sinkings, including the Commanding Officer and 2,700 troops (substantially all) of the 220th Infantry Regiment of the 35th Division. Two Japanese divisions, both critically needed as reinforcements, were thus decimated and their effectiveness seriously reduced. Both divisions have since been met in combat. The above information concerning operational results also was received from Ultra sources.

4. Ultra material used. Preparation of the intelligence dispatched to the field commands required the examination and integration of a large number of separate and frequenctly fragmentary messages and traffic analysis.

The fact that the two examples already chosen were both concerned with the sinking of convoys should not be allowed to give the impression that this was the only phase in which intelligence was derived from Japanese Army messages. To quote again from the report already cited as prepared by an MIS officer:

A 28 May (1944) message, available 1 June, mentioned supplies needed by the 18th (Japanese) Army (controlling operations in eastern New Guinea) which must arrive at Wewak by the end of June in order to be of use in "the attack on Aitape."

In a 24 June message, available shortly thereafter, the Southern Army stated that the 18th Army would attack Aitape. Various other fragmentary messages, all showing that an attack on Aitape was planned, were also received. On 25 June there became available a 20 June message from the 18th Army reporting that it was planning an all-out attack against the U.S. Aitape perimeter, to begin about 10 July and giving the detailed dispositions of each division under the command of the Army, plus the planned operations of each division in the attack. Total strength of the forces involved was stated in the message to be about 20,000. . . . All of (this) information was made available to the Commander-in-Chief, Southwest Pacific Area, before the date of the planned attack. . . . The Japanese attack was made on schedule and was completely defeated with heavy losses to the Japanese.

The examples just given show how the product of the Japanese Army cryptanalytic projects was of the greatest value in military operations in the Pacific area. We must now turn to the steps by which the product was made possible. Before the War attempts by the SIS to solve the secret communications systems of the Japanese Army had, for lack of sufficient traffic and cryptanalytic personnel, been fruitless. [text withheld] Immediately after the attack on Pearl Harbor more SIS personnel were assigned to the Japanese Army problems, but little could be done except to sort and file the traffic. Thus, cryptanalytic continuity was broken for a time. [text withheld] Cipher solution may be compared roughly to the operation of demolishing a building by undermining its substructure and causing the building to collapse suddenly; code solution is more like a mining operation, the ore is taken out of the mine bit by bit.

By the autumn of 1942, however, traffic sources had been established and more personnel had been obtained, so that considerable attention could be given to these problems. [text withheld] This historical method, though seemingly a long way round, was really the only recourse and it was fully justified by the results. By January 1943 progress had been made beyond the period of [text withheld] and at the same time encouraging results were being achieved in the recovery of code groups for addresses, which had previously seemed so hopeless a problem. [text withheld] In April 1943 the first break into a current system (that was used by the Japanese Army Water Transport organization was made possible [text withheld]. In this instance the entering wedge was simultaneously discovered (almost in the very same hour) by personnel of the SSA at Arlington Hall and of the CBB in Australia. It was most successfully exploited as the result of the constant collaboration maintained by daily intercommunications between the two organizations.

The result of this initial solution was a reorganization of facilities within the SSA leading to considerable expansion in personnel and services devoted to the Japanese Army problem. Ultimately, the number at work on these problems exceeded that of personnel at work on all other cryptanalytic problems combined, and yet there never were enough trained workers to carry out fully all phases which needed to be done: the man-power situation was such at the time that the

demand for personnel was always greater than the supply, and even when the needs were temporarily filled there always was some delay between the time new personnel reported for duty and the time they were ready to participate effectively in actual operations, because preliminary training was usually essential.

By early June 1943, two months after the initial break into the system, translation of Water Transport messages were being forwarded to MIS. Thereafter, until almost the end of the War, the Water Transport system provided not only a broad picture of the Japanese Army shipping organization and activities but also, from time to time, information regarding specific operational movements of which the logistics problems were discussed in Water Transport messages. To quote once more from General Marshall's letter to Governor Dewey:

"Operations in the Pacific are largely guided by the information we obtained of Japanese deployments. We know their strength in various garrisons, the rations and other stores continuing available to them, and what is of vast importance, we check their fleet movements and the movements of their convoys. The heavy losses reported from time to time which they sustain by reason of our submarine action largely results from the fact that we know the sailing dates and the routes of their convoys and can notify our submarines to lie in wait at the proper point. The current raids by Admiral Halsey's carrier forces on Japanese shipping in Manila Bay and elsewhere were largely based on timing of the known movements of Japanese convoys, two of which were caught, as anticipated, in his destructive attacks."

Although undoubtedly General Marshall included in this tribute to the signal intelligence services the very outstanding contribution from the signal intelligence service of the Navy, for fleet movements are mentioned, the bulk, however, of the information of the type cited came from the SSA.

Solution of the main Ground system was effected by a series of discoveries that began in May 1943 and culminated in decipherment of messages in September of that year. Also, by the summer of 1943, solution of the address system had reached a point where the addresses of current intercepts were readable. Reconstruction of the address code books, which had hitherto been carried on exclusively by a British organization in India, known as the Wireless Experimental Center (WEC), was now undertaken at Arlington Hall.

The order of battle intelligence derived from daily lists of the addresses of Japanese Army units was a useful adjunct to the text of the messages and even supplied knowledge of military operations in periods when the messages themselves were not readable. Thereafter, despite repeated changes and innovations made by the Japanese in their cryptographic systems, solution was continuous, though on occasion it was temporarily delayed. The knowledge of Japanese cryptographic practices and previous solution of the basic code book permitted the reading of periods which, from a cryptanalytic point of view, were as difficult as the systems encountered at the time of Pearl Harbor attack, systems which had then been considered hopeless of success.

Two major technical problems which had to be solved in 1944 were the introduction by the Japanese on 1 August of a new cryptographic practice which disguised the system indicators and a radical shortening of the life of one of the keying elements used in the Administrative systems. The uncovering of the disguise in the case of each system indicator was, of course, a prerequisite to the subdivision of intercepted messages into their respective systems preparatory to any other steps toward solving or reading the messages. Though the introduction of this feature might have been a major cryptanalytic disaster, it fortunately turned out to be only a nuisance, because it was at first effected by an insecure method, and speedy solution was therefore possible. Subsequently the Japanese modified the method to the point where, had it been used initially, solution would have been almost impossible. With continuity of solution, however, aided by information from cryptographic instruction messages and captured materials, this handicap was overcome.

The problem presented by shorter intervals (five days instead of three weeks) between changes of keys, was essentially one of carrying on analysis of one of the steps of encipherment with only about a fourth of the traffic previously available, was eventually solved by a combination of methods, namely, very careful correlation of every piece of intercepted traffic, the use of tabulating machinery, which enabled a tremendously large number of operations to be made in a short time, and the use of photoelectric equipment to exploit phenomena resulting from messages with identical or nearly identical text but cryptographed with different keys.

Once the Japanese began to suffer military reverses, their cryptographic materials were frequently captured and these soon came to play a vital role in solution. Especially important was the capture of the basic code books, or of the key books which the Japanese could not easily replace with new editions and which therefore were occasionally continued in effect for some time after their capture. The complete reconstruction of such code books and key books would have been a long and painstaking task which would have resulted in delays in production of intelligence and possibly also in some diminution of its reliability. Yet the continued capture of such materials was not an unmixed blessing, since whenever a capture was known or even suspected, the Japanese naturally changed as many of their other cryptographic materials as possible.

Thanks to the care with which information obtained from the translated messages was used by field commanders, the Japanese seem never to have suspected the possibility of cryptanalytic compromise but, as they began to realize that Allied Forces were able to anticipate their plans, they attributed our success to espionage activities. The following extracts are taken from a message, intercepted and read by the SSA, which was sent from Pinrang to Piru (RIYA Communications Officer) on 18 December 1944. . .

***

". . . .there are substantial indications that the enemy has understood our important plans in the Burma and Philippine areas. Therefore, we are inclined to be somewhat doubtful about the codes now in use (and) each unit commander must multiply his alertness toward counter-espionage . . . . This is an order. Furthermore, you should exert your best efforts towards overcoming the deficiencies in the counter-espionage set-up, and towards perfecting it. If you fail to do this, troubles will arise, and you must take resolute action in facing them, without a thought for yourself."

Because of actual or suspected compromise, however, changes were made so frequently and complications so often introduced in the Ground systems that analysis became more and more difficult. By the end of the War the Ground problem reached the point where the time required for solution made the production of current translations seemingly impossible. The general intelligence value and the special cryptanalytic interest of the problem, however, warranted studies of the last unsolved period of the highest-echelon Japanese Ground Force system, for which no captured material or special cryptographic intelligence were available. These studies, successfully carried out during the final months of 1945, demonstrated that the development of cryptanalytic attacks had kept pace with the ever-increasing complexity of Japanese cryptographic procedures.

On the other hand, no compromises or suspected compromises took place in the case of the Water Transport systems, and in the latter, the Japanese moved in an orderly fashion to make their periodic changes. Consequently, the cryptanalysts were less hampered by frequent or sudden changes and a fair proportion of the messages in each key book were read currently. Had no compromises been made in the ground systems, the same success might have been experienced. Therefore, it is a moot question whether compromised material gave an overall advantage or not.

For lack of sufficient personnel and because of the special interest of GCCS in the air systems, the SSA did not concern itself to any considerable extent with those systems until late in 1944. Thereafter, more and more attention was devoted to the air problem and the SSA eventually made large contributions to current solution.

After some early compromises in 1944 the Japanese signals systems were read from time to time. The cryptography used was such that, with the limited volume of traffic, solution would have been extremely difficult without a compromised code book, but fortunately at different times several successive editions of the signals code books were captured, along with the key books for a number of periods. The text of these systems, which discussed call-sign frequencies, and methods of handling traffic, was of special interest primarily to our traffic analysts.

While the study of low-echelon Japanese systems was never considered a primary responsibility of the SSA, reports from field agencies were examined here and their contents served as a guide in the training of military personnel destined for field agencies. The SSA did actively participate in the solution of the low-eche-

lon air system known as "BULBUL" but only as a support for the cryptanalytic unit in the India-Burma Theater.

The impression has already been given that had more personnel been made available and at at an earlier date, solution of Japanese military communications might have been expanded and expedited. Yet it should be pointed out that had all the U.S. Army personnel working on the Japanese Army problems, not only at Arlington Hall Station but also in the Central Bureau at Brisbane, in the Hawaiian Islands, and in the India-Burma Theater, been grouped together at one center and solution activities thus been concentrated, considerable unnecessary duplication, especially in the field of translation, would have been eliminated. On the other hand it must be admitted that had such a consolidation taken place problems of administration would have been greatly increased but the advantages gained by the increase of trained workers all applying their efforts in a coordinated attack would have outweighed by far any administrative difficulties. As it was, where circumstances permitted, duplication was eliminated and, considering the great distance between the agencies concerned, cooperation and coordination effected by the interchange of mail and telegraphic communications was good.

In retrospect, it may be noted that in the signal intelligence field the consequences of lack of continuity and unpreparedness for effective operation immediately upon the outbreak of hostilities are nowhere more clearly demonstrated than in the case of the Japanese Army high-echelon secret communications. It is a fact that, during the entire period from 7 December 1941 to the summer of 1943, none of these communications was being read. Had this been otherwise, the military situation might have been quite different. To judge purely by the disastrous effect that the solutions obtained by us after the autumn of 1943 had upon Japanese operations, it is legitimate to think that the important early Japanese penetrations to the south might have met with greater obstacles and that as a result the War in the Pacific might have been terminated many months earlier. If an adequate staff of cryptanalysis had been engaged in studying Japanese Army traffic continuously from 1939, when the systems were solvable with comparative ease, complete continuity could have been maintained from the very outset of the War. After 1939 the systems became more difficult but never more difficult than they were in 1945 when, because of the possession of a background of knowledge and experience built from successful reading of earlier periods, they were solved.

* * *

(4) German Army and Air Force Traffic. It has already been noted that a logical division of work between the British and the U.S. Governments resulted in concentration of the SSA on solution of Japanese diplomatic communications and Japanese military traffic in the Pacific theater, leaving the exploitation of German and Italian military traffic in the European theater the primary responsibility of the

British. [text withheld] In the tense days of early 1942, however, the advisability of insuring against the contingency that the British organization working on enemy communications might be put out of operation by enemy action led to the establishment of an SSA unit to serve as a back-up. Though the SSA played the minor role in the work on German Army and Air Force and Italian Army and Air Force traffic, nevertheless it made noteworthy contributions.

The German Armed Forces employed two basic types of cipher machines. One of them, a modification of a commercial machine known as the Enigma, produced cryptograms of a very high order of security, but faulty usage, Teutonic love of order, and addiction to stereotyped modes of expression made it possible for the British to solve a very large portion of all the messages transmitted, yielding intelligence of the highest value. In this work the SSA served as a cooperating and assisting echelon, contributing new ideas, techniques, and machinery. As a result of excellent coordination of basic research and development with practical operations, SSA engineers invented and built an electronic solution machine far in advance of anything hitherto known for solving messages in the most complicated form of the Enigma machine as used by the Germans.

In addition to the foregoing, specialy selected messages were sent from England to Arlington Hall for study and solution by SSA special machinery. The necessity for speed brought into use special communication channels and there were cases wherein the answer to a specific problem was obtained by the SSA, wired back and in the hands of the GCCS cryptanalysts within 90 or sometimes as few as 60 minutes.

* * *

The German Armed Forces also used a series of complex cipher machines for enciphering teleprinter communications among their highest echelons. Here again the SSA collaborated with [text withheld] in inventing and designing new machinery as well as in testing new techniques and procedures. Two machines in particular, invented, designed, and built either entirely at Arlington Hall Station, or by an outside contractor working under the direction of SSA engineers, [text withheld]...were successfully employed [text withheld] In addition to making an important contribution to the victory in Europe, the experience the SSA gained in such collaboration will, of course, be very useful to the U.S. Army in future research in this field.

Mention must also be made of our contribution in the signal intelligence operations in the Mediterranean Theater. Here again the SSA furnished key and basically-trained personnel for Signal Corps units working in collaboration [text withheld] on both German and secret communications.

* * *

(8) Commercial Code Traffic. Exploitation of the information to be obtained from decoding traffic [text withheld] in public commercial codes was carried on more or less continuously after early 1943. This activity was at first confined largely to codes in the chief languages of Europe but was ultimately extended to include also a group of Japanese commercial codes which provided a rich mine of militarily useful information concerning conditions in the Far East.
(9) Special Problems. In addition to the traffic already described, the SSA had to face a number of other special problems requiring other techniques.

These included the transcription of shorthand documents; the solution of open codes, a type of cryptography in which a secret text is hidden within an ostensibly harmless message; the transcription and translation of "scrambled speech," that is, telephonic and radiotelephonic conversations in enciphered and unenciphered form in foreign languages; and the solution of secret ink messages. The last named type involved much work for the Office of Censorship as well as for MIS. In this field the SSA technicians accomplished feats not duplicated elsewhere: the recovery of printing on documents which had been printed by use of inks soluble in water, In the case of two documents very valuable code materials were recovered for the Navy; one involved a German, the other a Japanese code book.

E. SOME GENERAL REMARKS

The remarkable success which the cryptanalytic units obtained must not be allowed to create the impression that any of the tasks was accomplished without skill, training, patience, vigilance, and mental labor of the most exhausting kind. A description of the essential features of a solved cryptographic system may often seem simple and it may be imagined therefore that solution was easy, but this is rarely the case. Frequently, a simple cryptographic trick may be as difficult to detect as one of the more complex varieties; in cryptanalysis the effect of some minor complicating factor, inserted solely to prevent solution, may prove to be a serious stumbling block, though occasionally it may also prove to serve in the end as the entering wedge leading to solution.

The time and effort needed for solution, of course, vary with the system. A simple substitution cipher may require only a few minutes' work by a single analyst; other systems may be so difficult that the entire efforts of a number of persons working for many months are needed. Of the two basic types of cryptography, codes and ciphers, reconstruction of the former is, as has already been noted, a slow, laborious process, each code group having to be identified singly, and the larger the code, the longer the time needed; solution of a difficult cipher may take equally long but success is instantaneous rather than gradual—at one moment the cipher is unsolved, the next it is solved. The reconstruction of a cipher machine is, of course a very long process, but when this is finished, the keys used in each day's traffic may still have to be solved as they appear. For this reason, even when the

machine has been reconstructed, reading of current traffic may be delayed until enough traffic all in the same specific key has been received to permit solution.

Systems differ so greatly that a counting of solved systems is no adequate indication either of the volume of work accomplished, or of the brilliance of the achievement of the cryptanalysts. During the War a group never numbering more than twenty, and for a long time many fewer, succeeded in making readable approximately twenty-five systems. In the same period a group of about eighty persons were needed for the solution of a single system. For this reason the efficiency of the two groups cannot be evaluated in terms of the number of systems solved.

* * *

. . .By August 1945, however, the traffic [text withheld] had been studied and translations were currently being prepared in large volume. The number of these translations is really the best gauge of the cryptanalytic achievements of the SSA, since they are the final products of the cryptanalysts, assisted by the combined efforts of intercept operators, clerks, translators, editors, typists, and proofreaders....Factors causing fluctuation of volume were complex: it is not always possible to explain declines, but on occasion the introduction of new cryptographic techniques had the effect of slowing up production temporarily until solution was achieved.

After cryptanalysis the messages in almost every instance still had to be translated—a small percentage of the messages are transmitted by their originators in English—and after the translations were prepared in draft form, they had to be checked for diction, accuracy, and format, and then typed for reproduction by the "Ditto" process. "Master copies" of the translations were then once more proofread for accuracy of typing and the required number of copies prepared. Following this, they were forwarded at frequent intervals during the 24 hours to MIS. In certain cases, where urgency required it, forwarding was either by special courier or by electrical means, over special cryptographic circuits.

Even then, the task of the SSA was not finished, for it was necessary that the daily "SSA Bulletin" of translations be read carefully by personnel whose duty it was to compile therefrom voluminous information which would, in turn, be useful to the cryptanalysts working in other problems. Thus the fruits of the labors of one working unit could be at the disposal of any others that might need it. In this connection it may be stated that the free exchange of information and results among the traffic analysis units, the cryptanalytic units, the translation and "bulletin" units, the communications-security units, and so on, is absolutely vital to success in the whole cryptologic field.

From *A Brief History of the G-2 Section, GHQ, SWPA. In the aftermath of World War II, the G-2 section of U.S. Armed Forces, Far East, commanded by General of the Army Douglas MacArthur, devoted some of its energies to preparing histories of its successes in the war in the Pacific. Included in A Brief History of the G-2 Section, GHQ, SWPA and Affiliated Units: Introduction to the Intelligence Series was a short history of MacArthur's own World War II COMINT organization, a collaborator—and rival—of Arlington Hall.*

CENTRAL BUREAU (CB)

Central Bureau, a combined Australian-American organization, was activated on 15 April 1942 under the command of Colonel Joe R. Sherr, one of the officers evacuated from Bataan. From its inception until the end of the war, the Bureau operated under the direction of Major General S.B. Akin, Chief Signal Officer of the Southwest Pacific Area, who was largely responsible for its establishment and technical development.

The first contingent of American signals intelligence personnel to reach Australia after the outbreak of war consisted of six officers and eight enlisted men who comprised the 837th Signal Service Detachment. These men left the United States on 16 April 1942 on the last scheduled Clipper flight to Hawaii. As all regular runs from Honolulu to Auckland, New Zealand, had been discontinued, they had to "sweat out" the remaining 7000 miles of their trip as space became available on USAAF and RAAF planes. From Sydney, they proceeded to Melbourne to join the GHQ established by General MacArthur. Within the next two months the American contingent was augmented by 12 additional enlisted men and 3 officers, including Major A. Sinkov who took over the command of the Detachment.

The Australian Army component of Central Bureau was the Australian Special Wireless Group which had seen considerable service against the Germans in Africa and the Near East and which included some British personnel who had escaped from Singapore. The Australian Air Force component consisted of personnel assigned from Victoria Barracks, Melbourne.

In the field at that time, Central Bureau maintained radio personnel as follows: AIF /Australian Imperial Forces/ - No. 51 W/T /Wireless Telegraphy/ Unit and the RAAF - No. 1 Wireless Unit. Attached to the latter as special instructors were three U.S. signal intelligence personnel (Lt. Howard W. Brown, Sgt. John J. Phelan, Sgt. Carl Card) who had been evacuated with Colonel Sherr from Bataan.

The 837th Signal Service Detachment was deactivated in May 1943 and replaced by the Signal Intelligence Service (still a component of Central Bureau) under Col. Harold S. Doud, with Capt. Chester W. Ray as Commander of Troops. In the autumn of 1943, Colonel Sinkov became Commanding Officer, SIS, and

During the 1920s, Herbert O. Yardley headed the legendary "Black Chamber," a secret cryptanalytic bureau jointly funded by the War and State Departments. Forced into retirement, he sought to recoup by writing a sensational exposé of American intelligence activities. (NSA)

Masses of calculating machines were used at Arlington Hall to process and exploit Japanese military traffic. (INSCOM)

Capt. I.W. Wolfe, Commander of Troops.

Central Bureau expanded rapidly. Its strength in 1943 was well over a thousand men and women. Technical direction under General Akin was vested in three assistant directors who were the ranking officers of the three largest contingents: Colonel Sinkov for the Americans; Lt. Col. A.W. Sandford for the Australian Military Forces, and Wing Comdr. H. Roy Booth for the Royal Australian Air Force.

The Bureau brought under a unified control personnel from the signal intelligence services of five nations. Included were the following military and naval forces: Army of the United States, Australian Imperial Forces, Australian Military Forces, Australian Women's Auxiliary Service, British Army, Canadian Military Forces, Royal Air Force, Royal Australian Air Force, Royal Australian Navy, Royal Navy, United States Women's Army Corps, Women's Auxiliary Australian Air Force, United States Army. The United States Navy was not included.

In order to avoid duplication, promote smooth inter-service relationships, and assure the maximum benefit from the pooling of resources and centralizing of control, representatives of each of the 14 component services were detailed to work on all of the major problems. Personnel were placed where they could work most effectively regardless of nationality or the component to which they belonged. Before the war came to an end the personnel strength of Central Bureau was more than 4000 and there were detachments in all parts of the Southwest Pacific Area. Of this number about fifty per cent were American personnel.

Since the work of Central Bureau was always closely connected with GHQ, the organization followed General MacArthur as he moved northward. This took the headquarters of Central Bureau from Melbourne to Brisbane (September 1942), to Hollandia (late summer 1944), to Leyte (October 1944), to San Miguel (Luzon) (May 1945), and to Tokyo (September 1945). The first move came in September 1942, when GHQ was moved to Brisbane. In Brisbane the administrative control of the American contingent passed (February 1943) to USAFFE. Operational control, however, remained with GHQ throughout the war.

In November 1945, its mission accomplished and a fine record of cooperative effort and notable achievement to its credit, Central Bureau was deactivated. General MacArthur commended the organization for its outstanding achievements and awarded the Legion of Merit to ten of its members.

From SRH 280. *This intercepted message from the Japanese Ambassador to Nazi Germany, Baron Oshima, contains useful technical information from inside the Third Reich, including data on German experiments with jet planes and rocket bombs. The Goebbels referred to was Joseph Goebbels, the infamous Nazi propaganda minister.*

From: Berlin (Oshima)
To: Tokyo
26 July 1944 #756
A 4 part message complete.

Urgent.

In recent statements made by GOEBBELS as well as some that appeared in the German newspapers and magazines, it is frankly admitted in their explanation of the European war situation that German weapons have to yield the palm to the enemy in both quality and quantity. However, at present the Germans are striving to improve the quality and increase the quantity of their weapons, and there are not a few people who say that in time Germany will be able to make up for her present technical inferiority [a]. . . .The Military and Naval Attaches have doubtless sent you detailed reports regarding this matter, but as I thought it would be necessary in order to get an estimate of the war situation in general, I am sending you merely the following outline regarding the new German weapons. Moreover, although quite a number of announcements have been made already with regard to this subject, since there are some very important matters in this message relating to military affairs, I wish you would treat this message with particular care.

1. Weapons connected with the Army:

(a) Tanks: I have already sent you information regarding the Tiger and Panther Tanks, but it seems that they are placing especial emphasis on the production of Panthers in large quantities.

(b) Assault Guns: This gun is primarily a weapon to be used for the smashing of the enemy's pillbox machine gun bases in cooperation with the Infantry, but it is often used also in anti-tank warfare. This is one of the weapons concerning which the Germans are placing great emphasis at present so far as production in large quantity is concerned. It is an 88 millimeter gun (the same as the gun on the Tiger) and has a crew of four men.

Part 2.

(c) The Panther Terror:[b] This is a kind of rocket gun that can be used by two soldiers, and is a weapon for close-range fighting to be used against tanks.

(d) The Panzer Fist:[c] This is the same kind of gun as the above, but it can be used by one person.

(e) Trench Mortars:[d] These weapons could hardly be called a new weapon today, but their size has been increased (up to 15 centimeters) and they are being used in large quantity.

(f) Robot Tanks (Goliath):[e] This is a small-type tank controlled by radio waves, and it seems that its effectiveness depends on the configuration of the ground.

(g) The establishing of artillery divisions with the self-propelled gun units acting as the main strength: The object of such a division is to concentrate the use of artillery.

I wish that in paragraph (c) above you would amend the words Panther Terror

to read Panzer Terror.

2. Weapons connected with the Navy:

(a) A New Type Submarine (Very Secret): This new type submarine scarcely shows itself on the surface of the sea, and has long-range maneuverability. At present it is in process of construction and its effect will first be felt from about September, and by November or December it is said that greater results will be effected by its use in great quantity.

Part 3.

(b) Torpedo Boats: I have nothing to add to what I have already reported to you concerning these boats.

(c) A Small-type Submarine (Very Secret): This is a submarine that has been improved one degree and seems to be a weapon that has two torpedoes to be ridden by one man. It is to be used in areas near the seashore.

(d) Special Torpedo (Very Secret): This is a torpedo which by means of special equipment has been made almost 100% effective in hitting the mark, and its testing has already been completed.

(e) The High Speed Boat:[f] This in itself is really not a new weapon, but a new type is being produced with a speed of 40 knots an hour, and having a Diesel engine. For this reason it has the special merit of not easily catching fire when damaged. It seems that the Germans are putting forth efforts to produce this boat in large quantity.

(f) Special High Speed Boat (Very Secret): This is a high speed boat to which has been added the principle of radio wave control, and it seems that its explosive power is especially great.

3. Weapons connected with the Air Force:

(a) The German are adding substantial improvements to the speed, armament, ammunition, and way the armor is put on, etc., in their various types of fighter and destroyer[g] planes, and besides that they are of course placing special importance upon the production of these planes in great quantity. Furthermore, in the near future propellerless planes are also going to make their appearance, and it seems that these planes will have especially high speed (this last paragraph is very secret).

(b) For the time being dive bombing has been suspended and as a substitute they are using ground attack planes (SCHLACHT FLIEGER). These planes cooperate with ground fighting, and considerable results have already been achieved in the destruction of enemy tanks (Captain RUUDERU alone, it has been announced, has destroyed more than 200 tanks).

Part 4.

(c) The main strenth of anti-aircraft guns lies in the 88 and 105 millimeter guns, it seems. However, 120 and 150 millimeter guns also are gradually being used in large quantity. Matching the improvement in shells the Germans are trying also to increase the power in their aircraft. Again it seems they are also using rocket guns.

(d) There has been a great deal of improvement in night fighters since last winter but in day-light air raids also special units, STORM GRUPPE, have recently been organized (within 2 minutes 1 American four-motored plane—10G— and —M—). They will at an appropriate time be newly established and although it may not be possible to call them new weapons, in outline they serve as an indication of the earnest efforts which Germany is puting forth in order to regain command of the air.

(e) Special Type Aircraft (Very Secret): It seems that a study is now being made with regard also to a bomber plane which will unite the rocket gun with the principle of radio wave operation.

4. Equipment for Long Distance Bombardment (Very Secret): I have already described to you in various telegrams the V-1, and it seems that preparations have already been made for the use of a more effective weapon than this. It will have five times the effect of the weapons thus used in the past. And again it is said that they will have a weapon whose effect will extend to a square of more than 1 kilometer. However, it is not clear as yet just when both these weapons will be introduced. It is anticipated that with regard to these weapons there will be both substantial developments and improvements made in their construction.

5. The weapons in which the Anglo-Americans made particularly great progress in the past were first of all the direction finder and then radio wave weapons in general, but in both these spheres the Germans by special efforts seem gradually to be catching up with the enemy. It seems that in weapons connected with rockets, because of the fact that the Germans as usual have had longer experience, Germany is temporarily in the lead. Again improvements and progress in explosives have been best indicated in the V-1 and it seems that this improvement has been very conspicuous.

a - V.H. 1891.
b - SCHRECK.
c - The Kana spelling for this word is HUAASUTO, which is doubtless the German word for FAUST.
d - WERFER.
e - The Kana spelling for this word is GORIAATO.
f - SCHNELL BOTE.
g - ZERSTOERER.

CHAPTER VI

Producing Intelligence

The decryption of encoded and enciphered enemy traffic was only the beginnings of the signals intelligence process. The messages had to be placed into a wider intelligence context. Until June 1944, when there was a general reorganization of the whole War Department intelligence structure, this was done by the members of the Special Branch, Military Intelligence Service. In the excerpts from SRH 185, War Experiences of Alfred McCormack, the father of the Special Branch gives an insider's account of the infighting that went on within War Department intelligence. Unlike most of the other Special Research Histories released by the National Security Agency, this document was originally prepared after the war as an unclassifed study; the reader will note that McCormack does not mention that the Special Branch dealt with signals intelligence.

The Special Branch not only exploited U.S. Army successes against Japanese diplomatic and later military communications, but also entered into an agreement to share signals intelligence with the British. As a result, after 1943, the United States was able to secure from the British the results of their unparalleled success in reading high-level German messages. See the excerpt from SRH 141-2. The type of intelligence windfall that resulted from this source is documented in the excerpt from SRH 005, Use of MX/CSS ULTRA by the War Department.

From SRH *185. In these excerpts from his unpublished memoirs, McCormack tells all about the Special Branch—except what it actually did! "Cravath methods" refer to the highly selective and personalized recruitment procedures used by his old law firm. At the time he wrote this account, McCormack had returned to a successful law practice. After reentering civilian life in 1945, he had briefly served as the State Department's first Director of Intelligence and Research. However, he apparently encountered the same kinds of bureaucratic resistance to intelligence work at the State Department as he tells us he met in the War Department.*

31 July 1947

WAR EXPERIENCE OF ALFRED McCORMACK

Early in January 1942, McCormack was asked by McCloy to do a job in the War Department in connection with military intelligence, and he took office on January 19 as a Special Assistant to the Secretary of War. In March he submitted his recommendations to the Secretary and was given the job of putting them into effect. A special section was created by G-2 to assist in the work, and in May 1942, Colonel (later Brig. General) Carter W. Clarke, with whom McCormack had become acquainted and whom he strongly recommended, was made head of that section.

Urged by the Assistant Chief of Staff G-2, General Strong, to go into the Army, McCormack at first declined but later concluded that his job could be done more effectively if he were an officer on the G-2 staff. He was commissioned as a Colonel on June 24, 1942, reversing roles with Clarke, who thereupon became Chief of a newly created "Special Branch" of G-2, with McCormack as Deputy Chief.

From then until the end of the war McCormack and Clarke, whose talents were complementary, worked as a team. McCormack took charge of the research and intelligence work and the recruiting and training of personnel, while Clarke concerned himself with administration, security, relations with G-2 and outside organizations and innumerable problems involved in organizing and building up units of the Army whose work produced the raw materials of intelligence, and for which Clarke assumed a continually increasing responsibility as the war progressed. Clarke was also employed on a number of important missions for the War Department Staff.

Both Clarke and McCormack considered G-2, as it existed in 1942, to be inadequate for the intelligence job that the war required, and they sought to use the Special Branch as a means of building up a more effective intelligence organization in the War Department.

The original assignment of Special Branch was the preparation of a daily intelligence report, but the work which that entailed provided many opportunities for

the production of useful intelligence, which the personnel of the Branch were quick to grasp. In August, 1942, McCormack, having established the form of the report and the methods to be used in the preparation, turned over the work to Henry W. Rigby, who had been a Cravath associate from 1937 to 1939, before going to the Providence firm of Tillinghast, Collins, & Tanner, and who had followed McCormack into the War Department in March 1942. Rigby's immediate assistant until August, 1944, was a Cravath associate, Louis T. Stone, Jr. . . .

McCormack used "Cravath methods" in the recruiting of personnel for the Special Branch, taking on only highly qualified persons. There were so many lawyers in the Special Branch that it used to be referred to humorously as "the best law office in Washington". McCormack believed, and his experience confirmed, that lawyers as a class are better fitted for intelligence work of the type that must be done in the War Department, i.e., what the Army calls "strategic intelligence", than is any other group in the community, because their training teaches them to deal with evidence, to be inquisitive and skeptical, to pursue an investigation through to a conclusion, to meet unfamiliar situations of fact and, most important, to do very detailed work without losing their sense of values.

After freeing himself from responsibility for daily reporting, McCormack turned his attention to specific problems of intelligence, being convinced that intensive and exhaustive research work would furnish dependable answers to many questions on which G-2 at the time could do no better than speculate. Every job that was done revealed new opportunities and emphasized the need for more personnel, and the results were good enough so that the personnel allotments were provided, though usually after long delays and much paper work. McCloy had an active interest in intelligence, followed the work of the Special Branch and helped out frequently; and the fight for personnel was made easier by high praise which the Branch received from time to time from General Marshall and other high officials, and occasionally from the President.

By the Fall of 1942 it was apparent to McCormack, and also to Clark, that G-2 had no dependable current information about the war in Europe. The reason was a simple one, but nobody seemed to realize it. There was a military attache in London with a large staff. He sent reams of paper back to Washington, which he had gathered from the British intelligence agencies; but the British did not regard military attaches as being entitled to top level information and so what the attache office sent home was seldom more than could be published in the newspapers. It was solemnly studied in G-2, though there was in the organization an almost universal suspicion of the British and a tendency to disagree with British conclusions, simply because they were British conclusions. Some of the G-2 "intelligence" on Europe was fantastic. For instance, at a time when the German Air Force had about 5,000 operational planes of all categories, there were devout believers in G-2 in a rumor picked up by an attache in Roumania that the Germans had 10,000 spare airplanes hidden in the Black Forest.

One of the bothersome characteristics of G-2 was a certain supine attitude toward intelligence. Everybody knew the classical Army doctrine that the three steps in intelligence are collecting, evaluating and disseminating, but nobody seemed to give much thought to the fact that evaluation and dissemination are worthless if what is collected is worthless. The attitude was in part a reflection of the viewpoint of the G-2 colonels, who regarded it as their function to make predictions. They operated in the manner of soothsayers. They showed no indication that their information might be inadequate. They seemed to think that they already knew enough to answer whatever questions might be put to them concerning the enemy countries.

G-2 organization as a whole did not appear to know that there was a war on. Except for the fact that they were required by departmental order to work on Saturdays and that some of them had to appear Sunday morning for a meeting with the General, they operated their organizations just as they had in peace time. Promptly on the dot of 5 p.m. the whole organization went home. There was no special sense of hurry or urgency and the job that did not get done one day would go over to the next unless the job had a deadline. If the job had a deadline, it was turned out on that deadline and it was good or bad, depending on whether the time was sufficient to get the job done.

The Special Branch had a different attitude toward hours. Every day's work had to be done that day and if it was not done by 5 p.m. the personnel stayed on and finished it. The Branch was hardly ever closed before 11 p.m., and it opened very early in the morning because Clarke's hour of arrival was never later than 7 a.m. and he not infrequently got in at 6. McCormack never went home before 7 and worked at night whenever there was any reason to do so.

McCormack had an early experience which he never forgot. At 4:40 one afternoon he went to the Chief of the European Branch of G-2 to get some information. The campaign in North Africa was then under way and the information, though not of any vital significance, was pertinent to a job that might have been useful in connection with that campaign. The Colonel apologized for not being able to get the information until the following morning. It was a fixed rule of his branch, he said, that all personnel must start putting their papers away by 4:40 p.m., in order that their desks might be clear and might be inspected and the files locked by 5.

In the two years of life of the Special Branch it grew in size from a dozen officers and civilians to a total of 100 officers and 300 civilians and enlisted personnel in Washington, and 80 officers abroad, stationed with the field commands and at other key places, and it had been given a directing responsibility for the work of Army units outside of Washington numbering several thousands of persons.

McCormack's work in early 1943 had to do largely with the war in Europe. At that time the relations between the War Department and British intelligence organizations were conducted at the top level; there was no working liaison and no important flow of the raw materials of intelligence from the British organizations

to the War Department. In April, McCormack was sent to England as the representative of the Assistant Chief of Staff G-2, to work out arrangements that would insure that the American field commands would be furnished promptly with all relevant British intelligence, and that the War Department would have access to British intelligence in all its aspects.

McCormack spent two months making a study of the British Intelligence agencies and reporting his findings to Washington, with recommendations for methods of coordinating British and American intelligence work on the European war. He was greatly impressed by the work of the British intelligence agencies and the high quality of their personnel, and he learned many lessons from them which he applied later in G-2. He found that British intelligence had a first call on military and civilian personnel—a startling contrast to the United States, where intelligence had in general a low priority for personnel or no priority at all.

McCormack and Lt. Col. (later Colonel) Telford Taylor, . . .who had accompanied him to England, worked out with the British a plan for coordinating British and American intelligence work for the German war and it was gradually put into effect as personnel were obtained. It involved establishing a unit of the Special Branch in England, headed by Colonel Taylor, converting certain British intelligence units into joint British-American units, and creating a new system of communications for the transmission of operational intelligence to American commanders.

* * *

On his return from England in June, 1943 McCormack set up a new unit under Capt. (later Lt. Col.) William R. Perdue of the Cahill, Gordon firm and Lt. (later Major) John W. O'Boyle, a Milwaukee lawyer, who had served as Judge Patterson's law clerk in the Circuit Court of Appeals and, before going into the Army, had held a number of important assignments in the Lend-Lease Administration.

The purpose of the unit was to exploit Japanese intelligence material with primary attention to the Japanese merchant marine.

No two intelligence organizations among the Allies could agree at that time on the amount of Japanese shipping at the start of the war or the amount of tonnage that had been sunk, and there were estimates of Japan's shipping position that varied by millions of tons. Clarke and McCormack were agreed that the Japanese merchant fleet was the primary military objective in the Pacific War and that the employment of that fleet was the best clue to the logistic problems of Japan and to her economic situation and military capabilities. Seeing an opportunity to do an important intelligence job in that field they requested, and after some months of delay obtained, 55 officers and 22 enlisted WAC's for the Perdue-O'Boyle unit.

The job was complicated by language problems. Not only was much of the intelligence material in Japanese, but the pre-war ship lists were a riddle because

the Japanese had an annoying habit of giving the same name to a number of ships (42 ships in one instance) and an equally annoying habit of rendering a single ship name into the kana syllabary in several different ways. Experts in the Japanese language were needed, and there was a great shortage of them. Again applying "Cravath methods", McCormack persuaded Harvard to release Professor Edwin O. Reischauer, its Director of Japanese Studies, and with Reischauer's assistance recruited the best staff of Japanese linguists in Washington.

The intelligence work on the Japanese merchant marine, which later became a joint Army-Navy operation under McCormack's supervision, was slow in getting under way, because of the perpetual difficulty of getting personnel;, but it proved to be exceptionally successful and contributed largely to the effectiveness of the submarine war against Japan. The United States Strategic Bombing Survey found, when they went to Japan after the war, that the information on Japanese shipping that Washington had had during the last year of the war was far more detailed and accurate than anything that could have been put together in Tokyo at the same time. From 1943 to 1945, McCormack was a member of the Joint Army-Navy Assessment Committee, which had the responsibility of determining enemy shipping losses.

The intelligence work on the Japanese merchant marine led into many other important subjects of Japanese intelligence. Techniques established in that work became applicable to other intelligence problems affecting Japan; and the application of those techniques accounted in large measure for the gradually increasing accuracy of American intelligence on the Japanese military and economic situation.

The work led, almost necessarily, into work in the Japanese Order of Battle unit and a group was set up to do that work paralleling the work of the regular Japanese Order of Battle unit of G-2 and dividing the responsibility with it.

The Special Branch reported directly to the A. C. of S. G-2, while the other intelligence units of G-2 were one echelon lower, under the Chief of the Military Intelligence Service. With some exceptions, they were organized on a geographic basis, and the geographical sub-sections had become highly compartmentalized. The Special Branch and the Order of Battle were strictly war products and confined their attention to intelligence that was relevant to the war, and mainly to intelligence of combat significance. The Geographical Branches, on the other hand, had taken their form and acquired their habits in peacetime. They attempted to cover the whole world of intelligence; and their contact with combat intelligence was often rather remote.

In the upper echelons of G-2 there were some able officers, but most of the regular ones knew that their futures depended on their getting assignments in the field, and of those who were willing to remain, because they realized the importance of good intelligence work, many became discouraged and obtained overseas jobs. Their replacements were often men with no better qualifications than that their shoulder insignia fitted the job; and thus from 1942 to 1944 a law of natural

selection worked against G-2 adversely.

The discouragements that made able officers get out of G-2 were numerous. There was a lack of imaginative leadership on the "Colonel" level. There were jealousies and political fights within the organization. There was an undue emphasis on rank and an attitude of unwillingness to give responsibility and credit to subordinates. There was a certain feeling of remoteness from the war. But the greatest discouragement of all was the inability of able officers to get qualified personnel, and in a sufficient number, to do their jobs.

Difficulties in getting personnel were partly due to a lack of recognition of the personnel needs of intelligence, and even a lack of appreciation of the importance of intelligence, on the part of the War Department General Staff; partly to the politically motivated drive to keep the number of officers in Washington to a minimum; partly to the Army's heavy-hand methods of handling personnel and partly to the stupidity of the Civil Service organization.

Though intelligence work requires a higher order of ability, War Department intelligence had practically no personnel priorities until McCormack got some priorities established in 1944. Moreover, intelligence personnel were subject to sweeping orders from above, which came unannounced from above and invariably caused trouble. In one of his early efforts to get civilian personnel, McCormack and his staff had interviewed dozens of people and had selected some 15 or 20 highly qualified ones. These were put through the long process of security clearance and Civil Service approval. Then, just as the clearances and approvals began to come through, a "personnel freeze" for the War Department General Staff was announced. No more persons could be hired until further notice. By the time the freeze was lifted practically all of the candidates (their security having been cleared and their Civil Service status established) had taken jobs with other agencies, and the recruiting of personnel for the vacant jobs had to be started anew.

The civilian agencies of government were hiring personnel at somewhat inflated salary scales, and under war-time conditions highly qualified persons could not be drawn from useful jobs in private life unless they were paid enough of a salary to support their families. But the G-2 salaries were very low. They were paid with one eye on the base pay scale of officers, and officers found it difficult to understand why a competent economist had to be paid $8,000, the base pay of a Brigadier-General. When McCormack went into G-2, the highest paid civilian in the Europe-Africa Branch of G-2 got $3,600 per year as salary. He was the "expert" in German economics; and it was only to be expected that he would be—as he was—unqualified for the job.

The recruiting of officers was very difficult. They had to be of ranks that fitted into a Manning Table. They could not be taken from either combat units or specialized schools. The Army had no OCS for intelligence personnel. Much of the work in McCormack's unit was young men's work, requiring much enthusiasm, long hours, and great physical and mental energy. So he tried to find bright young offi-

cers, and did find some very good ones. Then came an order forbidding the assignment in Washington of any more officers under 28 years of age, and somewhat later an order requiring all officers under 28 to be sent to the field.

Enlisted personnel were not permitted in G-2, except for a number of men who served as guards at night and in similar jobs. To get an enlisted man it was necessary to have him commissioned; and McCormack was able to get that done in a few cases, but it was a difficult and time-consuming job.

The most maddening difficulties came from the Civil Service, which could not understand why the war should interfere with its time-worn procedures. If G-2 wanted to hire an indexer, it was necessary to prove to Civil Service, not only that the candidate was qualified, but that an indexer was really needed. Thus Civil Service examiners, many of whom were incapable of understanding what G-2 was doing or what its problems were, quite often turned down an application on the ground that the work was not necessary.

* * *

Major General George B. Strong, the Assistant Chief of Staff G-2, attempted to give G-2 a vigorous and progressive administration. He encouraged and helped the Special Branch, and he recognized Colonel Lovell's work by creating an Order of Battle Branch with Lovell as Chief and centering in it all work on enemy Order of Battle. He encouraged another Branch of G-2 which proved to be of great value in the war—the Topographic Branch, headed by Colonel S. P. Poole, a geographer from the University of Rochester.

But General Strong was in failing health and was habituated to a system in which an officer must accomplish his results with the personnel given to him—an attitude that prevented him from seeing that what was needed in G-2 was a thorough shaking up. As one junior officer put it, the quickest way to reform G-2 was to kill off all officers above the rank of Major, and to throw in half of the Majors for good measure.

The career of the Special Branch was largely shaped by the deficiencies of G-2, in that it had to take on job after job that G-2 should have been doing but was not doing. McCormack discovered, even before he went into the Army, that G-2 had no biographical files for identification of foreign individuals. He proposed to the G-2 Chief of Intelligence that the latter set up a central name file, in which there would be assembled all information about persons figuring in G-2 intelligence material and for which a group of research workers would gather additional material from biographical sources. After some months, having got no action from G-2, McCormack decided to set up such files himself.

He assigned a very competent woman. . .to do the job and, being unable at first to give her any assistants, gave her instead a call on the free time of stenographers. The unit grew steadily, as it proved the importance of foreign biographical infor-

mation. By 1944 it had become the "Who's Who" branch, with a staff of over 180 persons, headed by Lt. Col. Edward C. Lapping, now Managing Editor of the Chicago Herald-American, and it had become a primary source of information about foreign individuals, serving not only the War Department but all other governmental agencies requiring such information.

McCormack tried to keep the Special Branch a flexible organization, so that, if a job of pressing importance came along, as many of the staff as were needed could be thrown into it. The G-2 organization, on the other hand, was rigidly organized along lines of command, down to the highly compartmentalized geographical "desks", and there was no flow of personnel from one "desk" to another to meet emergencies.

Late in 1943 Colonel Moses W. Pettigrew, Chief of the Far Eastern Branch, whom McCormack considers to be the ablest American intelligence officer on Japanese matters, was working up a Japanese Order of Battle, with the assistance of an able younger officer, Lt. Col. (later Colonel) Eric H. H. Svensson and a woefuly inadequate staff. Colonel Pettigrew had to do most of his work at night, as during the day his time was consumed in the administration of a cumbersome organization, in routine assignments from his superiors, and in a largely fruitless effort to get competent personnel. In spite of the handicaps, Colonel Pettigrew laid the foundations for work on the Japanese Order of Battle and was the Army's leading expert on the Japanese Army. . . .

An experience of Colonel Pettigrew's illustrates the difficulties that the able G-2 officers had to contend with. While he was building up his Order of Battle, a priceless intelligence document was captured and was translated in Australia—a Japanese Army Officer List of comparatively recent date. Here, if the list could be carded and the cards kept up to date with all information coming in about Japanese Army officers, was an extremely useful tool for Order of Battle intelligence. Pettigrew applied for personnel to do the job—two Japanese linguists and 6 typists. The application was turned down. Out of the hundreds of persons in G-2, no one could be spared for Pettigrew's job.

Pettigrew appealed to McCormack, who saw the importance of the job and said he would get it done somehow. . . .

* * *

Early in 1944 the work of the Special Branch had grown and developed to a point where a much larger staff was required to take advantage of the intelligence opportunities that were clearly there. The personnel authorities, however, had set an overall ceiling on G-2 personnel in Washington, and it was ruled that no future additions of personnel for the Special Branch could be made except by transfer of jobs from the rest of G-2. There were so many vested interests in G-2 that the war would be over before any considerable number of persons could be obtained that

way; and so it looked as if many promising opportunities in intelligence opportunities would have to be passed up.

It was Clarke who at that point came to the rescue with a bright idea, as he often did. After all, it was Secretary Stimson who had brought McCormack to Washington and given him a job to do in intelligence. Two years had passed and the Secretary had not yet asked McCormack how he was coming along. It was high time for the Secretary to ask that question, and no doubt he would ask it if he learned that McCormack was in trouble. Clarke was right. The Secretary requested General Strong (who had requested him so to request) to have McCormack prepare a full report. McCormack did so, accompanying it with an urgent application for an increase of officers from 100 to 400 and of civilian personnel from 300 to some 800, plus certain additions to personnel abroad.

The result was appointment of a War Department Board to pass on the application. It consisted of McCloy, the Deputy Chief of Staff (General McNarney) and a number of other general officers.

The Board heard evidence and argument and found that the personnel applied for could be profitably used. It granted the requested increase in the T/O, but it limited the addition of new officers to 100 pending an investigation of the entire G-2 organization, to determine what compensating personnel reductions could be made in other units. An investigation of G-2 by an Inspector General's Board was then ordered, and Clarke and McCormack spent several weeks explaining their organization and plans to the Board members. The Inspector General's investigation resulted in recommendations which summed up to an abolition of the geographical organization of G-2 and the merger of those units and the Order of Battle Branch into the Special Branch.

A new Board was then convened for the purpose of devising a suitable plan for the reorganization of G-2. The plan was adopted on or about April 1, 1944 and a new Assistant Chief of Staff, G-2, Major General Clayton Bissell, was directed to put it into effect.

General Bissell thereupon appointed a Reorganization Committee to translate the plan into specific terms and promptly departed for a trip abroad, directing the Committee to have its recommendations ready on his return. The members of the Committee were either old-line G-2 officers or officers whom General Bissell brought in from the outside, most of them having no experience in intelligence.

The plan of reorganization divided G-2 into a Policy Staff to advise the G-2 on weighty matters and the Military Intelligence Service to do the intelligence work. The Military Intelligence Service was in turn divided into a Director of Administration (to run the service organization), a Director of Information (to take charge of procurement of information and to run a variety of units engaged in that activity) and a Director of Intelligence to do the intelligence work and to provide intelligence for the War Department and the commands abroad.

Under the Director of Intelligence there were to be a group of Area Specialists

without staffs, a Research Unit and a Reports Unit. The bulk of the organization was to be in the Research Unit, which was to be divided into the following Branches: Military, Political, Economic, Sociological, Topographic, Scientific, Who's Who and Library.

The Reorganization Committee was dominated by the old-line prejudice toward the Special Branch and made it a primary objective of their plan to ensure that the Special Branch would be broken up—"and good". The plan distributed its personnel and functions among 53 separate branches, sections and sub-sections, and the literal provisions of the plan would also have destroyed its work. The key position in the new organization was that of Director of Intelligence, and a strenuous attempt was made to find a suitable regular officer for the post.

The attempt was not successful and, largely through the efforts of Clarke, McCormack was appointed to the post. Clarke was appointed Deputy Chief of the Military Intelligence Service. Brigadier General Russ Osman, Regular Army officer, was appointed as Chief. General Osmun, who belonged to the Quartermaster Corps, was replaced some months later by Brig. General Paul E. Peabody, who had returned from service as Military Attache' in London. General Peabody gave Clarke and McCormack the fullest support and did much to help them get their jobs done.

The reorganization was gradually put into effect in June, 1944, and it attained some newspaper fame by reason of the fact that the Sections doing German intelligence were moving their offices, and were without telephone connections, on the day of the Normandy invasion. That was of a piece with the rest of the Reorganization Committee's work. It set up about as impracticable a scheme of organization as could be devised. It apportioned responsibilities among the 3 units under the Director of Intelligence in a manner calculated to render all three useless. It put into key positions a number of officers without a shadow of qualifications. All McCormack's subordinates, down to the Branch Chiefs, were chosen for him and without consultation with him, and the personnel were distributed among the Branches according to the fancies of the Committee.

McCormack tackled his new job with a determination to weed out all misfits and put every job in the hands of a person, officer or civilian, clearly qualified to do it. He started out on the day when he took office by demanding the removal of the Acting Supervisor of Reports, on the ground that he was incompetent and dangerous. With the support of Clarke, and by submitting his resignation in writing, McCormack got the officer removed before he had taken office.

Then followed 4 months of agonizing efforts to make an organization out of the formless thing which the Committee had set up.

* * *

From SRH 141-2. *This excerpt from another McCormack memorandum—again, dealing with personnel—discusses the background of the 1943 British-War Department agreement that at last let the U.S. Army in on the ULTRA secret.*

MEMORANDUM FOR MR. McCLOY (Through GENERAL STRONG):
Subject: Personnel Situation of
Special Branch, M.I.D.

* * *

30. *German "E"*. The most important development affecting the Special Branch, since April, has been the opening up of the German "E" traffic. This has been the No. 1 source of military intelligence during the present war, from early 1940 to date. The achievement of the British in this field has been without question the greatest feat in the history of cryptanalysis, and the preservation and increasingly successful exploitation of this source for three and a half years has been an amazing achievement in security.

31. From the latter part of 1942 until May 1943, a controversy existed between the War Department and the British GC & CS, as a result of the refusal of the British to make this traffic available to the War Department in any way, and their unwillingness to consent to Arlington Hall's entering the "E" field. An agreement between the War Department and the GC & CS was worked out by General Strong in May, pursuant to which this source of intelligence was to be opened up. The agreement called for (a) establishment of an American cryptanalytic unit in England, to work on "E" in cooperation with the British, (b) assignment to Arlington Hall of a research job in the "E" field and (c) opening up of the traffic itself to the War department through liaison officers in England and the Special Branch in Washington.

32. Because of the great risks involved in the dissemination of intelligence from "E" sources, and the necessity of satisfying the British that our security arrangements are adequate—and the necessity also of persuading them to agree to our wishes as to what "E" intelligence should be transmitted to Washington—it took from May to the end of August to work out details of the arrangements with the GC & CS in the "E" field. These call for 4 officers to sit on shifts in the so-called "Watch Room" at B.P., where the material comes in from the cryptanalysts and is emended, translated and disseminated (a) in original form to the Service Ministries by teletype (b) in the form of informational messages to commanders abroad and (c) in memoranda for the Ministries which gather up and present the

information that is not of sufficient importance or urgency to go through channels (a) and (b).

33. In addition, one liaison officer is to sit in the War Office, at the point where "E" intelligence comes from B.P., and is put together with other intelligence into "appreciations" for the War Office and commanders abroad. This officer (who is being taken from another liaison assignment with the War Office) is to advise our liaison officers at B.P. what additional or explanatory material should be sent to Washington.

34. Attention is called to the fact that, under this arrangement, the War Department gets, for the first time, a basis for arriving at an independent judgement on British intelligence from "E" sources, which is the major part of British intelligence about the German Army and Air Force. Heretofore we have depended largely on the inferences and conclusions drawn by the British, and have had no means of checking their basis. We have been in the same position as those organizations and individuals within the British Government who are not "in the know," i.e., the MS information has been either withheld or transmitted to us late, for security reasons; or it has been given in general terms and in round numbers; and often it has been impossible to distinguish between 100% verified information and inferences which, upon examination of the evidence, might turn out to be mere guesses.

35. Under this arrangement we need no longer speculate about how much intelligence the British are giving us from their primary source. We now sit at the source itself and can watch it; or rather, we will be able to watch it when we get the necessary component of officers at B.P.

36. The British Security channel to Washington is used for sending the "E" messages and paraphrases here, and gives us direct and speedy access to the intelligence derived from "E" and related cryptanalytic activities. The nature and importance of this intelligence can be dealt with orally, and specimens of it can be furnished. Because of the unique security problem involved, it is undesirable to deal with them in a memorandum.

37. The above arrangement also gives American officers a part in the determination of what "E" intelligence shall be sent to American field commanders. The dissemination of "E" intelligence to the field is controlled at B.P., where representatives of the 3 Service Ministries decide what their respective commanders should get, and in the past they have decided this for American commanders, without any American representative having a vote. Under the new arrangements our liaison officers at B.P. will be in a position to insist that "E" information that is sent, for example, to General Montgomery is also sent to General Clark, if it might have a bearing on his operations; and if the decision is adverse they can take the matter up through the appropriate channels.

38. We agreed with the British to keep Lt. Col. Taylor's staff for the "E" operation at B.P. to the minimum necessary to do the job; and the British have agreed with us that the minimum is 4 first-class officers at B.P. We now have one officer on duty, and Lt. Col. Taylor is temporarily spending most of his time at the same

work. One other officer has been assigned to the job, and will go as soon as orders and transportation can be obtained for him. Efforts are being made to find 2 others, properly qualified for the job. The liaison officer at the War Office has already been selected and will start working in the near future.

39. Factors bearing on the determination of what reserves of manpower should be built up for the job at B.P. are (a) the desirability of rotating the officers and (b) that, when and if the need arises for American forces on a cross-channel or other operation to have special security officers to handle "E" intelligence for the commanders, they will have to be men trained at B.P. and the Special Branch officers will be likely candidates.

* * *

From SRH 005. *Excerpts from the Military Intelligence Service's European Summary of April 11, 1945 demonstrate the quality of intelligence about German capabilities and intentions that could be derived from ULTRA.*

EUROPEAN SUMMARY OF 11 APRIL 1945

No. 45-101 Copy No._
By Auth.

NOTE: No one, without express permission from the proper authorities, may disseminate the information reported in this Summary or communicate it to any other person.

Those authorized to disseminate such information must employ only the most secure means, must take every precaution to avoid compromising the source, and must limit dissemination to the minimum number of secure and responsible persons who need the information in order to discharge their duties.

No action is to be taken on information herein reported, regardless of temporary advantage, if such action might have the effect of revealing the existence of the source to the enemy.

The enemy knows that we attempt to exploit these sources. He does not know, and must not be permitted to learn, either the degree of our success or the particular sources with which we have been successful.

1. *Western Front*:

a. *Reorganization of Armed Forces chain of command*: An order issued by Hitler late on 7 April made sweeping changes in the organization of the chain of command in the West. Operational control of the Front is now divided between C-in-C West and "C-in-C Northwest," command of the forces in the Ruhr pocket is separated under Army Group "B," and those HQs, plus Naval Chief Command West, are subordinated directly to the OKW. In addition, a new command, "C-in-C

Netherlands," has been set up in preparation for "the defense of Fortress Holland."

Hitler's order prescribed the boundary between C-in-Cs West and Northwest as a line running eastward from Paderborn to Schoenebeck (7 m. SE of Magdeburg).

Details of the reorganization directed by the order are in substance as follows:

(1) *Subordinated directly to the OKW*

(a) "C-in-C Northwest (Army Group 'H')"

(b) Army Group "B"

(c) C-in-C West

(d) Naval Chief Command West

(2) *Subordinated to C-in-C Northwest*:

(a) "The former sphere of command of Operations Staff North Coast," the staff of which is made available to C-in-C Northwest.

(b) "C-in-C Netherlands, to whom the Twenty-fifth Army, Commander Armed Forces Netherlands, Admiral Netherlands, and GAF forces in Holland are subordinated." C-in-C Netherlands "is personally responsible to Hitler for the defense of Fortress Holland; as soon as land communications to the Reich are cut, the (previously announced) comprehensive regulations regarding Fortresses will govern his relations with the Reich Commissar for Occupied Areas of the Netherlands."

(c) Armeegruppe Student

(d) First Parachute Army

(e) Wehrkreis XI

(3) Subordinated to C-in-C West:

(a) Army Group "G" (with the First and Seventh Armies)

(b) Eleventh Army

(c) Nineteenth Army

(d) Wehrkreise V, VII, IX, and XIII.

(4) Subordinated to Army Group "B":

(a) Fifth Panzer Army

(b) "Fifteenth Army (Armee Abt. von Luettwitz)"

(c) All other units and personnel of all branches of the Armed Forces in the Army Group area (Ruhr pocket).

(5) GAF tactical forces: The organization of GAF tactical forces employed in the West is to conform to the organization of the field army. A GAF command staff is to be linked with each of the ground commands (presumably Luftflotte Reich in the north and GAF Command West in the south. . .).In addition, all flying and Flak units supporting the field army are to be subordinated operationally to C-in-Cs Northwest and West respectively.

GAF support of Army Group "B" will be arranged specially. b. Location of HQs following the command reorganization:

(1) C-in-C West moves southeast: On 28 March the HQ of C-in-C West was in a tunnel at Milseburg, 10 m. E of Fulda. . . .The next day Genobst. Jodl,

Chief of the OKW Operations Staff, stated that the area west of Ohrdruf (9 m. S of Gotha) was envisaged as an HQ location for C-in-C West "in case of need". . . .On 10 April, the following message was sent by an unidentified authority:

"As of 0800 hrs on the 10th, the temporary battle HQ of C-in-C West is in Hirschau (40 m. E of Nuernberg and about 100 m. SSE of Ohrdruf). The final battle HQ (special train D) will be reported later."

* * *

c. *Possible new commanders*: Hitler's order of the 7th did not identify the incumbents of the newly created posts, but slight suggestions are afforded by the language of the order and subsequent messages. Although Blaskowitz has been C-in-C Army Group "H" since February, the move of his HQ to western Holland seems inconsistent with his assumption of the command into which that Army Group has been merged, and is rather an indication that he may be the new "C-in-C Netherlands."

Genfldm. Busch, who has been CG Operations Staff North Coast, is a likely incumbent for "C-in-C Northwest." Hitler's order specified that this high command was to have subordinated to it "the former sphere of command of Operations Staff North Coast," and on 8 April C-in-C West addressed to "C-in-C Northwest, via Operations Staff North Coast" an inquiry as to when command over Army Group "H," including Armeegruppe Student and Wehrkreis XI, "can be taken over."

It is assumed that Genfldm. Kesselring continues as C-in-C West, Genfldm. Model as C-in-C Army Group "B" and Admiral Krancke as Naval Chief Command West.

d. *Harz sector*:

(1) *Appearance of a new Army*: On 9 April C-in-C West stated:

"Hitler has ordered the Harz (Massif) as the assembly area for the Twelfth Army. The foremost division of the Twelfth Army is the 85th Inf Div. . . .(portion missing). . . .Any intervention by C-in-C West, the Eleventh Army, or other staffs, is expressly forbidden. . . ."

Note: The new Army is to assemble in the region which
Wehrkreise IX and XI have been ordered to prepare for defense. . . .

On 2 April Hitler stated that six divisions "being set up" were to assemble in the area Hannover - Northeim - Brunswick —which is just northeast of the Harz and which is now being overrun by the Allies. That order said that "the later tasks of this Army will be ordered at the proper time". . . .

On 26 March the cadre personnel of the 85th Inf Div, which is being set up anew inside Germany, were ordered to move from a troop training ground north of Wuerzburg to one just west of Berlin.

(2) *Units to be refitted on the edge of the battle zone*:

(a) Also on 9 April, C-in-C West subordinated the 394th Assault

Gun Bde, which was assembling just north of the Harz Massif, to the Eleventh Army. The order stated that the Bde was to be rested and refitted, and that guns were to be provided as quickly as possible. Until its "operational capacity" was restored, the Bde was, "within the scope of the Harz defense, to take over defensive and blocking tasks in its rest and refitting area."

(b) On the same day (the 9th) C-in-C West ordered that a battle group of the 9th Pz Div to be transferred to the area of Sangerhausen (20 m. E of Nordhausen) for "further rest and refitting." While there, the battle group was also to "prepare for defense, take part in constructing blocking positions, and operate if the Allies attack."

(3) *Kesselring order to the Eleventh Army on 7 April*:

"(i) In order to gain time, the Eleventh Army, using no more forces than are necessary, must fight a battle of bitter delaying resistance on its western front, the rear of which rests on the Harz Massif and the mountainous country to the west. This gain of time will serve to make the strong sectors behind the Army's front capable of defense and to develop the Harz Massif into a blocking Schwerpunkt of the first order.

"(ii) It is of utmost importance for the Army, with all speed, to shift to its southern wing the forces which are to be economized on its front facing west. Then, driving toward Langelsalza and Gotha (respectively 10 and 20 m. SE of Muehlhausen), those forces can fall on the Allied flank with adequate striking power.

"(iii) At the same time it is most important to take immediate countermeasures to forestall the possibility of the Army's western front being rolled up from the north and south. This means that, on the north, all roads and tracks in the area Gronau - Alfeld and to the west (i.e., an area about 20 m. S of Hannover) must be rendered impassable with adequate defense; and, on the south, the Allies, as they feel their way northward from Muehlhausen, must be attacked on the flanks. Here the Eleventh Army's conduct of operations must be adjusted to the utmost mobility and flexibility.

"(iv) The area Nordhausen - Sonderhausen- Kelbra - Schmuecke Depression ((i.e., east and northeast of Muehlhausen)) must be turned into a firm defensive block. Farther west, local strongpoints such as Uslar, Hardegsen, Northeim, Adelebsen, Harste, Goettingen, Dransfeld and Witzenhausen ((all northeast and east of Kassel)) must be so strongly developed and adequately manned that they will hold firm under efficient Officers Commanding Local Operations. Because of the Allies' well known by-passing tactics, the flanks of these places must be covered and adequately protected. Covering forces in effective strength, with patrols out to the sides to prevent surprises, must be in position at least 1 1/2 kilometers in front of blocking sectors. The Allies must be brought to a dead stop in this system of blocks."

Note: By 10 April Allied troops had overrun the Gronau - Alfeld area and the local strongpoints above Kassel, thus rolling up the western front of the Eleventh Army from both the north and the south.

CHAPTER VII

Disseminating the Product

The twin breakthroughs achieved by the Army in the field of signals intelligence in mid-1943—making an entry into Japanese military traffic and reaching an agreement with Bletchley Park to share the British COMINT take from German sources—made it possible for the first time to provide American field commanders with immediate intelligence of operational use. This posed a major problem. How could this ultra-sensitive intelligence be disseminated in a timely fashion without risking compromise of the source which would undo the whole effort. The U.S. Army came up with the solution of adopting British security regulations and creating a Special Security Officer system under Special Branch to handle distribution of signals intelligence to the field. Specially picked and trained officers, operating under War Department control and utilizing a special communications system, would serve as the conduits for high-grade COMINT—ULTRA, as it was now called. These officers would act both as security watchdogs and as guides to properly interpreting the material.

In SRH 026, Marshall Letter to Eisenhower, the Army Chief of Staff explains the new security system to the Commander, European Theater of Operations. SRH 033, History of Operations of the Special Security Officers, provides a general overview. Excerpts from SRH 031, Trip Reports - ULTRA in the Mediterranean; SRH 022, ULTRA and the Seventh U.S. Army; and SRH 032, ULTRA in the Southwest Pacific Area, contain reports from individual Special Security Officers on conditions in the field.

From SRH 026. *As a result of the agreement between the British and the War Department to share cryptologic intelligence, "Ultra" material could be sent to American field commanders under strict security provisions. In this letter, Army Chief of Staff George C. Marshall explains the arrangements to his principal subordinate in Europe, General Dwight D. Eisenhower. The security regulations of April 1944 to which Marshall refers introduced the TOP SECRET classification to the U. S. Army for the first time.*

WAR DEPARTMENT
THE CHIEF OF STAFF
Washington, D. C.

March 15, 1944

Dear Eisenhower:

You are undoubtedly aware of the supreme importance which the War Department attaches to intelligence known as "Ultra." This intelligence is secured by the British from reading German enciphered radio communications.

The attached Tab sets forth the basis upon which German "Ultra" intelligence is made available to American field commands. Please give this matter your personal attention, and take all necessary steps to insure that the security regulations governing the dissemination of "Ultra" intelligence are meticulously observed. The arrangements described in the attached Tab are to be fully carried out.

Faithfully yours,
/s/ G.C. MARSHALL

General D.D. Eisenhower,
Supreme Headquarters,
Allied Expeditionary Force,
London, England.

1. A large volume of highly important military and air intelligence is derived by the British from reading German radio communications enciphered in high-level German cipher systems. This type of intelligence is known as "Ultra" intelligence.

2. The basis upon which German Ultra intelligence is made available by the British to the US War Department and to American Field Commands in active theaters is governed by an agreement made in June 1943 between the US War Department and the responsible British organization.

3. The British organization which produces Ultra intelligence is the Government Code and Cipher School, the Director General of which is Brigadier Sir Stewart Menzies.

4. Administration of the agreement of June 1943 is controlled by the British [text withheld] through Brigadier Menzies, and by the US War Department through the A. C. of S., G-2.

5. To carry out the agreement of June 1943, and to assist in and supervise the dissemination of Ultra intelligence to American Commands in the European Theater, a detachment of MID, the title of which is MID, War Department, London, has been detailed for service in the European Theater. This detachment is under the direct control of the A. C. of S., G-2, and the Commanding Officer of the detachment is the representative of the A. C. of S., G-2, on all matters relating to or affecting Ultra intelligence in the European Theater.

6. Security regulations governing the dissemination and handling of Ultra intelligence within the European and Mediterranean Theaters have been approved by the US War Department [text withheld] and will become effective on 1 April 1944.

7. Under the agreement of June 1943 and the security regulations of 1 April 1944, the basis of disseminating Ultra intelligence to American Commands in the European Theater is as follows:

a. Ultra intelligence produced by G.C. & C.S. (including the component of the US Signal Corps at G.C. & C.S.) is disseminated to Field Commands only by means of special communications channels established and controlled by the Director General, G.C. & C.S.

b. Communications between Field Commands which discuss or mention Ultra intelligence must be passed only over the above special communication channels.

c. American officers participate at G.C. & C.S. in the selection of Ultra intelligence for dissemination to the Field Commands and in the preparation of the messages in which the Ultra intelligence is so disseminated. These officers are attached to MID, War Department, London.

d. The receipt and distribution, at the Field Commands, of messages containing or relating to Ultra intelligence, is handled by Special Liaison Units furnished and controlled by the Director General, G.C. & C.S. The personnel of these units includes American officers attached to MID, War Department, London.

e. The Special Liaison Units distribute Ultra intelligence messages only to officers at the Field Commands who are listed as entitled to receive Ultra intelligence. The eligibility of officers for listing as authorized Ultra intelligence recipients is governed by the security regulations of 1 April 1944. The Director General, G.C. & C.S., and the Commanding Officer of MID, War Department, London, administer the provisions of the agreement relating to admission of American officers in your theater to the list.

f. One or more American officers assigned to MID, War Department, London, will be detailed to each American Field Command, which receives

Ultra intelligence. These officers will be subject to the administration and discipline of the Command to which they are detailed. They will work under the control of the G-2 or A-2 of the Command as part of his staff. They will have had a period of training at G.C. & C.S., and, if possible, with operational commands in the Mediterranean Theater, and this training will be directed toward equipping them to use Ultra intelligence effectively and securely. Their primary responsibility will be to evaluate Ultra intelligence, present it in useable form to the Commanding Officer and to such of his senior staff officers as are authorized Ultra recipients, assist in fusing Ultra intelligence with intelligence derived from other sources, and give advice in connection with making operational use of Ultra intelligence in such fashion that the security of the source is not endangered. If at any time the flow of Ultra intelligence is not sufficient to occupy fully the time of these officers, they may be used for other related intelligence assignments.

8. The Commanding Officer and the G-2's and A-2's of all American Field Commands in your theater, which receive Ultra intelligence, will take all steps necessary to insure that the requirements of this letter and of the security regulations of 1 April 1944, are fully carried out. In order to safeguard the continued availability of this enormously important source of intelligence, it is vital that these security regulations be meticulously observed, and that all personnel entitled to handle or receive Ultra intelligence take all possible precautions in connection with its handling and use. When operational action is taken on the basis of Ultra intelligence, the utmost care must be taken, by means of proper cover, to insure that the action does not reveal or in any way suggest that this source of intelligence is at our disposal.

9. It is of particular importance that:

a.Ultra intelligence be transmitted to the Field Commands only by those special channels mentioned in paragraphs 7a and b above, and that communications discussing or mentioning Ultra intelligence be transmitted only by those channels.

b.Ultra intelligence be discussed orally only with personnel of the field commands who are listed as authorized recipients of Ultra intelligence; and

c. Full facilities and opportunity be extended to the MID, War Department, London, officers detailed to Field Commands in order to enable them to perform their duties fully and effectively. The Commanding Officer, MID, War Department, London, and his principal assistants, will visit the Field Commands as occasion requires to consult with the G-2's or A-2's on methods of handling or using Ultra intelligence and on the scope and method of servicing Ultra intelligence from G.C. & C.S. to the field commands.

10. The contents of this letter will be communicated to the Commanding Officers and G-2's or A-2's of all American Field Commands in your theater which receive Ultra intelligence.

From SRH 033. *This document was prepared in 1945 as an introduction to the numerous individual activity reports prepared by Special Security Officers and Special Security Representatives assigned to the various theaters. Selected reports are reproduced later in this chapter.*

HISTORY OF THE OPERATIONS OF SPECIAL SECURITY OFFICERS ATTACHED TO FIELD COMMANDS 1943 - 1945

1. The Special Security Officer (SSO) system was organized for the purpose of providing a means of rapid and secure dissemination of Ultra intelligence to operating commands. The system was developed and put into operation by the old Special Branch, MID. At the time of the June 1944 reorganization of the Military Intelligence Service the functions of administering the SSO system were transferred to the new Special Branch, although certain of the dissemination functions were retained by the Director of Intelligence, MIS. Moreover, all policy problems were retained under the direct control of the Deputy Chief, MIS. This division of authority did not prove wholly satisfactory. In February 1945 complete responsibility for the administration of the SSO system was vested in the office of the Deputy Chief, MIS, where it still remains.

2. This history is concerned with the development of the SSO system as a whole and will cover the entire period of its operation regardless of the place in the MIS organization where the functions may have been located. Because each theater of operation presented different problems, it was necessary to place a large measure of responsibility in the senior SSO in each theater (eventually his title was changed to Special Security Representative, abbreviated as SSR) for the supply of Ultra to commands operating in his area. A history of the operations within each theater is therefore of much greater value in attempting to evaluate the merits of the system. For this reason detailed histories by theater have been prepared and are attached hereto. The purpose of this introductory statement is to describe the steps which led up to the organization of the system and the manner in which the "home office" was operated in support of the separate theater organizations.

3. The need for the field dissemination of Ultra did not become acute until 1943. Arlington Hall did not make its first entry into mainline Japanese military systems until March of that year, and it was not until the fall of 1943 that any worthwhile intelligence of an operational nature was being produced from these military systems. High level diplomatic traffic had been available since 1941 but its value was strategic in nature and very seldom did anything of immediate tactical importance develop from this source. There were in existence during the period from 1941 to 1943 certain special channels of communication by means of which Ultra intelligence could be made available to various field commands. The Navy

had a direct Ultra channel to CINCPAC at Pearl Harbor, with an extension to the Commander, Seventh Fleet in Brisbane. General MacArthur had his own cryptanalytic organization, Central Bureau Brisbane, which had special channels of communication to Signal Security Agency (Arlington Hall) [text withheld] There was no direct intelligence channel for Ultra from the Military Intelligence Service to any of these commands.

4. German military Ultra in great volume and of the highest operational significance was being produced by GCCS in London. The results were disseminated over a special Ultra intelligence channel maintained by British Special Liaison Units (known as the SLU organization). Throughout the North African campaign the SLU organization served key American officers with this intelligence in accord with British security practices. The Military Intelligence Service did not participate in this service, and as a matter of fact, was not completely aware of its existence until the summer of 1943. German military Ultra was never produced by Arlington Hall, the primary reason being that it was not possible to intercept German military traffic on the North American Continent.

5. The first steps taken to unify the method of field dissemination of Ultra and to insure that all Ultra intelligence was made available to the appropriate operational commands, was to come to an understanding with the British. In the spring of 1943 an agreement was entered into between G-2 and [text withheld] London [text withheld] providing for complete cooperation in the Ultra intelligence field. By the terms of this agreement, the British assumed primary responsibility for the production and exploitation of German military Ultra, and the United States Army agreed to devote its attention to the production and exploitation of Japanese military Ultra. Full exchange of the products of each service was provided, and the principle was established that each service, in cooperation with the other, would establish methods of dissemination to its own operational commands. [text withheld] The subject need not to be further discussed here other than to say that the British SLU organization [text withheld] was the pattern upon which the SSO system was developed for dissemination of Ultra to Pacific commands.

6. The German problem having been solved in principle, attention was then directed to providing a system for the Pacific. The peculiar nature of Ultra intelligence required a system of dissemination which, in some respects, was contrary to established principles of command responsibility. The high level Japanese military cryptographic systems were of such difficulty that only a tremendous organization equipped with expensive and bulky electrical tabulating machinery could produce any results. Consequently, detailed items of immediate tactical significance to an Army commander in the field could be read at Arlington Hall, but could not be produced by an agency located in the theater and near the Army commander interested. Therefore "combat intelligence" was being produced in Washington, some 15,000 miles away from the front lines. To forward this intelligence through normal command channels of communication and through every intermediate G-2

between the War Department General Staff and the combat commander concerned would delay its receipt and, in many cases, the particular message would lose all value by the time the commander finally received it. More important were the security considerations involved. Experience in World War I and the experience of the British in World War II had proved that wide dissemination of Ultra very often led to a compromise and complete loss of the source. The business of cracking codes is movie thriller stuff and the natural reaction of an uninitiated person is to make some comment about it to other responsible officers who would normally be supposed to be in on the secret. Careless talk by one uninformed person to another soon results in the "secret" being public information. To avoid these dangers, the British had adopted several rules of dissemination which had proved highly successful in maintaining the necessary security. They were:

a. Ultra was never to be made available to anyone, from a commanding general down to the code clerk who sent the message, without first explaining to the recipient the security questions involved, and how even the most innocent comment might lead to loss of the entire source;

b. Ultra would be disseminated only via special communication channels which would be used solely for that purpose.

This would prevent a casual knowledge of Ultra on the part of personnel employed in communication centers, and would also enable complete control of dissemination within the theater of any messages transmitted over this channel;

c. The special dissemination channels would be maintained by officers and enlisted men from a central organization and would be furnished only to commands which had actual need of Ultra intelligence. The local commander would therefore not have the authority to over-rule this personnel on any matters involving security.

d. Strict rules for the dissemination within the command, limiting the number of officers authorized to see the intelligence, and the uses which could be made of it, would be prescribed by the central organization.

7. The Pacific field dissemination system was devised in the summer of 1943 on the basis of the principles outlined above. It was decided to designate the officers who would maintain the special channels as Special Security Officers (SSO's). SSO's were to be assigned to the Military Intelligence Service and remain under the operational control of the A. C. of S., G-2, WDGS. They would be attached to the theater commander for purposes of administration and discipline and would disseminate Ultra in accord with rules announced in security regulations issued by the War Department. Authority was obtained from the Chief of Staff in the summer of 1943 to consult the theater commanders in the Pacific and to obtain their concurrence with this plan. The commanding generals of the Pacific Ocean Areas and the China-Burma-India (CBI) Theater readily concurred, but the Commander in Chief, Southwest Pacific Area, raised certain objections to the proposal on the ground that the SSO should be assigned outright to his command rather than

remain under the control of the War Department. Col. Carter W. Clarke, then Chief of Special Branch, was sent to Brisbane to confer personally with CINC, SWPA on this difference of opinion. As a result of this conference, General MacArthur concurred in the original plan.

8. The first War Department security regulations governing overseas dissemination of signal intelligence were issued in October 1943. Following the British practice, two classifications were established: ULTRA DEXTER and DEXTER. Subsequently these terms were increased to three, as follows: ULTRA [text withheld] PEARL [text withheld] THUMB [text withheld]....The regulations governing Pearl and Thumb were subsequently revised, in conjunction with the Navy, and the single code word PINUP was adopted for all low level signal intelligence.

9. The original Ultra Dexter regulations were implemented in the fall of 1943, when special security officers were sent to the following theater headquarters: Southwest Pacific Area, Brisbane (Major James Ashby, Jr.); China-Burma-India, New Delhi (Captain John F.B. Runnalls); Pacific Ocean Area, Fort Shafter, T.H. (Major Edwin E. Huddleson, Jr.). The original plan was to limit overseas dissemination of Ultra to theater headquarters and to await recommendations from the special security officers before making provision for broader dissemination. It will be recalled that the operational situation in all three theaters in late 1943 and the first half of 1944 was not such as to require dissemination to subordinate operational commands. Accordingly, all three special security officers undertook to serve the respective theater commanders and their staffs. To accomplish this each officer carried with him his own set of cryptographic equipment (SIGABA) for the enciphering and deciphering of Ultra messages. Special arrangements were set up to provide pouch service as well, and such material as the Diplomatic Summary was sent regularly by special Top Secret pouch. It should be noted that both radio and pouch communications were sent to the special security officer personally. Thus he received radio communications in enciphered form and did the actual deciphering himself. He was therefore the only person to see such messages in the clear, and showed it personally to the theater commander and other specified staff officers. At no point did the contents leave the control of the special security officer. Pouch material was delivered to him unopened, and he thereupon showed relevant material to appropriate headquarters officers, retaining actual custody of it himself. This system proved both secure and efficient. Except for certain considerations peculiar to SWPA [text withheld] the special security system won the approval and confidence of theater officers concerned.

10. Meanwhile, preparations were underway for the establishment of a special security system to serve in ETO in connection with the expected invasion of the spring of 1944. A larger number of officers were recruited and sent to the ETO for training. . . .Accordingly there arose the need of a Table of Organization which would provide vacancies for enough special security officers to fill the needs of both the European and Japanese wars. In December 1943 a staff study was pre-

pared which described the special security requirements and stated the estimated personnel needs. Approval was thereupon given by the Adjutant General for a field quota of 80 officers. In July 1944 this quota was enlarged to 172 officers and 65 enlisted men, a total which proved sufficient for the duration of the war.

11. In the spring of 1944 sufficient information had become available, based on recommendations of special security officers and upon projected operational plans insofar as they were available to MIS, to permit a decision as to the extent to which Ultra should be disseminated below the level of theater headquarters. Accordingly, the regulations were rewritten (10 July 1944) to allow dissemination to the level of Army (or equivalent Air Force Formations) and to Corps level when the Corps was operating independently. In April and May of 1944, by way of preparation for the revised Ultra program, officers were recruited for SSO duty in the Pacific and Far East. The first group, numbering about 20, began a training period on 3 July 1944 and were sent overseas about 1 September 1944. This group included a full complement for CBI and a group of officers for SWPA. The training course consisted of a week's tour of ASA, two weeks' training in the specific duties of the special security officer (study of regulations; lectures by returning officers familiar with the theater concerned; consultation with relevant sections of OPD; cryptographic security; communications, etc.) and from four to six weeks straight intelligence training, which included the Far Eastern Intelligence Course and selected reading of Ultra materials; where possible the officers spent from one to four weeks actually working on Ultra traffic as members of the various Ultra sections of MIS. The value of this latter aspect of training cannot be over emphasized. This first group which went overseas have all testified to the importance of an adequate intelligence background. By and large, this group was well trained, but as the operational situation grew more active it became necessary to send additional special security officers on very short notice. In many cases such officers had to be dispatched with very little training or background in Ultra. If there were one lesson to be learned from experience in connection with the SSO program in the Far East, it is this: a large potential pool of security officers should be recruited early—as early as possible and long before they will actually be needed overseas. They should function as working members of MIS—this is the very best type of training—and be available for overseas assignment as the need arises. The greatest single handicap in the past administration of the SSO system was the lack of adequately trained personnel to meet the suddenly increasing needs of the Pacific war. While it can be said that the program was carried out efficiently in the face of numerous obstacles, and that the sudden expansion in SSO requirements could not have been anticipated, the ultimate results could have been more satisfactory if we had had too many qualified personnel available rather than too few. Admitting that it is always difficult to obtain as many highly qualified officers as one would like, this phase of the problem should be given particular and immediate attention in the event that the need for an SSO organization should ever arise again.

12. The manner in which the SSO program was carried out in the respective theaters is fully explained in the individual histories.It remains only to discuss briefly the functioning of the home office. Before the G-2 reorganization of June 1944, the administration of the overseas dissemination was handled by two officers in Special Branch. After the reorganization, when the SSO field quota expanded from 3 to some 65 officers in the Pacific and Far East, the administration was made the responsibility of the newly constituted Special Branch. A total of three officers were actually engaged in the administrative phase of the SSO program. These officers were concerned with the following aspects of the SSO program: recruiting and training of SSO's; review and revision of Ultra, Pearl, and Thumb regulations; handling of all administrative correspondence, by radio and pouch, between MIS and SSO's overseas; liaison with interested sections of the intelligence group in connection with intelligence requests from SSO's; coordination, where necessary, with ASA, OPD, OCS, the Navy, and with various other organizations of the War Department; all personnel problems, including promotions, travel orders, security clearances for both officers and enlisted men; a myriad of miscellaneous matters which cannot be conveniently catalogued but which arise in any unit of the size and scope of the SSO organization. While it is a matter of record that there was no serious breach of security throughout the war, and while theater officers have uniformly testified to the quality of the service they received, it is submitted that a larger home office, more fully staffed both with officers and civilians, would be desirable "next time."

13. In January 1945 the functions of Special Branch were transferred to the Office of the Chief, MIS and placed under the direct supervision of the Deputy Chief. Inasmuch as the Special Branch program was under the direction of the Deputy Chief from the outset, this transfer proved more satisfactory, since it eliminated an extra step in the chain of command and simplified the matter of coordination with the Director of Intelligence, a major part of the Special Branch job. Again the duties were performed by three officers, although this number was increased to five during the summer of 1945. There were no substantial changes in procedures as a result of the above mentioned transfer.

14. Apart from personnel, the most important single factor in the efficient and secure operation of the SSO system, was the special communications channel, which worked magnificently and proved eminently satisfactory throughout the war.

From SRH 031. *In preparation for a future assignment as a Special Security Officer, an Air Corps lieutenant colonel went to the Mediterranean Theater of Operations to observe how the British had organized the distribution of Ultra material in that area. It should be remembered that Special Branch serviced air commanders as well as the ground Army. MAAF refers to Mediterranean Allied Air Forces; in today's military parlance, it was a combined service operation rather than a joint one.*

24 June 1944

SUBJECT: Report on Mediterranean Trip.
TO: Commanding Officer, MIS, WD, London.
FROM: Lt. Col. Leslie L. Rood, A.C.

1. This is a report on my visit to the Mediterranean Theater of Operations in June 1944, to observe the use of air special intelligence. Because the London office is already familiar with the general functioning of the Mediterranean organization this report is only of a supplementary nature.

2. Mediterranean Allied Air Forces, a joint British-American Command, is the supreme air headquarters of the Mediterranean Theater. It has a rear headquarters at Algiers and an advanced headquarters at Caserta. Under it are Strategic Air Force Tactical Air Force, and Coastal Command.

The Strategic Air Force is an almost wholly American Unit, the 15th Air Force, operating from Bari. They have one British group of Wellingtons for night bombing. The 15th is an operational command in that it plans and directs missions.

Tactical Air Force at Caserta, on the other hand, is a British-American Command that is not operational. It has under it (1) the 12th Tactical Air Command (American) which gives close support (fighter bombers) to the 5th Army, (2) Desert Air Force (British) which gives close support to the 8th Army, and (3) two wings, one of medium bombers and one of fighters, which operate at a greater distance behind the enemy lines.

Coastal Command, with defensive, convoy and coastal missions, is spread out over the whole Mediterranean. Tactical and Strategic are in Italy.

3. I departed from London on the evening of 26 May 1944 by sleeping car and arrived in Newquay, Cornwall, the next morning. I should have taken off from St. Mawgans that night, but due to engine trouble did not get off until the fourth night. The plane arrived at Casablanca the next morning and by evening I was in Algiers.

I spent three days with MAAF (rear) and took off for Caserta on 4 June. For the succeeding three days I was there with MAAF (adv.) and TAF. On 8 June I went to Bari by courier plane to spend three days with the 15th Air Force and 276th Wing. Returning to Caserta on the 11th I was unable to go forward to 12th

TAC at Rome until the 14th because they were disorganized by the rapid advance. When I did reach Rome I was able to stay with them for only two days because they again split into three echelons and moved on.

On the evening of the 17th I left Rome; on the morning of the 18th I left Caserta; the next morning I departed from Algiers; after a delay of one day in Casablanca I took off for the U.K. and was in London on the evening of 21 June 1944.

4. The two MAAF special intelligence sections operate like miniature Air Ministries. At each headquarters the four or five officers processing the material are segregated in an out-of-the-way room where they do their work. Each officer has a specialty such as order of battle, "Y," supplies, Balkans, or targets and as the expert on that subject, he writes part of the daily digest which is prepared for the generals. The senior officer of the group usually carries the digest around, so that he can answer any questions which arise. They write very few appreciations, nor do they have any direct connections with operations. Their prime purpose is to be completely familiar with the material so that they can interpret it to their operational people. Secondarily, they compile a weekly order of battle which is published at several levels. MAAF (rear) also sends out a weekly supply summary at the highest level.

5. The 15th Air Force at Bari impressed me as a very smoothly functioning organization and its "A-2 Liaison Officer," Major Murphy, as an able part of it. Each morning the staff meets with the A-3 (acting as the operational chief of staff) to plan the missions for the subsequent day. First the weather officer delimits the possible areas of operation by his forecast; the A-2 names the targets having priority in that area; the damage analysis officer advises the A-3 to what extent the suggested targets have already been destroyed. Attention then being officially centered on several targets (the staff had already informally decided on these and spread the proper target charts before the meeting) the flak officer is called upon for the number of minutes the ships will be in flak if approaches are made from certain angles.Major Murphy is then called upon for an estimate of where, how many, and what kind of enemy planes will be encountered. Along with the weather officer he stakes his reputation daily since both of their predictions are checked by the next evening.

After quite a succession of direct questions by the A-3 and unequivocal answers by the staff, the A-3 fluently dictates a complete operations order. Each officer copies down the part pertaining to his responsibility and during the early afternoon submits the written annex to the finished order which is placed before the Commanding General for his approval.

Because of his daily forecast, Major Murphy is known to most people as the order of battle expert but even more important is his servicing of senior officers with special intelligence. He separates from the general material that which might interest the senior officers, annotates it with brief notes when necessary, and then

shows them the annotated material. He often has to do some verbal explaining and elaborating but he writes no digest.

There was a time when special intelligence was important at Bari for its order of battle information, but now when the GAF puts up a maximum of 150 planes to protect the most important targets and none for lesser targets, raids are naturally planned with little regard for the possible opposition.

The most valuable material, therefore, is that pertaining to targets, e.g. that a bridge was destroyed, that shipping on the Danube has been stopped or that damage to refineries has caused a gasoline shortage. Operations people take a very keen interest in anything which gives a clear cut statement of the damage done by their bombers the day before. With the increase in blind bombing this is even more true.

Most of the intelligence at the 15th Air Force consists of target work, i.e. photography, collating of agents reports and economic studies of objectives, and bomb damage analysis. There is a large target section staff at MAAF (adv.) which serves the 15th Air Force almost exclusively by preparing target charts and 15th Air Force also has a large target section which selects objectives and analyzes bomb damage. Since no one in the target section at Bari has special intelligence, Murphy helps them with his superior wisdom quite frequently.

In attempting to summarize for me what special intelligence supplied to the whole intelligence organization at Bari, Murphy said that its primary contribution was a "negative influence." Most of the information Murphy gets from special intelligence is also procured from photos, PW's, pilots' reports, and "Y," but in them the good is mixed with the bad. Special intelligence tells Murphy and his superiors what not to rely on. Rarely does he get anything of pure operational value, something which causes him to rush into A-3 demanding that a mission be layed on.

6. TAF's functions are difficult to understand because of its intermediate role below the policy level of MAAF and yet above the target selection level of TAC and DAF. Its role is further complicated by its being an operational headquarters over its medium bomb wing but a non-operational headquarters over its close support commands.

It is primarily a coordinating command. Its greatest interest during my visit was in the progress of its campaign to choke off all supplies to the battle area. Special intelligence provided very good material on this subject.

The segregation of special intelligence is not very noticeable here because only the chief intelligence officer, W/C Wiseman, and his assistant, Captain Austin, have it. Their knowledge is used through attendance at all planning conferences, some of which are at the highest level. They show selected material to the senior officers and do not write a digest.

7. Discovering how Major Corning, at 12th Tactical Air Force, uses special intelligence was not easy. He keeps no records that one can analyze. He is the A-2

and the only person doing pure intelligence work so special intelligence is not neatly segregated for the visitor's examination. Corning operates out of his shirt pocket, merges all sources in his mind, and is not given to pat statements about what part of his total knowledge is supplied by special intelligence.

12th TAC, in supporting the 5th Army is meeting absolutely no enemy planes so naturally order of battle is forgotten. Likewise, the occasional damage reports on specific targets are of doubtful use because TAC attacks vast numbers of small targets each day such as motor transport, bridges, railway cuts and dumps.

What is important is that special intelligence shows TAC very clearly that its primary mission, cutting the lines of communication and supply, has been successfully accomplished. The German inability to defend has been caused to a great extent by the lack of supplies.

In the fast moving situation prevailing during my visit special intelligence indications of where the enemy might make a stand was also of great value to TAC in deciding where to establish its airfields as it advanced.

TAC's intelligence set up is very simple. The broad plans of attack are made by Army; the target section is run by the Army and all TAC gets is a set of photos and a request for missions; there is no air order of battle; almost all the special intelligence coming through during my visit concerned the Army and was only of incidental interest to the A-2. The A-2 does the pure intelligence work and his eight subordinates are primarily engaged in compiling operations summaries, an A-3 job.

8. My visit to the 276th Wing was valuable chiefly because I saw a complete "Y" organization operating under one roof. This organization functioning without the complicated refinements of Block F, was "Y for Children."

Special intelligence is used at 276 Wing solely as a guiding influence. It enables the senior officer to eliminate from the published reports many of the erroneous conclusions which would result from dependence on "Y" alone. Unfortunately there is so little traffic to be picked up in the Mediterranean that their reports are comparatively unimportant.

9. Seeing four levels of command in the field immediately following my visit to War Station and Air Ministry, the stair like decline of formality in handling special intelligence was very noticeable. At one extreme is an elaborate recording and weighing of every detail and at the other is the casual treatment at 12th TAC where the recipient skims through the pencil written pages of the day, tracing some out on the map, rereading some, ignoring others and in no case writing anything down. At MAAF (rear) quite a bit of indexing is done so that records will be available for appreciations and weekly summaries. At MAAF (advanced) only an order of battle index is maintained, and at the next lower level, TAF, the informality approaches that of TAC in that only an occasional note is made. The 15th, like its parallel command, TAF, uses practically no records.

10. It is also noticeable that each level of command endeavors to stand on its

own feet rather than rely on appreciations and digests from superior commands. MAAF (rear) sends little to MAAF (advanced), MAAF (advanced) almost nothing to TAF, TAF nothing to TAC and naturally TAC can have no recipients. What little is sent is treated with not too much respect. Each level services its own generals without attempting to also service its lower echelons.

Many of the recipients do see each other quite frequently to exchange views. Probably for this reason no great differences of opinion are evident.

11. At War Station and the Air Ministry, I got the impression that intelligence was 75% special intelligence, 10% "Y," 5% photographs, 5% PW, and 5% miscellaneous. The figures varied somewhat but were usually definite. The people in the field don't think much in terms of percentages and, if they did, the figures would vary tremendously from place to place because each headquarters looks to intelligence for a different type of information. Sometimes special intelligence can fill the need and sometimes it can't. The usefulness of other sources varies also, depending on what the headquarters is interested in.

For commands where few records are kept PW reports mean little because no report is complete within itself. Usually they are skimmed through. Agents reports are seldom read by the A-2 or the order of battle people but they are of some importance to target sections. "Y" in the Mediterranean is sketchy, but along with photo recce of airfields which is fairly good in the Med, does provide good cover for the special intelligence order of battle.

Probably the most valuable source in the theater is photography. With the decline in interest of order of battle, targets are of comparatively more importance. The photo tells the pilot where the target is and within 24 hours of the attack photos give fairly complete damage information. Special intelligence does, of course, enable one to exercise great wisdom in reading photos.

12. Covering the use of special intelligence in the field does not present the problems which I understood it did. This is primarily so because receipt of the material does not usually point the way to an operational mission. The material provides background which enables commanders to make the correct decisions: it confirms or negates information from normal sources; it provides basic facts. None of these need cover.

13. At both MAAF headquarters the groups of people processing special intelligence are wholly British. The senior intelligence officers under whom these people work, A/C Woolley and G/C Luard, each have American executive officers, but only Woolley's executive, Major Tandler, handles special intelligence. Even he does no actual work with it.

While in theory this use of British personnel alone to serve a joint British-American Command may be criticized, there is no practical solution. The British appear to be doing a good job and their long experience in work where knowledge of the past is invaluable would place any newly assigned American officer in a distinctly subordinate position. In addition they already are overstaffed.

At TAF also the chief intelligence officer is British but this provides good balance since the remainder of the staff is predominantly American.
DETAILS:

1. A helmet and gas mask are not needed in visiting Mediterranean headquarters. The only use for a helmet is as a wash basin at headquarters near the front and even there borrowing is expected.

2. Arrangements for transportation take time and should therefore be initiated for the next hop as soon as one arrives at a station.

3. Orders cut in London should authorize visits to all cities which must be reached by ATC, i.e. Algiers and Naples in June 1944. If orders mention only Algiers, more orders must be obtained to get on to Naples. Transportation beyond the ATC terminus is by courier plane or airfield hitch hiking for which no orders are necessary.

4. Cotton uniforms may be purchased in Algiers at the PX.

From SRH 022. *The report of the Special Security Officer assigned to the Seventh Army, the American force that took part in the invasion of Southern France in August 1944. The "SCU/SLU link" refers to the British-operated Special Communications Unit/Special Liaison Unit that served as the conduit for Ultra intelligence produced by the Government Code and Cypher School at Bletchley Park.*

ULTRA AND THE U.S. SEVENTH ARMY
AMERICAN EMBASSY OFFICE OF THE MILITARY ATTACHE
1, GROSVENOR SQUARE, W.I.
LONDON, ENGLAND

12 May 1945

MEMORANDUM FOR COLONEL TAYLOR
Subject: Ultra and U.S. Seventh Army

1. Introduction: The following report summarizes the experience of the Seventh U.S. Army in the use of ultra intelligence between 16 August '44 and 8 May '45. The judgments, conclusions, and recommedations are not intended as generalizations necessarily applicable to either air or other ground commands.

2. Operations: The SCU/SLU link and ultra specialist joined the Seventh Army at Naples, and the station opened on D plus 1, the 16th of August. It had been agreed with the G-2 that the job of the ultra specialist was to receive signals from

the SLU, process them, and post the information on a map. For the first few days of operations in South France, the only map available was a folding map which was shown periodically to the G-2. During this period the quality of ultra intelligence was usually high and in the rapidly moving situation was the primary source of tactical information. The G-2 decided, therefore, that an ultra war room was desirable, and henceforth the ultra specialist occupied a room in the CP adjacent to the G-2. Also during these early days the volume of ultra was so great that it was soon apparent to the G-2 that he could not personally brief his commander on the content. Accordingly, the responsibility for the briefing of all recipients devolved upon the ultra specialist.

At no time during operations by the Seventh Army was there a formal briefing for all recipients. There can be little doubt that formal briefings are desirable for they permit a more careful preparation of the material. But the recipients were not amenable to the idea because it involved an additional commitment of time in their already busy day. Also, the demands of the tactical situation dictated that important ultra intelligence be disseminated to recipients without delay, and any other information was of insufficient importance to justify formal briefings. The typical method by which ultra reached the recipients was as follows: Each morning the G-2 was briefed on the messages received during the night. If in his judgment the information was important, the Commanding General and/or the Chief of Staff were called in and the briefing repeated. Throughout the day, usually after dinner and again after supper, the G-2 was briefed on later messages. Other recipients were briefed throughout the day whenever they found it convenient. At any time during the day or night an important message was passed to the G-2 without delay. In the absence of the G-2, the ultra specialist was authorized to call any message directly to the attention of other recipients if the information therein warranted such action.

The ultra specialist was expected to be currently familiar with information from other sources, but at no time was it desired that his briefings include a merging of ultra and other information. This distinction was closely drawn by the G-2, both for reasons of security and because the merger of all sources of information was accomplished in other ways. At the Seventh Army the chief of the order of battle section was a recipient and the "opening up" of ultra was his primary responsibility. Estimates of the enemy situation were prepared by still another officer in the combat intelligence section, and ultra was injected into these estimates of enemy capabilities by informal consultation with the G-2. Target information derived from ultra provided no problem for it had been agreed between the G-2 and the A-2 of XII Tactical Air Command, supporting the Seventh Army, that all ultra targets would be handled by the Air Force. With the order of battle, estimates, and targets provided for in the above manner, the remaining ultra required little or no correlation with other information.

Attached hereto as Tab A is a statement of two instances in which ultra provided intelligence of extreme tactical importance to the Seventh Army. All recipients

were genuinely interested in ultra and aware of the tremendous advantage provided by source. On one occasion the G-2 remarked, "You know, this just isn't cricket." Generally, ultra information is of primary value in a static or defensive situation; this is indeed true of all information and intelligence derived therefrom. In the attack and pursuit, intelligence has done its job during the planning phase of the operation, and subsequent information is usually outdated by the time it reaches the command. The examples in Tab A, however, cover both situations.

3. Security: It is difficult to really know the security situation at a command, but it was evident that some recipients at Seventh Army were either not cognizant of or sufficiently impressed with the need for security in the use of ultra. There was little questioning the minimum security requirement that the nature of source must not be disclosed, but this understanding did not extend to an appreciation that information derived from source must be properly safeguarded and serve only as the basis for tactical orders when the information itself cannot be "opened up." The greatest misunderstanding here was in the idea of "cover." Recipients were inclined to believe that cover was an invention; the idea of cover as an indication from an actual but open source was alien to all but a few recipients.

The security situation at Seventh Army was complicated by the fact the G-2 of VI Corps, and at the outset the Commanding General, were former recipients at a time when the Corps was operating at Anzio as a virtually independent task force. On a few known and probably on many unknown occasions the G-2 of Army passed on "hunches" to the G-2 of Corps; the latter was certainly aware of their origin but was not bound by security regulations. In this situation it is almost impossible to expect that a Corps G-2, formerly in the picture, will not receive ultra, thinly disguised; as the Army G-2 frequently stated, "You can deny membership in the Elks to a person, but once he has been an Elk and forfeits his membership he will still remember the initiation."

Generally speaking, however, the handling of ultra from an intelligence point of view by the G-2 was consistent with security regulations. The difficulties at the command were more directly traceable to the Commanding General and in the operational use of ultra. The reasons for this are manifest. Charged with responsibility for success or failure in the battle, the temptation to knowingly or unknowingly employ ultra improperly is well-nigh irresistible at times. This, considered along with the fact that the Commanding General is relatively isolated from daily security reminders by the ultra specialist appears to be the major cause of violations.

. . .Once the violation was observed, the facts in the case were obtained from the G-2 and reported to London. The G-2 was never told by the ultra specialist, although he probably guessed, that violations were being reported.

4. Conclusions: The policy of a separate channel and the assigning of an ultra specialist to American commands is basically sound. If nothing else, the mere presence of a War Department representative has a salutary effect. For reasons of administration the SCU/SLU link might well become the responsibility of the spe-

cialist. There is often a real question whether a particular security violation is the responsibility of the SLU or the specialist. Moreover the command is frequently confused in their administrative relations with the SLU, and are never certain whether they should deal with the SLU or with the specialist. There was never any difficulty of this kind at Seventh Army, but there is a real danger in the failure to provide unified control.

There is much to recommend that all ultra matters be considered within the province of the Commanding General and his Chief of Staff, rather than as an instrumentality of the G-2. In the first place, the G-2 might then be subjected to controls which cannot be exercised under the present arrangement. Moreover, by attaching the ultra functions to the Chief of Staff's office, the ultra specialist has direct access to the Chief of Staff and the Commanding General and thus can more carefully safeguard security at the point where it is most vulnerable. Also, by removing the ultra function from the G-2, security is improved by the mere fact that it is not automatically associated with intelligence.

The reading and understanding of ultra security regulations is not sufficient to insure their inviolability. In addition to constant reminders by the ultra specialist, periodic warnings from high commanders seem desirable. The subject must be kept a live one at all times, and the interest of the War Department continuously impressed upon recipients.

Regardless of what other persons are recipients at a command, it seems particularly desirable that wherever possible the order of battle chief be included. At Seventh Army this occurred through accident; the personality involved was "in the picture" at a higher headquarters before joining Seventh Army and his status was continued. But this might well become standard practice, other considerations permitting, for the order of battle man is the key to opening up ultra and the preparation of sound strength estimates.

Finally, it is essential that well-grounded intelligence officers be assigned to commands. The proper interpretation of ultra is very often dependent upon a thorough familiarity with information derived from other sources.

TAB A

(1) Late on D plus 2, ultra information reached the Seventh Army which indicated that the enemy was withdrawing from south and southwest France. The Commander was faced with a major decision involving two factors:

a. To what extent could the enemy be pursued and outflanked, considering the difficulty of supplying advance columns over a beach, and

b. Would the enemy counter attack on the right flank, from the Maritime Alps, and so endanger rear communications.

Ultra provided the answer to the second question, at least a sufficient answer to permit a calculated risk; there was no indication that the enemy would adopt an

attitude other than defensive on the flank. Accordingly, it was decided to pursue and all unloading priorities were altered, with the whole emphasis given to fuel and vehicles. Also, Task Force Butler, which had penetrated deep in the enemy rear, was reinforced with the 36th Div. Together they established a road block at Montelimar in the Rhone Valley and cut the enemy escape route. The road block proved insufficient to destroy the 19th Army and they succeeded in fighting their way out, but all heavy equipment was lost in the process.

It is also noteworthy that ultra guided public relations all through these opening days of the campaign, for it was clear from source that the enemy was not aware of the character of the forces operating in his rear. He apparently believed that there were only guerilla forces endangering his lines of communications; and so the existence and operations of Task Force Butler were not disclosed to the press.

(2). . .Shortly after the German Eifel offensive in mid-December, it became evident that that the enemy was preparing an offensive in the Saar-Palatinate, possibly in conjunction with a coordinated attack out of the Colmar bridgehead and a crossing of the Rhine N. of Strassburg. German Air Force reconnaissance orders from ultra pin-pointed the possible crossing area but source was relatively quiet on the Colmar attack; open sources, however, clearly suggested the latter intention. But it was in the sector between Saarbrucken and the Rhine that ultra provided information necessary for a proper estimate of the situation and preparations to meet the attack when it came. During the critical days prior to the attack the Flivo with the German First Army was being read consistently, and enemy order of battle and boundaries were throughly known. It was possible, therefore, to state with relative certainty that the main effort in the attack would be made west of the Hardt Mtns., with a secondary attack between the mountains and the Rhine. If there was ever an essential element of information this was it, for the passes through the Vosges Mtns. were a serious obstacle to the rapid movement of Seventh Army reserves. Based on this appreciation, the sector west of the Hardt Mtns. was reinforced with the 2nd French Arm'd Div. and the 36th U.S. Inf. Div., both moving from the Rhine plain. It should be noted that up to the day of the attack, German intelligence failed to pick up these moves.

When the attack was launched on 1 Jan., the German main effort collapsed completely. Their only success was in the sector of the secondary effort, in and East of the Hardt Mtns. This German offensive was properly appreciated and preparations made to successfully meet the threat. Lacking ultra it seems very doubtful whether the attack would have been repulsed, or whether other sources of information would have given advance warning. Open sources provided only the most meager evidence of an attack, and there was much opposing evidence suggesting precisely the opposite — a thinning out in the sector and movement of units away from the Saar-Palatinate to reinforce the North.

* * *

From SRH 032. *This report was submitted by Major John H. Gunn, the Special Security Officer assigned to General Douglas MacArthur's Southwestern Pacific Area headquarters. As Gunn indicates, MacArthur ran his theater like a private fiefdom, and the members of his staff were not always happy to deal with people they regarded as interlopers from the War Department.*

WAR DEPARTMENT
MILITARY INTELLIGENCE SERVICE
Washington 25, D.C.

23 October 1945

MEMORANDUM FOR THE SPECIAL SECURITY OFFICER, MIS:
SUBJECT: Report of Major John H. Gunn, 0-388247

The undersigned officer departed Washington on 15 September 1944 for Brisbane, Australia. I reached Brisbane on the night of 22 September. At this time most of GHQ was in Hollandia, Dutch New Guinea, in the final stages of planning and preparation for the invasion of Leyte. The Leyte operation had been accelerated and it was necessary that those SSO's designated to serve the participating commands cut short their indoctrination course in Brisbane and proceed to Hollandia at an earlier date than planned.

My principal duties in Hollandia were to assist Lt. Colonel Ashby, then Special Security Representative for the theater, at his headquarters. I had been introduced to Lt. General Sutherland, Chief of Staff, and it was indicated that I was to accompany the Advanced Echelon into Leyte and serve General MacArthur, General Sutherland, and appropriate G-2 and G-3 personnel. The acceleration of the date for the Leyte operation necessitated Ashby's being absent several days while placing SSO's at the subordinate commands. During this period the undersigned was left at GHQ. I was impressed with the fact that the people on the working level in the theater are, despite the idiocyncracies, jealousies and animosities of their superiors, an amazingly cooperative group.

The Chief of Staff had indicated that there would be no room on the Command Ship for an SSO. As a result he referred Ashby and me to the G-3 section to make arrangement for transportation to Leyte in some other vessel in the Advance Echelon convoy. The G-2 officer in charge of the details of loading the G-2 section was to notify me of the proper time and means of departure. I am confident that this charge never again crossed this officer's mind, for Ashby and I discovered the following Saturday night that the G-2 convoy had loaded without any notice to our

office. In the improvision that was necessary I finally arranged to "hitch hike" to Leyte aboard a 6th Army convoy leaving the next day.

The trip to Leyte was uneventful. I carried no classified material other than a black handbag filled with cryptographic material. This material I kept stored in a locked closet in the ship's captain's cabin. This seemed the most secure procedure aboard a vessel whose Commanding Officer kept 18 quarts of bourbon whiskey in his ship's safe, and kept his top secret battle plans for several operations on top of the desk in his sleeping quarters.

We arrived off Dulag at the southern portion of the invaded beach area three days after the initial landings. The usual confusion prevailed on the beach and I was at a loss to find a secure place to keep my cryptographic materials until I could find transportation to GHQ, then located at Tacloban, 20 miles north. Such transportation was not immediately available. After two rather unpleasant nights ashore, when minor but apparent enemy infiltrations of the beach position occurred, the undersigned decided that the most secure place for himself and the classified material was aboard a boat in the harbor. A problem like secure storage seems minor, but it is typical of the practical problems our system often poses.

Upon arrival at GHQ I presented myself to the G-2 section and commenced operations. I was introduced to General MacArthur on the first day of my arrival and found him at all times as cordial and cooperative as possible. It is a matter of record that the same observation cannot be made of a number of his immediate subordinates.

It took only a short while to comprehend the low state of security at the headquarters. For example, no adequate safe accommodations existed, and the loose physical security of the headquarters was evidenced by the presence of innumerable Filipinos who stalked in and out of the staff section area at random. As for the handling of Ultra, complete insecurity was a recurring malignancy. The details of numerous security violations involving our material that occurred during this period have been reported to MIS. One fact was obvious—the main factor contributing to such incidents was a basic lack of appreciation of the value of our material. The principle of sacrificing tactical advantage to security was not even accorded lip service. It seems incredible that Ultra could be obtained and passed by a non-recipient to a non-authorized recipient over a radio relay telephone which was almost certainly being tapped by the Jap. This, and other occurrences as serious, if not as spectacular, are indicative of the security point of view of the persons designated to receive our material.

Without going further in detail, there are certain conclusions that I have drawn with regard to the situation as it occurred on Leyte.

First, General MacArthur has been oversold by his subordinates on the quality of the production of his theater agency, Central Bureau. For example, on one occasion General MacArthur expressed to me a desire to see more diplomatic material, as "I get all the other information anyway."

Second, tactically, the Navy material was incomparably superior to Army production. For example, no Army material was operationally comparable to the Navy material describing the pending Japanese reinforcements in the Ormoc area.

Third, there was no excuse for relaxing enforcement of our regulations to permit passage of Ultra down to Corps level. In no case can I recall seeing any Ultra appropriate for a Corps in its limited sphere of action, and I can imagine no case where a Corps, operating nonindependently, cannot be served by an operational order.

Fourth, none of us, staff officers or SSO's, dealing with Ultra, were adequately indoctrinated in the handling of this material in the field, and in the security practices necessary to ensure its safety. The G-2 men lacked any adequate security indoctrination. In the future the indoctrination of appropriate personnel should be as integral a part of their intelligence training as the preparation of maps or summaries. The security qualification should be a strict exaction for the holding of a responsible intelligence position. It was not in GHQ, SWPA. Nor were the SSO's adequately prepared for their job. Extensive training in the drafting of operational orders, as a security device, is one fundamental necessity in which no early SSO received any training whatsoever. The undersigned, without any previous experience, drafted several such orders in efforts to present an acceptable substitute for an otherwise unwarranted dissemination. It would have been an infinitely more simple task had the undersigned even seen an operational order before he tried his hand at drafting one. Further, if the SSO is to work in an Intelligence Section, he should be thoroughly schooled in the G-2 duties he will perform. Camp Ritchie should furnish the best answer to this problem.

Fifth, closer coordination between Army and Navy Ultra recipients and communications personnel is essential. Tales of the Navy "indiscretions" in SWPA are legion, but in a great measure they may be attributed to a lack of mutual understanding and agreement. For example, Navy furniture shipped from Hollandia to Leyte was addressed to "the Ultra section." and mess bills were addressed to Lt X, c/o the Ultra section. This came about in great measure because the Navy considered "Ultra" as a classification, not a code word. Similarly, Navy acceptance of SSO personnel as participating counterparts aboard ships receiving Ultra is essential to secure handling of the material - since Navy Ultra may obviously be used as the basis for Army directives to Army units. On such directives a trained SSO should be infinitely more authoritative, security wise, than a Navy communications man.

On completion of the transfer of GHQ to Leyte, I was sent to the Office of the Deputy Special Security Representative in Brisbane. There is no need to include in this report any description of the organization and work of this office. . . .

CHAPTER VIII

The Politics of COMINT

The motto of the great Army cryptologist William F. Friedman was "Knowledge Is Power." The power derived from the ability to exploit high-level signals intelligence meant that access to and control of COMINT became a political football in various bureaucratic and partisan struggles for advantage. Within the Army, the Military Intelligence Service fought with the Signal Corps over control of the Signal Security Agency. Excerpts from SRH 141-1 2nd SRH 141-2 document the course of the dispute, which was finally resolved (more or less) in December 1944, when the Military Intelligence Service gained operational control over Arlington Hall. On another bureaucratic front, the Military Intelligence Service tried to take on the Navy, claiming that Navy cooperation in sharing signals intelligence was lacking. Another selection from SRH 141-2 reveals the extent of the problem and the fierceness of the rivalry. Finally, in SRH 043, Comments on the Dewey-Marshall Exchange, Colonel Carter Clarke, Chief, Special Branch, describes what happened when Army Chief of Staff General George Marshall tried to ensure that COMINT secrets would not be compromised in the course of the 1944 presidential election contest between incumbent President Franklin D. Roosevelt and Republican challenger Governor Thomas E. Dewey of New York.

From SRH 141-1. *Two months after joining Stimson's staff to recommend better measures for handling signals intelligence, Alfred McCormack had become convinced that the Military Intelligence Division should be given overall control of all intercept activity. To help make his point about the importance of secret intelligence, he makes reference to two intercepted Japanese messages dealing with this subject, one from Japanese Foreign Minister Yosuke Matsuoka, and one from from his successor, Foreign Minister Shigenori Togo.*

March 1, 1942

MEMORANDUM FOR: MR. McCLOY
Subject: Signal Intelligence Service

Here are noted down the points discussed with you, touching on the question whether it is sound organization to leave with the Signal Corps the job of collecting and selecting intelligence materiel of great importance, instead of lodging that responsibility with G-2 as a part of its over-all job of collecting and supplying intelligence:

1. It appears to me to denote a rather negative conception of intelligence to have G-2 simply taking what the Signal Corps catches and turns in, leaving with the Signal Corps the responsibility for deciding how much it will catch and turn in, and from what sources. I am sure that the Signal Corps listens seriously to all suggestions from G-2, but the power of decision remains in the Signal Corps, and there is nobody in G-2 who has an affirmative responsibility for seeing to it from day to day that the material collected and processed (a) is all that possibly can be collected and processed and (b) is derived from the sources that are at the time of greatest importance from G-2's angle. Intelligence activities should be directed affirmatively and vigorously. Compare Minister Matsuoka's direction that "our principal aim is to collect *every possible bit* of intelligence concerning the United States" (18846) and Minister Togo's reference to the "absolute necessity of securing intelligence of this sort" (i.e., the sort not obtainable from newspapers and the radio; 27500).

2. The men in G-2 who are working on the processing of intelligence are too remote from the collection of this material. Let us suppose that Col. Heard, [text withheld] decided [text withheld] or was instructed by his superiors, to gather in as much current material as possible on political conditions and diplomatic maneuvering in [text withheld]. . . .He would not get any such material from the source under suggestion, though the S.I.S. has a lot of [text withheld] material on its shelves, all in its original form, which has never been tackled because of lack of personnel. If there were one officer in G-2 whose responsibility was to keep up to date on G-2's needs *and* be ready at any moment to turn the S.I.S. to work wherever the heat was

on, and if that officer could give orders to the S.I.S., maybe in such a situation all hands not elsewhere essential would go to work on the [text withheld] material. At least, there would be an evaluation of relative needs, and a conclusion would be arrived at in the light of all the facts. Moreover, the real needs as to personnel, equipment and supervision would quickly become apparent if that sort of an evaluation had to be made once in a while.

3. This is a situation in which an infinite number of little things are important. From the dim perceptions that I have obtained to date as to how an Army works (my past military observations having been from the bottom up), I have a notion that, if a good idea about a matter of detail should originate in one of the sections of G-2, affecting what should be done somewhere down in the ranks of the S.I.S., by the time it got up the G-2 command, over to the Chief Signal Officer and down through the appropriate channel, the impulse behind it might have become so attenuated as to be insufficient to actuate a full-grown adult. This is not meant critically, since, as I have already told you, I have been impressed by the ability of all the officers that I have encountered to date.

4. Under the present system of divided responsibility there is nobody in G-2 who knows, or could know, what goes on at the various S.I.S. stations or what decisions made from day to day at those stations affect the content of intelligence coming from those sources. Do we know, for instance, that we might not have obtained a lot more Honolulu material except for some decision by the Signal Corps in routine matters, e.g., to shift an experienced operator elsewhere, to postpone repairing a broken antenna, to use particular receiving apparatus for some other purpose, to run a station less than 24 hours a day, to shut it down for repairs when X might be heard, rather than when Y might be heard? These are minor items, but they might have an important effect on the content of intelligence. Yet in the nature of things the men responsible for intelligence could never know about them.

5. As to items of major importance, it necessarily must be true that the S.I.S. is in competition with the manifold other activities of the Signal Corps for money, supervisory direction and personnel. It seems illogical to keep one intelligence unit separate from all other intelligence units, and in competition with units not concerned with intelligence. The production of intelligence from this particular source ought not to compete for money, direction or personnel with anything except the production of intelligence from other sources. Then you could shift your money and personnel into the branch of intelligence which seemed most likely to be fruitful. As it is, it might be that the Signal Corps would be spending much too much time and money on the production of intelligence material from this source, in relation to the time and money spent on the production of intelligence from other sources. On the other hand, there is some ground for thinking that the Signal Corps is not spending nearly enough time and money on the production of the type of intelligence here under discussion.

6. Under the conditions which exist, it is necessary for the Signal Corps to make many choices which affect the content of the intelligence gathered. It must decide at each station what to listen to; and doubtless there would sometimes be a wide choice. Then it must frequently decide the importance of a particular item, in determining what risks may be taken in getting it to Washington promptly. The traffic that comes in is much greater than can be handled; and at each step in the process of putting the raw material into finished form there must be a selection of a small number of items out of a relatively large number of items. The average number of items going into the mill each day is understood to be around 1,200. Of these, only 200 are read (by the junior officers in charge of the various sections) and only 60 go beyond the stage of reading. In a particular situation—such as the French situation as I have described it to you—we get out hardly more than a sample of what goes in, and a mere fraction of a sample of what might go in. Consequently, the choices here are very important, especially since the material that comes out must be examined with two questions in mind, (1) whether it is valuable in itself and (2) whether it suggests that other material from the same source should be obtained for examination in larger quantities.

7. The present division of functions appears to increase quite materially the number of persons familiar with this material or with the fact that it exists.

Without having heard such arguments as there may be to the contrary, it appears to me that the organization would be sounder, and the job more effectively done *as an intelligence job*, if the S.I.S. were made a part of the General Staff, G-2.

A. McC.

From SRH 141-2. *The issue over whether the Signal Corps or the Military Intelligence Division should control SSA came a large step nearer resolution when Assistant Secretary of War John J. McCloy accepted McCormack's arguments in favor of G-2 control. This memorandum was sent to Lieutenant General James J. McNarney, the Army's Deputy Chief of Staff. As deputy to Marshall, McNarney played a major role in Army reorganization. (To oversimplify, Marshall fought the war while McNarney ran the Army.) The Generals Ingles and Somervell mentioned in the memorandum were, respectively, Major General Harry C. Ingles, Chief Signal Officer; and Lieutenant General Brehon B. Somervell, Commanding General, Army Service Forces (ASF). During World War II, the Army Service Forces commanded all of the Army's technical services, including the Signal Corps.*

22 August 1944

MEMORANDUM FOR GENERAL McNARNEY:

I have thought a great deal about the matter of transferring the Signal Security Agency to the Military Intelligence Service under the Assistant Chief of Staff, G-2. I have given it renewed consideration after the receipt of General Ingles's memorandum and General Somervell's indorsement.

1. It was my impression that the merits of this transfer were considered by the committee which was set up to go into the reorganization of G-2 and that we came to the conclusion that if the Assistant Chief of Staff felt that he needed this agency to render the proper service it should be given to him. Subsequently he delivered a memorandum to you which as I understand it was a proposed outline of the procedure to accomplish the transfer rather than any argument in favor of it. The memoranda of General Somervell and General Ingles do not criticize the procedure outlined but object to any transfer whatever.

2. The chief stated objections in Ingles's memorandum seem to be as follows:

a. That the MIS is only a "staff" section and not an operating agency and that it is not "authorized" by Congress.

b. That for some reason not clearly stated the Signal Corps will not be able to furnish the MIS the same communications facilities and services that it provides for the SSA.

c. That personnel engaged in operating communications facilities will not be able to make proper use of codes and ciphers if such codes and ciphers are supplied by the MIS rather than by the SSA.

3. As to the first of these arguments, above, I do not agree that the MIS merely because it is under the supervision of the A.C. of S., G-2 is not an operating agency. In fact, I think it is, and should be. Its relegation to a minor role between World War I and II was a tragic mistake and certainly the Signal Corps was not

able to keep up any vigorous or broad system of communication intercept during this period.

4. In my judgement one of the chief pillars of our national security system after the war must be an extensive intercept service. If we are to be a military power or, indeed, if we are to play an active role in world affairs, we cannot afford to leave this field entirely to the British and the Continental powers. It is one of the best sources of intelligence that there is and I would take it out of any existing service agency immediately in the hope and belief that it would develop into an organization which would stand a better chance of perpetuation in peacetime.

5. I think that the establishment of such a vigorous agency would be an attraction to the Intelligence Service. The curse of our so-called Intelligence Service to date is the attachment to it of only those officers who have social acceptance and means enough to enable them to pursue a life of relative ease. If we try to put this thing now on its proper level and scope it may be possible to create a real field of activity for ambitious and capable officers. I do not think that we will ever get anywhere if we merely seek to maintain a system whereby direction comes from the MIS and operation lies in the Signal Corps. It ought all to be under one roof. The British have been more successful in this field than any other country, I think. Certainly our efforts to date have been most fragmentary as compared to theirs. They use the system that MIS would wish to follow and I think it is the most persuasive example we have to look to.

6. I do not follow the argument on codes and ciphers. Certainly they can be separated from the operation or communication facilities. In fact, such a separation now exists in the Signal Corps and I do not see how it would be more difficult for the MIS to turn over codes and ciphers to the users than it is for the SSA to do so now.

7. I do not envisage that this transfer involves MIS responsibility for all Signal Corps training. Signal Corps will continue to provide signal training as before the proposed tranfer and the MIS will obtain personnel trained by the Signal Corps to the same extent that SSA now obtains such personnel and in the same manner that other components of the Army obtain such personnel. There will be certain highly specialized training in the Signal Intelligence which will be provided by the MIS but I think this is all to the good as it will give added emphasis to the intelligence aspects, which have been neglected heretofore.

8. I do not believe that it is proposed to "tear to pieces" any existing organization but to transfer SSA to the MIS in its present form and thereby to effect a closer integration of its activities with those of the present MIS.

9. I do not believe that it is good practice to have the MIS by general directive and the establishment of general policies to attempt to create a workable intelligence organization in the low echelons of the Army Service Forces as they are now attempting to do. If it has not already occurred, I am sure that there will be occasions when the MIS will seek to direct the SSA into certain activities or lines as to which, if the SSA is inclined to disagree, they may appeal to the higher levels of

the ASF. When this occurs, there is no one short of the Chief of Staff who can adjudicate the point.

10. Finally, I think that the argument that the present arrangement is successful because SSA furnishes the bulk of the information that the MIS has available is unsound because the total Intelligence available to the MIS really covers a much wider field and actually only a relatively small part of that intelligence is made available by SSA. Much of the most valuable work that the MIS have applied to the intercepts has come in the processing which that service has done on the material furnished it. No part of the Signal Intelligence which MIS has available in relation to European military matters is furnished by the SSA; no part of Naval Signal Intelligence is furnished by the SSA; and no part of the clandestine European field is supplied by SSA. About 70% of the diplomatic is and about 80% of Japanese military is. It is true that it provides the greatest amount of information obtained from any one source.

11. In summary, I believe that the MIS should be given the opportunity of proving that it can exploit this entire field to greater advantage. The enthusiasts are in the MIS; there is some great talent there, and I believe it is a source upon which a broad and effective Intelligence communication service can be erected after the war. The Chief of the Army Communications Services and the Chief Signal Officer are primarily interested in operating a signal communication service; they are not primarily concerned with Intelligence. I believe that the possibilities of greater accomplishment lie in the system advocated by the MIS than in a continuation of the existing system. I am not sure that MIS will take full advantage of all the possibilities but on balance I do believe that they would have a far better chance if they had full control. By such control there is a greater likelihood that we will come out of this war with an organization that can be maintained through the lean years of peace. I would be quite certain that if Signal budgets were cut and SSA were in the Signal Corps, the latter's budget would go, if not first, at least before the regular communications appropriations were cut. We will need an organization to support it whose primary and sole objective is Intelligence.

Of course, there is no merit to the argument that there is no statutory authority for the MIS. First, I think there is sufficient authority to meet any need and, second, when can the ASF complain about no statutory authority?

/s/ JOHN J. McCLOY
J.J. McC.

* * *

From SRH 141-2. *In this memorandum, the Special Branch takes on the U.S. Navy.*

WAR DEPARTMENT
MILITARY INTELLIGENCE SERVICE
WASHINGTON

4 March 1944

MEMORANDUM FOR GENERAL BISSELL:
Subject: Army-Navy Agreement regarding Ultra.

A. *Background of Army-Navy Relations in Ultra field.*

1. Except for the Japanese Army material that recently has started to flow in, the Navy has had the full benefit of the work done by Arlington Hall and the Special Branch. It receives copies of the decoded diplomatic and related traffic. Through the "Magic" Summary it is furnished with all evaluations and studies made by Special Branch.When the British European sources were opened up, and the Military and Naval Supplement was established to report intelligence from those sources, arrangements were made to furnish this daily report to Cominch.

2. Little or no cooperation was received from the Navy in return. It did furnish certain information about Japanese merchant shipping, and transmitted some Order of Battle information to G-2 through other channels . In general, however, the principle was applied that cooperation in the Ultra field would be restricted to the technical and cryptanalytic level and would not extend to intelligence. Not once, during the entire period over which the Navy has been receiving the "Magic" Summary, has any agency of the Navy volunteered any information that might have been of aid on any of the subjects of study covered by the Summary, although on some of them (such as Axis blockade-running) the Navy has had considerable information at hand.

3. When the Japanese Army source was opened up, it was decided not to furnish the traffic to the Navy without some arrangement for reciprocity. For almost a year Arlington Hall had worked on Japanese Army ciphers, had gradually solved them and applied itself to the tedious job of reconstructing code books, while Op 20-G, exploiting a parallel source and being in possession of intelligence that would have been of great value to Arlington Hall, withheld this intelligence and restricted its liaison to the technical level. In the opinion of the writer, the non-cooperation of the Navy retarded the exploitation of Japanese Army sources by not less than 6-months and resulted in depriving both services of intelligence that would have been of important operational use.

4. In spite of the Navy's attitude, the writer dld not feel justified in witholding

Vandenberg, Army Assistant Chief of Staff G–2; Brig. Gen. Preston W. Corderman, Chief, Army Security Agency; Col. Frank B. Rowlett; and William F. Friedman. (NSA)

from the Navy information, derived from Japanese Army traffic, which might be of value to Naval operational units. Therefore,with the approval of the A. C, of S., G-2, an arrangement was made for forwarding promptly to the Navy all information on which operational action might be taken.

5. The Japanese Army traffic is exploited by British units in England and India and by an Allied unit in Australia, as well as by Arlington Hall. As the work of Special Branch on this material progressed, it became apparent that we were in a less favorable position to get intelligence out of it than were the British, because they had the benefit of the U.S. Navy traffic and intelligence, whereas we did not. Efforts were made, by personal conversations wlth representatives of the Navy, to bring an end to this disgraceful situation. Those efforts probably contributed to bringing about the Navy's proposal for an exchange on the intelligence level. However, the success of Arlington Hall in opening up the Japanese Army sources was what probably brought the matter to a head.

6. In the discussions involved in preparation of a written agreement, the Army was represented by the writer, Colonel McCormack and Major Perdue of the Special Branch. Following the first meeting, the Special Branch submitted a simple agreement for an exchange of traffic and intelligence, along the lines of the agreement which exists between the A. C. of S, G-2, and the British GC&CS. This was not acceptable to the Navy, who insisted that liaison officers be exchanged and that various restrictions be put into the agreement, pursuant to which, in effect, either party might give or withold intelligence as it might see fit.

7. The final draft of the agreement, as prepared by the Navy, was not acceptable to the officers representing the Army, without a statement by the Navy of the principles that would be applied in interpreting the agreement. Those principles were stated on several occasions by Captain Stone, and were generally to the effect that the restrictive provisions of the agreement were necessary to cover special cases, which might never arise; and that the basic principle would be cooperation to the fullest extent in furnishlng the Army with all the "Ultra" material that it might find of value. It was on the basis of such assurances that the agreement in its final form was submitted to the A. C. of S., G-2, with the recommendation that it be approved by the Chief of Staff.

8. When the Special Branch appointed its liaison officer and he started to go through the Navy daily matarial, it was at once apparent that no one officer could sit in Op 20-G and make a final determination of what traffic might be of intelligence value to the Army; and that the arrangement would work effectively only lf the liaison officer were permitted to select decoded traffic and forward it to the Special Branch without being required to demonstrate how and why it might be of value. The decodes are readily available on duplicate cards and can be handled conveniently by the various specialist groups within the Special Branch who may be working on the subjects to which they relate or might relate.

9. The experience of the Navy's liaison officer with the Special Branch was

somewhat similar. He discussed the point with the Deputy Chief of the Branch, and was informed that an extra copy of all messages would be obtained for his exclusive use and that no restrictions would be put upon him in respect to what he might select; that if he cared to do so he might take all the traffic.

10. A day or two after the Army liaison officer, Major Snow, had started to function, he was informed that there would be certain general restrictions upon what he might transmit to the Special Branch. Those restrictions were then embodied in a memorandum, a copy of which is annexed as TAB A.

B. *Proposed Restrictions.*

(i) *U.S. Navy operational dispatches and reports.*

11. It is not clear just what this covers, but it appears to mean that we cannot receive the CINPCAC Bulletin, despite the fact that it is given to various British intelligence organizations, and despite the fact that one of the purposes of the agreement was to put an end to the situation in which the British were receiving material from the Navy which the Army did not receive.

(ii) *Japanese fleet movements and locations.*

12. Major Snow was instructed to select and transmit to Special Branch only those items relating to the Japanese fleet as represented major concentrations or movements. Insofar as the fleet itself is concerned, the daily Summary received from Captain Smith-Hutton will probably be sufficient to supply all major concentrations and changes. However, the Navy classifies hospital ships, tankers and auxiliaries as part of the fleet. Our information covers these vessels also; and to deny us the correlating information is to impair the value of our own intelligence material.

13. Moreover, communications dealing with the fleet, or elements of the fleet, may be of interest and value in a great many incidental ways; and no one can determine what value they may have until he has received and studied the material over a period of time.

(iii) *Japanese Naval Air items.*

14. No one dealing with Japanese Air intelligence can work simply on Army or simply on Navy material. An accurate picture of Japanese Air strength, dispositions, production, wastage, etc., can be obtained only by keeping up with both services. We do not intend to give the Navy Air material detailed processing, but we do want to have it at hand for the purpose of familiarizing ourselves with the type of material and spotting major pieces of information.

(iv) *OPTELS.*

15. The significance of this limitation is not understood. It is assumed that the OPTELS are received from the British Admiralty. If they bear any relationship to the Ultra problem in the Pacific they should be included in the exchange.

C. *Proposed scope of material to be released by Navy.*

16. Op 20-G's memorandum (TAB A) provides that the material to be released to the Army "shall ih- clude only that which concerns the Japanese Army." Apart from the well-proved principle that intelligence of value can often

be obtained from messages bearing no apparent relation to the subject of interest, the restrictlon is believed to be unsound, because the war against Japan is not being conducted by Navy against Navy and Army against Army. Where the U.S. Navy operates it is fighting the Japanese Navy and Army, and the U.S. Army is fighting the Japanese Army and Navy. The Army traffic and the Navy traffic are interrelated parts of a sum total of Japanese military communications. They cannot be separated without losing an important part of their potential intelligence yield.

D. *Proper Interpretation of Agreement.*

17. There is only one sound basis for exchange of cryptanalytical intelligence, and that is to permit the consumer to determine what may be of value to him. This is the system under which the British operate, and it accounts in large measure for their success in this field. In the Watch Room at Bletchley Park, representatives of each of the 3 Services determine for themselves what may be of interest to the Ministry and field Commanders whom they represent. So much emphasis do the British put upon this point that, after all the operations of Bletchley Park have been completed, every piece of paper produced, in the way of transmitted messages, paraphrases or reports, is put through a so-called "Intelligence Exchange" where a representative of each Service checks the whole output, in order to make sure that his Service has not been omitted from the distribution list for any paper that it might find of interest.

18. There may be special cases in which a particular message may be of such a dangerous character, from the angle of security, that the originating Service might not want to give it any circulation at all. Such cases are provided for by the last paragraph of the Army-Navy Agreement. Such cases, however, should be very rare.

19. To be of value to the Special Branch, the liaison arrangement with the Navy must permit the liaison officer a wide discretion in the selection of material for transmission to the Special Branch. If only for the purpose of educating the personnel of the Special Branch dealing with particular subjects, it is necessary at the outset that he select everything except items which are obviously too trivial or which have to do with very specialized subjects such as promotions of minor Naval Officers, from which the Special Branch would probably not obtain anything of intelligence value. This was the understanding under which the liaison arrangements were worked out and the arrangement recommended for approval. If the Navy is unwilling to commit ltself to this principle, then it is recommended that steps be taken to abrogate the agreement and return to the status quo.

20. Restoration of the status quo would not be a desirable solution of the problem because it is certain that the adding up of Army and Navy radio intelligence would produce a sum total of intelligence greater than could be produced by the 2 organizations working separately. Such a solution at this time, however, would not hurt the Army as much as the Navy's noncooperation has hurt us in the past, because we are rapidly getting to the point where we will have an independent basis for intelligence in the Pacific and the Far East, and at the present rate of

progress we could struggle along without the Navy's cooperation.

21. If the Navy is unwilling to accept the interpretation of the Agreement which we consider reasonable, and which was our basis for recommending it, then it is believed that all cooperation with the Navy in the radio intelligence field should be suspended. Specifically, it is recommended:

a. That the Signal Security Agency no longer furnish intercepted Navy traffic to the Navy;

b. That the service performed by the Signal Security Agency for Op 20-G, in collecting and transmitting weather traffic, be discontinued on 30 days' notice;

c. That exchange of traffic in the diplomatic field be suspended; and

d. That the Special Branch discontinue furnishing the Navy with its reports and studies.

E. *European Intelligence.*

22. The Navy has never been willing to agree to any exchange of radio intelligence affecting the European Theater. It receives what is provided by the Special Branch, but it contributes nothing from its own sources or from the British Naval sources. Further than that, the Navy has refused to permit the British to furnish the War Department with any intelligence from British Naval sources.

23.When the Navy first proposed to do business on the intelligence level, it was our impression that the agreement would be general, covering all theaters of operation. It developed, however, that the Navy was unwilling to agree to any exchange except for the material relating to Japan. It was suggested by the Navy negotiators, however, that once the first step had been taken and a suitable arrangement worked out for the Japanese traffic, an agreement covering other areas might also be worked out in due course.

24. In view of the attitude now taken by the Navy, it is apparent that they will do business only when they have something to gain, and that there will be little prospect of extending the existing agreement to the European Theater. It is therefore recommended, independently of whether a modus vivendi is arrived at for Japanese material, that Special Branch be instructed to discontinue furnishing to Cominch any intelligence relating to the European Theater.

25. It is now apparent that the Navy proposes to do business at arm's length. We should accept that attitude and act accordingly, giving the Navy nothing which our agreements do not require us to give and holding strictly to the letter of the agreements. After a year and a half of dealing with the Navy in this field, it is my conviction that you cannot do business with them in any other way, and that you will get more in the long run if you take this viewpoint.

CARTER W. CLARKE
Colonel, General Staff
Chief, Special Branch, MID

From SRH 043. *In the fall of 1944, Army Chief of Staff General George C. Marshall became concerned that the fact the United States had been reading enciphered Japanese traffic prior to the Pearl Harbor attack might be disclosed in the course of political debate in the forthcoming presidential election campaign. He wrote a personal letter to Republican presidential candidate Thomas E. Dewey urging him not to make any statements that might compromise American successes in cryptanalysis. Portions of this letter are quoted in the document SRH 349, which appears earlier in this volume. The letter was hand-carried to Dewey by Colonel Carter W. Clarke, Deputy Chief of the Military Intelligence Service and former head of the Special Branch. This is Clarke's personal account of his unique mission. In the end, Dewey did not make any secrets public, but it took some persuading.*

STATEMENT FOR RECORD OF PARTICIPATION
OF BRIG. GEN. CARTER W. CLARKE, GSC
IN THE TRANSMITTAL OF LETTERS FROM
GEN. GEORGE C. MARSHALL TO GOV. THOMAS E. DEWEY
THE LATTER PART OF SEPTEMBER 1944

* * *

In the forenoon of Monday, 25 September, I was asked by Maj. Gen. Clayton Bissell, A. C. of S., G-2, if I was known personally to Gov. Thomas E. Dewey, Lt. Gen. Hugh A. Drum, or any of Gov. Dewey's entourage or close associates. I stated that I did not know and, so far as I knew, was not known to any of these people. Gen. Bissell later informed me that I would be directed to take a letter to Gov. Dewey at Tulsa, Oklahoma, Gov. Dewey's next stopping point on his trip east from the West Coast. Later in the day, in the office of Col. Frank McCarthy, Secretary of the General Staff, I was given the letter to read, to check for accuracy of technical details. Later in the day I was informed by Gen. Bissell that I should travel in civilian clothes and, if possible, make my contact with Gov. Dewey unknown to any other person, but that under no circumstances was I to disclose to anyone except Gov. Dewey my mission or the contents of the letter, nor was I to give the letter to Gov. Dewey unless we were the only two present in the room at the time.

I left the Pentagon Building early in the afternoon of Monday, 25 September, and went home in order to get my civilian clothes out of storage and have them pressed in preparation for the trip. After dinner I returned to the Pentagon Building, where I received orders from Major Earman at 1942 EWT, Monday, 25 September. Went to airport and got off ground at 2040 EWT. Landed at St. Louis for fuel at 2330 CWT. In air again 2400 CWT and landed in Tulsa at 0150 CWT. Slept in

Hotel de Gink. Up at 0700. Phoned Gen. Bissell at 0730. Went to Meyo Hotel, had breakfast and phoned Roger Randolph at 0820. Got haircut and shave and saw Roger Randolph at O905. He contacted Mr. William Skelly, President of the Skelly Oil Company. Mr. Skelly was Gov. Dewey's campaign manager and was handling all arrangements. Went to Mr. Skelly's house and made arrangements to meet him in private hotel room in Tulsa Hotel. Met Mr. Skelly as agreed at 1600. He saw Gov. Dewey's Secretary who came down twice to insist that he know who I was and what I wanted. No one knew anything about the case except that I had a letter that had to be delivered to Gov. Dewey personally and alone. Finally he said, "You must write down the name of the man who has sent you, seal it and give it to Gov. Dewey." I did this, and after being gone 16 minutes, he returned and said Gov. Dewey would see me.

I saw Gov. Dewey alone, delivered the letter and asked that I not read it aloud. Gov. Dewey opened the outer envelope and then said, "Well, Top Secret - that's really top isn't it?" He read the first two paragraphs and then stopped. He asked if I were a Regular Army officer. When I said yes he asked if I would give him my word of honor that I had been sent by Gen. Marshall. I said I would. He then said he did not want his lips sealed on things that he already knew about Pearl Harbor, about facts already in his possession or about facts which might later come into his possession from other sources but which, if they were contained in Gen. Marshall's letter, could not be used because he had given his word on this letter, thereby sealing his lips. He said he would be glad to discuss this matter with me now. I told him I was merely a courier and was not authorized to enter into any discussion about what he knew about Pearl Harbor or about the contents of this letter. He then asked if I was authorized to say to him in the name of Gen. Marshall that if he read the letter through and then stated to me that he already had in his possession the identical information that was contained in the letter, that he would then be released from all obligations to keep silent. I said I had no such authority. He then said he could not conceive of Gen. Marshall and Adm. King being the only ones who knew about this letter. Furthermore he said he could not conceive of Gen. Marshall approaching an "opposition candidate" and making a proposition such as was apparently contained in that letter. He said "Marshall does not do things like that. I am confident that Franklin Roosevelt is behind this whole thing."

All this time the letter was lying face down in his lap. He then picked it up and said "Let me read those first two paragraphs again." He started to read, then laid the letter down and said "I have not reread them because my eye caught the word "cryptograph." Now if this letter merely tells me that we were reading certain Japanese codes before Pearl Harbor and that at least two of them are still in current use, there is no point in my reading the letter because I already know that." He then said "That is the case and I know it, isn't it?" I said, "Governor, I am merely a courier in this case." He said, "Well I know it and Franklin Roosevelt knows all about it. He knew what was happening before Pearl Harbor and instead of being

reelected he ought to be impeached." He then said "Would you like for me to phone Gen. Marshall and say to him what I have just said to you?" I said "Governor, this is a subject that should not, under any consideration whatsoever, be discussed or even mentioned over the telephone." He handed me back the letter saying, "I shall be in Albany Thursday and I shall be glad to receive you or Gen. Marshall or anyone Gen. Marshall cares to send to discuss at length his cryptographic business or the whole Pearl Harbor mess." He continued, "I can arrange it so the conference can be held in absolute secrecy." I then put the letter back into the envelopes, thanked him for his courtesy in giving me so much of his time, and departed. I then left the hotel, went to the field, phoned Gen. Bissell. Took off at 1815 CWT 26 September.

I arrived at Washington airport at 2245 EWT 26 September. I phoned Gen. Bissell and asked if it was necessary for me to make my report that night. He said "No but be in the office early the next morning in order that we may report to the Chief of Staff."

About 0740 on the morning of 27 September, accompanied by Gen. Bissell, I made oral report to Gen. Marshall as indicated above, leaving with him at that time Gen. Marshall's letter which I had taken with me to Tulsa and brought back on my return trip.

Later in the day on Wednesday, 27 September, I was informed by Gen. Bissell that on the following morning I was to go to Albany to contact Gov. Dewey and to give him another letter which had been prepared by Gen. Marshall. At 1008 on 28 September I took off from Washington airport and landed at Albany at 1205. Went by taxi direct to the State House. Arrived there at 1250. Contacted Gov. Dewey's office and was put in touch with Miss Ross, his private secretary. She asked who I was and what I wanted. I told her that I was same individual who had contacted Gov. Dewey last Tuesday in Tulsa and that I was there at Gov. Dewey's invitation with another letter and message for the Governor. She left to phone and in a few minutes came back saying that Gov. Dewey desired me to come right over to the Executive Mansion. I arrived there at 1330 and was taken directly to Gov. Dewey's reception room. Present were Gov. Dewey and a man introduced as Mr. Elliott V. Bell, Superintendent of Banks, State of New York. I stated to Gov. Dewey that at Gen. Marshall's direction and in accordance with Gov. Dewey's invitation extended in Tulsa, I was there to present him a letter and message from Gen. Marshall and to answer any questions of a technical nature that the Governor might care to ask after a reading of the letter. Gov. Dewey asked if it were the same letter I had in Tulsa. I said no but that it was on the same subject and that the meat of the letter was the same. He then asked if I still had instructions to see him alone. I replied that I had. He next asked if I could leave the letter with him. I said no that I was to return the letter to Gen. Marshall. He asked if I were authorized to discuss the contents of the letter with him. I stated that I could discuss the technical features of the case freely and could answer any technical questions on the subject that he might care to ask.

Gov. Dewey then said that, in view of the circumstances, his own personal position, in view of what he already knew, to say nothing about what he might later learn, and particularly in view of his trusteeship, he had decided that he could not see me or anyone else alone, that he would not read a letter which he could not keep and which he could not show to and discuss with Mr. Bell, nor would he enter into any further discussion without Mr. Bell being present. He said he could not afford to read a letter he could not keep as he might later be charged with reading a letter different from the one he had really read. He said I might be curious to know whether or not he had a recording device in the room. I said "No, Governor, I am not curious; I merely assume that you have one." He said "Well I haven't and I did not ever have one when I was District Attorney. I had one in my witness room, of course, but never in my own private office." He next said, "Now Colonel, Mr. Bell is an American citizen and is just as patriotic as any member of the Administration. He already knows all the facts that I know in regard to Pearl Harbor and I certainly intend that he know the contents of the letter if I read it. If I keep the letter I shall put it in my vault and no one but Mr. Bell and myself shall know of its existence or of its contents and we shall discuss it only between ourselves. Furthermore I do not see what Gen. Marshall is so exercised about. There are at least 12 Senators that I can name for you right now if you desire that know all there is to be known about Pearl Harbor and about how we were reading certain Jap codes before Pearl Harbor and how it is claimed that we are still reading two of these same codes. You know, Colonel, this code business is the worst kept secret in Washington, but I for one want to say to you that I do not believe any such thing as that to be a fact."

I said, "Well, Governor, whether you believe it or not, it is a fact and I am willing to take an oath to that effect right here and now. Let me assure you that Gen. Marshall's sole interest in this matter is to protect our most vital source of intelligence and to save the lives of thousands of troops that are certain to be sacrificed if security on these ciphers is blown and the Japanese change them." I then said, "There are many other aspects of this case that I would like to tell you but I feel that you should read the letter first."

He sat silent for about three minutes then said, "Why don't you phone Gen. Marshall and tell him that I will not discuss the matter with you unless Mr. Bell is present, nor receive the letter unless I can let Mr. Bell read it and then I keep it?" I said that I did not want to phone from the Executive Mansion but would go to a pay phone and call; that if I were unable to reach Gen. Marshall I would fly back to Washington at once, deliver Gov. Dewey's message, and return to Albany tonight and be available to see him (Dewey) early tomorrow morning. He said, "Well I have a direct line in here and I have a line that goes through the switchboard and there is no tap on either of them unless O'Connor has just put one on. I have them checked several times a week so I feel that they are safe." I asked who O'Connor was and he said he was the Democratic leader here in Albany. I said, "Well I prefer not to have the phone used in this case." He said, "Oh hell, I'll

phone Marshall, I've talked to him before and this will be all right." He then picked up the phone and put in a call to Gen. Marshall. While waiting for the call, which took about seven minutes, Gov. Dewey said, "If, as you say, the Japs are still using two of their codes that they used before Pearl Harbor, why in hell haven't they changed them, especially after what happened at Midway and the Coral Sea?" I explained the difference in the types of codes and ciphers used by the various Jap agencies, their distribution problems: and gave the reason we think the Japs have not changed these codes. He then asked why Gen. Marshall was so anxious to stop him from talking when everyone else in Washington knows the story and is talking about it. Just then the call was completed and he talked to Gen. Marshall in re the letter and about Mr. Bell. He then gave the phone to me, and Gen. Marshall authorized me to give the letter to Gov. Dewey, to leave it with him and to discuss the case technically in the presence of Mr. Bell.

As I was opening the envelope Mr. Bell said, "Colonel, hundreds of people know all about the Midway affair and how most of our other successes in the Pacific have been due to our reading Jap naval codes. Everyone who has ever been out there knows about it and talks freely about it. Why not long ago at a dinner where a large number of people were present I talked to a naval commander who had been out there and had participated in nearly every engagement we have had. He said that they always knew where the Jap ships were and that our people were told by radio where to station their own ships to meet the Japs, and that all this information came from reading Jap codes."

Gov. Dewey said "Yes and I have lots more information about the pre Pearl Harbor messages you were reading." He then took the letter and started to read.

Mr. Bell said, "Tom, do you want me to read it over your shoulder?" Gov. Dewey said "No I'll hand it to you a page at a time." Gov. Dewey continued to read, then put the letter down and said, "Well I'll be damned if I believe the Japs are still using those two codes." I again assured him that they were and that one of them was our life blood in intelligence. The letter was still in his lap when I said "Governor, I would like to repeat that I know that Gen. Marshall's sole interest in this case is to preserve the only worthwhile source of intelligence that this nation has. You do not realize it but the War Department has 10,200 people working in the Signal Security Agency; the Navy Department has almost 6,000 in their Communications Annex, and both the Army and Navy each have several thousand in tactical field and fleet units engaged in signal intelligence work.

* * *

Gov. Dewey said "Yes, Gen. Marshall just said that we had over 10,000 on that work."

I then stated that Churchill considered this his secret weapon and that it had really saved England. I described how Churchill felt about security, how the Navy

prized it so highly and how difficult it had been to break down British resistance because of American lack of security consciousness. I quoted to him Churchill's reported statement about protecting this source, how that in order to protect the source the British had time and again permitted convoys to be attacked rather than divert them from their course and thus blow security.

Gov. Dewey then picked up the letter and read some more. Then he put it down and said "Is this true about the OSS?" I said it was. He said "Well I don't feel towards the OSS like most of the Army and Navy people I have talked to. I have a lot of my men in it and they are all damn good, excellent fellows in fact, and they tell me that we have no really trained intelligence personnel in either the Army or Navy. They say that in both the Army and Navy the officers are merely on temporary detail and that they then go to sea or back to a regiment or somewhere, and that most of the officers of both services are woefully ignorant of world affairs. I suppose that may be the real reason for taking no action on the Pearl Harbor warnings they had—they could not interpret the warning."

Mr. Bell then said "Well it don't account for them not doing anything about that message that gave them the warning that Japan was going to attack the United States—you know the one I mean—where they set the deadline for Kurusu for November 25 and then postponed it till November 29 saying to get done with their negotiations by that time or that things would automatically begin to happen. Anyone should have known that that meant they were going to attack the United States. That was just the time limit on sailing dates."

Gov. Dewey said "Yes that's right." Mr. Bell then said "Those messages you did not get till December 8 and after, why did it take so long for you to receive them?" I said "I do not know what you are referring to, but before Pearl Harbor all our traffic intercepted on the West Coast, Hawaii and elsewhere was sent in by air mail which of course delayed it."

Gov. Dewey then read the letter through and handed the last page to Mr. Bell. After Mr. Bell had finished reading, he handed the letter back to Gov. Dewey. After a minute or so Gov. Dewey said "Well, except for the matter of the two codes and the OSS, there is little in this letter that I did not already know. There is one point though, what in hell do Jap codes have to do with Eisenhower?" I explained the linkage with a general statement on the three types of ciphers used by G.A.F., Abwehr, Clandestine, German Navy, Oshima's visits and interviews, etc. He seemed satisfied. He then said "Colonel, I know a hell of a lot about this business. You probably know that some years ago when Stimson was Secretary of State he got very damn pure minded one day and stopped all such things as this. He afterwards denied that he had done it but said he was acting on orders from President Hoover. Well, as you know, the man who headed the cryptographic work of the Government was Yardley who was fired by Stimson. Yardley was a friend of mine in those days and I am the man who stopped Yardley from publishing his second book. I met him in a speakeasy one night and persuaded him against publishing the

book. He agreed provided that Mr. Stimson write him a letter of apology for the abusive manner in which Stimson had fired him. Stimson did, too."

I did not comment on this other than to say I was quite familiar with the Yardley case. I then asked if there were any questions the Governor or Mr. Bell would like to ask. Gov. Dewey said "Not just now but I would like to discuss this case with Mr. Bell." I got up to go out of the room into the hall but Gov. Dewey said "No you stay here, we will go across the hall." I sat down and Mr. Bell said "Well, Governor, we have pledged ourselves not to discuss this letter with anyone else but just between ourselves but what about Colonel Clarke—who is he going to discuss it with?" Gov. Dewey said, "Oh he will of course report this conversation to Gen. Marshall—is that not correct?" Before I could reply Mr. Bell said "Yes but with who else?" Gov. Dewey said "Anyone else?" I said, "I shall report to my immediate superior, Major General Clayton Bissell, A. C. of S., G-2, War Department, and through him to Gen. Marshall and to no one else."

They then got up and left the room, leaving the letter on a stand by Gov. Dewey's chair. They were gone about 22 minutes. When they returned Gov. Dewey said "Let me look over this letter again and read carefully a couple of paragraphs." When he finished he said, "Well, Colonel, I do not believe that there are any questions I want to ask you nor do I care to have any discussion about the contents of the letter. Will you give me your full name, serial number, office location and phone number, and your residence address and phone number?" I did this and he thanked me and asked where I was staying. I told him I was flying back to Washington tonight and was going direct to the airport. I then asked him if he had any message that he wanted me to take to Gen. Marshall. He said "No, no message." I thanked him for giving me so much of his time. He shook hands and said "Well I hope we meet again under more auspicious circumstances." I said goodbye to him and to Mr. Bell and left for the airport at 1610. Next I phoned Gen. Bissell and to plane. In air at 1645.

I arrived at Washington Airport 1855 and phoned Gen. Bissell advising him of my return and asking if it was desired that I make report that night. He answered in the contrary but directed me to be in the office early the following morning in order that we might make report to the Chief of Staff. Again about 0740 on Friday, 29 September, accompanied by Gen. Bissell I made my second report to Gen. Marshall as indicated above.

CHAPTER IX

Tactical COMINT

The Army signals intelligence effort was a divided one in World War II. At the national level, the Signal Security Agency provided high-level cryptanalysis. The intercept arm of the agency was the 2d Signal Service Battalion, which maintained large fixed intercept stations in a number of locations in the Continental United States and around the globe. However, in the field, theater commanders directed a separate tactical effort through theater-level signal intelligence services, which controlled a multitude of signal radio intelligence companies and (in Europe) smaller signal service companies. By the end of the war, numbered Army Air Forces also had their own signal intelligence elements in the form of Army Air Forces radio squadrons, mobile. The diversity and scope of the tactical effort is shown by the following excerpted documents: SRH 124, Operational History of the 849th Signal Intelligence Service; SRH 048, Summation of Operational Activity, Signal Service Detachment "D"; SRH 042, Third Army Radio Intelligence History; and SRH 227, History of the 126th Signal Radio Intelligence Company. The excerpt from SRH 049, Technical Intelligence Transmitted Directly to G-2 12th Army Group, ETO From 14 August 1944 to May 1945, contains one day's intelligence "take" from tactical COMINT efforts in Europe. It demonstrates what could be gleaned from radio direction-finding and the exploitation of low- and medium-level German ciphers.

From SRH *124. Excerpts from the official history of the Army's signal intelligence service in the Mediterranean Theater of Operations. The account shows the slow evolution of Army signals intelligence organization in the field as the result of lessons learned in actual combat operations. As a matter of interest, the 849th Signal Intelligence Service was the only World War II theater signal intelligence service to be assigned a numerical designation.*

OPERATIONAL HISTORY
of the
849TH SIGNAL INTELLIGENCE SERVICE

Mediterranean Theater of Operations
United States Army

* * *

PART I: BEGINNINGS

GENERAL

1. It was originally planned that all U.S. signal intelligence activities at AFHQ would be handled by a unit entitled Signal Intelligence Service, AFHQ, the commanding officer of which would be a member of the Chief Signal Officer's Staff. A T/O and an SLOE were submitted to the War Department on this basis. These were approved, but the unit was redesignated as the 849th Signal Intelligence Service, and it was decided that the unit would not constitute the Signal Intelligence Division of the Signal Section, but would work under that division in a separate location of its own at some distance from headquarters. Since there was no basis of experience in contemporary warfare on which to build, the original T/O merely represented a careful guess as to what the function of such an organization in an active theater of operations should be, and what personnel would be necessary to perform them. The organization, being unique, was not referred to in any T/BA: and the Special List of Equipment, which was its only basis for drawing supplies, would have been markedly inadequate in any case. The fact that it was not modified in any way to conform to the change from a staff section to a field unit multiplied this inadequacy. As a result, the unit set up in an isolated ravine in North Africa, without a telephone, a foot of field wire, a radio set, or a power unit, to mention only a few of the more obvious necessities. Many of these items would have been provided automatically for a staff section, but to procure (and keep) them for a field unit, entitled only to T/E and T/BA allowances has involved a com-

plicated and continual struggle.

2. In order to take advantage of greater British experience in intelligence operations, the 17 officers, and 90 EM called for in the Cryptanalytic and Radio Intelligence Sections of the Intelligence Branch were activated at Fort Dix on 8 November 1942 as Signal Intelligence Detachment 9251-A, under the command of Capt. [text withheld]....The Detachment left for England on 24 November. It was only upon their arrival in Africa, three months later, that the members of this group learned that they were earmarked for the 849th SIS, of which they had never heard. On 2 December 1942 the 849th SIS was formally activated at Fort Devens, with Capt. [text withheld] in command. Assigned to it at this time were 16 officers and 102 EM, which, with the personnel of Detachment 9251-A made up the exact number called for on the T/O. Captain [text withheld] was under the impression that the personnel of Detachment 9251-A had also been assigned, and no evidence was available by which this impression could be corrected. The unit was therefore apparently up to full strength; but the C.O. was junior to Capt. [text withheld] who had originally been intended merely as a section head. In general, technical qualifications and relative rank were so poorly adjusted that it was clear that one or the other would have to be disregarded unless additional officers were brought in at the top. The fact that the organization, including the detachment in England, contained only six officers above the grade of second lieutenant and none above the grade of captain, while the T/O called for a colonel, two lieutenant colonels, and seven majors suggested that this was very likely to happen.

a. It did happen on 14 January 1943, when five officers from SIS, Western Task Force and three from SIS, AFHQ were assigned by NATOUSA orders to the 849th SIS, which embarked from NYPE the same day. This group included Major [text withheld] Commanding, and Capt. [text withheld] selected as OIC, Intelligence Branch. Twenty seven enlisted men from the same sources were also assigned to the 849th SIS, a site was found at Hammam Melouane, and operations were begun on such a limited scale as was possible. On 1 February the main body of the 849th personnel arrived, and Capt. [text withheld] was designated OIC, Security Branch. On 20 February, Signal Intelligence Detachment 9251-A, less three officers and twelve men left in England for further training, arrived and was assigned to the 849th. The organization was now considerably above its authorized strength, particularly in officers; but in the midst of the general confusion this fact escaped unfavorable comment. The key position had been filled, the general shakedown process was well under way, and the organization was ready to begin full scale operation under the supervision of Colonel Harold G. Hayes, SIS officer, AFHQ. It must be confessed that the question of what these operations were to be still needed a good deal of clarification.

b. Three major policy problems had to be faced:

(1) Coordination with the [text withheld] whose intelligence and security organization does not parallel our own.

(2) Determination of the levels at which various SIS activities were to be carried on and the inter-echelon coordination of these activities.

(3) Adaptation of radio intelligence organizations to the intelligence and security needs of the theater. In addition there were the continually developing problems of procuring and training personnel, procuring, modifying, and improvising equipment, selecting specific commitments and devising techniques to meet them, etc.

3. After these three problems and those of supply had been solved to a degree which permitted operations to begin, another and more difficult problem became apparent as soon as the 849th SIS began to serve other headquarters. This was the non-acceptance by many commanding and staff officers of the benefits, intangible tho many were, resulting from an adequate signal intelligence program.

a. The Intelligence Branch met this problem in the reluctance with which American tactical staffs first allowed Detachments of the Branch to operate in combat areas, where tactical information available to intercept and cryptanalysis was most abundant. It was believed that such an apprehension for the safety and security of signal intelligence operations was founded on a general ignorance within the then new American tactical staffs of the role which signal intelligence could play in combat operations and an unfortunate misconception in the same quarters of how the exploitation of German Army low-security radio traffic could best be accomplished. American tactical commands, unfamiliar with signal intelligence services, were not anxious for the information which signal intelligence could supply, and were at first skeptical of the validity of some of the information produced by the Detachments. Furthermore numerous serious security violations were at first made by tactical commands in handling signal intelligence information, illustrating the general lack of appreciation for signal intelligence methods in tactical commands.

b. Unlike the [text withheld] in North Africa, whose staffs had become thoroughly familiar with tactical signal intelligence operations as a result of the desert campaigns, the new American staffs in Algeria and Tunisia had to be indoctrinated with the manner and value of signal intelligence work. The critical period of "selling" signal intelligence to American staffs as an integral intelligence function in forward areas occurred during the invasion of Sicily. Detachments "A" and "E" of the Intelligence Branch were originally scheduled to go ashore in Sicily with the Headquarters Seventh Army and the reinforced 3rd Division (VI Corps), Detachment "A" to land as soon as a beachhead of 10 square miles had been secured, Detachment "E" to land within a few days after D-Day. Concern for the security of signal intelligence personnel and operations resulted in Seventh Army Headquarters holding the Detachments in North Africa until 7 August (D + 30), and the units did not land in Sicily until 10 August, one week before the end of the Sicilian campaign. With such a short period remaining for operations before the

conclusion of the campaign the achievements of American signal intelligence units in Sicily were obviously not impressive. The Detachments furnished valuable tactical information throughout the short period; but their greatest contribution, which would have been possible in the early days of the campaign, when enemy strengths and dispositions were largely undetermined, was lost to the Allied effort.

c. Gradually, however, American tactical commands developed greater appreciation for intercept intelligence and the problems involved inproducing such intelligence; and in time signal intelligence was considered at all times to be a dependable source of intelligence and under some conditions to be the best source of information concerning enemy tactical forces available to American Army and Air force tactical commands. That Detachments were in time allowed to operate in forward combat areas where tactical information was best intercepted is demonstrated by the fact that two Intelligence Branch Detachments landed at Anzio on D-Day and were scheduled to land in Southern France on D-Day but were held up until approximately D + 5 because of confusion in shipping schedules.

d. Early, effective operations by the Security Branch were hindered through a failure of staff and unit officers to appreciate or even realize that all signal security efforts were directed at protecting them and their units from enemy action. It was this factor which made it impossible to correct quickly the uniformly low state of signal security training with which American troops entered North Africa. The general attitude towards signal security was that it consisted of a set of cumbersome regulations, and the reaction varied according to temperament. Many officers were frankly hostile, considering all SIS personnel as parasitical non-combatants conspiring to complicate the jobs of honest fighting men. Others, having developed a philosophical resignation toward all regulations, were almost pathetically eager to comply with whatever was published;....In operations, the first reaction resulted in so many messages passed in clear and others so carelessly enciphered that it looked like a conspiracy to ignore as many security provisions as possible and in the second, resulted in an attitude which said in effect "put it in some sort of code, that is what the book says". The idea that the enemy might use intercepted information with unfortunate results to themselves was almost entirely absent. It was only after the loss of much valuable time and intense missionary work that an understanding of the purpose of signal security was achieved.

e. Time and further contact with the enemy brought changes in these attitudes. By the close of hostilities in the MTO the importance of signal intelligence was well accepted as an essential part of a complete military effort and the 849th was being called upon to perform many functions in addition to its primary mission. That all aspects of signal intelligence activities were eventually appreciated in Mediterranean Theater of Operations can best be illustrated by the 70 letters of commendation and 42 awards received by approximately 400 individuals of the 849th SIS. . . .

4. Attached. . .is a table of personnel originally allotted to the 849th SIS. It is shown here with the caution that it proved inadequate for signal intelligence activities in MTO and that at best can only be used as a guide in planning similar units since SIS functions appear to vary greatly from theater to theater. The scope of the 849th early increased beyond the bounds of the T/O. The personnel problem however was alleviated to a large extent by the assignment of an AFHQ Signal Intelligence pool of 27 officers and 284 enlisted men and an AFHQ Cryptographic pool of 29 officers and 323 enlisted men. While this appears to be a tremendous increase over the T/O, the 849th also took over the mission of those two pools. The additional personnel permitted the headquarters section to be augmented where needed and permitted a shifting of officers and men to meet the ever changing operational demands, all of which greatly increased the effectiveness of the 849th SIS.

PART II: INTELLIGENCE BRANCH

GENERAL FUNCTIONS

1. Introduction.

a. The basic duties of the Intelligence Branch were clear in principle from the date of activation of the 849th SIS: to derive intelligence from enemy radio transmissions. At that date, however, the multiple forms which Intelligence Branch functions would later assume and the many problems which were to be encountered in fulfilling those duties could not be foreseen.

b. Before the end of hostilities in Europe the Intelligence Branch would develop from a handful of personnel to a complex organization whose activities included: three Detachments fulfilling signal intelligence commitments at U.S. Corps (II, IV, VI) Headquarters, involving the interception and analysis of German Army low-security radio traffic; two similar Detachments fulfilling similar commitments at U.S. Army (Fifth, Seventh) Headquarters; one Detachment analyzing German Army medium-security traffic; two Detachments providing the Mediterranean Allied Air Forces with information derived from the analysis of German Air Force low-security and plain-language (voice) radio transmissions; one Detachment analyzing enciphered European weather broadcasts emanating from within enemy-held territories for the 12th and 15th U.S. Air Forces; one Detachment analyzing [text withheld] radio traffic and later providing the Office of Strategic Services with information from a study of clandestine radio traffic of enemy agents in Allied controlled territory; one Detachment providing the Civil Censorship Group of the Allied Control Commission with information from the analysis of secret inks and other types of unauthorized correspondence; and a Headquarters whose operations included, in addition to routine administrative functions, a continuous supply of technical intelligence and information to the Detachments in the field, research into the German communications systems, solu-

tion of German Army medium-security traffic, a Communication Section to provide all communications between the Headquarters 849th SIS and its Detachments and other Headquarters, and a Laboratory Section for reproducing important captured documents and photographing materials of all kinds.

c. When the Intelligence Branch began operations in North Africa during the winter of 1942-43 radio intercept and the cryptanalysis of enemy low- and medium-security radio traffic within an active theater of operations constituted an unexplored field for the new United States Army. Consequently, the growth of the Intelligence Branch was attended by many restrictive elements. [text withheld] It had been arranged to have several Signal Radio Intelligence Companies provide all American radio intercept facilities required within the theater, operating in conjunction with, but independent of, Intelligence Branch cryptanalytic Detachments; and it was not long before such an arrangement presented a number of shortcomings. Inadequacies in the 849th SIS T/O presented additional difficulties to the development of the Intelligence Branch; and the invariable insufficiency of training of all newly-arrived personnel from the United States and London was another stumbling block to the proper expansion of the Intelligence Branch. Finally, the problem of equipping each newly organized detachment was complicated by grave inadequacies of the T/E of the 849th SIS.

2. Cryptanalysis.

a. In order to limit to a reasonable extent the scope of work to be performed by the Intelligence Branch, consideration being given to the number of personnel available and to their state of training, it was planned originally that the work of the Branch would involve at first only the study of German Air Force low-security radio traffic. Such traffic consisted of radio activity of the German Air Forces operating throughout the western and central Mediterranean area, involving transmissions of both enemy aircraft and ground radio stations. [text withheld] With this type of traffic in mind the first operational unit created within the Intelligence Branch, eventually called Detachment "F", was formed in February 1943. Personnel of this Detachment underwent preliminary training [text withheld] near Algiers, and by the summer of 1943 were ready and able to assume an independent signal intelligence operational commitment.

b. After the personnel of Detachment "F" had commenced their training and additional personnel were available to the Intelligence Branch consideration was given to another type of enemy radio traffic, German Army low-security traffic, most of which emanated at regimental level and below. This traffic consisted of [text withheld] jargon codes, simple substitution ciphers and transposition systems, and was fairly easily broken also by elementary cryptanalysis when sufficient depth was encountered. At the end of February a small group of personnel was attached to [text withheld] United States II Corps in Tunisia to learn the techniques of analyzing such German Army low-security traffic. These people formed the basis of what later became Detachment "A". As time went on additional

detachments were formed to perform the same type of cryptanalytic functions as Detachment "A", and eventually there were five detachments exploiting such German Army low-security traffic: Detachment "A" at Headquarters Fifth Army, Detachment "B" at Headquarters Seventh Army, Detachment "E" at Headquarters U.S. VI Corps, Detachment "H" at Headquarters U.S. II Corps, and the 3916th Signal Service Company at Headquarters U.S. IV Corps.

c. During the summer of 1943 it became apparent that an additional cryptanalytic task could be undertaken by the Intelligence Branch. The Army Air Forces were in need of the information which could be derived from enciphered European meteorological radio transmissions giving vauable weather data over enemy-held territories. Work on this material was begun in July 1943 with the formation of Detachment "G". International Business Machine equipment was obtained; techniques for breaking the traffic were evolved; and the latest meteorological observations for enemy held territory were made available to tactical and strategic air forces in the Mediterranean area.

d. In July 1943 a further development occurred when it was found possible to attempt the solution of German Army medium-security doubly-enciphered Playfair traffic. Personnel for this task, who had been trained in the solution of German Air Force medium-security traffic in London, arrived in the Mediterranean Theater in early July. These people, who became the nucleus of Detachment "B" and later of the Solution Section at the Headquarters, Intelligence Branch, enjoyed considerable success in their solution operations whenever traffic in sufficient depth was available. The greatest difficulty encountered in dealing with such traffic, emanating usually from enemy Divisional networks, was in finding suitable sites for its interception.

e. The value of German Air Force voice traffic on Very High Frequencies (38-42 mcs), mostly plain language, had long been recognized, and in August 1943 a detachment of German linguists was formed to exploit this source of intelligence, eventually becoming Detachment "D". Personnel were assigned aboard the USS Ancon, and the group provided important intelligence of German Air Force activity during the landings at Salerno. Later the Detachment operated in the vicinity of Naples, on the Anzio beachhead, during the invasion of Southern France, and northward with the Allied forces throughout France and into Germany, working with Allied Tactical Air Commands and Fighter Wings. The same type of traffic was also exploited during more than a year's period by two groups of three enlisted men of Detachment "D" aboard United States destroyers escorting Allied convoys throughout the Mediterranean area. After January 1944 German linguists were used regularly in all Intelligence Branch Detachments serving Corps Headquarters to intercept German Army voice traffic on such Very High Frequencies (32-38 mcs).

* * *

4. Laboratory Facilities.

a. Communications Intelligence. A small section had originally been provided at the Headquarters, Intelligence Branch for the collection and study of captured enemy communications equipment. It was soon felt, however, that the section was unable to carry on its prescribed duties successfully as a subordinate part of the Intelligence Branch, and in June, 1944 the section was activated as the Enemy Equipment Intelligence Service. Having its own T/O and E, the new unit was assigned to the 849th SIS and removed from the control of the Intelligence Branch. . . .

b. Laboratory Section—Photographic and Chemical. Photographic facilities provided by the original 849th SIS T/O and E proved inadequate to the tasks which later developed, and constant additions in personnel and equipment were necessary to meet constantly greater requirements. In addition to providing photographic facilities for the 849th SIS the Laboratory Section was responsible for maintaining a laboratory to make chemical analysis of civilian and prisoner-of-war mail for secret ink and other unauthorized means of communication. Original estimates of personnel, equipment, and supplies necessary for the Chemical Subsection were similarly disproportionate to actual requirements, and a process of continuous growth was characteristic of that subsection also.

c. Communications Section—From a small group of personnel who installed telephone and lighting facilities at Hammam Melougne in February 1943 was gradually evolved a Communications Section. Although part of the Intelligence Branch the section provided communications facilities for the entire Headquarters, Intelligence Branch. In time the section expanded in size and operations until it maintained radio and teletype links with most field units.

MAJOR PROBLEMS ENCOUNTERED

* * *

a. At the opening of operations in the Mediterranean Theater [text withheld] already had a number of signal intelligence units in the field properly trained for the interception and solution of German Army and Air Force low-security radio traffic. Plans for utilizing U.S. signal intelligence personnel had not been properly integrated with the British before the invasion of North Africa; but shortly after the formation of the 849th SIS and its arrival in North Africa [text withheld] it was recognized that American units would in time be able to contribute to the North African signal intelligence effort.

* * *

2. U.S. Signal Radio Intelligence Companies.

a. Four U.S. Signal Radio Intelligence Companies—the 117th, 122nd, 123rd, and 128th- together with a number of intercept operators later assigned to

the 849th SIS itself provided intercept facilities for the several detachments of the Intelligence Branch. In a number of cases the SRI Companies were themselves split into detachments to provide facilities for new Intelligence Branch detachments formed to meet new commitments. All four SRI Companies were originally assigned to Allied Force Headquarters (AFHQ), and their operational activities were then directed by the American Signal Intelligence Officer of AFHQ.

b. Of these four SRI Companies the 122nd and 128th arrived in North Africa with the invasion forces. The operators were inexperienced with the new types of traffic they were to intercept; and until late 1944 there was an insufficient number of trained operators to meet the minimum requirements of the individual Intelligence Branch detachments and monitoring tasks which were assigned by the Monitoring Section of the Security Branch, 849th SIS.

c. Early in 1943 steps were taken to remedy the shortage of intercept operators by securing the 117th and 123rd SRI companies to supplement the first two. Before these units arrived in North Africa several important months had passed, and more months of training were required to bring the operational efficiency of all units to a point where specific commitments were possible.

d. A directive from the American Signal Intelligence Officer, AFHQ, made clear the fact that the Intelligence Branch Detachments working in conjunction with the SRI Companies were to direct the employment of sets and assign specific intercept missions. Experience proved, however, that although relations between the SRI Companies and the Detachments of the Intelligence Branch were on the whole satisfactory the degree of cooperation and efficiency obtained often depended on purely personal relationships between the officers and men of the units in question and not on any clearly defined policy of command. The separation of intelligence and intercept sections, although possible in theory, in some cases produced situations in which questions of policy and operational control were in open conflict. The fact that the Intelligence Branch Detachments had to be attached to the SRI Companies for rations, quarters, and administration produced other unsatisfactory situations that hindered proper cooperation between the two types of units.

e. A step toward remedying the situation was taken by the Army Air Forces after the assignment of the 122nd and 123rd SRI Companies to the 12th Air Force in November 1943. A plan was studied and later approved to provide a self-contained signal intelligence unit comprising both intelligence and intercept personnel. On the basis of such reorganization the 123rd SRI Company was renamed the 9th AAF Radio Squadron Mobile (G) in March 1944; after a long delay intelligence personnel were obtained for this new Squadron from the U.S., and the Squadron began to function as a complete unit in December 1944. The 122nd SRI Company was never reorganized, and continued to operate in conjunction with the Intelligence Branch Detachment "G" until June 1945.

f. A similar step in the right direction within the Army Ground Forces occurred when T/O's and T/E's were approved by the War Department in January

1945 for Corps Signal Service Companies, providing for self-sufficient organizations which contained both intercept and intelligence personnel. Detachment "H" and a detachment of the 128th SRI Company which had been operating in conjunction with Detachment "H" were combined to form the nucleus of one such Signal Service Company (3915th SS Co) in February 1945. . . .

g. Another critical handicap encountered as long as the SRI Companies and Intelligence Branch Detachments operated independently involved a theater policy concerning dissemination of signal intelligence information. According to theater regulations personnel of SRI Companies were not allowed access to technical signal intelligence information and procedures that formed the basis for intercept set assignment. Consequently SRI personnel were given only specific frequency and callsign missions daily, and were not entitled to know the basis for such missions. Such an arrangement required additional signal intelligence personnel on duty in intercept rooms supervising intercept activities to guarantee proper coverage. And in spite of such efforts many valuable minutes of intercept operators' time were often wasted by copying worthless traffic before being noticed by signal intelligence personnel on duty in the intercept rooms. Both intelligence and intercept personnel resented the restriction; but as long as they existed under separate units nothing could be done. Intercept personnel were especially resentful of the fact that they were denied access to information which would increase the efficiency of their work. The situation was corrected only when the two types of personnel were placed under one command, as in the case of the 3915th Signal Service Company; for then both intercept and intelligence personnel were allowed complete access to all pertinent signal intelligence data.

3. Procurement and Training of Personnel.

a. When the 849th SIS was activated it was expected that the Intelligence Branch would consist only of Signal Intelligence Detachment 9251-A; but, in fact, it was subsequently composed of several heterogeneous groups, each trained for different tasks. SID 9251-A, after preliminary training in cryptanalytic methods for a short period at Vint Hill Station, USA, embarked for SIS ETOUSA in November 1942 for practical experience in processing traffic from both German Army and Air Force units. Of this group 14 officers and 77 enlisted men were sent to the 849th SIS in February 1943, leaving 3 officers and 13 enlisted men in London (eventually to become nucleus of Solution Section, Headquarters Intelligence Branch) to deal operationally with German Air Force medium-security traffic.

b. During January 1943 the intelligence members of the Western Task Force SIS Section consisting of 2 officers and 6 enlisted men having completed their duties in Morocco, had set up their headquarters at Hammam Melouane, near Algiers. One officer and one enlisted man from AFHQ joined them there, and with the arrival of the London group in February plans for training and operations in the theater were put into effect.

c. The largest single increment of personnel became available when the

T/O for the Signal Intelligence Detachment, NATOUSA, was assigned to the 849th SIS in June 1943. Thanks to this pool additional personnel were subsequently available to fulfill the demands of new commitments as they arose.

d. Constant additions to the Intelligence Branch were, however, required since that time. Throughout the history of the Branch it was a never-ending struggle to get adequately trained officers and enlisted men to perform the tasks required of the Branch. The process of obtaining personnel from the USA was almost always a slow and unsatisfactory one. Frequently men arriving in the theater proved to be totally unfit for the duties for which they were requested and hence could not be used. For example, a request was sent to Washington in February 1943 for immediate shipment of 10 officers trained in elementary cryptanalysis and, more important, with fluent knowledge of spoken and written German.The 10 officers arrived at the 849th SIS at the end of May 1943, after the close of the Tunisian Campaign; and of the ten officers only two had any knowledge of the German language. Another example of the inadequate training experienced by many people who were assigned to the 849th SIS was the case of personnel of the Western Task Force, who had received only 10 days' instruction in the problems of radio intelligence prior to the invasion of North Africa and who had been given no idea of the code and cipher material they might be called on to deal with. Consequently training of personnel was the most important single problem that faced the Intelligence Branch. No single increment arriving at the 849th SIS had had a sufficiently long training period under anything approaching operational conditions before entering the Mediterranean Theater. Personnel trained at SIS ETOUSA for a month or two benefitted greatly from instructions given there [text withheld] but the burden of forming detachments into units capable of assuming actual commitments rested entirely on the 849th SIS. Experience proved that most detachments required from three to five months' experience under field conditions to be able to undertake successfully any operational commitment.

e. It should be noted that too few senior officers with adequate training were available to the Intelligence Branch during the early days of the 849th SIS. The majority of officers competent to handle the technical problems of the various detachments were in the grade of Lieutenant and were consequently placed in a difficult position as regards efficient liaison with the operational staffs to which they were furnishing intelligence. Over a period of two years the situation gradually adjusted itself; but it is felt that had the initial handicap not existed existed there would have been considerably smaller loss of valuable time and, perhaps, lives.

4. Organization and Equipment of Field Detachments.

a. As has been stated above, the original T/O and T/E of the 849th SIS were manifestly inadequate to meet the great expansion of the organization in the past two and one half years. This problem was especially evident when Detachments were formed for service in the field. The only possible way for detachments to start operations was by attaching them to other self-contained orga-

nizations, such as the SRI Companies, for rations, quarters, and administration. Because of the steady development of the Branch; grades and ratings were not allotted to the Detachments on any fixed basis; and equipment for the Detachments consisted of such supplies as were available to the 849th SIS as a whole and could be spared from other duties. Such supplies and equipment as were available were issued on memorandum receipts to the Detachments. Allocation of grades, ratings, supplies, and equipment to the Detachments was made by the Officer in Charge of the Intelligence Branch on the basis of what was hoped to be a fair distribution among the Intelligence Branch, Security Branch, and the 849th overhead.

b. Such conditions were obviously unsatisfactory and unconducive to a proper spirit of morale among the Detachments. No definite grades and ratings could be counted upon with certainty within the Detachments, and Officers in Charge of the Detachments experienced difficulties from being in a subordinate administrative position to the Commanding Officers of the SRI Companies.

c. Basic T/O's for Signal Intelligence Service Detachments types A, B, C, D, and E were in existence since December 1943, but Theater regulations did not permit activation of any such detachments until June 1944, when an "A" type and a "B" type unit were activated as the 3200th and 3201st SIS Detachments assigned to the 849h SIS....The personnel for these new Detachments were obtained from the Intelligence Branch Detachments "A" and "E" respectively, and some gains in operational efficiency were noted from the reorganization. Great improvement was particularly noted with respect to grades and ratings, for with their own T/O's at their disposal the officers commanding the new detachments were assured definite grades and ratings and could handle their own promotional problems. On the other hand such reorganization did not solve the basic problem of the relationship between the Detachments and the SRI Companies, for there was no provision within these new Detachments for intercept personnel; and consequently operations with independent SRI Companies were still necessary.

d. The most satisfactory solution was reached when the T/O for Corps Signal Service Companies, approved by the War Department in January 1945, became available in the Mediterranean Theater. Two such units were activated as the 3915th and 3916th Signal Service Companies, and were assigned to the 849th SIS....The new companies, calling for both intelligence and intercept personnel under a single command, eliminated entirely the problems of grades and ratings, supplies and equipment, and operational control.

e. In spite of the advances made by the activation of such units three Detachments of the Intelligence Branch- Detachments "D", "F", and "G"—could not be reorganized, and operated throughout their existence without benefit of special T/O's, T/E's, or administrative independence of the SRI Companies with whom they worked.

* * *

From SRH 048. *Once American forces had established themselves in France, Signal Security Detachment "D" served as the central command-and-control element for all signals intelligence operations conducted by General Omar Bradley's 12th Army Group.*

SUMMARY OF OPERATIONAL ACTIVITY OF SIGNAL SECURITY DETACHMENT "D", COVERING THE PERIOD 1 SEPTEMBER 1944 TO 1 APRIL 1945

1. PURPOSE

a. This report is intended to summarize briefly the signal intelligence mission assigned to Signal Security Detachment "D" and actions taken by that Detachment in the accomplishment of that mission. Although the Detachment began field operations as a unit in the middle of August 1944, 1 September was chosen as the starting point of this report since effective contacts with G-2 Section, 12th Army Group Tactical Headquarters, and with the signal radio intelligence units in the field were firmly established by that date.

2. MISSION OF THE DETACHMENT

a. The mission assigned to the Detachment was the procurement of Signal Intelligence from the solution of enemy (German) medium and low grade tactical codes and ciphers for the AC of S, G-2, 12th Army Group, the coordination and technical supervision of the Signal Radio Intelligence Companies and Signal Service Companies operating under units assigned to 12th Army Group, technical liaison with adjacent Army Group Signal Intelligence units and with those of higher headquarters, and the coverage of clandestine radio traffic for study by the Radio Security Service (British) and as required by the AC of S, G-2, 12th Army Group. The latter mission, being somewhat separate and distinct from the provision of signal intelligence, will not be covered in this report.

b. The mission of the Detachment may be conveniently divided into four distinct responsibilities:

(1) To Signal Intelligence Division, Hq ETOUSA.

(2) To G-2 Section, Tactical Headquarters, 12th Army Group.

(3) To Signal Radio Intelligence and Signal Service Companies, 12th Army Group.

(4) To flanking Army Groups (6th and 21).

c. The manner in which the mission was carried out, will be described in the sections of the report which follow.

3. SIGNAL INTELLIGENCE DIVISION, HEADQUARTERS ETOUSA

a. Signal Security Detachment "D" was charged with the responsibility of enforcing the general signal intelligence policies of the War Department, Hq ETOUSA, and the 12th Army Group, among the Signal Radio Intelligence units of 12th Army Group.

b. In addition, the detachment provided the higher headquarters with the raw

material and finished productions of all signal radio intelligence organizations of 12th Army Group.

(1) All signal intelligence and technical data were forwarded to the Signal Intelligence Division, OCSigO, Hq ETOUSA. This commitment included transmission to that office of all technical reports published by the Intelligence Branch of the Detachment. . . .These reports were also disseminated to the Mediterranean Theater of Operations, to British signal intelligence agencies in the United Kingdom and to the War Department, Washington, D.C., through the Signal Intelligence Division, Hq ETOUSA.

(2) Radiograms and teletype messages containing current information were prepared and transmitted at least twice daily. These messages reported all data collected by the Detachment in the course of its daily operations.

(3) Captured documents, received from signal intelligence units of 12th Army Group were processed, studies published, and copies forwarded to Signal Intelligence Division, Hq ETOUSA, for permanent files.

4. G-2 SECTION, TACTICAL HEADQUARTERS, 12TH ARMY GROUP

a. Detachment "D" was charged with the responsibility of passing to the Assistant Chief of Staff, G-2, 12th Army Group, signal intelligence procured from the analysis of enemy low grade and medium grade (THUMB, PEARL and CIRO PEARL) tactical traffic. This was accomplished in two ways.

(1) Direct telephone communication was available until 4 March 1945 when, due to the tactical situation, the Detachment operated too far in advance of Tactical Headquarters to allow utilization of metallic telephone lines. However, radio or teletype (or both) links maintained constant communication from that date onwards. The appointment on 3 February 1945 of a liaison officer from the Detachment to G-2 Section also aided in the smooth flow and interpretation of signal intelligence.

(2) All pertinent technical reports published by the Detachment were transmitted daily to G-2 Section. These reports supplemented and enlarged upon the information already passed to G-2 Section by communications means described in paragraph a(1) above.

b. A complete record of all signal intelligence, of immediate value only, transmitted to G-2 Section by telephone, radio or teletype has been maintained by the Intelligence Branch of Detachment "D", but this record is too bulky for reproduction and inclusion in this report. However, for the sake of completeness, an estimate of the quantity of timely information reported during the period under review may be derived from the following figures:

	No. of Items
CIRO PEARL	1422
PEARL	632
THUMB	162

c. It is not possible to evaluate the signal intelligence made available to G-2 Section, either in the form of immediately applicable information (i.e., location of Division or Army ammunition, supply and fuel dumps, command posts, etc.), or in the form of confirmation of prisoner-of-war reports, large scale movements or intentions of major enemy formations and the appearance of new battle units in a given sector. As an approximation of the use made of the data received from Detachment "D", the CIRO PEARL, PEARL and THUMB included in the daily G-2 ISUM. . . .The G-2 ISUM was sent by teletype, operational priority, to the following headquarters:

SHAEF Main
6th Army Group
21 Army Group (Main)
8th Air Force
First U S Army Command Headquarters
Third U S Army Main
Ninth U S Army Main
Fifteenth U S Army Forward
12th Army Group Main
12th Army Group Tac
Headquarters First Allied Airborne Army
Com Z
ASCZ
9th Air Force Advance

d. It is of interest to note that an estimated 6,000 CIRO-PEARL messages were read during the seven-month period under discussion. Of these, 3238 messages from twenty-four different formations were published in CIRO-PEARL/SSDD reports, which were transmitted to G-2, 12th Army Group. It is of further interest that on the average either CIRO-PEARL, PEARL or THUMB material, or all three, were included in one out of every three G-2 ISUMS.

5. SIGNAL RADIO INTELLIGENCE AND SIGNAL SECURITY COMPANIES 12TH ARMY GROUP

a. The mission of Detachment "D" in connection with the signal radio intelligence units of 12th Army Group was subdivided into three categories:

(1) Reporting of Signal Intelligence of Immediate Value to Army and Corps G-2's

(a) All technical signal intelligence of tactical value, particularly CIRO-PEARL, was transmitted daily by the most expeditious means to the Army Signal Radio Intelligence Companies. . . .contains intelligence extracted from technical messages sent to the field units during a typical month. This intelligence was used in two different ways:

(1) It was reported to Army and Corps G-2's.

(2) It was employed as a basis for allocating intercept and direction-finding coverage priorities.

(b) The most convenient means of transmission of technical signal intelligence to the field units was radio, teletype and courier. Two radio broadcasts were made daily, one in the morning and one in the early evening to establish coverage priorities and to assist in the preparation of technical reports for the respective G-2 Sections. Technical signal intelligence was also transmitted by the same means at any hour of the day or night when the urgency of the information so warranted.

(2) Consolidation of Technical Material of all Field Units

(a) All technical data from the signal radio intelligence units of 12th Army Group were consolidated daily with those obtained by the two intercept units directly responsible to Detachment "D" and with data received from intercept units of the two flanking Army Groups (6th and 21). Items of immediate value were transmitted along with intelligence described in paragraph a preceding. In addition, all such data were published in greater detail in reports of the Intelligence Branch. . .and dispatched to the field units.

(b) The daily publications of the Branch not only aided the field units in the normal execution of their missions, but provided the only means of maintaining technical continuity on enemy formations during the frequent moves of the field units. This was particularly true when Army and Corps fronts were radically altered, resulting in an entirely new, and frequently unfamiliar, group of enemy units facing them.

(3) Supervisory Control Over Operations of Signal Radio Intelligence Field Units

(a) Policies concerning operations emanating from higher headquarters, or those arising from within Detachment "D" from time to time, were distributed and enforced. Aid in complying with the policies was provided in the form of directives, special technical reports, and by conferences at the Detachment headquarters. Also frequent liaison visits to the field units were made by technical experts from the Intelligence Branch.

6. FLANKING ARMY GROUPS

Continuous liaison was maintained with 21 and 6th Army Group signal radio intelligence agencies both by personal visits and by radio teletype and telephone communications on a twenty-four hour basis. All technical reports published were exchanged with those two organizations.

From SRH 042. *This account of signals intelligence operations in General George S. Patton's Third Army gives the reader a good feel for the "nuts and bolts" of World War II collection activities in the field.*

THIRD ARMY RADIO INTELLIGENCE HISTORY IN CAMPAIGN OF WESTERN EUROPE

I. OPERATIONAL ORGANIZATION AND PROCEDURE OF RADIO INTELLIGENCE AGENCIES.

A. Organization of Signal Service Companies.

(1) All signal service companies (corps signal radio intelligence companies) were organized and equipped as prescribed by T/O & E 11-500, 1 July 1943, with an authorized strength of eight officers and one hundred twenty-one enlisted men. Several weeks after activation, the 3253rd, 3254th, 3255th, and the 3256th Signal Service Companies were moved to Wincham Hall, England (K-19), in order that these companies might collaborate on common problems of training and supply. At a later date each signal service company was attached to a corps with whom it would work in the field, and as the various corps were committed in combat operations, the respective corps companies would accompany them remaining within a few miles of corps headquarters in order that close liaison could be effected between the companies and the corps G-2.

(a) After the usual training program in Burton Bradstock, England, the 3253rd Signal Service Company left for Omaha Beach in France, arriving on 12 July 1944. The company was attached to XV Corps and remained with Third Army until 21 September 1944 when it moved under the command of Seventh Army.

(b) The 3254th Signal Service Company was activated at Marbury Hall, Cheshire, England (K-19) on 19 April 1944. The operations of the company were begun immediately after activation; however, it was not on an entire company basis until operations against the enemy on 2 July 1944. Prior to that time operations consisted of a general training program as well as individual team operations. A few intercept positions were established in June at Lyme Regis, England, with the traffic analysis unit controlling the intercept of nets and preparing the intelligence reports. On June 29 the company arrived in France with the primary mission of supplying tactical intelligence to VIII Corps.

(c) Effective 6 May 1944 the 3255th Signal Service Company was activated at Marbury Hall, Cheshire, England. The unit has been with XII Corps since its activation except for brief periods in its early days when it was assigned to Army so that activities of the company as well as the remainder of the service companies could be controlled and correlated by Army headquarters. After completion of the training program the company was concentrated at Lymington, England (U-

71), and departed to Omaha Beach on 12 August 1944. Thus, the unit arrived in the combat zone ready to become operational on the ninty-eighth day after its activation in the Communications Zone.

(d) Activated on 5 May 1944 at Wingham Hall, Cheshire, Northwich, England, the 3250th Signal Service Company was engaged in a signal intelligence training and field program for the next three months until 7 August when the company was committed at Courville-Sur-Huisine, France (T-08). Excepting for temporary attachment to III Corps during the Battle of the Bulge, the company has always serviced XX Corps.

(e) The 3259th Signal Service Company came into existence on 16 September 1944 under XIII Corps. Training in Ringwood and Lymington, Hants, and Dartford, Kent (Q-99) in England equipped the unit for its first action under III Corps on the First U.S. Army front on 14 February 1945, and after the liquidation of the Ruhr Pocket, it was transferred with the III Corps to Third Army, where it remainded until the termination of the campaign.

(f) At the cessation of hostilities on 8 May 1945, the following corps companies were with the Third Army: 3250th Signal Service Company under V Corps which was attached to Third Army for the last three weeks of the war; the 3255th and 3256th Signal Service Companies which served under Third Army during practically the entire campaign with XII and XX Corps respectively; and the 3259th Signal Service Company under III Corps. The 3254th Signal Service Company attached to VIII Corps also spent much time under this command, although during the last weeks of the war it was First Army.

(2) 118th Signal Radio Intelligence Company.

The 118th Signal Radio Intelligence Company was activated on 20 April 1942 at Fort Sam Houston, Texas based on T/O 11/77 which was later superseded by T/O & E 11-500, 1 July 1943, as amended by Change No. 1, dated 13 November 1943. After extensive training on maneuvers the company arrived in England in January 1944. At the direction of the Signal Officer, Headquarters European Theater of Operations United States Army, the intelligence company, later assigned to the Third Army, began intercepting German military traffic on 26 April at Dartford, Kent, between London and the Channel. During the next six weeks the practice traffic of the enemy indicated certain troop movements to and along the Atlantic wall, and also revealed radio characteristics later used in identifying and locating German units in the field. On 1 June, the company, then serving 21st Army Group, moved to a point on the English coast just across the Channel from the Cherbourg Peninsula where it covered enemy radio activity during the invasion and part of the build-up period gaining slight intelligence of operational value. On 15 July the unit arrived in France and proceeded to the vicinity of the Third Army headquarters to whom it supplied intelligence through the end of the campaign.

B. Radio Intelligence Procedures.

(1) Operational Procedures.

(a) Corps Level

Although the signal service companies were originally organized along identical lines, each, after being committed, adopted new methods of procedure, and changed the basic organization to fit specific operational needs. This report is designed not only to show the original composition of these units, but also to point out their major differences. The companies included in this report are the 3253rd, 3254th, 3255th, and 3256th Signal Service Companies; although the 3255th and 3256th Companies were the only ones to be assigned to Third Army throughout the entire campaign, the others were on separate occasions under this command.

Radio Intercept: The normal radio intercept section consisted of an intercept officer and from forty two to forty six operators who were divided into tricks composed of a trick chief (control chief) and a number of men determined by the traffic level of the current situation. The operators worked in HO 17's and HO 27's mounted on 2 l/2 ton trucks; the deployment of the trick chiefs varied with the company involved: The 3256th employed a trick chief for each truck but both the 3253rd and 3254th Companies used one man to control an entire intercept shift. In the 3255th the use of an inter-communication system by which the IA section could contact the individual operators entirely eliminated the need for trick chiefs. The average working day for the intercept sections was divided into three shifts with their times and set allocations as follows: 0001-0800, eight sets; 0800-1600, 15 sets; 1600-2400, fifteen sets.

The functions of the trick chief, whether he was in charge of the entire shift or of a single truck, were to control the interception of nets, check frequencies, and in general to act as an intermediary between the radio operators and the IA section. The process of searching for nets was one which especially demanded control by a single source; the 3254th control was achieved by means of a home constructed monitoring board channeled to each operating position whereas the 3256th simply submitted a search list of known priorities to the individual operators; these were compiled by all radio intelligence sources by the IA Section on the second day of the German three day frequency cycle. This latter method greatly minimized the time spent in recording nets of no immediate value, and thus insured that the majority of enemy units actively engaged on the front in question would be covered. As a further aid, lists of fixed call signs and peculiarities of procedure were also kept available at each set.

In regard to the technical aspects of radio intelligence work, it was found that the super-pro receiver tended to supplant the SCR 342 and 344, having been adjudged as more adaptable to intercept requirements. Each truck was usually equipped with one high frequency set connected to an appropriate antenna. For both high and low frequency work, antennae of varying characteristics were experimented with by the individual companies: The horizontal directional type proved to be the most popular with the 3255th, but the 3253rd Company on the other hand

preferred the "L" shape antenna.

Speaking in terms of general operating procedure it should be mentioned here that the interception of enemy traffic by those companies employing the leap frog method of moving was rarely interrupted. When the tactical situation warranted, advance parties to division and forward headquarters were sent out and the proximity to the enemy lines proved reasonably profitable as demonstrated by the extremely tactical low grade traffic intercepted by the 3255th and 3256th forward echelons.

Since continuous wave interception was not the sole function of an intelligence agency, it was necessary to have on hand operators capable of copying German voice traffic; these radio telephony operators were part of the intercept personnel in the 3255th Company, but in the 3256th they were furnished by the IA Section. The type of traffic obtained by this source was comparatively low in volume, and that which was intercepted ordinarily proved to be of local tactical value. Radio telephony personnel were also employed in the VHF (very high frequency) experiments when small teams were sent up close to the front equipped with high frequency intercept sets. The results obtained in these cases, as well as in the attempts to intercept German voice traffic on the medium frequencies from similarly advanced positions, were fairly good in so far as the mechanics of interception were concerned, but the intelligence gained therefrom was not of far reaching value.

Direction Finding: Operations of the direction finding teams in the signal service companies were for a long time hampered by technical difficulties involving equipment. The SCR 503 Receivers proved to be inadequate as long as the front remained fluid and even on a comparative static front the direction finding sites had to be relatively close to the enemy in order to obtain satisfactory results. Later in the campaign the equipment was supplemented and modified by individual companies, and as a result marked improvements were apparent. The final set used by the 3254th Company was an SCR 555 with an improved antenna loop and an SCR 244 as a receiver, the latter giving a wider null but better reception. The 3256th Company utilized German equipment found at a signal depot in St. Menehould, France, but this too was effective only at short range.

Generally, each company had two and some times three teams depending on the tactical situation; one was always located at the company site and the other or others at some forward position. The conditions of the roads, the availability of water and rations, the maintenance of radio and power equipment at the advanced locations, and the necessity of wire communication being installed for the most part by corps signal battalions—all these factors had a direct bearing on the efficiency of the direction finding platoon.

Control of direction finding stations was accomplished by various methods. The 3253rd Company placed a direction finding man directly in the radio trucks and acted as a liaison between the intercept and the direction finding sections. The

3254th Company on the other hand set aside one operator whose duty it was to pipe signals to the local direction finding station for re-piping to the advanced sites.

In spite of all the difficulties encountered direction finding results from the standpoint of signal service companies were uniformly good during the Battle of the Bulge, the cleaning out of the Saar-Moselle Triangle, and the Battle of the Rhine. Evidence derived from this source as a confirmation of the intelligence gained through other means consistently proved valuable.

Traffic Analysis: The Traffic Analysis Section (IA Platoon) was commonly divided into two main groups, Traffic Analysis and Cryptanalysis Departments; originally the section had a complement of twelve men, but this number was later augmented by personnel from other platoons of the individual companies according to specific needs. Perhaps more appropriately referred to as the Intelligence and Coordination Team, the section had four principal functions: The analysis and processing of intercepted traffic and the identification of enemy radio nets; the cryptanalysis of enemy low grade codes and ciphers; the determining of German order of battle and the maintenance of the necessary files on enemy units, personalities, code names, and other necessary data to achieve this end; lastly, the compiling of statistics on the technical aspects of the work to aid in the identification and analysis of the traffic.

The Traffic Analysis Department usually consisted of four traffic analysts whose duties were reading logs and searching the files in order to identify the current enemy units. There was a man designated to keep order of battle information including personality files, breakdown of enemy units, situation maps, and all such pertinent information derived from G-2 reports, captured documents, and other reliable sources. One of the analysts coordinated the information obtained from analysis and direction finding for submission to the traffic analysis officer for final approval; that which was of immediate tactical importance was relayed to corps G-2 and subsequently the finished product was dispatched to all other interested agencies.

Two translators and two cryptanalysts comprised the Cryptanalysis Department whose province was the breaking of all types of low grade traffic and the examination of all medium grade for possible compromises. When teletype communication was available, raw traffic (low grade) was exchanged with the other intelligence units of Third Army. In some cases the men of this department were called on to interrogate prisoners thought to be of importance to radio intelligence work, to serve as radio telephony operators, and to process captured documents destined for higher headquarters. In this department as well as in traffic analysis it soon came about that each man, although trained for a specific position, became capable of handling a variety of duties.

The plotting of direction finding bearings was usually done by some member of the Traffic Analysis Section, although it should be mentioned that much better results were obtained from assigning a certain man to that duty. Most of the com-

panies were restricted in their use of situation maps and overlays by the lack of space in the housing units. When the Traffic Analysis Section of the 3256th Company moved indoors, it was possible to exploit further the results of direction finding in connection with the order of battle picture. In this company the direction finding man, in addition to his primary duties, maintained an overlay on a 1:25000 map showing the breakdown to battalion level of all enemy units on the corps front; this map also included the direction finding bearings of the preceding day as well as any additional information of the same kind extracted from reports of other radio intelligence units. When it was possible to obtain a large number of bearings from various sources on any specific unit, a special overlay of that formation's area was made, thus affording a closer check on its movements.

As a final comment all of the work done in evaluating intelligence gained from intercepted traffic was channeled to one principal destination, the daily activity report which served as a complete record of the day by day radio intelligence results. The form of the report was as follows: (I) Intelligence Summary; (II) Decodes and Translations; (III) Technical Summary of Nets Heard; (IV) Message Count and Set Allocation; (V) Direction Finding Bearings; (VI) Code Idents and Cipher Values.

(b) Army Level

The Radio Intelligence Company at Army level naturally differed in several respects from the corps' agencies; approximately twice the size of the Signal Service Company, the Army unit had several additional functions, chief among which was the coordination of the work done at lower levels and the dissemination of information thereto.

Radio Intercept: Aside from the disparity in numbers between the intercept section of the Army company and that of the corps (the former maintaining some twenty two men on each shift) there were major differences in operational procedures. Certain minor points not mentioned before were common to intercept work at all echelons.

During times of heavy radio activity it was found best to have at least two intercept operators on random search, who would scan the dial until an enemy net was heard. The frequency and call signs were then given to one of the other operators and the search was continued for other nets.

When an enemy net went off the air, or when the operator, for various reasons, could no longer hear the transmissions, the spot checking practice was used. This meant that the operator would go on search, returning to the frequency every fifteen minutes.

In order to ensure good copy of messages, important for the cryptanalytic work, nets were frequently double banked; since this meant the assigning of two or more operators to cover the same traffic, it was naturally more easily done at Army level, where more men were available. In any given case, the necessity of double banking was determined by the traffic analysis control man with the one exception,

that it was a standing rule to double bank all three letter traffic and plain text.

In the case of voice transmission the handling of plain text in the Army company occasionally involved use of the dictaphone, the recording being sent to the Traffic Analysis Section. In certain urgent cases, the voice signal was piped by telephone directly to a translator in that section.

When the Army agency initially went into operations, the intercept and direction finding control man occupied different housing units and were linked by telephone. It was later decided that the work of these two sections could be better coordinated if their control chiefs operated in the same unit and simultaneously received directions from the Traffic Analysis Section.

Direction Finding: The size of this section and the existence in the Army company of a wire section to establish communications made it possible to operate as many as three outstations; later, radio control was used and proved more practicable than in the corps companies. As a general rule, the length of the base line between the outside stations was forty miles with land line communications, and sixty miles with radio. As already mentioned, it was found best to have the direction finding control man work closely with the intercept trick chief, but aside from these points, the operational procedure involved in taking any given bearing did not differ greatly from the methods used by the signal service companies.

Traffic Analysis: The traffic analysis section of the Army company also differed in only a few respects from that at the lower level; of course, since this section was larger, being comprised of twenty nine men and three officers, it was possible to extend the work of the various sub-sections to a finer point of detail and to act as a coordinator of the results obtained on the corps' front.

As this latter function became more and more important, it became necessary to create a special section in the Army radio intelligence company to act in liaison with corps, flanking armies, and Army group; information was thus routed more efficiently and expeditiously up and down the line.

Security considerations, in many cases, made it impossible to send certain data down to corps level directly and one of the functions of the Army company was to see that the signal service units receiver whatever extracts and conclusions from this information it was possible to disseminate. To further this end and to accommodate the large influx of the many different reports and documents, it was necessary at Army level to create another sub-section within the traffic analysis platoon known as the incoming documents section; the purpose of this miniature message center was to regulate the distribution of all incoming and outgoing material and to keep the necessary extensive files and records.

In the matter of intercept and direction finding control, the techniques were the same as those used by the signal service companies, except that the Army company was naturally expected to concern itself with all corps' fronts and even with some units close to the Army Zone of Advance in view of the possibility of sudden movement. The particular method of establishing control generally followed one of

those already outlined, that of distributing each day a list of the desirable frequencies and call signs to the control chiefs of the other sections.

Since the cryptanalytic section at Army was larger than that at corps, it was soon found that in many cases rapid transmission of traffic intercepted at the lower level to this section accelerated the eventual breaking of it. A teletype net involving Third Army radio intelligence agencies provided the necessary means of communication and proved fairly practical.

In this, as in almost every case, the greater manpower in the Army traffic analysis section made possible much more detailed files and records of all kinds; as a result, intelligence could be interpreted on a wider basis. When the data at Army level itself was insufficient, the Army company was able to have recourse to Army group, or, in certain instances, to Signal Intelligence Division, European Theater of Operations United States Army. This was especially important when a signal service company suddenly found itself concerned with new German units because of a re-allocation of corps zones; in all probability, the Army company had already been intercepting traffic from these units, but if not, the above mentioned channels for obtaining information were open. It can be readily seen, therefore, that the Army Radio Intelligence Company was, in almost every respect, essentially a larger scale signal service company with far more extensive functions because of its size and position in the organization of a Field Army.

(2) Communication Set-Up of Radio Intelligence Agencies. . . .

Signal intelligence agencies employed most of the known means of communication. Each company Mobile Radio Team operated a sub-station of a net with the Army Radio Intelligence Company as control. The Army company itself had a lateral radio link with its corresponding unit in flanking armies, and of course was part of the Twelfth Army Group Radio Intelligence Net.

In the signal service units radio contact with direction finding outstations did not prove to be quite as satisfactory (in comparison with wire lines) as at Army level. For communication within the companies themselves telephone naturally was used, but there were some variations in the details of its use; the 3255th Company and the 118th Signal Radio Intelligence Company had their systems so arranged that each individual operator and trick chief could communicate separately with the traffic analysis section, but in the 3256th Company direct communication existed only between the trick chiefs in each truck and the IA inter-communication operator.

A teletype net was operated for a long time involving the signal service companies, the Army company, and Third Army Signal Intelligence Service. The chief purpose here was the exchange of raw traffic, and, on several occasions, this means was employed to send traffic back to the company proper from advance teams. When the teletype lines were in good order, this was by far the quickest, easiest, and most secure manner of exchanging information. During certain periods there was a teletype line between Army group and the 118th Signal Radio Intelligence

Company over which raw traffic and items of technical information were transmitted.

Telephone was naturally widely used. Both army and corps agencies communicated with their respective G-2 sections by this means and in addition the former always had a direct line to the Signal Intelligence Service Office at Army headquarters. This latter circuit was supplemented by a direct teletype line to provide printed confirmation of any information relayed to G-2 by telephone. Telephone communications further existed between the Army company and Army group, flanking armies, and the signal service companies in Third Army. Whenever a telephone or teletype line passed through one or more switchboards, a jargon code was used, except in the teletype transmission of raw traffic.

C. Captured Documents.

From the beginning of the campaign in Normandy the importance of captured documents to increase the value of radio intelligence information was ascertained. During the first few weeks after the initial landing, little was done in this direction because the static line prevented the capture of documents in any quantity. After the St. Lo breakthrough advantage was taken of an increased number of captured documents which necessitated a system of distribution, so that this information could be expeditiously disseminated. Corps' G-2 first analyzed any documents in search of facts peculiar to its own work, then passed all signal documents on to the corps' signal service companies for analysis. Any information of value was immediately extracted and the original document was sent to Army Signal Intelligence Service where it was photographically reproduced and distributed to service companies under Third Army Command, First, Seventh, and Ninth American Armies and Twelfth Army Group. Code names, code and cipher keys, frequency and call sign allocations, maps with encoded terrain features and place names, map coordinate codes and grid systems, and the German methods of signal intelligence operations constituted information of particular importance. Over three hundred signal intelligence documents requiring some eight hundred pages were reproduced and disseminated during the course of the campaign. To supplement this information signal intelligence notes were published and distributed when documents received were particularly current or when only extracts from lengthy documents were of value. Enemy units were often identified through code names continued in documents, and encoded traffic was frequently easily read due to the capture and dissemination of documents, diagrams, and German signal intelligence publications. During August in the early days of the campaign, intelligence companies were able to follow the movement of the 9 Panzer Division from non-indicator cipher keys captured from this unit. Numerous examples could be cited to justify the work required in maintaining a small Documents Evaluation, Reproduction and Dissemination Section.

D. Prisoner of War Interrogations.

In order to obtain all available radio intelligence information PW interrogations were made frequently. During the campaign the various PW cages were

visited at least once a week under ordinary circumstances. Arrangements were made with PW authorities that Signal Intelligence Service should be notified when routine screening indicated that a PW might possess information of signal intelligence value. In most instances the information obtained from PW's had already been secured through other sources, however, any additional facts always served as a confirmation. Frequently PW's were interrogated soon enough after capture to obtain detailed information on effective frequencies and call signs which otherwise was a difficult matter in view of the fact that they, excepting in most cases of reconnaissance traffic, were customarily changed every third day in the German army. Although valuable radio intelligence information was obtained from PW interrogation, its principal virtue lay in the security angle. German signal intelligence men, especially those from corps headquarters and higher, could always give information as to which of our code or cipher systems were being broken, what difficulties arose in the process, how long a system could be depended on for security, and what disposition was made of the intelligence gained. . . .

* * *

From SRH 227. *This is part of the official unit history of a signal radio intelligence company assigned to the Southwest Pacific Area, General Douglas MacArthur's theater of operations. It should be noted that unlike the situation in Europe, where tactical COMINT units concentrated their efforts on low-level traffic, the 126th Signal Radio Intelligence Company reported directly to Central Bureau, a high-level theater processing center. The information in the first sentence is actually incorrect: the unit's predecessor, the 1st Radio Intelligence Company, was activated in 1938 and was not a provisional unit.*

OPERATIONAL HISTORY
126TH SIGNAL RADIO INTELLIGENCE COMPANY

February 1944

The 1st Signal Radio Intelligence Company was activated at Fort Monmouth, New Jersey, in February 1941, having previously been known as the 1st Provisional Radio Intelligence Company. The operational set-up of the new company included three operating platoons, each of which was to be capable of operating independently on a combined intercept, direction finding, wire-laying mission. Operational training was begun with regular classes in International code, direction finding, plotting, and wire-laying. 206-C Direction Finders were set up under simulated

field conditions and bearings were taken on local stations, to familiarize the operating teams with the methods of operation.

In March 1941 the company moved to Fort Meade, Maryland, where training was continued. In June of the same year, the unit designation was changed to the 121st Signal Radio Intelligence Company. The company participated in the North and South Carolina maneuvers during the period extending from September through the 6th December 1941. Intercept positions were set up in a 2-1/2 ton truck which also included a typewriter at each of the eight intercept positions. Back to back with the intercept truck was another 2-1/2 ton truck containing the plotting equipment. Goniometric wire lines were laid out to the four 206-C direction finders, which were the only DF's in the company with the exception of the 504 equipment items, which were not used. The direction finders were generally spread over a base line of approximately 20 miles. Thus, at this stage, with limited equipment, the company was not using the three-operating-platoon set-up. The company worked at one time with the Red army, at another with the Blue army, intercepting "enemy" traffic, and locating "enemy" transmitters, for GHQ, in each case. The company also worked with the referees, monitoring all radio traffic for violations of signal security.

Following maneuvers, the company returned to Fort Meade, Maryland. Shortly thereafter it moved again to Ft Bragg, North Carolina where it participated in day-to-day maneuvers with the field artillery, locating "enemy" transmitters, which were than "neutralized" by the artillery.

Following the company's return to Ft Meade, on the 25th of February 1942, one operating platoon of the 121st Signal Radio Intelligence Company was designated as the First Operating Platoon. 1st Lt Menear was placed in command of the platoon over 45 enlisted men. The platoon left Ft Meade for Ft Dix, New Jersey, to await movement orders for an overseas destination. Its equipment included intercept receivers, the four 206-C direction finders, plotting equipment, wire and wire-laying equipment, and field range equipment for independent operations.

On the 1st of March 1942 the First Operating Platoon sailed from the Brooklyn Port of Embarkation on the USATS URUGUAY. On board ship the platoon radio operators were placed in charge of the radio room and the signal bridge, and operated the ship's radio, blinkers, and signal flags. The ship arrived at Melbourne, Australia, on the 10th of April 1942.

At Camp Pell, Melbourne, training in intercept and direction finding operations was continued until the 6th of June.

Meanwhile, on the 19th of May 1942, the platoon was redesignated, and became the First Operating Platoon, 126th Signal Radio Intelligence Company.

On the 6th of June the platoon left Camp Pell and proceeded by motor convoy to Mt. Massadon, Victoria, the contemplated site for a permanent camp. The platoon set itself up for independent operation, performing its own house-keeping and cooking chores. Intercept facilities, consisting of three positions, were operated in

the van of a 1-1/2 ton truck. One direction finder, 206-C, was placed in operation atop Mt. Massadon, about 3/4 miles from the camp. On 1 July 1942, while still at this location, T/Sgt Messer of the 823rd Signal Service Company was attached to the platoon for temporary duty to instruct the platoon's intercept operators in ROMAJI and Japanese KANA telegraph code.

On 10 July 1942, the platoon moved again by motor convoy to Townsville, Queensland, arriving there on 2 August 1942. Lt Menear was reported to Capt Brown, GHQ radio intelligence officer, who in turn assigned two GHQ officers, Lt Phelan and W/O Card, to establish a Japanese code school for the instruction of the platoon's intercept operators. In addition, the platoon was assigned the mission of monitoring Allied Air Reconnaissance frequencies copying Allied clear and coded messages during the attacks on Guadalcanal and reporting by TTY to GHQ. The platoon's 206-C direction finders were set up to work with the No 1 Wireless Unit, RAAF, which was operating in Townsville. The DF's were located respectively at Townsville, Cairns, Charters Towers, and Cloncurry, and communicated with Townsville by wire. . . .Their mission was to work with the RAAF unit in securing bearings on enemy aircraft. However, the work was not wholly successful because of the long lines of communication and because the DF's were not suited to long range work, nor to the rapid action required to obtain bearings on short aircraft transmissions. In addition, the DF operators were not trained to read Japanese code, and therefore could not distinguish readily between the various transmissions they were to pick up.

On 15 November, the platoon travelled again, this time by rail to Brisbane, Queensland. M/Sgt Nurss, working under Capt Brown and GHQ, had preceded the platoon to arrange for the establishment of a radio station and antenna equipment. The platoon arrived in Brisbane on 18 November 1942 and immediately began work on a new operational site at Northgate. With the completion of a radio "shack" constructed by Australian workmen, and an antenna installation, using 6 rhombic antennas, work was begun in intercept, covering Japanese Army and Diplomatic radio traffic. All traffic was turned over to Central Bureau, GHQ, for analysis. Capt Brown, and his officers, Lt Phelan and W/O Card directed the operations of the platoon from this point on, using experience gained in and since the invasion of the Philippines to further the instruction and efforts of the platoon's intercept operators. It was necessary to train more men as intercept operators. Consequently, all men, regardless of their previous assignments in the platoon were given training, and of these the best became intercept operators. No direction finding work was done during this period.

The rainy season which followed shortly thereafter caused the site of the radio station to become inundated. On 10 January 1943 the platoon moved to Stafford, Brisbane, where it established an independent camp and a temporary radio station, the latter housed in two tents, and using simple antenna equipment. Work on a new GHQ radio station was begun at once, a short distance from campsite. Australian

workmen constructed the building. Grounded V-antennas were installed to cover directionally the arc from northwest through northeast of Brisbane. Fifteen antennas were set up for this purpose, arranged in groups of three, each group covering the same direction with spacing for diversity use if necessary. By the beginning of March the new radio station was in operation, continuing the work begun at Northgate. The amount of enemy traffic being copies by the First Operating Platoon, 126 Signal Radio Intelligence Company, was almost being doubled each month.

In April 1943, the First Operating Platoon, all its personnel except Lt Menear, and all its equipment, were combined with the 126th Signal Radio Intelligence Company which had arrived in Brisbane on the 25th of March 1943.

The 126th Signal Radio Intelligence Company had its origin at Camp Crowder, Missouri, where it was activated on the 14th of August 1942. Five officers, all second lieutenants, were present for duty with the company on the date of its activation. By virtue of seniority, Lt Joe L. Thurston assumed command. . . .The strength of the organization on the date of its activation, was 5 officers, 0 warrant officers, and 85 enlisted men.

The Table of Organization of the company included a group known only as the First Operating Platoon, which had already been activated. The whereabouts of the First Operating Platoon was not known or not revealed. However, its strength of 1 officer and 45 enlisted men was to be included as part of the strength of the 126th Signal Radio Intelligence Company, and it was believed that the two units would eventually be joined.

The new company was placed under the Signal Corps Unit Training Center at Camp Crowder, for administration and preparation for active duty overseas. It was the function of the Unit Training Center to coordinate administration, training, and securing of personnel and equipment for newly activated SOS units at Camp Crowder.

On the 19th August 1942, following movement of the company to its own area at Camp Crowder, operational training began. Full advantage was taken of specialists' schools available at the MidWestern Signal Corps School and the MidWestern Signal Corps Replacement Training Center at Camp Crowder. Chauffeurs and field linemen were sent to school for further training. All radio operators were enrolled for advanced training in International code, Joint Army and Navy Procedures, and net operations.

Among the radio operators assigned to the company were twenty specialists, with knowledge of the Japanese Romaji characters and their code equivalents. These men had received their special training at Fort Monmouth, New Jersey, and had been assigned from there to join the company on the 19th August 1942. At that time there was no course of training at Camp Crowder suitable for specialists of this type. For the time being, therefore, they were entered with the other operators in the International code classes.

* * *

Four SCR-255 Direction Finders had been received by the company. These were set up in the field near camp and connected by goniometric wire lines for several days operation and practice. Tentative operating teams for the DF's had been assigned for this work to learn as much as possbile about the equipment, and to use that knowledge in teaching others. All officers familiarized themselves with the equipment. Lt Dibos took charge of assembly and disassembly, and instruction in DF operation. The direction finders were then dismantled and prepared for crating.

Additional supplies and operational equipment were received by the company during the remainder of the month of September. Lt Kuch was tentatively placed in charge of intercept training. A schedule was arranged whereby the twenty Japanese specialist operators were to work several hours each day on company receivers installed in one of the barracks, picking up and copying Japanese radio code transmissions. This procedure was not too satisfactory due to weakness and unreliability of the signals. Therefore, training was later amplified to include copying of Japanese code from disc and tape recordings, made for the purpose by one of the operators.

During all this period, activities of the company were centered around crating and preparing for overseas movement. In early October 1942, news was received of a short delay, due to supply shortages and changes in War Department plans. The company, however, remained alerted.

One direction finder SCR-255 was uncrated and assembled near the camp. DF crews were assigned to work under the instruction of non-commissioned officers who had previous training, in assembling and disassembling the direction finder, as well as in operating. SCR-284 transmitters were installed, both as fixed and as mobile stations, and operators were trained to tune and operate these sets; 342-type receivers were used to intercept the transmission of the SCR-284's for the practice of copying and guarding friendly transmissions.

Lt Skinner was transferred from the company on the 21st of October 1942 due to a physical ailment; and Lt Hadd replaced him as Supply and Motor Transport officer. By oral assignment, Lt Dibos became Operations Officer, Lt Wilson was made Liaison and special services officer, Lt Swomley became Wire and Personnel Officer, and Lt Kuch was assigned as Intercept Officer.

During November 1942 word was received of a further delay in overseas movement. Training continued through the use of Signal Corps specialists' schools available on the Post. New intercept operators were being assigned to the company from time to time, and these were entered in new code and traffic classes, which were especially arranged for through the radio schools of the Replacement Training Center. Men who were not operators, but who were believed to have potentialities as such, were entered in beginners' classes. Many of the men assigned to the company as specialists in certain types of work, were found to be inadequately trained. Consequently, eight men were selected to attend night classes in teletype operation; five men who had been assigned to the company as radio

repair men were sent to the repair section of the Signal Corps Replacement Training Center, to learn and work on maintenance of Signal Corps receivers and transmitters; and the wire platoon was assigned to practice pole-climbing, use of the compass and maps in nearby fields and woods, and use of hand and engine-driven reels.

* * *

During early December crating was again speeded in anticipation of overseas movement. Training was continued spasmodically, due to the need for men to assist in packing and crating. The Unit Training Center began a new training project, in which it created an "army" headquarters, and two "corps" headquarters, with emphasis on message center work. All available intercept, telegraph, teletype, and switchboard operators of the 126th Signal Radio Intelligence Company were assigned to operate with other groups in the three headquarters' message centers. Radio operators handled radio traffic between the headquarters, using International code. Several company receivers, operated by company personnel, were set up and used as army and corps intercept units, guarding the radio nets and copying all traffic. After the first week, however, orders were received to ship all company equipment to arrive at the San Francisco Port of Embarkation by 1 January 1943. On the 23rd of December, the equipment was shipped in three box cars from Camp Crowder.

At this time, twenty enlisted men were enrolled in a six weeks course of training which included operation of the 206-D and SCR-255 direction finders, elementary map reading, elementary maintenance of radio equipment, elementary trigonometry, elementary wave-propogation, and the technique of recording on cylinders and tapes. The men selected for this course were NCO's of the operations section, nco's in charge of direction finding teams, as well as direction finder operators who showed potentialities for possible leadership of teams.

During January 1943, the company remained alerted, although movement was again delayed. Toward the end of the month the company was given a final inspection by a staff of officers and men from the Inspector General's Department. During the last week in January, orders were received for personnel of the company to move to the port of embarkation. All men in school were withdrawn. Lts Wilson and Hadd were sent immediately to the port to act as liaison officers for personnel and supplies respectively, and to prepare for arrival of the main body of the company. . . .

On the 3rd of February 1943, the company departed by railroad for the San Francisco Port of Embarkation, arriving there on the 6th. The company was assigned for a period of staging and physical "hardening" to quarters at Camp Stoneman. Then, on the 25th of February, with a strength of 6 officers, 1 warrant officer, and 203 enlisted men, the company boarded the USATS "President

Johnson" for shipment overseas.

The company disembarked at Brisbane on the 23rd of March 1943, and marched to Camp Doomben, where casual quarters were assigned. During the third day at Camp Doomben, the company was visited by GHQ officer, Capt Howard M Brown, and by 1st Lt Menear. The latter was introduced as the commanding officer of the First Operating Platoon for which allowances had been made on the Table of Organization, and the location of which had until then been unknown to the company. . . .

From SRH 049. *This document was produced by the 12th Army Group's Signal Security Division "D". The excerpt shows the results of one day's intercept of low-level German communications by Army tactical COMINT units. On November 11, 1944, intelligence was produced on three German divisions: the 15th Panzergrenadier Division; 17th SS Panzer Division; and 116th Panzer Division. Intelligence came from exploitation of German messages enciphered in medium-level cryptosystems (CIRO PEARL); low-level systems (PEARL); and radio direction-finding (THUMB). As can be seen from the text, CIRO PEARL messages were intercepted on November 6, but could not be decrypted and translated until November 11. The "cut" referred to in the final paragraph describes simultaneous bearings on an enemy radio station obtained by two separate radio direction finders.*

CHAPTER X

Reshaping the Tools

By 1945, there were growing pressures to rationalize the Army's signals intelligence structure. A major step towards achieving this had already been taken in December 1944, when, as we have seen, the Military Intelligence Service assumed operational (but not administrative) control of the Signal Security Agency. Another initiative came about as the result of a belated Navy proposal to finally create an Army-Navy Communications Intelligence Board to coordinate the activities of the two service signals intelligence arms. Major General Clayton Bissell, the Army Assistant Chief of Staff for Intelligence, initially demurred, on grounds that the Army's structure was too decentralized to allow for meaningful interservice collaboration. However, he then used the Navy approach as a wedge to establish centralized Army control over all its COMINT assets. His arguments in favor of this are set forth in the excerpt from SRH 169, Centralized Control of U.S. Army Signal Intelligence Activities. With the war in Japan coming to a close, all the theater commanders in the Pacific—even Douglas MacArthur—accepted implementation of the proposition once the fighting was over. On 15 September 1945, just thirteen days after the war in the Pacific had ended, the Army created the Army Security Agency, which would control all Army signals intelligence elements through a vertical command structure for the next 32 years.

From SRH 169. *The head of the War Department's Military Intelligence Division argues that all signals intelligence assets should be under his control. His appeal was ultimately successful.*

CENTRALIZED CONTROL OF U.S. ARMY SIGNAL INTELLIGENCE ACTIVITIES

* * *

1 June 1945

MEMORANDUM FOR THE CHIEF OF STAFF

SUBJECT: Centralized Control of Signal Intelligence Activities for War Against the Japanese

1. On 8 May the War Department requested comments of the U.S. Army Theater Commanders in the Pacific and Far East on a proposal to place under the control of a single War Department agency all Army units and personnel engaged in signal intelligence activities for the war against the Japanese. . . .

2. General Wedemeyer has advised of his "wholehearted approval" of this proposal. . . .General Sultan advises that he "concurs in the need for a central agency to coordinate" all U.S. signal intelligence activities but believes this can be accomplished "without removing units and personnel from theater commanders' control". . . .General MacArthur advises that he does not concur in the proposal because it would place such activities under the "absentee control" of an agency "many thousands of miles away"; would interfere with the "close association" which his headquarters has had with such activities; would "disrupt an Allied agency which is now functioning most effectively" in his theater and would prevent signal intelligence results from being made available to the theater commander with the required speed. . . .

3. Attached hereto is a memorandum which explains the facts and circumstances pertinent to the proposed centralized War Department control. It is believed that such control is essential:

a. To coordinate U.S. Army signal intelligence activities in the various theaters and in the United States, eliminate duplication of effort and insure full exploitation of signal intelligence sources.

b. To coordinate U.S. Army signal intelligence activities with those of the U.S. Navy and the British.

c. To utilize most economically the limited Japanese linguistic and other specialized personnel available for this work.

d. To provide full technical support for all advanced signal intelligence units.

e. To ensure maximum distribution and utilization of signal intelligence technical data and results regardless of place of production.

4. The objections raised by General MacArthur are not considered valid. The world-wide nature of enemy radio interception and the total absence of any relationship between Theater boundaries and the location of interception or solution of Japanese messages, makes it essential that the principal cryptanalytic center be at a geographic point where the machinery, facilities and skilled research personnel are located if the signal intelligence system is to produce the maximum intelligence of which it is capable. Control should be centralized at this same point which is the only location that has or can have access to all of the enemy radio traffic without prohibitive duplication of personnel and facilities. The principal cryptanalytic center is near Washington and must remain here because it would be totally impracticable to move the machinery and facilities to another site and secure effective results during the probable period of the Japanese war. Adequate communications exist to ensure not only fullest exploitation, but to guarantee almost instantaneous delivery of results to any Theater Headquarters.

RECOMMENDATIONS

5. It is recommended that:

a. The proposed centralized control of the signal intelligence system be approved.

b. The attached draft of cable to theater commanders concerned be dispatched.

CLAYTON BISSELL
Major General, GSC
Assistant Chief of Staff, G-2

* * *

I. Circumstances leading to proposal

1. The present recommendation for centralizing control of all U.S. Army signal intelligence activities for the war against Japan is a direct outgrowth of a proposal made by Admiral King on 14 February 1945 to establish an Army-Navy Communication Intelligence Board charged with coordinating the plans and operations of the communications intelligence organizations of the Army and Navy. . . .

2. All signal intelligence activities of the Navy, including those conducted within theaters of operations, are under the direct operational control of the Navy Department in Washington. . . .In the Army, on the other hand, responsibility for signal intelligence activities is divided among the War Department and theaters of operations in the same manner as responsibility for the conduct of strictly combat operations against the enemy. Although this basic difference in the signal intelli-

gence organizations of the two Services made it unlikely that the proposed Army-Navy Board could function as effectively on the Army side as it could on the Navy side. . . , that fact was not considered an adequate ground for rejecting Admiral King's proposal. . . .The proposal was therefore accepted by the Chief of Staff. . . .

3. However, Admiral King's proposal gave impetus to consideration by the Deputy Chief of Staff, the Military Intelligence Division and the Operations Division of the need for centralizing control of the Army's signal intelligence activities for the war against the Japanese. This consideration led to the conclusion that the basic principles of command applicable to combat operations are entirely inapplicable to the highly technical and specialized activities involved in deriving intelligence from Japanese military radio communications, and that all such activities should be placed under the control of a single War Department agency. . . .

II. Proposal to theaters and replies thereto

4. Accordingly, after receipt of an independent suggestion from General Sultan as to the need for centralizing control of signal intelligence activities...and after obtaining the views of the Chief Signal Officer..., the proposal now under consideration was presented for comment to the theater commanders concerned. . . .

5. The comments received from the theater commanders have raised no considerations not previously taken into account by the War Department. General Wedemeyer's approval of the proposal is based upon considerations similar to those which constituted the basis for the proposal. . . .General Sultan's reply approves the basic idea of centralized control and suggests only a different procedure for putting it into effect. . . .General MacArthur's reply. . .raises objections of the same nature as those which had previously been considered and rejected as invalid. . . .Those objections are discussed below.

III Basic reasons for proposal

6. The basic reason for the present proposal is that Japanese radio communications, their availability for interception, the cryptographic systems used, and the usefulness of the results derived therefrom, all have no relation to the considerations which are determinative in assigning command responsibility for combat operations against enemy forces.

Availability of traffic for interception.

7. There is no relation between the availability of Japanese military traffic for interception and the geographic organization of our Army for combat operations. Traffic of great intelligence value to one theater may be intercepted at a point thousands of miles from the theater. For example, more of the Japanese military traffic received by Signal Security Agency is now intercepted in California than at any other place. The most advantageous locations for intercepting Japanese military traffic originating in Manchuria, Korea and North China are in the vicinity of Manila, Guam and Adak; the intelligence derived from this traffic may be of operational interest to any of the Far Eastern theaters, the Twentieth Air Force and the War Department.

Cryptanalysis

8. The main Japanese cryptographic systems are used throughout the Japanese Army. [text withheld] High level Japanese systems can be solved with the use of large numbers of personnel and elaborate tabulating machinery. The degree of success depends directly upon the volume of traffic obtained; no one theater intercepts sufficient volume for continuous high level cryptanalaysis. Effective exploitation requires the pooling at one place of all available traffic from all available U.S. and Allied intercept facilities, regardless of their location. This place might be at almost any location in the world where adequate personnel and machinery could be assembled and to which adequate communication facilities exist for forwarding traffic. At present, the principal such cryptanalytic agency is Arlington Hall Station, Arlington, Virginia, operated by Signal Security Agency under the operational command and control of G-2.

9. Forward exploitation of traffic at or near the point of intercept is desirable only where (1) the current period of the cryptanalytic system has been solved at the central cryptanalytic center having all traffic available to it, and (2) communication facilities are not adequate to permit particular messages in the solved system to be transmitted as quickly to the central agency as they can be to a local exploitation center. Because of the almost instantaneous speed of electrical transmission, mere distance in itself has no bearing upon the adequacy of communications; they may be and often are better to a point thousands of miles from the point of intercept than they are to a point much nearer.

10. The above basic considerations make it imperative that this work be under central direction and control. Any division of responsibility for this work among the War Department and theaters can have little if any relation to the practical problems involved, and necessarily results in duplication and inefficiency, without compensating advantages.

Usefulness of results obtained.

11. If it were attempted to divide interception and cryptanalysis of Japanese military traffic according to U.S. Army theater boundaries, the results obtained within each theater would have little if any relation to the combat operations conducted in that theater. From the cryptanalytic point of view each theater commander would be forced to exploit all traffic which he could get, regardless of its place of intercept or its value to his own operations, in order to read any traffic of primary concern to him.This would necessitate each theater commander duplicating the entire effort of other theaters and the War Department, in order to produce results most of which would be of no greater value to his theater than to other theaters. For example, the Alaskan Defense Command and the China Theater might produce results which would be of greatest value to the Southwest Pacific if that theater were to undertake operations on the coast of China or in the main Japanese islands. On the other hand, the Southwest Pacific might produce results most useful to U.S. Commanders in China for directing operations of Chinese forces from

the interior of China. Either theater might produce results of primary interest to the Twentieth Air Force or to the War Department.

"Low level" signal intelligence.

12. The foregoing comments are applicable chiefly to "high-level" signal intelligence activities, i.e., intercepting and reading Japanese messages transmitted in codes and ciphers having a high degree of security classification. Similar considerations are applicable to the important field of "low-level" signal intelligence, i.e., reading communications transmitted in low-grade codes and ciphers, or obtaining intelligence from the observation of radio traffic without reading the texts of the messages (traffic analysis).

13. There are very few Japanese cryptographic systems which are "low level" and those low level systems which it has been found possible to exploit are used in widely separated areas. For example, the most productive low level Japanese system now being exploited is an air-ground system used by the Japanese throughout the Pacific and Far East. Most effective exploitation of that and similar low level systems is impossible without immediate and full exchange of current technical data and results among the various signal intelligence units throughout the Pacific and Far East.

14. An additional important factor peculiarly applicable to the Japanese problem is the need for close integration of the results of this low level work with the results obtained from the high level work done primarily by Signal Security Agency. Only by a close tie-in of results from all sources can complete and reliable intelligence be produced.

15. For these reasons, a central agency is required in order to afford each unit working on this low level material the fullest technical support and to integrate the results of its work with the results obtained from other sources.

IV. Objections raised by SWPA

16. The principal objection raised by SWPA is to "absentee control" by an agency "many thousands of miles away," with "such delays as to seriously reduce the value of the derived intelligence and in many cases render it completely useless." These objections ignore the basic nature of signal intelligence activities and reflect a desire for theater complete self-sufficiency which does not and cannot ever exist due to such limiting factors as critical machinery, trained cryptanalysts, linguists and skilled research personnel.

17. The objection that the War Department agency is "many thousands of miles away" disregards the speed of modern electrical communications. This is strikingly illustrated by the fact that the Director of the British Government Code and Cipher School has recently advised the War Department that the British are greatly expanding their intercept facilities in India and Burma, but that they desire all of the traffic intercepted in those areas (which are as far from Washington as SWPA) to be exploited cryptanalytically only in London and Washington (with basic research on certain systems done in London and primary reading of current

messages done in Washington). The Director recommends against exploitation by the British personnel of the joint agency in SWPA. [text withheld] It recognizes that the important question is not at what location the exploitation is done so long as it is all done at one place.

18. The degree to which all exploitation should be concentrated at a single center depends not on the location of that center but upon the availability of communications between that agency and (1) all places of intercept and (2) all headquarters needing the derived intelligence. Experience has demonstrated that most Japanese military traffic now intercepted in the Pacific and Far East can be forwarded to Arlington Hall Station, decoded, translated, evaluated and disseminated to operational headquarters more quickly than the same processes can be performed within any theater.

19. It is not contemplated that all exploitation will be transferred to Arlington Hall. Before any exploitation now done in any theater is transferred either to another theater or to Arlington Hall Station, it will be determined exactly where such exploitation can be most effectively conducted. For example, such consideration might show that it would be desirable to forward recovered keys in certain systems to an exploitation center within a theater in order that traffic on specific circuits, known to carry material relating particularly to that theater's operation, might be read more expeditiously. Only by centralized control, based on knowledge of all pertinent facts, plus the capabilities of respective theaters, can intercept and solution problems be most intelligently integrated or can the most effective results be produced.

20. Centralized control of signal intelligence activities cannot properly be characterized as "absentee control." The reason for placing the control in the War Department is to assure unified control which can be provided only by a War Department agency. Even under the existing organization, actual control of signal intelligence activities in SWPA is exercised from distances of 3,500 miles and the Navy controls Guam signal intelligence from Washington, 8,000 miles away. It is immaterial whether the distance is 100 miles or 10,000 miles, provided the control of all activities is exercised by a single agency having authority to coordinate.

21. The comment from SWPA further states that the proposal would "serve to disrupt an Allied agency that is now functioning most effectively." The Allied agency referred to is the Central Bureau Brisbane, a joint U.S.-British organization under the control of the Chief Signal Officer, SWPA. Considered alone, this organization is operated with a relatively high degree of efficiency. However, from the overall viewpoint its operations are wasteful, since they are uncoordinated with other much more extensive signal intelligence operations of both the U.S. Army and the British. The British have proposed that the principal cryptanalytic work of the SWPA agency, which is absorbing large numbers of skilled linguistic and technical personnel, be transferred to Washington where the British believe the work can be done more effectively. There is no basis in the past or present relations of

either the War Department or SWPA with the British for the suggestion that the proposed centralized control will have anything other than a highly salutory effect upon cooperation with the British in the field of signal intelligence. The proposed creation of a British Theater in rear of the American zone of operations in the Pacific will further complicate the present unsatisfactory situation.

22. Probably the most unfortunate single consequence of our present decentralized signal intelligence organization is the strong tendency, most marked in SWPA, for each theater to strive for self-sufficiency and to undertake tasks far beyond its capacity to perform. This has at times been carried to ridiculous lengths, and has resulted in (a) useless duplication of effort and waste of highly technical and specialized personnel and machinery available only in limited numbers, and (b) neglect of opportunities on the part of theater signal intelligence organizations to derive intelligence of great and immediate tactical value from low level cryptanalysis and local traffic analysis.

23. It is certain that centralization of control of signal intelligence activities, rather than reducing the amount of useful signal intelligence work done within theaters of operations, will free personnel and units—now wasted on high level work beyond their capabilities—for greater concentration upon low level sources which can be best exploited locally and the possibilities of which have been grossly neglected. This will require the full backing and technical support of a central agency having authority (1) to coordinate the missions of all signal intelligence units including those engaged in low level work, (2) to ensure prompt interchange of technical data and results, and (3) to consolidate results from all sources for both technical and intelligence uses.

V. Procedure for placing centralized control into effect

24. Pursuant to a directive from the Deputy Chief of Staff dated December 10, 1944..., operational command and control of the signal intelligence activities of the Signal Security Agency are vested in the A. C. of S., G-2, WDGS, who exercises such control through the Chief, Military Intelligence Service. This permits close working relations between the production of signal intelligence and its evaluation, research and dissemination through MIS Special Security Officers attached to the operational headquarters and all units requiring information from this source.

25. The Signal Intelligence Units and personnel now under the command of theater commanders should be placed under the command of the Chief, Military Intelligence Service who will be in a position to integrate the activities of such units and personnel with activities of the Signal Security Agency and to direct all such activities in the light of intelligence requirements. The transfer of such units to be command of the Chief, Military Intelligence Service, will require no interruption in the existing working arrangements. The only immediate operational effect of the transfer will be that the present Theater Signal Intelligence officers will report *directly to the Chief, MIS thorugh the Signal Security Agency*, with which they all now communicate directly on technical matters.

26. The Signal Intelligence Units and personnel transferred will, as in the case of the Navy's Advanced Signal Intelligence Units and the Signal Security Agency's fixed intercept stations, remain under theater commanders for administration and discipline.

* * *

Appendixes

CHRONOLOGY

1917 - Formation of Code and Cipher Bureau within Military Inteiligence Section, War Department General Staff.

1918 - Code and Cipher Bureau redesignated as MI-8.

1919 - Herbert O. Yardley secretly employed by State and War Departments to operate clandestine cryptanalytic bureau.

1920 - William F. Friedman hired by Signal Corps to compile codes.

1921 - Yardley's success in reading Japanese diplomatic code paves the way to major U.S. diplomatic victory at Washington Peace Conference.

1929 - Yardley's bureau discontinued; all Army cryptologic activity transferred to Signal Corps where William F. Friedman becomes first head of the Signal Intelligence Service (SIS).

1931 - Yardley published *The American Black Chamber,* revealing secrets of U.S. cryptanalysis.

1934 - Provisional Radio Intelligence Detachment organized at Fort Monmouth, N.J.

1935 - Maj. Haskell Allison becomes first Army officer to head SIS.

1938 - 2d Signal Service Company activated to serve as consolidated intercept arm for SIS.

1940 - SIS team led by Friedman succeeds in breaking the Japanese PURPLE machine cipher by purely cryptanalytic methods. Decrypts, given the codename MAGIC, are given restricted dissemination to a few top policymakers.

1941 - Pearl Harbor attack; U.S. enters World War II.

1942 - Special Branch of MIS organized.

- SIS moves to Arlington Hall, is given mission of intercepting all diplomatic traffic, and is repeatedly redesignated.
- major intercept stations established at Vint Hill Farms Station, Virginia, and Two Rock Ranch Station, California.

1943 - SIS successor organization succeeds in solving first Japanese military (vice diplomatic) system and achieves final World War II designation as Signal Security Agency.

- BRUSA agreement gives Army access to British ULTRA; agreement is made that Arlington Hall will serve as principle center for exploitation of Japanese military communications, and that SSA will participate in exploiting German problem.

- Military Intelligence Service (MIS) sets up Special Security Officer system to disseminate product to the theater commanders.

1944 - Special Security Officer (SSO) system expanded to service field commands down to armies and numbered air forces.

- Special Branch is dissolved to eliminate excessive compartmentation within MIS. American forces invade Normandy.

- MIS is given operational control of SSA.

1945 - Army-Navy Communications Intelligence Board created to direct all U.S. COMINT operations.

- Army Security Agency created to centralize all Army COMINT assets.

GLOSSARY

The documents included in this collection necessarily contain a number of abbreviations and acronyms (some now obsolete) as well as foreign terms that may be unfamiliar to the general reader. This is a brief guide.

A-2	Air Force intelligence staff
A-3	Air Force operations staff
AAF	Army Air Forces (U.S., World War II)
Abt.	*Abteilung* (German word for troops)
A/C	Air commodore (British and British Commonwealth Air Force rank equivalent to brigadier general)
A.C. of S.	Assistant chief of staff
AEF	American Expeditionary Forces (World War I)
AFHQ	Allied Forces Headquarters (World War II Mediterranean theater)
AGCT	Army General Classification Test
AGO	Adjutant General's Office
AIF	Australian Imperial Forces
AIS	American Intelligence Service (a semi-autonomous branch of the Military Intelligence Service in World War II that dealt with Western Hemispheric affairs)
Armeegruppe	Army group
AR	Army regulation
AS	Air Staff
ASA	Army Security Agency
ASCZ	Advanced Sector, Communications Zone
ASF	Army Service Forces
ASTP	Army Special Training Program (World War II program in which selected draftees were allowed to attend college under military auspices)
ATC	Air Transport Command
AUS	Army of the United States
Bde.	Brigade
BEW	Board of Economic Warfare
B.P.	Bletchley Park (World War II British COMINT headquarters)
Btry.	Battery

C/A	Cryptanalysis
CBB	Central Bureau, Brisbane
CBI	China-Burma-India (theater)
CG	Commanding general
C-in-C; CINC	Commander in Chief
CINCPAC	Commander-in-Chief, Pacific
CIRO PEARL	World War II code word assigned to product derived from analysis of medium-level codes and ciphers
CO	Commanding officer
COMINT	Communications intelligence
COM-Z	Communications zone
CP	Command post
CWT	Central War Time
DAF	Desert Air Force
DDMI, BAS	Deputy Director of Military Intelligence, British Army Staff (Washington, D.C.)
DEXTER	British term for lower-grade signals intelligence
DF	Direction finding (radio)
"E"	Enigma
EM	Enlisted men
ETO	European Theater of Operations
ETOUSA	European Theater of Operations, U.S. Army
EWT	Eastern War Time
FBI	Federal Bureau of Investigation
FEB	*Feld Ersatz Battalion* (German field replacement battalion)
Flivo	German Air Force liaison officer attached to ground units
FY	Fiscal year
FYI	For your information
G–1	Military personnel staff section
G–2	Military intelligence
G–3	Military operations staff section
G–4	Military supply staff section
GAF	German Air Force
GC & CS	Government Code and Cypher School (the World War II British COMINT organization headquartered at Bletchley Park)
Genfldm.	*Generalfeldmarschal* (German rank of Field Marshal, equivalent to General of the Army in U.S. rank)
Genobst.	*Generaloberst* (German rank of colonel general, equivalent to general in the U.S. Army)
GHQ	General Headquarters
GI	Government issue
GSC; G.S.C.	General Staff Corps

HF	High frequency (radio communication)
HF/DF	High frequency/direction-finding
HO	Designation of various types of truck-mounted shelters used to house mobile signals intelligence operations in World War II
IA	Intelligence and Analysis (section)
IB	Intelligence Bulletin
IBM	International Business Machines
Inf.	Infantry
ISUM	Intelligence Summary
JA	Japanese Army
JIC	Joint Intelligence Committee
Kana	Japanese syllabary used for foreign terms
KP	Kitchen police
Luftflotte	German air fleet (equivalent to a U.S. numbered Air Force)
M-134A	Electromechanical cipher device invented by the Signal Intelligence Service in the 1930s
M-134C	Improved version of the M-134A used in World War II, familiarly known as the SIGABA
M-138	Strip cipher device introduced by the Signal Intelligence Service
M-209	Mechanical cipher device invented by the Swedish cryptologist Boris Hagelin and used to encipher U.S. Army tactical communications in World War II
MAAF	Mediterranean Allied Air Forces
MAGIC	Code word assigned to decrypts of Japanese diplomatic communications
MF	Medium frequency (radio transmission)
MI-8	World War I cryptanalytic unit of Military Intelligence Division
MID	Military Intelligence Division, War Department General Staff
MIS	World War II Military Intelligence Service
MOS	Military occupational specialty
MS; MS/CXX	British category of high-grade signals intelligence
MTO	Mediterranean Theater of Operations
NATOUSA	North African Theater of Operations, U.S. Army
NCO	Noncommissioned officer
NYPE	New York Port of Embarkation
O/B	Order of Battle
OCS	Officers Candidate School; Office of the Chief of Staff
OCSigO	Office of the Chief Signal Officer (U.S. Army)
OD	Olive drab
OIC	Officer in charge
OKW	*Oberkommando der Wehrmacht* (the World War II German Armed Forces High Command)

ONI	Office of Naval Intelligence
OP	Observation post
OP-20-G	U.S. Navy cryptanalytic organization
OPD	Operations Division (the U.S. Army's central command organization in World War II)
OSCRP	Officers Signal Corps Replacement Pool
OSS	Office of Strategic Services
OWI	Office of War Information
PEARL	World War II code word assigned to product derived from analysis of low-level codes and ciphers
PURPLE	Code name assigned by U.S. to advanced Japanese diplomatic machine cipher
PW	Prisoner of war
PX	Post exchange
RAAF	Royal Australian Air Force
RAM	Rapid Analytical Machinery
Rasterschuessel	German transposition cipher device
ROMAJI	Use of English letters to transcribe Japanese words
R/T	Radio/telephone
Schwerpunkt	German military term used to denote "vital point" for attack or defense
SCR	Signal Corps radio
SCU	Special Communications Unit (British units used as communications channels for ULTRA)
SHAEF	Supreme Headquarters, Allied Expeditionary Forces
SID	Signal Intelligence Division
SIGINT	World War II British term for signals intelligence
SIS	Signal Intelligence Service
SLU	Special Liaison Unit (British equivalent of Special Security Officer)
SNAFU	"Situation normal—all fouled up"
SLOE	Special List of Equipment
S.O.	Special order
SRH	Special Research History
SS	Signal Service
SSA	Signal Security Agency
SSB	Signal Security Branch
SSD	Signal Security Division
SSO	Special Security Officer
SSR	Special Security Representative
SSS	Signal Security Service
SWPA	Southwest Pacific Area (MacArthur's World War II command)
T/4	Technical sergeant, fourth class

T/5	Technical sergeant, fifth class
TAC	Tactical Air Command
TAF	Tactical Air Force
T/BA	Table of basic allowances
T/E	Table of equipment
THQ	Headquarters hut at Vint Hill Farms School
THUMB	Code word assigned to product derived from radio direction finding
T/O	Table of organization
TOE	Table of organization and equipment
ULTRA	World War II code word assigned to high-level signals intelligence product (originally ULTRA DEXTER)
USAAF	U.S. Army Air Forces
USAFFE	U.S. Army Forces, Far East
USATS	U.S. Army Transport Service
VHF	Very high frequency (radio transmission)
V-J	Victory over Japan
WAC	Women's Army Corps
W/C	Wing commander (Royal Air Force - British Commonwealth rank, equivalent to a colonel)
WD	War Department
WDGS	War Department General Staff
WEC	Wireless Experimental Centre (India-based British COMINT element)
Wehrkreis	Territorial division of World War II German Home Army
W/O	Warrant officer
W/T	Wireless telegraphy (radio)
WT/I	Wireless telegraphy intelligence (early term for traffic intelligence)
"Y"	British term for low-level signals intelligence

A DICTIONARY OF PEOPLE, PLACES, AND TERMS

This is a list—by no means exhaustive—of some of the key people, places, and military and cryptologic terms that the reader may encounter in the documents.

Arlington Hall - a converted girls' school in Arlington, Virginia, which was taken over by the U.S. government in World War II to serve as the headquarters for the Signal Intelligence Service and its various successor organizations.

base line - extent of area over which radio direction sets are dispersed. The longer the base line, the more accurate the bearings.

Bissell, Clayton W. - Major General Bissell, an Army Air Forces officer, served as Army Assistant Chief of Staff for Intelligence from 1944 to 1945.

Bletchley Park - British estate that served as the wartime home of the Government Code & Cypher School - the British cryptologic organization.

bookbreaking - recovering the underlying "values"—i.e., meanings—of the various code groups within a single code.

"buck slip" - referral form.

Camp Ritchie - This National Guard installation located in the hills of Maryland was the site of the Army's Military Intelligence Training Center in World War II.

cipher - method of secret writing involving the transposition or substitution of individual letters or syllables in a message.

Clark, Mark - General Mark Clark served as commander of the Fifth Army in the Mediterranean Theater of Operations.

Clarke, Carter W. - Colonel (later Brigadier General) Carter Clarke served as Chief, Special Branch, Military Intelligence Service from 1942 to 1944. He later

became Deputy Chief of the Military Intelligence Service, and went on to command the Army Security Agency.

Class IV Installation - in World War II, a base or camp controlled by a technical service, as opposed to Army Ground Forces.

code - a method of secret writing involving the substitution of words and phrases in a message.

code values - the meanings assigned to different words in a given code.

collateral - intelligence derived from sources other than signals intelligence.

colored warplans - U.S. Army warplans devised prior to World War II. Plans were aimed against individual enemy countries, each of which was assigned a different color code. The plan to defend against Japanese aggression was Plan Orange.

compromise - a security breakdown uncovering a secret to the enemy.

converter - pre-World War II Army term for a machine cipher device.

cover - deceptive information put out to hide the real source of signals intelligence.

cryptanalysis - the science of breaking codes and ciphers.

cryptographer - someone who composes codes and ciphers.

cryptology - this term, invented by Friedman, embraces the wholefield of secret communications, to include cryptanalysis, cryptography, and intercept.

depth - a cryptologic term referring to the existence of a sufficient number of messages in the same code or cipher key.

Fabyan, George - Eccentric philanthropist who founded Riverbank Laboratories and was responsible for the initiation of cryptologic studies in the United States.

Fort Monmouth - A major Army Signal Corps installation in New Jersey.

Friedman, William - Originally trained as a geneticist, Friedman became America's foremost cryptologist after George Fabyan hired him to solve the alleged hidden cipher in Shakespeare's plays that would prove the works to have been written by Sir Francis Bacon. He served as code compilation clerk for the

Signal Corps from 1920 to 1930, and was the first head of the Signal Intelligence Service. His major accomplishment was in leading the team that broke the Japanese machine cipher that the United States assigned the codename PURPLE. During World War II, he served as Director of Communications Research for the Signal Security Agency.

"gig" - U.S. Army term for a demerit in an inspection.

goniometric - having to do with radio direction-finding.

grades - enlisted ranks. Before World War II, these went from Grade 7 (buck private) to Grade 1 (master sergeant).

Halmahera - Island in the Moluccas.

indoctrination - in intelligence, the procedure whereby selected individuals are instructed on the importance of the secret they will have access to and the need to avoid taking any actions that might result in compromise.

intercept - in signals intelligence, the act of listening to broadcast communications.

key; keying elements - elements applied to plaintext to produce a ciphered message.

King, Ernest J. - Admiral (later Fleet Admiral) King served as Commander in Chief, United States Fleet and Chief of Naval Operations throughout World War II.

Marshall, George Catlett - General (later General of the Army) Marshall served as Army Chief of Staff throughout World War II.

McCloy, John J. - a prominent lawyer who served as Assistant Secretary of War during World War II.

McCormack, Alfred - Colonel Alfred McCormack, a Wall Street lawyer in civilian life, was called into government service to analyze intelligence problems at the beginning of World War II. He served as deputy chief of the Special Branch until 1944, and then became Director of Intelligence in a reorganized Military Intelligence Service. After World War II, McCormack served briefly as the first head of the State Department's Bureau of Intelligence and Research.

McNarney, James J. - Lieutenant General McNarney served as Army Deputy Chief of Staff in World War II and was deeply involved in organizational issues.

Miles, Sherman - Major General Sherman Miles was the Army's Assistant Chief of Staff for Intelligence at the time of the disastrous surprise at Pearl Harbor.

Montgomery, Bernard - Field Marshal Montgomery commanded the British Eighth Army against Rommel in World War II and later went on to command the 21 Army Group under Eisenhower.

non-indicator traffic - messages sent without any obvious indication of what particular code or cipher key they have been enciphered in.

null - radio direction-finding term. A "null" occurs when a radio station can no longer be heard, indicating that the antenna of the receiving set is directly aligned on a bearing pointing towards the emission source.

overhead - personnel not assigned to an organized Army unit.

period - time-frame in which a given code or cryptosystem was allowed to remain in use. Codes and ciphers were changed regularly to protect security.

ratings - lower-ranking soldiers before World War II could acquire additional pay within their basic grade by demonstrating professional proficiency in technical specialties.

reserve editions (codes) - new codes would be held in reserve to be issued in case existing codes had become compromised.

Riverbank Laboratories - This "think tank" was founded by George Fabyan at Geneva, Illinois, to conduct research in a number of scientific fields, ultimately including cryptology.

Scharnhorst - World War II German battle cruiser sunk by British Navy as a result of successful exploitation of COMINT.

system indicators - information at the beginning of a message telling the receiving operator what code or cipher the message has been transcribed in.

Stimson, Henry L. - prominent statesman who served as Hoover's Secretary of State, where he abolished codebreaking activity, and later as President Franklin Roosevelt's Secretary of War, where he sponsored it.

Strong, George V. - Major General Strong served as the Army's Assistant Chief of Staff for Intelligence from 1942 to 1944.

superencipherment - enciphering a message already rendered into code.

Taylor, Telford - Colonel (later Brigadier General) Telford Taylor, a lawyer in civilian life, was commissioned as an intelligence officer in World War II and became the Military Intelligence Service's chief liaison officer in Britain. After World War II, he became a military prosecutor in the war crimes trials at Nuremberg, Germany.

transposition - a method of encipherment in which the order of letters is systematically altered.

Two Rocks - Two Rock Ranch near Petaluma, California, was the site of the Signal Security Agency's main West Coast monitoring station in World War II.

Vint Hill Farms - This large estate near Warrenton, Virginia, became the World War II site of the Army's cryptologic training school and Monitoring Station Number 1.

Yardley, Herbert O. - Major Yardley headed up MI-8, the Army's cryptologic unit in World War I. He later headed up the so-called "Black Chamber" element that broke codes for the State Department and War Department in the 1920s. After being dismissed by Henry L. Stimson, he went on to write a sensational and damaging exposé of his activities.
